28 *H. BRACHYSEMUM*; stem erect; leaves with 5-9 pairs of ovate smooth leaflets; stipulas concrete; bracteas longer than the pedicels; vexillum one-half shorter than the keel, but about equal in length to the wings; legumes smooth, pendulous. 2. *H.* Native of the Altaian mountains, at the metal mines of Riddessk. *H. obscurum* *Altaicum*, *Fisch. in litt.* *H. obscurum*  $\beta$ , *brachysemum*, *D. C. prod.* 2. p. 343.—*Gmel. sib.* 4. t. 10. Flowers larger than those of *H. obscurum*, purple, seldom white.

*Short-bannered Hedysarum.* Fl. Jul. Aug. Clt. 1817. Pl. 2 ft.

29 *H. ALPINUM* (*Lin. spec.* 1057.) stem erect; leaflets oblong or lanceolate, pubescent beneath; upper stipulas distinct; bracteas usually shorter than the pedicels; legumes pendulous, quite glabrous. 2. *H.* Native of Siberia and Dahuria. *Jacq. vind.*

266. *H. Sibëricum*, Poir. suppl. 5. p. 17. Lam. ill. t. 628. f. 3. Flowers purple, seldom white. An elegant plant.

*Var. β, pedicellare* (D. C. prod. 2. p. 343.) bracteas shorter than the pedicels. *H. alpinum*, Willd. spec. 3. p. 1207. Ker. bot. reg. 808. Sims, bot. mag. 2213.

*Alpine Hedysarum*. Fl. July, Aug. Clt. 1798. Pl. 2 to 3 ft.

30 *H. CAUCA'SICUM* (Bieb. fl. taur. 2. p. 178.) stem erect; leaflets ovate, smoothish; upper stipulas concrete, opposite the leaves; racemes on long peduncles; bracteas longer than the pedicels; legumes glabrous, pendulous.  $\alpha$ . *H.* Native of Caucasus and Iberia, on the Alps. Flowers purple. Peduncles almost a foot long.

*Caucasian Hedysarum*. Fl. Ju. Aug. Clt. 1820. Pl. 2 to 3 ft.

31 *H. BOREALE* (Nutt. gen. amer. 2. p. 110.) stem rather decumbent; leaflets oblong-obovate, villous beneath; stipulas joined, sheathing; with subulate segments; racemes on long peduncles; joints of legume smooth or pubescent, and roundish.  $\alpha$ . *H.* Native of North America, on the naked arid plains of the Missouri at Fort Mandan, and in the north of Canada, and from the Saskatchewan to the Arctic circle, Rocky mountains, &c. *H. alpinum*, Michx. fl. bor. amer. 2. p. 74. Flowers purple, secund.

*Northern Hedysarum*. Pl. 2 to 3 feet.

32 *H. MACKENZII* (Rich. in Frankl. journ. append. p. 745.) stems decumbent; leaflets oblong, clothed on both surfaces with canescent pili; stipulas sheathing; joints of legume wrinkled transversely and pilose.  $\alpha$ . *H.* Native of Arctic America and about the Saskatchewan, on the Eagle and Red-deer hills. Flowers large, red. This is the liquorice plant mentioned by Sir Alexander Mackenzie as being indigenous to North-west America.

*Mackenzie's Hedysarum*. Pl. decumbent.

33 *H. SUBSPINOSUM* (Fisch. in litt. D. C. prod. 2. p. 343.) stems suffruticose, much branched, erect, and are as well as the leaves clothed with adpressed canescent down; branches and peduncles permanent, and becoming hardened into spines; petioles flattish; leaves with 5-7 pairs of elliptic leaflets; spikes of flowers pedunculate, longer than the leaves; wings shorter than the calyx; ovary linear, glabrous.  $\beta$ . *H.* Native of Siberia, at Lake Inderskoi. This is a very singular species, with the habit of *Astragalus gibbosus*.

*Spinose Hedysarum*. Shrub  $\frac{1}{2}$  to 1 foot.

34 *H. INCARNATUM* (Willd. spec. 3. p. 1209.) stem erect, glabrous; leaflets oblong, acute, hoary beneath; stipulas wanting; flowers racemose, drooping.  $\beta$ . *H.* Native of Japan. *H. incarnum*, Thumb. fl. jap. 289. but not of Swartz. Flowers flesh-coloured. Said to be allied to *H. obscurum*, but the plant is without stipulas.

*Flesh-coloured-flowered Hedysarum*. Pl. 1 foot.

† *Doubtful species.*

35 *H. LINEARE* (Lour. fl. cochin. 452.) stem suffruticose, diffuse; leaflets lanceolate-linear, glabrous; spikes terminal; legumes straight, linear, smooth, 6-seeded.  $\beta$ . *H.* Native of Cochinchina. Flowers pale violet. The root is esteemed to be deobstruent, emmenagogue, and to create an appetite.

*Linear-podded Hedysarum*. Shrub 2 feet.

36 *H. UNIFLORUM* (Lapeyr. abr. p. 436.) stems ascending; leaflets elliptic, rather silky beneath; flowers pedunculate, solitary; wings twice the length of the calyx; legumes 4-parted, villous beneath; lobes 2-horned.  $\alpha$ . *H.* Native of the Pyrenees, among rocks. Flowers yellow.

*One-flowered Hedysarum*. Pl. ascending.

*Cult.* All the species of this genus are very handsome when in flower, being clothed with racemes of elegant pea blossoms; they are therefore well adapted for ornamenting flower borders or rock-work. They succeed well in light rich soil, and the perennial kinds are increased by dividing the plants at the roots

in spring or by seeds. The seeds of the annual species only require to be sown in the open border in spring.

CLIX. ONOBRYCHIS (from *ovos*, *onos*, an ass, and *βρυχω*, *brycho*, to gnaw; the plants are grateful to the ass). Tourn. inst. t. 211. Gært. fruct. 2. t. 148. D. C. fl. fr. 4. p. 511. legum. mem. vii. prod. 2. p. 344. Desv. journ. bot. 3. p. 125. t. 6. f. 33, 34. 1814. 1. p. 80. Hedysarum species of Lin. and others.

LIN. SYST. *Diadelphia*, *Decandria*. Calyx 5-cleft, with nearly equal subulate segments. Corolla papilionaceous, with the carina as if it was truncate, and the wings short. Stamens diadelphous. Legume sessile, of only one compressed, indehiscent, rather coriaceous, echinated, crested or winged, 1-seeded joint, which is thicker and straight on the upper suture, but convex and thinner on the lower suture.—European or Asiatic herbs, with impari-pinnate leaves, axillary elongated peduncles, bearing spikes of red or white flowers at their tops. The ovary when young is perhaps truly bi-ovulate. The legume also is sometimes 2-seeded, but only 1-celled.

SECT. I. EUBRYCHIS (from *eu*, *eu*, well or good, *βρυχω*, *brycho*, to gnaw; this section contains the most useful species in agriculture). D. C. legum. mem. vii. prod. 2. p. 344. Legume oblique, wrinkled or prickly in the disk, and toothed or interruptedly crested on the back.

1 *O. SATIVA* (Lam. fl. fr. 2. p. 652.) stem erect; stipulas usually distinct; leaflets elliptic-oblong, mucronate, glabrous; spikes of flowers elongated; keel of flower shorter than the vexillum; wings shorter than the calyx; legumes pubescent, denticulated on the back, but having the sides wrinkled, and rather prickly.  $\alpha$ . *H.* Native of Europe, on dry calcareous hills. In Britain on all calcareous hills. Hedys. onobrychis, Lin. spec. 1059. Jacq. austr. t. 352. Smith, engl. bot. 96. *O. vicicifolia*, Scop. *O. vulgaris*, Jaum. *O. spicata*, Moench. Flowers variegated, crimson.

*Saintfoin* is called *L'esparcet* in French; *Espazette* in German, and *Cedrangola* in Italian. It is a deep-rooting perennial plant, with branching spreading stems. It is a native of England and many parts of Europe, but never found but on dry, warm, chalky soils, where it is of great duration. It has been long cultivated in France and other parts of the continent, and as an agricultural plant was introduced from the latter country into England about the middle of the 17th century. It has since been a good deal cultivated in the chalky districts, and its peculiar value is that it may be grown on soils unfit for being constantly under tillage, and which would yield little under grass. This is owing to the long and descending roots of the *saintfoin*, which will penetrate and thrive in fissures of rocky and chalky substrata. Its herbage is said to be equally suited for pasturage or for hay, and that eaten green it is not apt to swell or hove cattle like the clovers or lucern. Arthur Young says, that upon soils proper for this plant no farmer can sow too much of it; and in the code of agriculture it is said to be "one of the most valuable herbage plants we owe to the bounty of Providence." There are no varieties of this plant, but there are numerous other species of the same genus that might be cultivated.

*The best soil for saintfoin* is that which is dry, deep, and calcareous, but it will grow on any soil that has a dry subsoil. Kent thinks that the soils most suited to the culture of this plant are those of the chalky loam, and light sandy or gravelly kinds, or almost any of those of a mixed quality, provided they be not too wet, and have a rocky and hard calcareous bottom to check the roots at the depth of a foot or foot and a half below the surface, which he, notwithstanding the above, conceives necessary, as the plants are apt to exhaust themselves in running down. And for this reason he considers it as improper for being sown

where there is a great depth of soil or mould. Marshal says, that the poorest soils afford a large produce, and such as are more rich and arable abundant crops. Still he conceives that it is only on calcareous soils, as the dry chalk and limestone, or such as have been well impregnated with that sort of matter, that it succeeds in a perfect manner, or becomes durable. In sandy soils, as in Norfolk, which are unfit for any other purpose, under *saintfoin* will produce after the first year about two tons per acre of excellent hay, with an after grass extremely valuable for weaning and keeping lambs.

*The best preparation* which any soil fit for this plant can undergo is deep trenching, but the usual preparatory culture is the same as for clover, ploughing however deeper than ordinary, either by means of the trench plough, or by the common plough going twice in the same tract. Boys (Communications to the Board of Agriculture, vol. iii.) recommends as a preparation for *saintfoin*, 1st year, pare and burn for turnips to be eaten on the land by sheep; 2nd, barley to be sown very early, with clover seed; 3rd, clover eaten off by sheep; 4th, wheat; 5th, turnips, with manure; 6th, barley, with *saintfoin*. The corn crops must be carefully weeded, and in particular cleared of charlock. Under this system, the produce has been great, and the ground has been laid down in the highest order with *saintfoin*, or any other grass calculated for this species of soil.

*The season of sowing saintfoin*; it may be observed, that the earlier it can be put into the soil in spring the better, as from the greater moisture of such soils at that season, there will be a greater probability of their vegetating in a perfect manner; therefore the sowing of *saintfoin* seed should never be deferred later than the beginning of March, and it is still better if this work is completed in February. Some, however, think it may be deferred to the middle of March without injury.

*The manner of sowing saintfoin seed* is almost always broadcast, but it may be sown in drills, or even transplanted, though neither of these modes can be recommended. Some advise its being sown with about half the quantity of barley, which is annually sown for a full crop, that it may shade and keep it moist during the first summer, and at the same time not injure it from the crop being lighter, which is sometimes the case. Where the barley is drilled, the *saintfoin* may be put in afterwards in the same manner, but in a contrary direction. If sown over wheat, it should be harrowed in, and afterwards rolled. In whatever manner it is sown, as the seeds are larger than those of many other herbage plants, the ploughing the seed in with a very thin or shallow furrow is recommended. In most cases, especially in all the more light soils, in which this sort of crop is grown, the use of the roller may be necessary immediately after the seed is put into the ground. It is the practice in some districts to sow a small portion of clover-seed with *saintfoin*, with the idea of increasing the first year's produce, but it is perhaps better to increase the quantity of *saintfoin*-seed without mixing it with that of any other, as different kinds of herbage seed do not answer well when sown together, from there being a continual contest in their growth. It is, however, supposed by Marshal that such a practice is beneficial in alternately procuring a fine clean crop of *saintfoin* upon the land. It is a sort of crop that grows in so perfect a manner in the broad-cast method, that there can seldom be any necessity for having recourse to drills. It may, however, be cultivated in the latter mode with much success. And in Norfolk it is the practice with some cultivators to have it drilled at nine inches apart across the barley field, which has been sown in the same way, but in a contrary direction.

*The quantity of seed* required in the broad-cast method, which is that mostly employed, is about four bushels the acre, though less is frequently given, but of soils proper for this plant that quantity is always necessary. But when the drill system is

adopted a smaller quantity is used, from two to three bushels per acre. In Lincolnshire, where this plant is much grown, the common allowance of seed is five bushels per acre. In that county 4 pounds of trefoil-seed is recommended to be sown with each acre of *saintfoin*. The reason for which is, that in that exposed country, the young plants suffer more by the sun in summer than by the frost in winter. Of course, the trefoil coming to perfection in the first year, and living only three, will be a shelter for the young plants during the first year or two, and die off when the *saintfoin* wants its room.

*In the choice of saintfoin-seed* it is the best practice for the cultivator to select it from the best and most abiding plants in his particular soil, as such as is purchased from the seed-shops can rarely be depended upon. The external signs of good seed are, that the husk is of a bright colour, and the kernel plump, of a light grey or blue colour, and sometimes of a shining black. The seed may be good though the husk is black, which is owing sometimes to the letting it receive wet on the field. If, when the kernel is cut across, it appears greenish and fresh, it is a certain sign that it is good. Seed of the former year's sowing is always the best, as older seeds seldom vegetate in a perfect manner.

*The after culture and management of saintfoin* consists in occasional dressings with manure, and in the judicious intervention of mowing and pasturing. The first year some farmers do not mow it, while others do; but the second year and the succeeding summer a crop of hay may be taken, and the after grass be fed down with any sort of stock but sheep till towards December, care being taken that they do not eat it in too close a manner, as where that is the case, from the largeness of the roots, there may be danger of injuring the crowns of the plants. In the following autumn there will, however, be less risk in this respect, and sheep as well as cattle stock may be turned in and kept upon the pastures till they are well eaten down, being always careful to shut them up as early as possible in the beginning of the year. This is the opinion of Kent. And it is supposed, that as this sort of herbage is considered to be improved by being nipped by the frost, it may be a proper practice not to turn stock upon these leys too early in the autumnal season. With this intention it may be advisable to defer it till the latter end of September, when this sort of rough or after grass will be found to have much effect in promoting the flow of milk in cows, as well as in forwarding the condition of fattening beasts, great store of feed being still left for sheep. But with this sort of stock they should not be too closely fed down, or the sheep remain too long upon them, as much injury may be sustained by it. It has been suggested that all sort of cattle stock should be removed by the beginning of the year from these roughs, as much harm may be done by their continuing longer.

*In top dressing saintfoin*, peat ashes are the best material that can be made use of, where they can be procured in sufficient quantity. And other sorts of ashes are likewise found beneficial where these cannot be had. This should be applied so as to form a thin, even, regular dressing over the whole surface of the crop. In this view soot has also been found of great utility, when spread evenly over such leys in the beginning of January, in the proportion of 25 to 30 bushels to the acre. Malt dust has also been employed in the same way with considerable success; and it is supposed where these sorts of dressings can be applied every third or fourth year, the *saintfoin* crops, when well established in the soil, may be preserved in a state of vigorous growth for 10 or 15 years or more, and the land be considerably improved by the roots striking so deeply into it.

*In taking and using the saintfoin crop*, the same practice may be followed as for taking clover; it may be mown for soiling or hay or seed, and eaten on the spot by tethering, huddling, or common pasturing. In making it into hay, it is cut immediately

on its coming into full blossom, and as it remains but a short time in that state, as much expedition as possible should be employed both in mowing it and making the produce into hay. It is the most easy crop to make into hay, when the season is favourable. The haymakers follow the scythe, and having turned over the swaths, throw it into wind-rows, when it may be immediately formed into cocks, and the whole crop be fit for carting in a week after it is mown; and though it may appear green, and the stack acquire a considerable degree of heat, there is no danger to be apprehended, provided the weather has been fair during the hay-ricking, as it is so far from taking harm by heating in the stack, that the contrary state is most to be feared, and for this reason great care is necessary not to suffer the fodder to continue too long either in the swath or in the cocks, lest the air and wind should dry it too fast, and by exhaling its juices prevent its heating in the stack, and thereby render it of little value.

In regard to the frequency of cutting *saintfoin*, it is probable that on the thinner sorts of soils it can seldom be done more than once, but on those of the deeper sorts two crops may sometimes be taken, in the same manner as clover, care being taken in these cases that the future growth of the plants be not injured by this means.

The usual duration of *saintfoin*, in a profitable state, is from 8 to 10 years. It usually attains its perfect growth in about 3 years, and begins to decline towards the 8th or 10th year on calcareous soils, and about the 7th or 8th on gravels. There are instances, however, of fields of *saintfoin* which have been neglected and left to run into pasture, in which plants have been found upwards of 50 years from the time of sowing. In general the great enemy to the endurance of *saintfoin* is the grass, which accumulates and forms a close tuft on the surface, and thus chokes up the plant.

The quantity of produce on a medium of soils and cultivation may probably be estimated at from about one and a half to two tons per acre. And on the poorer and thinner staple sorts of land it will perhaps seldom afford less than from a ton to a ton and a half on an acre.

The nutritive products of *saintfoin* are the same as clover, viz.  $3\frac{1}{10}$  being  $1\frac{6}{10}$  per cent. more than those of lucern.

In saving seed from *saintfoin*, it should remain on the land till the husks become of a somewhat brownish colour, and the seeds are perfectly plump and firm. It requires some experience to know of what degree of ripeness to cut the seeded *saintfoin*, because all the seeds do not ripen at the same time on the same spike or head, as all the heads begin blossoming at the lower part, and continue to blow gradually upwards for many days, so that before the flowers have gone off the top, the seeds are almost mature at the bottom, therefore if the cutting is deferred till the top seeds are quite ripe, the lower, which are the best, would then all be lost. The best time to cut it is when the greater portion of the lower seeds are ripe, and the last blown beginning to be full. The unripe seeds will ripen after cutting, and be in all respects as good as those that were ripe before. It should be mown in the morning and evening, when the plant is most supple, for if mown in the heat of the day the ripe seeds will shed. In fine clear weather *saintfoin* seed will soon dry. After being dried it may be either thrashed out in the house or on the field on a large sheet, it then should be riddled through a large sieve, to separate the seed from the chaff and broken stems. The haulm may be then used as hay.

Cultivated or Common Saintfoin. Fl. June, July. Britain. Pl. 2 to 3 feet.

2 *O. TANAITICA* (Sprong. neue. entd. 2. p. 162.) stem erectish; stipulas usually distinct; leaflets elliptic-lanceolate, mucronulate, clothed with silky pubescence beneath, the rest of the

plant as in *O. sativa*. 2. H. Native of Siberia, on the banks of the Don. Hedys. onobrychis, Bieb. fl. taur. no. 1431. *O. sativa*, var.  $\beta$ , subvillôsa, D. C. prod. 2. p. 344. *O. sativa* Tatarica, Fisch. in litt. Flowers flesh-coloured.

River Don Saintfoin. Fl. June, July. Clt. 1817. Pl. 2 ft.

3 *O. MONTANA* (D. C. fl. fr. 4. p. 611.) stem rather decumbent; stipulas joined together, opposite the leaves; leaflets cuneate-lanceolate, mucronulate, glabrous; spikes of flowers short; keel longer than the vexillum; wings shorter than the calyx; legumes toothed on the back, but wrinkled and pubescent on the sides. 2. H. Native of the alps of Europe and of the Pyrenees, in the higher meadows. Hedys. montanum, Pers. ench. 2. p. 324. According to Wahlenberg this is only a variety of *O. sativa*. Flowers deep purple or red.

Mountain Saintfoin. Fl. June, July. Clt. 1817. Pl. dec.

4 *O. CONFERTA* (Desv. journ. bot. 1814. 1. p. 83.) stems declinate; stipulas usually distinct; leaflets oblong-elliptic, mucronulate, pubescent beneath; racemes of flowers ovate; wings shorter than the calyx; keel equal in length to the vexillum; legumes rather hoary, furnished with rather long prickles on the back, but wrinkled and furnished with a few short prickles on the sides. 2. H. Native of Caucasus, Iberia, south of Podolia, in grassy places. Hedys. confertum, Bieb. fl. taur. et suppl. 1452. Flowers deep red.

Crowded-flowered Saintfoin. Fl. June, Aug. Clt. 1817. Pl. decumbent.

5 *O. FONTANESII*; procumbent, pubescent; stipulas ovate, acute, dry; leaflets crowded, elliptic, obtuse, pubescent, and nerved beneath; racemes of flowers ovate, crowded. 2. H. Native of Tunis, in sandy places near Sbiba. Hedys. confertum, Desf. fl. atl. 2. p. 178. *O. conferta*  $\beta$ , Fontanèsii, D. C. prod. 2. p. 344. Flowers fine red.

Desfontain's Saintfoin. Fl. June, Aug. Clt. 1820. Pl.  $\frac{1}{2}$  ft.

6 *O. PROCUMBENS* (Stev. in litt. D. C. prod. 2. p. 344.) stems procumbent; leaflets oblong-linear, mucronate, pubescent beneath; spikes of flowers cylindrical, on long peduncles; wings shorter than the calyx; keel rather exceeding the vexillum; legumes pubescent, denticulated on the back, with the sides wrinkled, and rather prickly. 2. H. Native of Iberia, about Tiflis. Hedys. onobrychis var. Ibérica, Bieb. suppl. 484. Flowers red.

Procumbent Saintfoin. Fl. June, Aug. Clt. 1819. Pl. proc.

7 *O. SUPINA* (D. C. fl. fr. 5. p. 612.) stems diffuse, rather hairy; leaflets oblong, hardly mucronulate; spikes ovate-oblong, pedunculate; wings of flower shorter than the calyx, and the carina shorter than the calyx; legumes villous, crested and toothed on the back, but with the disks wrinkled, and rather prickly. 2. H. Native of Lower Vallais, Provence, Dauphny, Cevennes, and the Pyrenees. Hedys. supinum, Vill. dauph. 3. p. 394. H. herbaceum, Lapeyr. H. pallidum, Schleich. Flowers pale red.

Supine Saintfoin. Fl. June, July. Clt. 1819. Pl. proc.

8 *O. GLABRA* (Desv. journ. bot. 1814. vol. 1. p. 82.) stems ascending; leaflets lanceolate, acuminate, quite glabrous; legumes oblong, chinky, glabrous, crested, with the crest toothed at the apex. 2. H. Native of Tauria. Hedys. onobrychis var.  $\epsilon$ , Gouan. ill. 48. ? Flowers red.

Glabrous Saintfoin. Fl. June, July. Clt. 1816. Pl. ascending.

9 *O. ARENARIA* (D. C. prod. 2. p. 345.) stem erect, suffrutescent at the base; leaflets oblong-linear, mucronate, glabrous; spikes of flowers cylindrical; wings shorter than the calyx; keel about equal in length to the vexillum; legumes pubescent, almost toothless on the back, but wrinkled on the sides. 2. H. Native of Hungary and of Siberia, at the Irtysh about Kroupeanka. Hedys. arenarium, Kit. in litt. Willd. enum. suppl. 31. H. erectum, Patrin. herb. Flowers red.

*Sand Saintfoin.* Fl. June, Aug. Clt. 1818. Pl. 1 foot.

10 *O. MAREÓTICA* (Steven, in litt. D. C. prod. 2. p. 345.) stems erect; leaflets linear, mucronate, glabrous; racemes cylindrical, very long; wings shorter than the calyx; keel about equal in length to the vexillum; legumes villous, prickly on the back, and with the sides wrinkled and prickly.  $\gamma$ . H. Native of the Marcotic marsh in Egypt. Lobes of calyx long and villous. Prickles on the legumes arranged in two rows on each side. Flowers pale red. Very nearly allied to *O. álba*, but differs from it in being glabrous.

*Marcotic Saintfoin.* Fl. June, Aug. Clt. 1820. Pl. 1 foot.

11 *O. ÁLBA* (Desv. l. c.) stem erect, velvety; leaflets linear, mucronate, clothed with silky-pubescent on the under surface; spikes of flowers cylindrical; wings shorter than the calyx; keel a little longer than the vexillum; legumes pubescent, crested on the back, and furnished with longish prickles, but with the disks wrinkled, and furnished with short prickles.  $\gamma$ . H. Native of Hungary, on calcareous mountains, and of Abruzzo by way sides. Hedys. álbum, Waldst. et Kit. pl. hung. 2. t. 111. Stem angular. Upper leaves sessile. Flowers white.

*White-flowered Saintfoin.* Fl. Ju. Aug. Clt. 1804. Pl. 1 ft.

12 *O. ECHINÁTEM*; stem nearly erect, velvety; leaves all pinnate, petiolate; leaflets linear, mucronate, pilose above, and clothed with silky pubescence beneath, elegantly nerved; spikes of flowers cylindrical, short; wings falcate, acuminate, not half so long as the calycine teeth; legume 1-seeded, crested, and prickly on the back, with the sides pitted and prickly in front.  $\gamma$ . H. Native of Calabria, on calcareous hills. Hedysarum echinatum, Guss. pl. rar. p. 201. Flowers flesh-coloured.

*Echinated-podded Saintfoin.* Fl. June, July. Clt. 1831. Pl. 1 foot.

13 *O. PETRÆA* (Desv. l. c.) stem erect; leaflets linear, mucronate; spikes cylindrical, on long peduncles; wings twice the length of the calyx; keel a little shorter than the vexillum; legumes crested, and denticulated on the back, but wrinkled and toothless on the sides.  $\gamma$ . H. Native of Caucasus, among calcareous rocks. Hedys. petræum, Rich. fl. taur. et suppl. 1453. Corolla white, but with the keel tipped with purple. There are two varieties of the species, the one having the legumes and leaves quite smooth, and the other having the under side of the leaves and the legumes pubescent.

*Rock Saintfoin.* Fl. June, Aug. Clt. 1818. Pl. 1½ foot.

14 *O. GRACILIS* (Bess. enum. pl. volh. p. 74.) stems ascending; leaflets linear-lanceolate, mucronate, with the mid-rib usually beset with adpressed pili above; wings of flower hardly longer than the tube of the calyx; legumes roundish, canescent, toothed with prickles on the back, and with the sides reticulately wrinkled.  $\gamma$ . H. Native of the south of Podolia. *O. petræa*, Bess. enum. p. 27. Flowers small, pale, the vexillum streaked with pale red and yellow at the base, but having the keel tipped with purple.

*Slender Saintfoin.* Fl. June, Aug. Clt. 1820. Pl. ascending.

15 *O. SAXATILIS* (All. pedem. no. 1191. t. 19. f. 1.) stem ascending; leaflets linear, mucronate; spikes cylindrical, pedunculate; wings longer than the calyx; keel a little shorter than the vexillum; legumes glabrous, crested, and entire on the back, and wrinkled on the sides.  $\gamma$ . H. Native of Provence, Dauphiny, Nice, and Spain, on hills and among rocks. Hedys. saxatile, Lin. spec. 1059. *O. tennifolia*, Mœnch. Hedys. microcarpum, Dufour, in litt. Flowers white. There are varieties of this species with glabrous and silky-villous leaves, and glabrous and pubescent legumes.

*Stone Saintfoin.* Fl. June, Aug. Clt. 1790. Pl. ascending.

16 *O. ERIOPHORA* (Desv. l. c.) stems trailing; leaflets linear, acute, pubescent; legumes clothed with hoary tomentum, crested and prickly on the back, and wrinkled and prickly on the disks, VOL. II.

the prickles are hairy, and disposed in 3 rows.  $\gamma$ . H. Native of Spain. Hedys. eriophorum, Pourr. Flowers red!

*Wool-bearing Saintfoin.* Pl. trailing.

17 *O. CRINITA* (Desv. l. c.) stems trailing; leaflets ovate, obtuse, pubescent, hoary; legumes prickly on both sides; prickles pubescent.  $\gamma$ . H. Native of the Levant.

*Hairy Saintfoin.* Pl. trailing.

18 *O. HORRIDA* (Desv. l. c. t. 22.) stems declinate; leaflets linear, acuminate, pubescent; legumes crowded, large, lunate, bearing spines; spines acute, pubescent, longer than the crest on the back of the legumes.  $\gamma$ . H. Native of Barbary.

*Horrid Saintfoin.* Pl. declinate.

19 *O. STENORRHIZA* (D. C. prod. 2. p. 346.) stem erectish; leaflets oblong-linear, mucronate, 3-4 pairs, clothed with silky-hoary down beneath; legumes crowded, clothed with hoary villi, and beset with prickles on all sides; the prickles pubescent.  $\gamma$ . H. Native of Spain in the kingdom of Valentia, in arid places. Hedys. stenorrhizum, Dufour, in litt. Root long, slender, simple. This plant differs from all the other species of the genus in the leaves having only 3 or 4 pairs of leaflets. Flowers unknown.

*Slender-rooted Saintfoin.* Pl. 1 foot.

20 *O. CAPUT-GÁLLI* (Lam. fl. fr. 2. p. 651.) stems erect; leaflets oblong or cuneate-obovate, mucronate, pubescent; spikes few-flowered; wings rather longer than the calyx; keel a little shorter than the vexillum; legumes rather pubescent, very prickly on all sides.  $\odot$ . H. Native of the south of Europe, in rugged exposed places. Hedys. caput-gállí, Lin. spec. 1059. -- Lob. icon. 2. p. 81. f. 1. Flowers flesh-coloured.

*Cock's-head Saintfoin.* Fl. July, Aug. Clt. 1731. Pl. 1 foot.

21 *O. CRISTA-GÁLLI* (Lam. fl. fr. 2. p. 652.) stems trailing; leaflets cuneate, oblong or obovate, obtuse or retuse, pubescent; spikes few-flowered; calyxes about equal to the corolla; wings and keel about the same length as the vexillum; legumes glabrous, crested on the back; the crest parted into broad, flat, oblong, toothed segments, having the disks wrinkled, and rather prickly.  $\odot$ . H. Native of the south of Europe, in rugged exposed places. Gärtn. fruct. 2. t. 118. Hedys. crista-gállí, Lin. syst. 563. Flowers pale red.

*Cock's-comb Saintfoin.* Fl. June, Aug. Clt. 1710. Pl. proc.

22 *O. FOVEOLATA* (D. C. prod. 2. p. 346.) stems trailing; leaflets cuneate-oblong, mucronate, villous; racemes few-flowered, hardly twice the length of the leaves; legumes pubescent, crested on the back; the crest divided into 3 or 4 entire unequal segments; disks reticulated, with prominent, prickly, villous nerves, the hollows between the nerves deep and glabrous.  $\odot$ . H. Native of Sicily, on arid hills. Flowers pale red?

*Foveolate-podded Saintfoin.* Fl. June, July. Pl. tr.

23 *O. EQUIDENTATA* (D'Urv. enum. pl. archip. p. 90.) stem erect; leaflets oblong, obtuse, mucronate, rather pubescent; peduncles 3 or 4 times longer than the leaves; legumes glabrous, somewhat orbicular, with the disks wrinkled and somewhat arched; the back crested, with the crest divided into equal entire teeth.  $\odot$ . H. Native of the islands of Candia and Melos on hills. *O. Crética foliis vicie, fructu magno cristato et aculeato*, Tourn. 26. Hedys. aequidentatum, Smith, fl. grac. prod. 3. p. 1752. *O. cristata*, Desv. journ. bot. 1814. vol. 1. p. 83. t. 23. Flowers red, having the vexillum streaked with blood-colour.

*Equal-toothed-crested Saintfoin.* Pl. 1 foot.

† *Species belonging to section Eubrychis, but are not sufficiently known.*

24 *O. ECHINUS* (D. C. prod. 2. p. 346.) stems glabrous; leaflets linear, rather pilose, mucronate; raceme terminal? simple; calyx villous; legumes thick, lanuginous, very prickly on all sides. R r

sides.  $\mathcal{L}$ .? H. Native country unknown. Hedys. echinus, Poir. suppl. 5. p. 19. Perhaps only *O. caput-galli*.

*Hedgehog Saintfoin.* Pl.  $\frac{1}{2}$  foot.

25 *O. PEDUNCULARIS* (D. C. prod. 2. p. 346.) leaflets linear-lanceolate, villous; peduncles very long, bearing racemes of flowers at their tops; legumes 1-seeded, prickly.  $\odot$ .? H. Native about Tangiers. Hedys. pedunculare, Cav. anal. sci. nat. 1801. vol. 4. p. 75.

*Long-peduncled Saintfoin.* Pl. 1 foot.

26 *O. INCURVATA* (D. C. prod. 2. p. 346.) leaflets oblong, silky beneath; spikes of flowers incurved; wings 3 times shorter than the carina; legumes 1-seeded, hairy, with a prickly crest.  $\mathcal{L}$ . H. Native country unknown. Hedys. incurvum, Horn. hort. hain. 2. p. 702. Flowers pale red.

*Incurved-spiked Saintfoin.* Pl. ascending.

27 *O. CARPATHICA* (D. C. prod. 2. p. 346.) stems ascending; leaflets lanceolate; wings length of vexillum; legumes glabrous, 1-seeded, prickly.  $\mathcal{L}$ . H. Native of the Carpathian mountains. Hedys. Carpathicum, Walld. et Kit. in Willd. enum. p. 776. Flowers red.

*Carpathian Saintfoin.* Fl. June, Aug. Clt. 1817. Pl. asc.

28 *O. BERGERIANA* (D. C. prod. 2. p. 346.) stems diffuse, smoothish; leaflets obovate, rather retuse, and rather pilose; stipulas scarious; corolla shorter than the calyx; legumes 1-seeded, prickly; prickles subulate, a little hooked.  $\mathcal{L}$ . H. Native of Campagna, near Girace. Hedys. Bergerianum, Spreng. pug. p. 2. t. 74. Habit of a species of *Medicago*.

*Berger's Saintfoin.* Pl. diffuse.

SECT. II. HYMENOBRYCHIS (from *ὑμην*, *hymen*, a membrane, and *βρυχω*, *brycho*, to gnaw; in reference to the species contained in this section being furnished with a membranous crest on the back of the legume). D. C. legum. mem. vii. prod. 2. p. 346. Legumes falcate or somewhat orbicular, wrinkled, and prickly in the disks, expanded into a membranous, denticulated, or entire crest the whole length of the back. This section agrees with the genus *Hymenocarpus*, but differs in the pods being 1-seeded, not many-seeded, and in the disks of the pods being wrinkled, not smooth, as in that genus.

29 *O. TOURNEFORTII* (Desv. journ. bot. 1814. vol. 1. p. 81.) stem erect, velvety; leaflets elliptic-oblong, acute, velvety beneath; spikes of flowers cylindrical, erect; wings longer than the calyx; calyx and legumes velvety.  $\mathcal{L}$ . H. Native of Armenia and Galatia. Hedysarum Tournefortii, Willd. spec. 3. p. 1214. *O. orientalis incana flore luteo*, &c. Tourn. cor. 26. Flowers yellow, about the size of those of *Hedysarum coronarium*. Legumes falcate.

*Tournefort's Saintfoin.* Pl. 1 foot.

30 *O. PALLASII* (Bieb. pl. ross. 1. t. 35.) stem erect, hairy; leaflets elliptic-oblong, acuminate, tomentose beneath; spikes of flowers cylindrical; wings shorter than the calyx, oblong, and with one tooth at the base of each; calyx villous; legumes pubescent.  $\mathcal{L}$ . H. Native of Iberia and Tauria, on calcareous hills. Hedys. Pallasii, Willd. spec. 3. p. 1214. Bieb. fl. taur. et suppl. no. 2. p. 178. *O. Buxbaumiana*, Desv. journ. bot. l. c.—Buxb. cent. 2. t. 42. Flowers cream-coloured, but the vexillum is painted with purple veins.

*Pallas's Saintfoin.* Fl. June, Aug. Clt. 1820. Pl. 1 ft.

31 *O. RADICATA* (Bieb. cat. hort. gor. 1812. p. 73.) stem erect, pilose; leaflets ovate, obtuse, mucronate, hairy beneath; spikes of flowers cylindrical; wings sagittate, twice the length of the calyx; calyx and legumes villous.  $\mathcal{L}$ . H. Native of Caucasus, Iberia, and Cappadocia, on hills among stones. Hedys. radiatum, Desf. ann. mus. 12. t. 13. Bieb. suppl. no. 1150. Hedys. Buxbaumii, Bieb. fl. taur. no. 1150, exclusive of the synonyme of Buxbaum, Hedys. circinnatum, Willd. spec. 3. p. 1213. *O.*

circinnata, Desv. l. c. Flowers cream-coloured, but the vexillum is lined with red, and with a yellow mark at the base.

*Rayed-podded Saintfoin.* Fl. June, Aug. Clt. 1818. Pl. 1 ft.

32 *O. MICHAUXII* (D. C. prod. 2. p. 347.) stem erect, smoothish; leaflets elliptic-oblong, mucronate, glabrous; spikes elongated, loose-flowered; wings sagittate, shorter than the calyx, with the auricles diverging; calyxes villous; legumes clothed with velvety tomentum.  $\mathcal{L}$ . H. Native of the Levant. Hedys. cryptopterum, Iher. herb. *O. picta*, Desv. in herb. Desf. Flowers pale, with the vexillum striated. The figure in Buxb. cent. 2. t. 42. agrees pretty well with this species.

*Michaux's Saintfoin.* Fl. June, Aug. Clt. 1820. Pl. 1 ft.

33 *O. ORNATA* (Desv. l. c.) stem erect, flexuous, glabrous beneath, but pubescent above; leaflets ovate, cuspidate, clothed with hoary pubescence beneath; spikes elongated; wings longer than the calyx; legumes villous.  $\mathcal{L}$ . H. Native of Galatia. Hedys. ornatum, Willd. spec. 3. p. 1215. Hedys. coronarium. Poir. dict. 6. p. 139. Flowers red? Legumes semi-orbicular.

*Decked Saintfoin.* Pl. 1 foot.

34 *O. VENOSA* (Desv. l. c.) stem almost naked; leaflets elliptic, villously-tomentose beneath, outer one a little larger than the rest; peduncles radical, longer than the leaves; flowers spicate, distant; wings shorter than the calyx; legumes very villous.  $\mathcal{L}$ . H. Native of Tunis, on the mountains of Sbiba, and of Persia, as well as the island of Cyprus. Hedys. venosum, Desf. fl. atl. 2. p. 179. t. 201. Corollas pale yellow.

*Veiny Saintfoin.* Pl.  $\frac{1}{2}$  foot.

35 *O. PTOLEMAICA* (D. C. prod. 2. p. 347.) stem erect, villous; leaves with 3-6 pairs of elliptic villous leaflets; spikes about the length of the leaves; wings shorter than the calyx; legumes silky, orbicular, 2-seeded.  $\mathcal{L}$ . F. Native of Egypt, in the desert of Suez. Hedys. Ptolemaicum, Delil. fl. aegypt. 111. t. 39. f. 1. Poir. suppl. 5. p. 18. Flowers yellow, painted with brown lines. Said to be allied to *O. venosa*, but differs in the legumes being lunulate, with entire margins, and 2-seeded.

*Ptolemais Saintfoin.* Fl. June, Aug. Clt. 1816. Pl. 1 foot.

SECT. III. DENDROBRYCHIS (from *δένδρον*, *dendron*, a tree, and *βρυχω*, *brycho*, to gnaw; in allusion to the species contained in this section being shrubby). D. C. legum. mem. vii. prod. 2. p. 347. Legumes smooth, unarmed, and crestless. Stems shrubby.

36 *O. CORNUTA* (Desv. journ. bot. 1814. vol. 1. p. 81.) stem erect, shrubby; leaflets linear-lanceolate, pubescent; peduncles divaricate, few-flowered, and at length become spines; wings of flower longer than the calyx; vexillum villous, crenated at the apex.  $\mathcal{L}$ . F. Native of the Levant, about Barbout (ex Tourn. voy. 2. p. 249. with a figure), and of Eastern Caucasus, in subalpine situations (ex Bieb. fl. taur. 2. p. 181.) Hedys. cornutum, Lin. spec. 1060. *O. orientalis*, Jaume, fam. nat. 2. p. 239. Flowers purple. Legumes reticulated in the disk. Perhaps the Caucasian plant is the same as the Armenian one.

*Horned Saintfoin.* Fl. June, Aug. Clt. 1816. Sh.  $\frac{1}{2}$  to 1 ft.

37 *O. TRAGACANTHOIDES* (D. C. prod. 2. p. 347.) stem erect, shrubby; leaflets oblong-lanceolate; peduncles at length hardening into spines, and divaricate; wings longer than the calyx; vexillum obtuse, glabrous.  $\mathcal{L}$ . F. Native of the Levant. Stipulas membranous, white, concrete in one, which is bifid at the apex.

*Tragacanth-like Saintfoin.* Shrub  $\frac{1}{2}$  to 1 foot.

38 *O. ? PUMILA* (Desv. l. c. p. 81.) stem suffruticose; leaflets oval-oblong; calyxes glabrous; wings shorter than the vexillum, and the vexillum shorter than the keel.  $\mathcal{L}$ . F. Native of Spain. Hedys. pumilum, Lin. mant. 448. Fruit unknown.

*Dwarf Saintfoin.* Shrub  $\frac{1}{2}$  foot.

SECT. IV. ECHINOBRACHIS (from *εχινος*, *echinos*, a hedge-hog,

and βρυχω, *brycho*, to gnaw; in reference to the legumes being prickly). D. C. legum. mem. vii. prod. 2. p. 348. Legumes trigonal, rather incurved, prickly on the back. Leaves simple. Perhaps a proper genus.

39 *O. ROTUNDIFOLIA* (Desv. l. c.) stems prostrate, angular, glabrous; leaves obovate, on short petioles, quite smooth, and bistipulate; racemes few-flowered; legumes somewhat incurved, triquetrous, acuminate, prickly on the back.—Native of the East Indies. Pluk. alm. t. 433. f. 1. Hedys. rotundifolium, Vahl. symb. 2. p. 81. Hedys. erinaceum, Poir. dict. 6. p. 393. Hedys. nummularifolium, Vahl. in herb. mus. par. et Juss.

*Round-leaved Saintfoin.* Pl. prostrate.

40 *O. CUNEIFOLIA* (D. C. prod. 2. p. 348.) stem erect, shrubby, glabrous; leaves ovate-cuneate, ending in a very short recurved mucrone; flowers solitary, terminal; legumes half-lunate, prickly. *h.* S. Native of the East Indies. Hedys. cuneifolium, Roth. nov. spec. 357. Stipulas scarious, ovate-subulate, ciliated, half-stem-clasping.

*Wedge-leaved Saintfoin.* Shrub.

*Cult.* All the species of this genus are very showy when in bloom, and are therefore well adapted for ornamenting flower-borders or rock-work. The best method of increasing them is by seeds, which should be sown where the plants are to remain. The shrubby kinds do best in pots, filled with a mixture of chalk, loam, and sand.

CLX. ELEIOTIS (from ἐλεῖος, *eleios*, a dormouse, and οὐς *ous*, *ous otos*, an ear; in allusion to the shape of the leaves, which have some resemblance to the ear of a dormouse.) D. C. legum. mem. vii. prod. 2. p. 348.

LIN. SYST. *Diadelphia, Decandria.* Calyx campanulate, truncate, hardly, but bluntly 5-toothed. Corolla papilionaceous. Vexillum obovate. Keel obtuse. Stamens diadelphous, permanent. Legume compressed, 1-celled, 1-seeded, rather membranous, semi-oval, with the upper suture straight, and the lower one curved.—Slender Indian herbs, with triquetrous stems, small acute adpressed stipulas, simple or pinnately trifoliate petiolate leaves, axillary racemes of small flowers much longer than the leaves, and twin distant pedicels. The plants are commonly called *Dormouse-ears* in India; hence the generic name.

1 *E. MONOPHYLLA* (D. C. legum. mem. vii.) leaves simple, orbicular, somewhat emarginate at both ends. *q.* S. Native of the East Indies. Flowers red.

*Var. a, hebecarpa* (D. C. prod. 2. p. 348.) legumes puberulous in the disk on both sides. *Glycine monophyllos*, Burm. fl. ind. 161. t. 50. f. 2.

*Var. β, leiocarpa* (D. C. l. c.) legumes glabrous. *Petiv. gaz.* t. 32. f. 1.

*One-leaved Eleiotis.* Pl. trailing.

2 *E. SORORIA* (D. C. legum. mem. vii. prod. 2. p. 348.) leaves pinnately-trifoliate, 2 lateral leaflets very small, rising beneath the middle of the petiole, terminal one very large, and almost orbicular, and emarginate at both ends. *q.* S. Native of the East Indies. Hedys. sororium, Lin. mant. 270. exclusive of the synonyme of Burm. Poir. dict. 6. p. 403.? *Hallia sororia*, Willd. spec. 3. p. 1170. *Onobrychis sororia*, Desv. journ. bot. 3. t. 6. f. 31. 1814. vol. 1. p. 60. Flowers red.

*Sister Eleiotis.* Clt. 1817. Pl. straggling.

*Cult.* The species of this genus grow well in any light rich soil, and cuttings will root under a bell-glass, in heat.

CLXI. LESPEDEZA (in honour of — Lespedez, once governor of Florida, and a great patron of botany). Michx. fl. bor. amer. 2. p. 70. Nutt. gen. amer. 107. Pers. ench. 2. p. 318. Desv. journ. bot. 3. p. 124. f. 6. f. 28. D. C. prod. 2. p. 348. —Hedysarum species of Lin. and others.

LIN. SYST. *Diadelphia, Decandria.* Calyx 5-parted, bilabiate at the base; segments nearly equal. Corolla papilionaceous. Keel transversely obtuse. Stamens diadelphous. Legume lenticular, compressed, indehiscant, 1-seeded, unarmed.—Stems herbaceous or suffrutescent. Leaves trifoliate; leaflets entire, the middle one stalked. Spikes racemose, pedunculate. Bractees trifid, 2-flowered. Flowers of a violaceous purple-colour, yellow or cream-coloured, with a purple mark on the vexillum, rarely white.

1 *L. JUNCEA* (Pers. ench. 2. p. 318.) stem erect, simple; petioles short; leaflets linear-lanceolate, mucronate, clothed with adpressed villi on both surfaces; racemes short, almost sessile. *h.* H. Native of Siberia, Tartary, &c. Hedys. junceum, Lin. fil. dec. 1. t. 4. Flowers purple or yellow.

*Rushy Lespedeza.* Fl. July, Aug. Clt. 1776. Sh. 2 to 3 feet.

2 *L. CHINEENSIS*; stem erect, branched; leaflets obovate, retuse, mucronate; bractees small; racemes short, on short peduncles. *h.* G. Native of China and Japan. Hedys. sericeum, Thunb. fl. jap. 287. ? Flowers yellow or purple.

*Chinese Lespedeza.* Shrub 2 to 3 feet.

3 *L. CUNEATA*; stems simple; petioles very short; leaflets cuneate, retuse, mucronate, clothed with strigose pubescence beneath; racemes subumbellate, almost sessile; legumes smooth, about equal in length to the calyx. *h.* F. Native of? *Anthyllus cuneata*, Dnn. cours. bot. cult. 6. p. 100. Flowers yellow or purple.

*Wedge-leafletted Lespedeza.* Shrub 2 to 3 feet.

4 *L. PALMATA*; shrub erect, branched; branches short, and are, as well as the under side of the leaves, clothed with adpressed pubescence; stipulas subulate; leaflets ovate-elliptic, ending each in a spine-like mucrone; racemes many-flowered, pedunculate, longer than the leaves. *h.* F. Native of Siberia. Flowers white or yellow.

*Pallas's Lespedeza.* Shrub 2 feet.

5 *L. VIOLACEA* (Pers. ench. 2. p. 316. Pursh. fl. amer. sept. 2. p. 481.) plant diffuse, much branched, glabrous; petioles elongated; leaflets elliptic, obtuse, clothed with short adpressed strigæ beneath; racemes somewhat umbellate, shorter than the leaves; calyxes shorter than the corolla; legumes rhomboid, reticulated, glabrous. *q.* H. Native of sandy and gravelly places from Virginia to Carolina. Hedysarum violaceum, Lin. spec. 1055. Flowers violaceous. Plant procumbent.

*Var. β, reticulata* (Pers. ench. 2. p. 318.) plant erect, simple; leaflets linear-obtuse. *q.* H. Native of New Jersey and Illinois. *L. sessiliflora* var. Michx. Hedys. reticulatum, Muhl. *L. angustifolia*, Rafin. but not of Nutt. Plant erect.

*Var. γ, divergens* (Pursh. fl. amer. sept. 2. p. 481.) plant diffuse, branched; leaflets oblong; legumes ovate; racemes shorter than the petioles. Hedys. divergens, Muhl. in Willd. spec. 3. p. 1196. *L. violacea* var. Nutt. gen. amer. 2. p. 108.

*Var. δ, sessiliflora* (Nutt. gen. amer. 2. p. 107.) plant erect, branched; petioles short; leaflets elliptic, obtuse; racemes axillary, almost sessile; legumes minute, naked, acute. *Medicago Virginica*, Lin. syst. 3. p. 573. ex Pursh. Hedys. sessiliflorum, Lam. dict. 6. p. 414. Plant erect.

*Violaceous-flowered Lespedeza.* Fl. July, Aug. Clt. 1739. Pl. 2 feet or procumbent.

6 *L. TRICHOCARPA* (Pers. ench. 2. p. 318.) plant erect; petioles very short; leaflets elliptic-oblong, mucronate; racemes few-flowered, somewhat umbellate, axillary, almost sessile; calyx about equal in length to the corolla; legumes ovate, pubescent, one half shorter than the calyx. *h.* H. Native of Siberia. Hedys. trichocarpum, Willd. spec. 3. p. 1194. Stems and under surface of leaves clothed with very fine pubescence beneath. Stipulas filiform. Flowers purple.

*Hairy-fruited Lespedeza.* Pl. 2 to 3 feet.

7 *L. ERIOCARPA* (D. C. in ann. mus. sci. nat. 4. p. 102.) erect; petioles short; leaflets cuneate-obovate, retuse, mucronate, reticulated on both surfaces; glabrous above, but clothed with strigose pubescence beneath; racemes in fascicles, almost sessile; calyxes one-half shorter than the corolla and legume, which is orbicular, acuminate, and hairy. ♀. G. Native of Nipaul. *Aspalathus violaceus*, D. Don, prod. fl. nep. 246. *Anthyllus cuneata*, Hamilt. mss. Flowers violaceous. Calycine segments lanceolate, acuminate, about equal in length to the corolla. (D. Don, l. c.)

*Woolly-fruited Lespedeza*. Fl. July, Aug. Clt. 1819. Sh. 2 to 3 feet.

8 *L. STUVEI* (Nutt. gen. amer. 2. p. 107.) plant erect, simple, clothed with soft silky villi; petioles very short; leaflets elliptic-oval, mucronate; racemes corymbose, many-flowered, axillary, on short peduncles, about the length of the leaves; legumes pubescent, longer than the calyx. ♂. H. Native of the state of New York, in sandy fields. Flowers purple.

*Sturtevant's Lespedeza*. Fl. July, Aug. Clt. 1824. Pl. 2 to 3 ft.

9 *L. LONGIFOLIA* (D. C. prod. 2. p. 349.) stem erect, angular, pubescent; petioles very short; leaflets oblong, glabrous above, but clothed with adpressed, silky-silvery pubescence beneath; racemes fasciculately corymbose, many-flowered, axillary and terminal; legume shorter than the lobes of the calyx. ♂. ? H. Native of Louisiana. Flowers purple.

*Long-leaved Lespedeza*. Pl. 2 to 3 feet.

10 *L. FRUTESCENS* (D. C. prod. 2. p. 349.) plant erect; stems simple, villous; petioles short; leaflets elliptic, obtuse, rather mucronate, clothed with silky pubescence beneath; racemes axillary, almost sessile, shorter than the leaves; calyx shorter than the corolla; legumes pilose, shorter than the calyx. ♀. F. Native of Carolina. *L. fruticosa*, Pers. ench. 2. p. 318. *Hedys. frutescens*, Lin. spec. 1055. Willd. spec. 3. p. 1193. Flowers purplish.

*Shrubby Lespedeza*. Fl. Ju. Aug. Clt. 1739. Sh. 2 to 3 ft.

11 *L. CAPITATA* (Michx. fl. bor. amer. 3. p. 71.) plant erect, simple; petioles very short; leaflets elliptic, clothed with adpressed pubescence beneath; spikes capitate, on short peduncles, axillary, but they are also disposed into globose heads at the tops of the branches; calyxes villous, length of corolla, but much longer than the legume. ♀. H. Native from Carolina to New York, in sandy fields and on the edges of woods. Pursh, fl. sept. amer. 2. p. 480. *Hedys. conglomeratum*, Poir. dict. 6. p. 416. Flowers pale purple.

*Capitate-flowered Lespedeza*. Fl. Ju. Jul. Clt. 1789. Pl. 1-3 ft.

12 *L. ANGUSTIFOLIA* (Ell. sketch. 2. p. 206.) plant erect, pubescent; petioles very short; leaflets oblong-elliptic, or lanceolate, clothed with canescent pubescence beneath; racemes capitate, longer than the leaves; corolla longer than the calyx. ♀. H. Native of Carolina, in arid, sandy places. *L. capitata*, var. *angustifolia*, Pursh, fl. amer. sept. 2. p. 480. Flowers pale purple.

*Narrow-leafletted Lespedeza*. Fl. Ju. Jul. Clt. 1800. Pl. 2 ft.

13 *L. POLYSTACHYA* (Michx. fl. bor. amer. 3. p. 71. t. 40.) plant erect, branched, very villous; petioles very short; leaflets roundish-oval, obtuse; spikes oblong, axillary, twice the length of the leaves, pedunculate; calyxes about equal in length to the corolla, but hardly longer than the legume. ♀. H. Native from Pennsylvania to Carolina, and of Upper Canada, in waste fields. *Hedys. hirtum*, Willd. spec. 3. p. 1193. Flowers white with a red spot on the vexillum.

*Many-spiked Lespedeza*. Fl. June, Aug. Clt. 1789. Pl. 2 to 3 feet.

14 *L. VILLOSA* (Pers. ench. 2. p. 318.) plant erect, branched, clothed with villous tomentum; petioles rather elongated; leaflets elliptic, obtuse; spikes axillary, slender, 3 or 4-times longer

than the leaves; calyxes shorter than the corolla, but longer than the legumes. ♀. H. Native of North America. *Hedys. hirtum*, Lin. spec. 1055. ? *L. hirta*, Horn. cat. 699. ? *Hedys. villosum*, Willd. spec. 3. p. 1195. Flowers white and pale yellow, twin, the lower pairs distant, with the flowers sometimes abortive and sometimes in fascicles, mixed with scales in the axils of the leaves.

*Villous Lespedeza*. Fl. July, Aug. Clt. 1819. Pl. 2 feet.

15 *L. PROCUMBENS* (Michx. fl. bor. amer. 2. p. 70. t. 39.) plant procumbent, slender, pubescent; petioles elongated; leaflets oval, obtuse, mucronulate; racemes axillary, loose-flowered, very long and slender; calyxes shorter than the corolla; legumes ovate, naked, smoothish. ♀. H. Native from New York to Carolina, in sandy or gravelly places. Nutt. gen. amer. 2. p. 108. *Hedys. Lespedeza*, Poir. dict. 6. p. 415. Flowers of a violaceous-purple colour.

*Procumbent Lespedeza*. Fl. July, Aug. Clt. 1816. Pl. pr.

16 *L. PROSTRATA* (Pursh, fl. amer. sept. 2. p. 481. Nutt. gen. amer. 2. p. 108.) plant prostrate, slender, glabrous; petioles short; leaflets elliptic, obtuse, mucronate, hardly pubescent beneath; racemes axillary, slender, few-flowered, longer than the leaves; calyxes shorter than the corolla; legumes ovate, rather pubescent. ♀. H. Native of Pennsylvania (Muhl.), of New Jersey (Nutt.), Upper Canada (Dougl.). *Hedys. prostratum*, Muhl. in Willd. spec. 3. p. 1200. Flowers purplish.

*Prostrate Lespedeza*. Fl. June, Aug. Clt. 1810. Pl. pr.

17 *L. GLOMERATA* (Horn. hort. hafn. suppl. 81.) stems twining; leaflets oval, obtuse, rather pubescent; spikes of flowers axillary and terminal, sessile, glomerate. ♂. S. Native of the East Indies. Flowers probably red.

*Glomerate-spiked Lespedeza*. Fl. Jul. Aug. Clt. 1819. Pl. tw.

18 *L. VIRGATA* (D. C. prod. 2. p. 350.) stem herbaceous, erect, branched, angular, pilose; leaflets ovate, mucronate, lined, glabrous, bearing hairs on the nerves beneath and on the margins; stipulas membranous, oblong. ♀. G. Native of Japan. *Hedys. virgatum*, Thunb. fl. jap. 290. Peduncles 2-flowered and pilose, according to Thunberg, l. c. The plant is in habit like *L. eriocarpum*, which is seen by a specimen in the herbarium of Agardh, at Copenhagen.

*Twiggy Lespedeza*. Pl. 1 to 2 feet.

19 *L. INDICA* (Spreng. syst. 3. p. 202.) leaflets roundish-ovate, clothed with rusty tomentum beneath; racemes axillary, crowded, few-flowered; flowers bracteate; calyxes villous; stem shrubby. ♀. S. Native of the East Indies. *Hallia trifoliata*, Roth.

*Indian Lespedeza*. Shrub 2 to 3 feet.

*Cult.* The species are rather showy when in flower, and are therefore worth cultivating for the purpose of decorating flower-borders. The herbaceous perennial kinds grow well in a light rich soil, or in peat borders, and are increased by dividing at the root in spring, or by seeds. The shrubby kinds are also very elegant plants, but they will not live unless protected by a greenhouse or frame during winter; for this purpose they should be grown in pots, in a mixture of sand and peat, and young cuttings of them will strike root readily if planted in a pot of sand, with a bell-glass placed over them. The seeds of the annual kinds should be sown in a peat-border, in as sheltered a situation as possible.

CLXII. EBENUS (from *abnons*, the Arabic name for ebony, or *ἐβενος* or *ἐβλος*, of the Greeks, *ebenus* or *ebenum* of the Romans, from the Hebrew *Heben*). Lin. gen. no. 895. D. C. legum. mem. vii. prod. 2. p. 350.—*Anthyllis* species of Lam.

LIN. SYST. *Monadelphica*, *Decandria*. Calyx permanent, left into 5 beyond the middle; the tube becoming at length rather ventricose; the segments linear-subulate, about equal in length

to the corolla. Corolla with minute wings, almost shorter than the tube of the calyx. Stamens monadelphous. Legume roundish, 1-2-seeded.—Plants with usually pinnate leaves, having the terminal or odd leaflet sessile. Stipulas distinct from the petiole. Peduncles axillary, elongated, bearing dense spikes of reddish flowers. This genus differs from *Anthyllis* in the wings of the flower being small, and in the calycine segments being longer. The plants have the habit of *Onobrychis*.

1 *E. CRÉTICA* (Lin. spec. 1076.) shrubby; leaves rarely trifoliate, usually impari-pinnate, with 2 pairs of leaflets and an odd sessile one; leaflets oblong-linear; stipulas connected, and therefore bifid at the apex and opposite the leaves; spikes of flowers ovate-cylindrical. *h. F.* Native of Candia. *Anthyllis Crética*, Lam. dict. 1. p. 203. Sims, bot. mag. 1092.—*Alp. exot.* t. 278.—Barrel. icon. t. 377. and 913. Flowers large, reddish, or purple. Stamiferous tube elegantly striated.

*Cretan Ebony.* Fl. June, July. Clt. 1737. Sh. 1 to 2 ft.

2 *E. PINNATA* (Desf. act. soc. hist. nat. par. 1. p. 21. t. 3. fl. atl. 2. p. 152.) plant herbaceous; leaves pinnate, with 4-5 pairs of linear or oblong leaflets, with an odd one; stipulas distinct, acuminate; stem beset with soft hairs; spikes of flowers ovate. *g. F.* Native of Barbary, on uncultivated hills. *Iher. stirp. nov.* t. 38. *Hedys. sericeum*, Vahl. symb. 2. p. 83. t. 41. *Anthyllis sericea*, Willd. spec. 3. p. 1014. *Onobrychis*, &c. Shaw, spec. no. 431. *Onobr. sericea*, Spreng. syst. 3. p. 205. Bractes ovate, acute, concave, one under each flower. Corolla reddish, shorter than the calyx.

*Pinnate-leaved Ebony.* Fl. July, Aug. Clt. 1786. Pl. 1 ft.

3 *E. SIETHORPI* (D. C. legum. mem. vii. t. 53.) plant herbaceous; leaves impari pinnate, with 4-5 pairs of oblong-linear, mucronate leaflets; stipulas distinct, acuminate, bifid; stem clothed with adpressed pubescence; spikes spherical. *g. H.* Native of Mounts Atlas and Parnassus. *E. pinnata*, Smith, fl. græc. prod. 3. p. 92. exclusive of the synonyme of Desf. and Willd. *Onobrychis orientalis*, &c. Tourn. cor. 26. Leaves rather silky. Bractes 3-4, broad, ovate, appearing like an involucre at the base of each head of flowers. Corolla purplish, about equal in length to the calyx.

*Sibthorp's Ebony.* Pl. 1 foot.

*Cult.* The species of this genus are propagated by seeds, which should be sown in pots in autumn, and placed in a frame or greenhouse, and in the month of May, when the plants will have attained a proper size, they should be planted singly in small pots, filled with a mixture of loam, sand, and peat, and the plants shifted into larger pots as they grow, some of them may be planted out into the open border, in a sheltered situation, where they will probably survive the winter with a little protection, if not too severe.

CLXIII. FLEMINGIA (in honour of John Fleming, M.D. F.R.S. and F.L.S., &c., an acute botanist, formerly President of the honourable East India Company's medical establishment in Bengal). Roxb. cor. 3. p. 44. Ait. hort. kew. ed. 2. vol. 4. p. 349. D. C. prod. 2. p. 351. Millingtonia, Roxb. mss.

LIN. SYST. *Diadelpia*, *Detandria*. Calyx acutely 5-cleft, 4 of the segments almost equal, but the lowest one is much longer than the rest. Corolla papilionaceous. Vexillum striated. Stamens diadelphous. Legume sessile, oval, turgid, 2-valved, 1-celled, 2-seeded. Seeds spherical.—Herbs or shrubs, natives of the East Indies. Stipulas lanceolate, acuminate, deciduous. Leaves petiolate. Flowers red or purple, disposed in axillary crowded racemes. This genus is perhaps more nearly allied to *Rhynchòsia*, and therefore perhaps referrible to tribe *Phaseoleæ*, especially in the seeds being spherical.

SECT. I. FLEMINGIASTRUM (an alteration from the generic

name). Flowers naked, or propped with small deciduous bractes. Leaves trifoliate; leaflets sessile.

1 *F. STRICTA* (Roxb. l. c. t. 248.) stem herbaceous, almost simple, straight; leaflets feather-nerved, broad-lanceolate, glabrous; racemes axillary, solitary, length of petioles; bractes very long, acuminate, deciduous. *h. S.* Native of Coromandel. *Crotalaria macrophylla*, Puer. herb. Flowers purple.

*Straight-stemmed Flemingia.* Fl. July, Sept. Clt. 1798. Pl. 2 to 4 feet.

2 *F. SEMIALATA* (Roxb. l. c. t. 249.) stem shrubby, branched; branches silky, erectish; leaflets 3-nerved, elliptic, acuminate, glabrous above, but clothed with silky pubescence beneath; petioles winged at the apex; spikes branched, panicle, terminal, and axillary; bractes ovate, mucronate, villous. *h. G.* Native of Nipaul. D. Don, prod. fl. nep. 242. *F. paniculata*, Dietr. ex Steud. Flowers pale red.

*Half-winged-petioled Flemingia.* Fl. July, Aug. Clt. 1805. Shrub 3 to 4 feet.

3 *F. CONGESTA* (Roxb. in hort. kew. 4. p. 349.) stem shrubby, erect; leaflets broad-lanceolate, lateral ones 2-nerved, terminal one 3-nerved; racemes axillary, crowded, shorter than the petioles. *h. S.* Native of the East Indies. Branchlets, petioles, and racemes villous when young. Flowers purple. Perhaps the same as *F. trinervia*, Desf.

*Crowded-flowered Flemingia.* Fl. July, Sept. Clt. 1802. Shrub 2 to 3 feet.

4 *F. NANA* (Roxb. in hort. kew. 4. p. 350.) stem shrubby, much branched; leaflets obovate; petioles winged; racemes crowded; legumes covered with viscid glands. *h. S.* Native of the East Indies.

*Dwarf Flemingia.* Clt. 1808. Shrub 1 foot.

5 *F. LINEATA* (Roxb. l. c.) stem suffruticose, erect, branched; leaflets oblong-cuneate, 3-nerved, linear, clothed with canescent velvety down; racemes axillary, elongated, pedunculate, dichotomous; legumes clothed with glandular pili. *g. S.* Native of the islands of Ceylon and Timor, and on the mountains called Nelligery, in India. *Hedys. lineatum*, Lin. spec. 1054. *Burm. ind.* t. 53. f. 1. *Lepedeza lineata*, Pers. ench. 2. p. 318. *Onobrychis lineata*, Desv. in journ. bot. 1814. vol. 1. p. 80. Flowers purple.

*Lined-leaved Flemingia.* Fl. Jul. Aug. Clt. 1793. Pl. 2 to 3 ft.

6 *F. ROTHIANA* (D. C. prod. 2. p. 351.) stem shrubby, erect, rather tomentose; leaflets roundish-ovate, with the nerves rusty on the under side; racemes axillary, crowded, loose, 5-6-flowered; legumes compressed, pubescent, 1-seeded. *h. S.* Native of the East Indies. *Hallia trifoliata*, Roth. spec. 352.

*Roth's Flemingia.* Shrub 2 to 3 feet.

SECT. II. OSTRYODIUM (from *οστρυον*, *ostryos*, a scale, and *οδον*, *odous*, a tooth; in reference to the large leafy scale-like bractes). Desv. journ. bot. 3. p. 119. t. 4. f. 2. D. C. prod. 2. p. 351.—*Lourea*, Jaume, journ. bot. 3. p. 61. Flowers furnished with a large, leafy, concave, permanent bractea each. Leaves simple, feather-nerved.

7 *F. STROBILIFERA* (Ait. hort. kew. ed. 2. vol. 4. p. 350.) stem shrubby, erect; leaves simple, entire, ovate, acuminate; spikes strobile-formed; bractes cucullate, leafy, reticulated. *h. S.* Native of the East Indies. Lin. fl. zeyl. 287. t. 3. *Hedys. strobiliferum*, Lin. spec. 1053. *Burm. ind.* 164. *Zornia strobilifera*, Pers. ench. 2. p. 319. Flowers purple.

*Strobile-bearing Flemingia.* Fl. July, Aug. Clt. 1788. Sh. 5 to 10 feet.

8 *F. GUINEENSE*; shrub glabrous; leaves with 5, obovate, obtuse leaflets; stipulas about the size of the lateral leaflets, nerved; peduncles axillary, racemose; bractes large, round, nerved, crowded, one to each flower. *h. S.* Native of Sierra

Leone. This species is remarkable in having pinnate leaves and large stipulas. It is perhaps a species of *Dicérna*.

• *Guinea Flemingia*. Shrub 2 to 3 feet.

*Cult.* The species of this genus are not worth cultivating, unless in botanical gardens. They will grow well in any light soil, and cuttings will root, if planted in a pot of sand, with a hand-glass placed over them, in heat.

SUBTRIBE III. ALHAGIÆ (plants agreeing with *Alhagi* in some important characters). D. C. prod. 2. p. 352. Flowers disposed in racemes (f. 45. h.) or spikes. Legumes almost terete (f. 45. d.).

CLXIV. ALHAGI (*Aghal* or *Ajgal* is the Arabic name of the first species). Tourn. cor. 54. t. 489. Desv. journ. bot. 3. p. 120. t. 4. f. 4. D. C. prod. 2. p. 352.—Hedysarum species of Lin.—Manna, D. Don, prod. fl. nep. 246.

LIN. SYST. *Diadelphia, Decandria*. Calyx campanulate, 5-toothed; teeth small, nearly equal. Corolla papilionaceous, with the petals almost equal in length, but the carina is a little shorter than the vexillum, which is obovate and complicated. Keel straight, obtuse; wings rounded at the apex. Stamens diadelphous. Ovary linear, many ovulate. Style filiform, glabrous, acute. Legume stipitate, rather woody, terete, torulose, few-seeded, not articulated. Seeds reniform.—Oriental subshrubs or herbs, with simple leaves and minute stipulas, and axillary spinose peduncles. Flowers few, red, disposed in racemes along the peduncles.

1 *A. MAURORUM* (Tourn. l. c.) stem shrubby; leaves obovate-oblong; teeth of calyx acute. h. G. Native of the deserts of Egypt, Syria, Mesopotamia, and other eastern countries. Rauw. itin. 94. with a figure. Hedys. Alhagi, Lin. spec. 1051. exclusive of some of the synonyms. Alhagi mannifera, Desf. l. c. • *Ononis spinosa*, Hasselq. ed gall. 1. p. 138. 2. p. 187. but not of Lin. Manna Hebræica, D. Don, prod. fl. nep. 217. Spines strong, and longer than those of the following. Flowers purple in the middle and reddish about the edges. It is on this shrub that manna (*Trungibin* or *Tercengabin*) is found in Mesopotamia. It is chiefly gathered about Tauris, where the shrub grows plentifully. Sir George Wheeler found it growing in Tenos. Tournefort also found it in many places in Armenia and Georgia. The manna is a natural exudation from the leaves and branches of this shrub, which takes place only in very hot weather. The Arabian writers believed that it fell from the clouds upon the plant. At first the manna resembles drops of honey, but soon thickens into solid grains, as big as a coriander seed at most. It is collected with more or less care, and is valued according to its purity, which is evinced by the distinctness of the granulations. The manna of this country is collected from the flowering ash, and has nothing to do with Persian manna.

*Moors' Alhagi* or Hebrew Manna. Fl. July, Aug. Clt. 1714. Shrub 2 to 3 feet.

2 *A. CAMELORUM* (Fisch. cat. hort. gor. 1812. p. 72.) stem herbaceous; leaves lanceolate, obtuse; teeth of calyx manifestly obtuse. M. F. Native of Caucasus, about the Caspian Sea, Tartary, and in Middle Iberia, in arid fields. Hedys. pseudo-Alhagi, Bieb. fl. taur. et suppl. no. 1442. Hedys. Alhagi, Lerche, nov. act. cur. 5. p. 167. Alhagi pseudo-Alhagi, Desv. l. c. Manna Caspica, D. Don, prod. fl. nep. p. 247.—Gmel. itin. 2. p. 29. Flowers red. Manna exudes from this plant as from the last.

*Camel's Alhagi* or Caspian Manna. Fl. July, Aug. Clt. 1816. Pl. 1 to 2 feet.

3 *A. NIPAULENSIS* (D. C. prod. 2. p. 352.) plant shrubby; leaves obovate, mucronulate, veinless, clothed with silky-silvery down on both surfaces; calyxes longer than the pedicels; teeth

acute, h. G. Native of Nipaul, near Sitaucund. Flowers red. Manna Nepaulensis, D. Don, prod. fl. nep. 247. Hedys. Hamiltonii, Spreng. syst. 3. p. 316.

*Nipaul Alhagi* or Manna. Fl. April. Shrub 1½ to 2 feet.

*Cult.* These plants require to be grown in pots filled with a mixture of sand, loam, and peat, in order that they may be sheltered in winter in a greenhouse. Young cuttings will root if planted in sand, with a bell-glass placed over them; but seeds, if they can be procured, is a preferable mode of increasing the plants, which should be raised on a hot-bed.

CLXV. ALYSICARPUS (from *αλυσος*, *alysis*, a chain, and *καρπος*, *karpus*, a fruit; in reference to the shape of the legume, which is composed of many 1-seeded joints, giving the whole the appearance of a chain). Neck. elem. no. 1315. Desv. journ. bot. 3. p. 120. t. 4. f. 8. D. C. prod. 2. p. 352.—Hallia, Jaume, journ. bot. 3. p. 60. but not of Thunb.—Fabricia, Scop. but not of Gaertn.

LIN. SYST. *Diadelphia, Decandria*. Calyx campanulate, permanent, 5-cleft (f. 45. a.); segments equal, lanceolate, acute (f. 45. a.). Corolla small, papilionaceous (f. 45. c.). Stamens diadelphous. Legume (f. 45. d.) constantly composed of many closed, 1-seeded joints (f. 45. c.), which are equal on both sides, terete, or compressed, at length separating from each other.—Indian and African herbs, with scarious stipulas and bracteas, and simple, linear, oval or roundish, entire leaves. Racemes of flowers opposite the leaves and terminal, bearing pedicellate, twin, or solitary, distant flowers, which are either yellow or purple, and hardly longer than the calyx.

• *Joints of legume smooth or irregularly nerved.*

1 *A. BUPLEURIFOLIUS* (D. C. prod. 2. p. 352.) plant smooth; leaves lanceolate-linear, acute; stipulas rather longer than the petioles; lobes of calyx puberulous; legumes terete, moniliferous, glabrous with 2-4 joints, a little longer than the calyx. h. S. Native of the East Indies. Hedys. rugosum, Sieb. fl. maur. exsic. no. 153. Hedys. bupleurifolium, Lin. spec. 1081. Burm. ind. 163. Roxb. cor. 2. t. 194. Sims, bot. mag. 1722. Hedys. gramineum, Retz. obs. 5. p. 26. Wendl. hort. herr. 1. t. 5. Hedys. Cochinchinense, Schranck, hort. monac. 3. t. 23. Flowers red. (f. 45.)

*Var. β, hybridus* (Burm. herb, D. C. prod. 2. p. 352.) lower leaves roundish, as in *A. nummularifolius*, but the upper ones are oblong and acute, as in *A. bupleurifolius*, and the upper stipulas are longer than the petioles.

*Hare's-car-leaved Alysicarpus*. Fl. June, Aug. Clt. 1793. Pl. 1 to 2 feet.

2 *A. VAGINALIS* (D. C. prod. 2. p. 353.) stem rather rough from short hairs; leaves rather cordate at the base, oval or oblong mucronulate, glabrous, but with the margins and middle nerve rather pubescent; stipulas length of petiole; legume terete, reticulated, 4-5-jointed, rather pubescent, much longer than the calyx. c. S. Native of the East Indies and of Senegal. Burm. zeyl. t. 49. f. 1. Hedys. vaginale, Lin. spec. 1051. fl. zeyl. 287. Hedys. ovalifolium, Vahl. in herb. Desf. Hedys. bupleurifolium, Sieb. pl. seneg. exsic. no. 39. Flowers red.

*Sheathed Alysicarpus*. Fl. July, Aug. Clt. 1790. Pl. pr.

3 *A. NUMMULARIFOLIUS* (D. C. prod. 2. p. 353.) plant gla-

FIG. 45.

brous; leaves ovate or roundish; stipulas shorter than the petioles; legumes between terete and compressed, rather reticulated, smoothish, 5-6-jointed, much longer than the calyx. *U. S.* Native of the East Indies and the Mauritius. Hedys. nummularium, Lin. spec. 1051. fl. zeyl. 288. Burm. fl. ind. 164. Hedys. cylindricum, Poir. dict. 5. p. 400.—Petiv. gaz. t. 26. f. 1. Flowers purple.

*Money-wort-leaved Alysicarpus.* Fl. July, Sept. Clt. 1777. Pl. 1 to 2 feet.

4 *A. MONILIFER* (D. C. prod. 2. p. 353.) stem hispid; leaves elliptic-roundish, pubescent beneath; stipulas length of petioles; legumes terete, velvety, 4-5-jointed, much longer than the calyx. *U. S.* Native of the East Indies and the Mauritius. Hedys. moniliferum, Lin. mant. 102.—Burm. ind. t. 52. f. 3. Flowers purple.

*Necklace-bearing Alysicarpus.* Fl. July, Aug. Clt. 1816. Pl. prostrate.

5 *A. GLUMACEUS* (D. C. prod. 2. p. 353.) plant glabrous; leaves lanceolate, acuminate; stipulas length of petioles; joints of legume 4-6, roundish, compressed, wrinkled. *U. G.* Native of Arabia Felix. Hedys. glumaceum, Vahl. symb. 2. p. 106. Willd. spec. 3. p. 1172. Hedys. violaceum, Forsk. descr. 136. Vahl. symb. 1. p. 54. Flowers yellow, but reddish inside.

*Glumaceous Alysicarpus.* Pl. procumbent.

*\*\* Legumes articulated, furrowed, and wrinkled transversely.*

6 *A. STYRACIFOLIUS* (D. C. prod. 2. p. 352.) stem villous; leaves ovate, obtuse, clothed with villous pubescence beneath; stipulas length of petioles, which are villous; joints of legume 3-4, glabrous, wrinkled transversely, a little longer than the calyx. *U. S.* Native of the East Indies and the Mauritius. Hedys. styracifolium, Lin. spec. 1052. *A. cylindricus*, Desv. Flowers red.

*Styrax-leaved Alysicarpus.* Fl. Jul. Aug. Clt. 1816. Sh. as. ?

7 *A. RUGOSUS* (D. C. prod. 2. p. 353.) stem glabrous, but with a pilose, decurrent line the whole length; leaves linear-lanceolate, obtuse, pubescent beneath and on the margins; stipulas longer than the petioles; joints of legume 4-5, roundish, compressed, wrinkled transversely. *U. S.* Native of Guinea. Hedys. rugosum, Willd. spec. 3. p. 1173. Flowers red?

*Wrinkled-podded Alysicarpus.* Pl. 1½ foot.

*Cult.* The species of this genus are not worth cultivating, unless in botanical gardens. They grow well in light rich soil, and are increased by cuttings or seeds.

CLXVI. BREMONTIERA (in honour of M. BremonTier, a French agricultural writer). D. C. in ann. sc. nat. 4. jan. 1825. p. 93. Legum. mem. vii. prod. 2. p. 353.

*LIN. SYST. Diadelphina, Decandria.* Calyx campanulate, rather truncate, hardly 5-toothed; teeth small, acute, rather distant. Corolla papilionaceous, 3-times longer than the calyx. Stamens diadelphous. Legumes constantly of numerous, compressed, 1-seeded joints, which are prominent at the sutures and truncate at both ends, at length separating from each other. Seeds ovate, with a lateral hilum. Radicle incurved. Cotyledons foliaceous, obovate-oblong.—Shrubs with simple, oblong leaves, which are canescent from short down, and standing on short petioles, tapering at both ends. Stipulas small, acute, not scarious. Flowers small, purple, disposed in axillary, spicate racemes.

1 *B. AMMÓXYLON* (D. C. l. c.). *U. S.* Native of the Mauritius, where it is called *Bois-de-sable*, or sand-wood. Mullèra verrucosa, herb. mus. par. but not of Pers. Hedys. ammoxylon, Spreng. syst. append. 293. Legume with 12-14 joints. Branches terete but angularly compressed at the apex, and are as well as the leaves clothed with cinereous pubescence.

Leaves usually dotted with black, from some species of *Puccinia*.

*Var. β, Burmanni* (D. C. prod. 2. p. 353.) legume with only 5 or 8 joints, *U. S.* Native of Ceylon. Ornithopodium, &c. Burm. zeyl. 177. t. 82. Perhaps a proper species.

*Sand-wood Bremontiera.* Clt. 1826. Shrub 4 to 6 feet.

*Cult.* See *Alysicarpus* for culture and propagation.

§ 2. *Sarcolobæ* (from *σαρξ σαρκος*, *sarx sarcos*, flesh, and *λοβος*, *lobos*, a lobe; in reference to the thick fleshy cotyledons). *Embryo with thick fleshy cotyledons* (f. 21. b.), which do not undergo any change at the time of germination. The seeds of all the plants contained in this division of Leguminosæ are used as food in different countries, while none of those of the first division, *Phyllolobæ*, are so employed.

#### Tribe IV.

VICIEÆ (plants agreeing with *Vicia* in some characters). Bronn. diss. p. 133. D. C. legum. mem. vii. prod. 2. p. 353. —*Vicieæ*, Adans. fam. 2. p. 329. Corolla papilionaceous (f. 46. d.). Stamens diadelphous, 9 joined, and 1 free (f. 46. g.). Legumes continuous (f. 46. h.). Cotyledons thick, farinaceous, not changing, even in germination, when above the earth, but remaining inclosed in the spermaderm. Radicle curved inwards (f. 21. f. c.). The leaves of all the plants contained in this tribe are abruptly-pinnate (except in some species of the genus *Cicer*, which are impari-pinnate), with the common petiole ending in a bristle or tendril instead of a leaflet, the petiole not jointed above the stem. This is a very natural tribe, which agrees with *Phascolææ* in the twining habit and thick cotyledons.

CLXVII. CICER (from *κικυς*, *kikys*, force or strength). The Ciceronians had their name from the pulse, as the Pisons had from pisum or pea, and the Lentuli from the lens or lentil). Tourn. inst. 389. t. 210. f. 2. Lin. gen. no. 1189. Gartn. fruct. 2. p. 326. t. 151. D. C. prod. 2. p. 351.

*LIN. SYST. Diadelphina, Decandria.* Calyx 5-lobed, with the tube more or less gibbous on the upper side; lobes acuminate, with 2 or 4 of the upper ones lying upon the vexillum. Legume turgid, 2-seeded. Seeds gibbous, mucronate.—Annual herbs, clothed with numerous glandular hairs, with impari or abruptly-pinnate leaves; having the leaflets and stipulas much nerved, and the petioles ending in a tendril, and axillary and almost always solitary flowers from abortion. Fruit pilose.

1 *C. ARBITISUM* (Lin. spec. 1010.) leaves impari-pinnate; leaflets ovate, serrated, equal; stipulas lanceolate, somewhat toothed; calyxes hardly gibbous, with the segments equal in length to the wings of the corolla. *U. H.* Native of Spain, Italy, and the Levant, among corn. Lam. ill. t. 632. Sims, bot. mag. 2274. The glandular hairs on the plant are full of acid juice. Flowers purple or white. The form of the seed is like that of a ram's head. The seeds are eatable, and the plant is cultivated for their sake in the south of Europe and the Levant, where they are frequently eaten both raw and boiled. The seeds should be sown broadcast like tares, or in drills like peas, about 2 feet asunder, that there may be room for the branches to spread, when the plants are fully grown, as also to hoe the ground, to keep it clean from weeds, which is all the culture these plants require. The plant flowers in June, and the seeds ripen in August, but unless the season proves dry and warm the plants decay in this country before the seeds are ripe.

*Ram's-head-podded or Common Chick-pea.* Fl. July, Aug. Clt. 1548. Pl. 1 foot.

2 *C. SONGARICUM* (Steph. ex Fisch. in litt. D. C. legum. mem. viii. with a figure) lower leaves impari-pinnate, upper ones abruptly pinnate, bearing simple tendrils at the apex; leaflets obovate-cuneate, serrated, upper ones smallest; stipulas ovate,

toothed; calyx very gibbous at the base, with the segments shorter than the wings of the corolla. ☉. H. Native of Songaria and Persia. The flowers and the fruit are almost twice the size of those of *C. arietinum*.

*Songarian Chick-pea*. Pl. 1 foot.

3 *C. SOLONIE'NSE* (Schrank, not. pl. dec. Frioul, p. 49.) peduncles elongated, 1-flowered; leaves with 2 pairs of leaflets, lower ones obovate, middle ones oblong, upper ones linear. ☉. H. Native of Europe.

*Solon Chick-pea*. Pl. 1 foot.

4 *C. ? NUMMULARIFOLIUM* (Lam. dict. 2. p. 2.) stem filiform, slender; leaves simple, obovate, entire, hairy; peduncles 2-3-flowered; calycine segments obtuse; legumes cordate. ☉. H. Native of the East Indies.—Pluk. alm. t. 389. This plant ought to be perhaps excluded from the present tribe.

*Money-wort-leaved Chick-pea*. Pl. prostrate.

*Cult.* The seeds of these plants require only to be sown in the open ground in the spring.

CLXVIII. FABA (from φαγω, *phago*, to eat; the esculent seeds of the common bean are well known). Tourn. inst. t. 222. D. C. fl. fr. t. p. 598. prod. 2. p. 354.—*Vicia* species of Lin. and others.

LIN. SYST. *Diadelphia, Decandria*. The character of *Faba* is nearly the same as that of *Vicia*, but differs principally in the great size of the legume, which is coriaceous, and rather tumid, and in the seeds being oblong, not round, and in the hylum being terminal, not lateral.—Erect plants, with abruptly-pinnate leaves with or without a simple tendril.

1 *F. VULGARIS* (Mench. meth. p. 130.) leaves thick, with 2-5 broad, oval, mucronate leaflets; stipulas semi-sagittate, oval; tendrils of leaves almost wanting; teeth of calyx almost linear. ☉. H. Said to be found wild on the confines of Persia, not far from the Caspian Sea, and is now cultivated to a great extent in gardens and fields, for the sake of its seeds. *Vicia Faba*, Lin. spec. 1039. Flowers white, with a blackish-blue silky spot in the middle of the wings. The legumes almost terete, or flat, green or black. Seeds more or less roundish, or very broad and flat, varying much in size.

*Var. a, hortensis*; seeds flat, white, usually large. There are the following varieties of the garden bean.

1 *Mazagan-bean*. An excellent early bean. It was brought from a Portuguese settlement just without the straits of Gibraltar. The seeds of this are even smaller than the *horse-bean*. If the seeds of this sort are sown in October under a warm hedge, pale, or wall, and carefully earthed up when the plants are advanced, they will be fit for the table by the middle of May.

2 *Early Portugal or Lisbon-bean*. This appears to be the *Mazagan* sort saved in Portugal. It is the kind used by gardeners for their first crop, but it is not so well tasted as the *Mazagan*; therefore when the *Mazagan-bean* can be procured no one would think of sowing this sort.

3 *Small Spanish-bean*. This will come in well for the second crop, soon after the *Portugal*, and as it is rather a sweeter bean, it should be preferred to it.

4 *Broad Spanish-bean*. This is a little later than the last sort, and being a good bearer is therefore frequently sown.

5 *Sandwich-bean*. This comes in soon after the *broad-Spanish*, and is almost as large as the *Windsor-bean*, but being harder is commonly sown a month sooner. It is a plentiful bearer, but not a very delicate sort for the table.

6 *Toker-bean*. Is ready for use about the same time as the *Sandwich*, and is a great bearer, but rather a coarse bean.

7 *White and black-blossomed beans* are by some persons much esteemed; the seeds of the former when boiled are almost as green as peas; and being a tolerably sweet sort renders it more

valuable. These two sorts are very apt to degenerate if the seeds are not saved with great care.

8 *Windsor-bean*. This is allowed to be the best of all the sorts for the table. When sown on a good soil, having plenty of roots, the beans will be very large, and when gathered young they are the sweetest and best tasted of all the sorts. This sort is seldom sown before Christmas, because it is found not to bear the frost so well as many other sorts; so it is generally sown for the principal crop to come in in June and July.

9 *Fan'or cluster-bean*. This sort is chiefly sown for curiosity. It is dwarf 6 or 10 inches high, with branches spreading like a fan, and flowers succeeded by small pods, both in clusters.

10 *Long-podded-bean*. A very tall kind, and a good bearer; the pods long and narrow, closely filled with oblong middle-sized seeds. Of this there are several subordinate varieties, as the *early Turkey*, &c.

11 *White blossomed-bean*. The flowers are pure white, having none of the black marks on the wings. The seeds are semi-transparent, and have less of the peculiar bean flavour when young than any of the others, and are by some persons esteemed on that account. It bears abundance of smallish, long, narrow pods, and the seeds are almost black when ripe.

12 *Red-blossomed-bean*. This is a very shewy plant; the blossoms very red, without any mixture of white. It bears smallish pods and seeds, which are not very palatable, and the plant is therefore only grown for curiosity.

There are a number of other varieties of the *garden-bean*, such as the *green-nonpareil*, *Munford*, &c., but they are hardly worth notice.

The following varieties of the *field or horse-bean* are worth cultivating.

*Var. β, equina*; the *common horse-bean*, from which perhaps all the varieties have originated.

1 *Common field or horse-bean*. This is the kind most commonly sown for agricultural purposes.

2 *Tick-bean*. This is lower in stature than the former, but is a more plentiful bearer, and succeeds better on light land. There are several subordinate varieties of this kind, such as the *Flat-Ticks* or *May-beans*, *Small* or *Essex Ticks*, and *French Ticks*. Some of the *garden-beans* are taken into field culture in Kent, as the *Toker*, *Windsor*, *Long-podded*, *Spanish* or *Lisbon*, and the *Mazagan-bean*; besides others cultivated only in small quantities for supplying the London seedsmen.

#### \* *Garden beans, their culture and uses.*

*Estimate of sorts.* The *Mazagan* is one of the hardiest and best flavoured of the small and early sorts. The *Lisbon* is next in point of earliness and fruitfulness. The *dwarf-fan* or *cluster-bean* is likewise an early variety, but it is planted chiefly for curiosity. The *Sandwich-bean* has been long noted for its fruitfulness. The *Toker* and the *broad-Spanish* are also great bearers. Of all the large kinds, however, the *Windsor-bean* is preferred for the table. When gathered young, the seeds are sweet and very agreeable. There are several sub-varieties of the *Windsor-bean*, such as the *Kentish-Windsor* and *Taylor's-Windsor*. The *long-podded-bean* rises about 3 feet, and is a great bearer. This sort is now very much cultivated, and there are several sub-varieties of it, as the *early*, the *large*, and the *sword-long-pod*. The *white-blossomed-bean*, so called because it is destitute of the black mark on the wings of the blossom so conspicuous in other kinds. The seed is transparent, and when young has little of the peculiar bean flavour, and is on that account much esteemed; it is at the same time a great bearer, and proper for a late crop. DeLauney, in *Le Bon Jardinier*, describes as excellent a new variety cultivated about Paris, which he calls the *green-bean* from China. It is a late sort, but very

productive, and the pods remain green even when ripe and dried.

*Times of sowing for early and successive crops.* For the earliest crop plant some *Mazagans* in October, November, or December, in a warm border, under an exposure to the full sun. Set them in rows, 2 or 2½ feet asunder, about 1½ inch deep, and 2 or 3 inches apart in the rows. The most successful plan for nurturing a crop over the winter, is to sow the beans thickly together in a bed of light earth under a warm aspect, for the intermediate object of protecting the infant plants the better from rigorous weather, and with the view of transplanting them at the approach of spring or when the size of the plants (2 or 3 inches in height) require it, into warm borders, at the distances at which the plants are in fruit. For this object, the size of a garden frame is a convenient width for the bed, which should slope a little to the south; plant at the depth of 2 inches, and an inch apart each way. At the approach of frost, protect the young plants with a frame, or matting or other shelter. In February or March, as soon as the mild weather offers, transplant them into a warm south border, placing one row close under a protecting fence, as far as that advantage can be given. Take them from the seed bed with balls of earth, and pull off the old beans. Then plant them at final distances, closing the earth rather high about the stems. Beans are accelerated in their growth by transplanting. If severe frosts kill the early advanced plants, or if it were omitted to sow an early crop at the general season, a quantity may be sown thick in a moderate hot-bed in January or February, or in large pots placed therein, or in a stove, to raise some plants quickly for transplanting as above. In all cases, as the young plants come up give occasional protection in the severity of winter, and hoe up a little earth to the stems. Plants which can have no other shelter should be covered lightly with the haulm of plants or straw, but such a covering must be carefully removed as often as the weather turns mild. To succeed the above, plant more of the same sort, or some of the *early-long-pod* or *small-Lisbon* in December or January, when mild weather, for larger supplies, in more open exposures. And in order to obtain either, a more full succession, or a first general crop, plant some *early* and *large long-pods* and *broad-Spanish* at the end of January, if open weather, in some warm quarter of mellow ground. Some of the larger *Sword long-pod*, *Sandwich*, and *Toker-beans* may also be planted in fuller crops in February, if the weather permit, both for succession and principal supplies. You may likewise plant any of the preceding kinds, as well as *Windsors* and other sorts, in full and succession crops in February, March, and April. For the main summer crops adopt principally the *Windsors*, *Sandwich*, *Toker*, *large-long-pod*, and *broad-Spanish*. The *Windsors* rank first in regard to flavour, but prove on common soils not so plentiful a bearer as other late kinds. Plant also full succession crops in March and April, and smaller portions in May and June for late production, especially the *long-pod*, *broad-Spanish*, and *Toker*; also any of the early sorts, which are more successful in late planting than the larger broad varieties. The *white-blossomed bean*, though the smallest of the middle-sized sorts is very desirable to plant as secondary crops, both in the general and late planting seasons, from March till June and July, being a great bearer and a tender and sweet eating bean, if gathered young. Any of the other sorts named may also be planted to increase the variety. For sowing in June and July, the smaller and early kinds again become the most proper, as their constitution fits them for standing late as well as early. Thus the regular supplies may be provided for, in succession from June till September. (Abercrombie).

*Quantity of seed.* For early crops one pint of seed will be requisite for every 80 feet of row; for late crops nearly the same quantity as for the early. For the main crops the quantity

cultivated, in proportion to that for early or late crops, is generally treble or quadruple, as to the extent of ground; but a less quantity of seed is requisite for the same space.

*Method of sowing.* Plant all the sorts in rows, 2½ feet apart for the smaller, or very early, or very late kinds; and 3 feet for the larger; the smaller beans 2 inches deep, and 3 inches distant in the row; the larger beans 3 inches deep, and 4 inches apart in the row.

*Transplanting.* Speechly constantly transplants his early *bean* crops, and considers this plant may be as easily transplanted as cabbage or any other vegetable. He plants them alternately with potatoes in the same row, the rows 3 feet apart, and the potatoes 18 inches apart in the row. The beans are transplanted, by which means they have the start and advantage of the potatoes and weeds, and as they come in early may be gathered before they can possibly incommode or injure the potatoes. (Speechly's Practical Hints, &c. p. 17.)

*Manual process.* The work of sowing is most generally effected by a dibble, having a thick blunt end to make a wide aperture for each bean, to admit it clean to the bottom without any narrow hollow parts below, strike the earth fully and regularly into the holes over the inserted beans. Or the planting may be performed occasionally in drills, drawn with a hoe the proper depth and distance, placing the beans at proper intervals along the bottom of each drill, and earth them over evenly, which method, though suitable to any kinds, may be more particularly adopted in sowing the early and other small sorts.

*Soaking seed in summer.* In planting late crops in June and July, if the weather be dry, it is eligible to give the beans a previous soaking for several hours in soft water, or if they are to be sown in drills, water the drills beforehand, then directly put in the beans, and earth them in while the ground remains moist.

*Subsequent culture.* As the plants come up, and advance from 2 to 4 and 6 inches high, hoe up some earth to the stems on both sides of each row, cutting down all weeds. Repeat the hoeing as future weeds arise, both to keep the ground about the plants clean, and to loosen the earth to encourage their growth. In earthing up, great care must be taken that the earth does not fall on the centre of the plants so as to bury them, for this occasions them to rot or fail. After earthing up, stir between the rows with a three-pronged fork. As the different crops come up into full blossom, pinch or cut off the tops, in order to promote their fruiting sooner in a more plentiful production, or well-filled pods. (Abercrombie). Nicol says, "Topping is unnecessary for any but the early crops." Most gardeners are, however, of opinion, that topping improves the crop both in quantity and quality. To forward an early crop, see Pisum.

*To produce a very late crop.* Neill mentions an expedient sometimes resorted to to produce a late crop. A quarter of beans is fixed on, and when the flowers appear, the plants are entirely cut down, a few inches from the surface of the ground. New stems spring from the stools, and these produce a very late crop of beans.

*Gathering.* For table use, gather only such as are tender, the seed decreasing in delicacy after they obtain about half their proper size. When they become black eyed, they are tough and strong tasted, and much inferior for eating.

*To save seed.* Either plant some of the approved sorts in February or March wholly for that purpose, or leave some rows of the different crops ungathered, in preference to the gleanings of gathered crops. The pods will ripen in August, and the beans become dry and hard; then pulling up the stalks, place them in the sun to harden the seed thoroughly, after which thresh out each sort separately. (Abercrombie).

*Use.* The seeds are the only part used in cookery, and are either put in soups, or sent up in dishes apart.

• • *Field beans, and their culture.*

It is only of late years that the *bean* has been cultivated in Britain upon general soils, being formerly considered as adapted to rich and moist clays. At that time they were all sown in the broad-cast method, in which way instead of benefitting the ground, they were of detriment to it, for weeds got away on the outset, and in dry seasons often ruined the crop.

*The drilling of beans* with a small mixture of peas is now become a general practice in every well cultivated district, more particularly in those where the soil and climate permit the practice to be successfully executed. In this way not only heavy crops are raised, but what is of greater importance, the ground is kept constantly in good order, provided suitable attention is bestowed upon the clearing process. This is generally carried on by horse-hoeing the crop at different times.

*The varieties of the bean* may be included under two general heads, the white or garden *beans*, and the grey or field *beans*. Of the white *bean*, sown in the fields, the Mazagan and Long-pod are almost the only sorts. Of the grey *beans*, that known as the horse-bean, the small or ticks, and the prolific or Heligoland, are the chief sorts. New varieties are procured in the same manner as other plants.

*In the choice of sorts*, tick-beans are supposed by some farmers to be more productive than horse-beans, but the latter grow higher in the stem and shade the land more, and are consequently the most suitable for the stronger sorts of soil; and Young remarks that the common little horse-bean has the advantage of all others, in being more generally marketable, for in certain situations, it is not always easy to dispose of ticks, Windsors, long-pods, and various other large sorts. They also grow higher, shade the ground more from the sun in summer, and yield a larger quantity of straw, which makes excellent manure, but some of the other sorts are generally supposed to yield larger products.

*The best soils for beans* are clays and strong loams; on such soils they generally succeed wheat or oats, but sometimes also clover leys. Turnip soils or sands are by no means proper for them.

*In the preparation of the soil*, much depends upon the nature of the land and the state of the weather; for as *beans* must be sown early in spring, it is sometimes impossible to give all the labour which a careful farmer would wish to bestow. It must also be regulated in some measure by the manner of sowing. In all cases it ought to be ploughed with a deep furrow after harvest or early in winter, and as two ploughings in spring are highly advantageous, the winter furrow may be given in the direction of the former ridges, in which way the land is sooner dry in spring than if it had been ploughed across. The second ploughing is to be given across the ridges as early in spring as the ground is sufficiently dry, and the third furrow either forms the drills or receives the seed (Suppl. E. Brit. Art. Agr.).

*Manure* is applied if the crop succeeds wheat. By some, dung is spread on the stubble previous to the winter ploughing, but this cannot always be done in a satisfactory manner, unless during frost, when it may lie long exposed to the weather before it can be turned in. The most desirable mode therefore is, to lay the manure into drills immediately before the beans are sown. According to Brown (Treatise on Rural Affairs) the best way is to apply the dung on the stubble before the winter furrow is given, which greatly facilitates the after process. Land dunged to *beans*, if duly hoed, is always in high order for carrying a crop of wheat in succession.

*The climate* most favorable to *beans* is one neither very dry nor very moist; the first brings on the fly and the last prevents the setting of the blossoms.

*The time of sowing beans*, is as early as possible after the severity of winter, in the south sometimes in January, but never later than the end of March, as the ripening of the crop and its safe harvesting otherwise would be very precarious in this climate.

*The mode of sowing* is almost always in rows; they are sometimes dibbled, but for the most part drilled by judicious cultivators, or deposited after the plough in every furrow, or only in every second or third furrow. In the latter method the crop rises in rows at regular intervals of 9, 18, or 27 inches, and the hand hoe ought to be invariably employed, but it is only where the widest intervals are adopted that the horse-hoe can be used with much effect in their subsequent culture. The seed may either be deposited by the drill machine or by the hand.

*The dibbling of beans* is considered by some as an excellent method, if well performed; the rows are marked out one foot asunder, and the seed deposited in holes made by the dibbler 2 inches apart; this method is greatly to be preferred to sowing the beans at random.

*The quantity of seed* is very different in the southern and northern parts of Britain, in the former, even when in rows, only 2 or 2½ bushels are allowed per acre, but in Scotland seldom less than 4 bushels to an English statute acre, even when sown in rows, 27 inches distant, and a bushel more when sown broadcast. Thin sown crops of *beans* seldom turn out well, unless upon very rich lands, for unless the rows are close weeds get the better after the clearing process is finished. Both in the broad-cast and drill husbandry it is common to mix a small quantity of peas along with *beans*. This mixture improves both the quality and quantity of the straw for fodder, and the peas-straw is useful for binding up the bean-straw in harvest.

*The after-culture* of the *bean* crop commences with harrowing just before the young plants reach the surface. When sown in rows, in either of the modes already described, the harrows are employed about 10 or 12 days after, and being driven across the ridges, the land is laid completely level for the subsequent operations, and the annual weeds destroyed.

*After the beans have made some growth*, sooner or later, according as the soil may happen to be incumbered with or free from weeds, the horse-hoe is employed in the intervals between the rows, and followed by the hand-hoe, for the purpose of cutting down such weeds as the horse-hoe cannot reach, and the weeds among the *beans* beyond the reach of either hoe should be pulled up by the hand. The operation may be repeated as often as the land requires it. Before the introduction of the horse-hoe, a common small plough, drawn by one horse, was used in working between the rows, and is still necessary where root-weeds abound. The plough goes down the intervals, turning the earth from the *beans*, and forming a ridgelet in the centre, then hand-hoes are immediately employed. The same plough with an additional mould-board, finally splits open the intermediate ridgelet, and lays up the earth to the *beans* on each side.

*Before reaping beans* the grain ought to be tolerably well ripened, otherwise the quality is impaired, whilst a long time is required to put the straw in such a condition as to be preserved in the stack. In an early harvest, or where the crop is not weighty, it is an easy matter to get *beans* sufficiently ripened; but in a late harvest, and in every one where the crop takes on a second growth, it is hardly practicable to get them thoroughly ripened for the sickle. Under these circumstances, it is unnecessary to let *beans* stand uncut after the end of September or the first of October, because any benefit that can be derived afterwards is not to be compared with the disadvantages that accompany a late wheat-seed time. *Beans* are usually cut with the sickle and tied in sheaves, either with straw ropes or with ropes

made from peas sown along with them. It is proper to let the sheaves lie untied several days, so that the winning process may be hastened, and when tied to set them up on end, in order that the full benefit from the air may be obtained, and the grain kept off the ground. *Beans* are sometimes mown, and in a few instances pulled up by the roots. In all cases they should be cut as near to the ground as possible, for the sake of the straw, which is of considerable value as fodder, and because the best pods are often placed on the stems near the roots (Brown).

*Beans* are stacked either in the round or oblong manner, and it is always proper, if the stack be large, to construct one or more funnels, to allow a free circulation of air.

The threshing of *beans* is nearly as easy as that of peas.

The produce of *beans*, when proper management is exercised, and where diseases have not occurred, is generally from 25 to 35 bushels per acre. Donaldson says that a crop of *beans*, taking the island at large, is from 16 to 40 bushels, but that a good average crop cannot be reckoned to exceed 20. In Middlesex, Middleton says that *bean* crops vary from 10 to 80 bushels per acre. The produce in hauh is very bulky in moist seasons.

In the application of *beans*. The grain in Scotland is sometimes made into meal, the finer for bread and the coarser for swine; but *beans* are for the most part applied for feeding horses, swine, and other domestic animals. In Middlesex, all are given to horses, except such as are preserved for seed, and such as are gathered while green and sent to the London markets. When pigs are fed on *beans*, it is observed that the meat becomes so hard, as to make very ordinary pork, but excellent bacon.

The flour of *beans* is more nutritive than that of oats, as appears in the fattening of hogs; whence, according to the respective prices of these two articles, Dr. Darwin suspects that peas and *beans* generally supply a cheaper provender for horses than oats, as well as for other domestic animals. But *beans* are more difficult of digestion than oats, although of more nutriment. Some advise cut straw or bran to be mixed with *beans* to accelerate their digestion.

*Bean-straw*, when mixed with peas, Brown considers as affording almost as much nourishment, when properly harvested, as is gained from hay of ordinary quality, when it is well got horses are fonder of it than of pea-straw. It should either be given when newly threshed, or else stacked up and compressed by treading or covering, as the air is found to affect materially both its flavour and nutritive quality.

The produce of *beans* in meal is like that of peas, more in proportion to the grain than in any of the cereal grasses. A bushel of *beans* is supposed to yield 14 pounds more of flour than a bushel of oats, and a bushel of peas 18 pounds more, or according to some, 20 pounds. In 1000 parts of bean-flour, were found by Sir Humphrey Davy, 570 parts of nutritive matter, of which 428 were mucilage, 103 gluten, and 41 extract, or matter rendered insoluble during the process.

The diseases of *beans* are the rust, the honey-dew, mildew, and black-fly or aphides, which the lady-birds are supposed to feed upon, as they are observed to be plentiful wherever the black-fly is found. The fly almost always succeeds the honey-dew, both are most prevalent on the summits of the plants, and some have attempted to mitigate the evil by cutting them off. In general, however, these diseases are without remedy, either preventive or positive; therefore the best thing that can be done when the plants are attacked is to plough them down.

Common Garden-bean and Horse-bean. Fl. year. Clt. ? Pl. 2 to 3 feet.

CLXIX. VICIÆ (said to be from *vincio*, to bind together, because the species have tendrils by which they bind other

plants). Tourn. inst. t. 221. Juss. gen. 360. D. C. fl. fr. 4. p. 589. prod. 2. p. 354.—*Vicia* species of Lin.

LIN. SYST. *Diadelphia*, *Decandria*. Calyx tubular, 5-cleft or 5-toothed (f. 46. a.), the 2 superior teeth shortest (f. 46. a.). Corolla papilionaceous (f. 46. d.). Stamens diadelphous (f. 46. g.). Style filiform, almost forming a straight angle with the ovary, villous on the upper side (f. 46. g.) and on the under side beneath the apex. Legume oblong (f. 46. h.), 1-celled, many-seeded (f. 46. h.); seeds with a lateral, oval, or linear hylum.—Usually climbing herbs, with abruptly pinnate leaves, having many pairs of leaflets; the common petiole drawn out into a tendril at the apex (f. 46. i.), which is usually branched. Stipulas usually semi-sagittate. Peduncles axillary, elongated, many-flowered, or short and 1-flowered. The species of the genus are not well defined.

§ 1. *Peduncles elongated, many-flowered; flowers secund.*

1 V. *PISTIFORMIS* (Lin. spec. 1034.) plant quite smooth; leaves mucronate, with 3-4 pairs of ovate, cordate, obtuse, reticulately-veined, distant leaflets; stipulas ovate, semi-sagittate, toothed; peduncles many-flowered, length of leaves; calycine teeth nearly equal, shorter than the tube; legumes oblong, compressed, reticulately veined; seeds globose, with the hylum linear.  $\mathcal{U}$ .  $\infty$ . II. Native of the south of Europe, in woods. Sturm, deutsch. fl. 1. fasc. 31. Jacq. austr. 4. p. 33. t. 364. Riv. tetr. irr. t. 52. The lowest leaflets approximating the stem and sessile. Flowers cream-coloured, about the size of those of *V. sylvestrica*.

*Pea-formed Vetch*. Fl. July, Aug. Clt. 1739. Pl. cl.

2 V. *AMEŒNA* (Fisch. in litt. Ser. in D. C. prod. 2. p. 355.) stems erect, tetragonal, firm, and smoothish; leaves distant on the stem, tendrilled at the apex; leaflets numerous, dense, opposite and alternate, elliptic-lanceolate, rather mucronate, reticulated with numerous diverging fine nerves; stipulas semi-sagittate, toothed; peduncles many-flowered, rather longer than the leaves; the superior teeth of the calyx broadish, short, and acute, lower ones elongated and subulate; style hardly pilose at the apex; legumes unknown.  $\mathcal{U}$ . II. Native of Siberia, about Truetsk.—Gmel. sib. 4. p. 11. no. 11. t. 3. ? Flowers purple, about the size of those of *V. onobrychioides*. Leaflets large, like those of the first species.

*Pleasing Vetch*. Fl. June, July. Clt. 1818. Pl. cl.

3 V. *CAROLINIANA* (Walt. fl. carol. p. 182.) plant smoothish; leaves with 8-10 or more elliptic-lanceolate, obtuse, mucronate, alternate leaflets; stipulas ovate-lanceolate, entire, small; peduncles many-flowered; flowers rather distant; calycine teeth short; style villous at the apex; legumes lanceolate, glabrous, obliquely reticulated.  $\mathcal{U}$ .  $\infty$ . II. Native of Carolina. V. parviflora, Michx. fl. car. 2. p. 69. V. craccoides, Rafin. in litt. V. Cracca, Pursh, ex Rafin. Corolla white, smaller and narrower than in *V. Cracca*, having the vexillum tipped with black.

*Carolina Vetch*. Fl. June, July. Clt. 1820. Pl. cl.

4 V. *PONTICA* (Willd. spec. 3. p. 1094.) plant pubescent; leaflets numerous, elliptic-lanceolate, obtuse, mucronate; stipulas lanceolate, quite entire, nerved; peduncles very long, many-flowered; flowers crowded; legumes unknown.  $\mathcal{U}$ . H. Native of the country near the Euxine sea. Flowers secund, nodding, about the size of those of *V. Cracca*, white. Leaves with a few, scattered, adpressed pili on the under side. *Vicia multiflora*, floribus albis, calyce purpureo, Tourn. cor. 27.

*Pontic Vetch*. Pl. cl.

5 V. *DUMETORUM* (Lin. spec. 1035.) plant smoothish; leaflets reflexed, ovate-lanceolate, mucronulate, alternate, very finely and reticulately veined; stipulas lunate and setaceous toothed; peduncles many-flowered, about the length of the leaves; calycine teeth very short, equal among themselves; style bearded at the apex; legumes oblong, compressed, reticulately and finely

veined; seeds roundish, with the hylum linear. *2. H.* Native of America and Europe, in bushy and shady places, particularly in Austria, Switzerland, Piedmont, France, and Germany. Sturm, deutschl. fl. 1. fasc. 31. with a figure. *Oxyphogon elegans*, Rafin. in litt. *V. tetragona*, hort. par. in litt. This species differs from *V. pisiformis* in the flowers being purplish-blue, and in the deep-green and longer leaflets, with the lower pairs not approximating the stem.

*Hedge Vetch.* Fl. May, June. Clt. 1752. Pl. cl.

6 *V. MENZIESII* (Spreng. syst. 3. p. 267.) leaflets ovate, smooth, near an inch and a half long; stipulas lunate, with sharp teeth; peduncles few-flowered, shorter than the leaves; petals all strongly recurved; calycine teeth taper-pointed. *2. ? G.* Native of Owyhee, at the upper edge of a forest, on a mountain called Mowna-rooa, which is 6000 feet high, where it was collected by Mr. Menzies. *V. grandiflora*, Smith, in Rees' cycl. Flowers pale-purple, full twice the size of those of *V. dumetorum*. Clusters of flowers rather loose and downy. Legumes not seen.

*Menzies's Vetch.* Pl. cl.

7 *V. DENTATA* (Fisch. in litt.) this plant differs from *V. dumetorum* in the smaller approximate leaflets, which are ovate-obtuse, the lower ones roundish and acutely toothed towards the apex in the more loose flowers, and in the semi-sagittate serrated stipulas. *2. H.* Native of the south of Russia. *V. dumetorum*, var. *β*, *dentata*, Ser. in D. C. prod. 2. p. 355. Gmel. sib. 4. p. 9. tab. p. 221. Flowers violaceous.

*Toothed-leafletted Vetch.* Fl. June, Jul. Clt. 1819. Pl. cl.

8 *V. SYLVATICA* (Lin. spec. 1035.) plant smooth; leaflets numerous, alternate or opposite, elliptic-oblong, mucronulate, finely and reticulately veined; stipulas between semi-sagittate and reniform, setaceous-toothed; peduncles longer than the leaves, many-flowered; calycine segments hardly the length of the tube; style villous at the apex; legumes oblong-linear, compressed, finely reticulated, incurved at the apex; seeds globose, with a linear hylum. *2. H.* Native of Europe, in mountain woods. Plentiful in mountainous parts of the north of England and Scotland, in woods. Sturm, deutschl. fl. 1. fasc. 31. with a figure. Smith, engl. bot. 79. Oed. fl. dan. 277. Hall. helv. no. 426. t. 12. f. 2. Stipulas fringed. Style with the beard at the apex hardly discernible. Flowers rising from the peduncle by twos or threes, with interruptions, rather large, having the vexillum and wings whitish, and beautifully variegated with blue, and keel pale blue. This is an elegant plant when in flower.

*Wood Vetch.* Fl. June, Aug. Britain. Pl. cl.

9 *V. AMERICANA* (Muhlenb. ex Willd. spec. 3. p. 1096.) leaflets numerous, elliptic-lanceolate, obtuse, glabrous, mucronate; stipulas semi-sagittate, deeply toothed; peduncles many-flowered, shorter than the leaves; legumes unknown. *2. H.* Native of Pennsylvania. This plant differs from *V. sylvatica*, in the longer leaflets, in the teeth of the stipulas not being awned, and lastly in the racemes being fewer-flowered and never longer than the leaves. Leaflets 8-12 in number.

*American Vetch.* Fl. June, July. Clt. 1800. Pl. cl.

10 *V. VARIEGATA* (Willd. spec. 3. p. 1096.) plant villous; leaflets numerous, elliptic, obtuse, villous, alternate, lower ones emarginate, mucronate; tendrils trifid; stipulas semi-sagittate, quite entire; peduncles many-flowered, rather longer than the leaves; racemes crowded with secund flowers; calycine teeth about equal, shorter than the tube; style bearded; legumes rather pubescent. *2. H.* Native of Eastern Caucasus, on the alps. Desf. cor. p. 86. t. 65. ann. mus. 12. p. 111. t. 12. Leaflets 14-26. Stipulas ovate-lanceolate, bipartite at the base. Flowers with a rose-coloured standard, white wings, and purplish keel, and variegated.

*Variegated-flowered Vetch.* Fl. Ju. Jul. Clt. 1816. Pl. cl.

11 *V. PURPUREA* (Stev. in mem. soc. mosq. 4. p. 53. et Bieb. fl. taur. suppl. 468.) plant hardly canescent; leaflets numerous, oval, mucronate, villous; stipulas semi-sagittate, quite entire; peduncles many-flowered, rather longer than the leaves; racemes crowded with secund flowers; calycine teeth much shorter than the tube, the superior ones almost obsolete. *2. H.* Native of Tauria. Flowers purple.

Var. *β*, *minor* (Stev. l. c.) leaves small; flowers paler. *2. H.* Native of Tauria, near the region of perpetual snow.

*Purple-flowered Vetch.* Pl. cl.

12 *V. ALPESTRIS* (Stev. in mem. mosq. 4. p. 53. and Bieb. fl. taur. suppl. 469.) plant hardly canescent; leaflets elliptic-obovate, mucronulate, villous; stipulas semi-sagittate, almost quite entire; tendrils usually trifid; peduncles usually 6-flowered, longer than the leaves; racemes crowded; calyx villous, having the teeth much shorter than the tube, but with the superior ones almost obsolete; legumes unknown. *2. H.* Native of Tauria. Flowers purple.

*Alp Vetch.* Pl. cl.

13 *V. CASSUBICA* (Lin. spec. 1035.) leaflets numerous, opposite or alternate, ovate-elliptic, mucronate, nearly glabrous, firm, reticulated with numerous diverging nerves; lower stipulas lanceolate and semi-sagittate at the base, upper ones linear and almost entire; peduncles many-flowered, about equal in length to the leaves; racemes crowded with secund flowers; calycine teeth unequal, shorter than the tube; style villous at the apex; legumes coriaceous, hardly reticulated, oblong, short, compressed, smoothish; seeds globose. *2. H.* Native of the south of Europe. Oed. fl. dan. 98. Pluk. phyt. t. 72. f. 2. Root creeping. Flowers pale blue. Leaves impari-pinnate.

Var. *α*, *glabriuscula* (Ser. mss. in D. C. prod. 2. p. 356.) stem pilose; petioles cirrhous, villous; leaflets almost glabrous. *2. H.* *V. multiflora*, Poll. pal. 2. p. 307. Wallr. sched. 385. D. C. fl. fr. 5. p. 577. *V. Cassubica*, Sturm, deutschl. fl. 1. fasc. 31.

Var. *β*, *Orobis* (Ser. mss. in D. C. prod. 2. p. 356.) the whole plant clothed with pili; leaflets pilose or ciliated; tendrils wanting, or somewhat foliaceous. *2. H.* *V. orobis*, D. C. fl. fr. 5. p. 577. *Orobis sylvaticus*, D. C. fl. fr. 4. p. 586.

*Cassubian Vetch.* Fl. June, July. Clt. 1711. Pl. 1 foot.

14 *V. ABBREVIATA* (Fisch. in litt. ex Spreng. pl. min. cogn. pug. 1. p. 50.) leaflets oblong, rounded at both ends and mucronulate, rather pubescent; stipulas almost obsolete; peduncles many-flowered, shorter than the leaves, which are impari-pinnate. *2. H.* Native of Caucasus, on the margins of woods. Very like *V. Cassubica*, but differs in the stem being quite smooth and not flexuous, in the stipulas being very minute, and lastly in the calyxes being villous. Leaves impari-pinnate, as in *V. Cassubica*. Perhaps only a variety of *V. Cassubica*, according to Ser. Flowers pale blue.

*Short Vetch.* Fl. June, July. Clt. 1818. Pl. 1 foot.

15 *V. GALLOPROVINCIALIS* (Poir. suppl. 5. p. 471.) leaflets opposite or alternate, very numerous, elliptic-lanceolate, mucronulate, villous; stipulas semi-sagittate; tendrils almost simple; peduncles shorter than the leaves; flowers small, very numerous; vexillum broad, length of wings; legumes unknown. *2. H.* Native of the south of Provence, on the mountains. Ger. Galloprov. p. 497. no. 5. t. 19. Flowers blue or purple.

*Provence Vetch.* Pl. cl.

16 *V. CINERIA* (Bieb. fl. taur. suppl. 470.) leaves with very short tendrils; leaflets linear-elliptic, obtuse, clothed with hoary villi; stipulas bipartite, with elongated teeth; peduncles usually 2-flowered, shorter than the leaves; calycine teeth triangular, acute, superior ones very small. *2. H.* Native of Tauria, about Tiflis. Flowers pale blue, about the size of those of *V. Cracca*. Calyx clothed with silky villi.

*Cinereous Vetch.* Pl. cl.

17 *V. SETIFOLIA* (H. B. et Kunth, nov. gen. amer. 6. p. 500.) stems weak, smoothish; leaflets 8-9, very narrow-linear, mucronate, puberulous on both surfaces, as well as the rachis or petiole; stipulas lanceolate, semi-sagittate; calyx turbinate at the base, with the superior teeth ascending; peduncles 3-4-flowered, a little longer than the leaves, and arc, as well as the calyxes, pubescent; legumes lanceolate, glabrous.  $\mathcal{U}$ . H. Native near the city of Mexico, Quito, and Santa-Fé de Bogota, at the height of 3500 or 4500 feet above the level of the sea. Flowers flesh-coloured.

*Bristle-leaved Vetch.* Pl. cl.

18 *V. BROTERIA'NA* (Ser. mss. in D. C. prod. 2. p. 357.) leaflets nearly oval, villous; lower stipulas semi-sagittate, and somewhat dentate; flowers imbricate; peduncles very villous; calyxine teeth setaceous, and villous; legumes rather villous, pendulous.  $\odot$ . H. Native of Portugal, in cultivated fields about Coimbra. *V. villösa*, Brot. fl. lus. 2. p. 150. but not of Roth. Corolla deep purple at the apex.

*Brotero's Vetch.* Fl. June, July. Clt. 1817. Pl. cl.

19 *V. ACUTIFOLIA* (Ell. sketch. car. et geogr. 2. p. 225.) stem glabrous; leaflets few, linear, acute at both ends; stipulas lanceolate, entire; peduncles few-flowered, longer than the leaves. —Native of Georgia.

*Acute-leafletted Vetch.* Pl. cl.

20 *V. PULCHRELLA* (H. B. et Kunth, nov. gen. amer. 6. p. 499. t. 583.) stems weak, puberulous; leaflets 8-12, linear, acute, pubescent beneath, as well as the calyxes; stipulas linear, semi-sagittate; calyxine teeth very unequal, superior ones much the smallest; peduncles 16-20-flowered, longer than the leaves, pubescent; legumes unknown.  $\mathcal{U}$ . H. Native of Mexico, on the western declivities of mountains, especially near Mescala at the height of 795 feet above the level of the sea. Flowers white.

*Neat Vetch.* Pl. cl.

21 *V. CRÆCCA* (Lin. spec. 1095.) stems branched; leaves cirrhou at the apex; leaflets numerous, oblong, lanceolate, alternate or opposite, pubescent, mucronate, with rather parallel simple nerves; stipulas linear, semi-sagittate; peduncles angular, hairy, bearing numerous secund flowers, equal in length to or exceeding the leaves; calyxine teeth unequal, upper ones very short, lower ones shorter than the tube; style pilose at the apex; legumes oblong-lanceolate, coriaceous, reticulated, compressed, glabrous; seeds globose, black.  $\mathcal{U}$ . H. Native of Europe, in fields and hedges; plentiful in all parts of Britain. Sturm, deutsch. fl. fasc. 31. with a figure. Smith, engl. bot. t. 1168. Curt. lond. 5. t. 54. Mart. fl. rust. 117. *Cræcca*, Riv. tetr. irr. t. 50. Root creeping. Flowers blue and purple or violet mixed, marked with veins of a deeper colour. Leaves clothed with canescent down, giving them a manifest whiteness; this is most apparent in plants growing in exposed dry situations, for in moist soils the leaves are almost green. Dr. Plot, in his history of Staffordshire, says, that this and the *Wood-Vetch* advance starved or weak cattle above any thing yet known. These perennial vetches yield such abundance of food, that they seem to deserve the notice of agriculturists. But it is well observed in English botany, that to gather them from their native situations would be impracticable, so firmly do they cling by their tendrils to their neighbours; and if cultivated, they would probably choke themselves for want of support.

FIG. 46.

*Var. α, violæcca*; flowers bluish violet.

*Var. β, purpurea*; flowers purple.

*Var. γ, albiflora*; flowers pure white.

*Cræcca* or *Tufted-Vetch.* Fl. June. Sept. Britain. Pl. cl.

22 *V. BIVONÆ* (Rafin. prec. 37. Desv. journ. bot. 1814. p. 269.) plant pubescent; stems tetragonal; tendrils simple; leaflets 10-14, oblong-linear, mucronate; stipulas linear, semi-sagittate, rather toothed at the base; peduncles few-flowered, about equal in length to the leaves; flowers secund, rather distant; calyxine teeth setaceous, length of tube; style bearded at the apex; legumes oblong-lanceolate, compressed, finely reticulated.  $\mathcal{U}$ . H. Native of Sicily about Palermo, and of Corsica. *V. leucantha*, Bertol. stirp. sig. fasc. *V. littoralis*, Salzin. exsicc. Flowers pale, purplish blue, with the carina tipped with black. Perhaps the same as *V. pseudocræcca*.

*Bicon's Vetch.* Pl. cl.

23 *V. GERARDI* (Jacq. fl. astr. t. 229. D. C. fl. fr. 4. p. 591. exclusive of the synonymes,) stems simple; leaves cirrhou at the apex; leaflets numerous, oblong-lanceolate, alternate or opposite, mucronate, rather woolly, having parallel simple nerves; stipulas linear, semi-sagittate; peduncles many-flowered, rather shorter than the leaves; style pilose at the apex; legume oblong, coriaceous, finely reticulated, compressed, glabrous.  $\mathcal{U}$ . H. Native of the south of Europe, particularly in Austria and France. *V. mutilans*, Crantz. Flowers violaceous. Root creeping? Calyxine teeth unequal, pilose.

*Gerard's Vetch.* Fl. June, July. Clt. 1810. Pl. cl.

24 *V. PSEUDOCRÆCCA* (Bertol. pl. rar. p. 58.) plant pubescent; stems branched at the base, diffuse; leaflets 8-12, oblong-obtuse; stipulas linear, semi-sagittate; peduncles usually 6-flowered, longer than the leaves; flowers secund, loose, deflexed; calyxine teeth unequal, linear, acute, shorter than the tube; style villous at the apex; legumes elliptic, short, smooth, finely reticulated.  $\odot$ . H. Native of Italy near Pisa. *V. tenuifolia*, Tenore, prod. p. 42. Very like *V. Cræcca*, but differs in the annual roots, in the broader legumes, and in the longer calyxine teeth. Flowers blue.

*False-Cræcca Vetch.* Fl. June, July. Clt. 1820. Pl. cl.

25 *V. ANDICOLA* (H. B. et Kunth, nov. gen. amer. 6. p. 198. t. 582.) plant pubescent; stems weak; leaflets 7-12, linear-lanceolate, obtuse, mucronate; stipulas linear, semi-sagittate, acute; tendrils bifurcate; peduncles 2-4-flowered, hardly exceeding the leaves; calyx bilabiate, the superior teeth the smallest; legumes somewhat cultriform, smoothish.  $\mathcal{U}$ . F. Native of the Andes of Quito on mount Antisana, at the height of 6300 feet above the level of the sea. Flowers violaceous.

*Andes Vetch.* Pl. cl.

26 *V. MICROPHYLLA* (D'Urv. enum. pl. arch. p. 87.) stems weak, branched at the base, and diffuse; leaflets 8-10, ovate on short petioles, small, mucronate; stipulas very small, and semi-sagittate; peduncles straight, twice or thrice longer than the leaves, 4-6-flowered; flowers pale; legumes compressed, glabrous, 5-7-seeded.  $\mathcal{U}$ . H. Native of the island of Melos, on hills. Corolla very pale violet or white, double the length of the calyx, and sometimes longer. Perhaps the same as *V. pseudocræcca* of Bertol.

*Small-leafletted Vetch.* Pl. cl.

27 *V. POLYPHYLLA* (Pers. fl. atl. 2. p. 162.) leaflets numerous, linear-lanceolate, mucronate, villous; stipulas linear, semi-sagittate; peduncles many-flowered, longer than the leaves; flowers secund, crowded.  $\mathcal{U}$ . H. Native about Algiers. The flowers are like those of *V. Cræcca*, but they are larger and paler. The vexillum is blue, and wings and keel white.

*Many-leafletted Vetch.* Fl. June, July. Clt. 1816. Pl. cl.

28 *V. TENUIFOLIA* (Roth. fl. germ. 2. p. 183.) stem branched; leaves cirrhou at the apex; leaflets numerous, linear-lanceolate, smoothish, mucronate, alternate or opposite, full of parallel sim-

ple veins; lower stipulas semi-sagittate, linear, upper ones linear-setaceous; peduncles longer than the leaves; flowers crowded, secund; calycine teeth unequal, lower ones length of the tube; style pilose at the apex; legumes lanceolate.  $\mathcal{U}$ . II. Native of France, Germany, and Thuria. Sturm, deutschl. fl. 1. fasc. 31. V. Gerárdi, Willd. enum. no. 736. Flowers beautiful violaceous or purple. Very like *V. Cracca*, but does not creep at the roots.

*Fine-leaved Vetch.* Fl. June, Aug. Clt. 1799. Pl. cl.

29 *V. SE'SSEI*; plant smoothish; stems angular; stipulas subulate, semi-sagittate or bifid; leaflets 15-16, linear-lanceolate, mucronate; tendrils trifid, and divided again; peduncles about the length of the leaves; flowers numerous, racemose; style villous at the apex.  $\mathcal{U}$ . II. Native of Mexico. V. polyphylla, Moc. et Sesse in herb. Lamb. Flowers apparently pale blue.

*Sesse's Vetch.* Pl. cl.

30 *V. SUBULATA* (Sesse et Moc. mss. in herb. Lamb.) plant canescent and pubescent; leaflets 10-12, subulate; tendrils bifid; peduncles shorter than the leaves; flowers crowded, secund; stipulas subulate, semi-sagittate.  $\mathcal{U}$ . II. Native of Mexico. Flowers white or pale blue.

*Subulate-leafletted Vetch.* Pl. cl.

31 *V. CONSENTINA* (Spreng. pl. min. cogn. pug. 2. p. 74.) stem and petioles pubescent; leaflets lanceolate, mucronate, lower ones elliptic; stipulas semi-sagittate; peduncles many-flowered, longer than the leaves; flowers remote, glabrous, cream-coloured.  $\odot$ . H. Native of Naples and about Cosenza. Perhaps only a variety of *V. pseudocracca*.

*Cosenza Vetch.* Fl. June, Aug. Clt. 1818. Pl. cl.

32 *V. CAPE'NSIS* (Berg. pl. cap. p. 215.) stem branched at the base; leaves impari-pinnate; leaflets linear, truncate, and mucronate; stipulas lanceolate, acute; peduncles elongated, many-flowered; style hairy at the apex; legumes lanceolate, compressed.  $\mathcal{U}$ . G. Native of the Cape of Good Hope. Flowers purple.

*Cape Vetch.* Fl. June, Aug. Clt. 1802. Pl. 1 foot.

33 *V. CANESCENS* (Labill. syr. dec. 1. p. 17. t. 7.) plant clothed with canescent down; leaflets numerous, oblong-linear, obtuse, alternate; tendrils almost wanting; stipulas lanceolate, semi-sagittate, quite entire; peduncles 3-7-flowered, about equal in length to the leaves; calycine teeth narrow, shorter than the tube; style bearded at the apex; legumes ovate-lanceolate, compressed, hairy, 3-4-seeded; seeds roundish.  $\odot$ . H. Native of mount Lebanon. Flowers blue. Lower leaves impari-pinnate.

*Canescent Vetch.* Fl. June, July. Clt. 1800. Pl. cl.

34 *V. OCHROLEUCA* (Tenore, prod. p. 42. and cat. 1819. p. 56.) leaflets ovate-lanceolate or oblong-linear, obtuse, mucronate, smoothish, nearly opposite, with the nerves parallel; stipulas subulate, semi-sagittate at the base, quite entire; peduncles many-flowered, longer than the leaves; flowers crowded; teeth of calyx very short; style pilose at the apex; legumes glabrous, reticulated.  $\mathcal{U}$ . II. Native of Italy. This plant is very like *V. Cracca*, but the flowers are cream-coloured, and smaller.

*Cream-coloured-flowered Vetch.* Clt. 1825. Pl. cl.

35 *V. PUNCTATA* (Schleich. ex Pers. ench. 2. p. 307.) leaflets ovate-lanceolate, mucronate, glabrous; stipulas cut; peduncles many-flowered, longer than the leaves; calyxes obtuse.  $\odot$ . H. Native of Switzerland. Flowers purple? The under side of the leaflets are observed to be dotted with white, when examined by a microscope.

*Dotted Vetch.* Fl. July. Clt. 1819. Pl. cl.

36 *V. ONORRYNCHOIDES* (Lin. spec. 1036.) stems striated; tendrils almost simple; leaflets numerous, linear, alternate or opposite, obtuse, and mucronate, with parallel nerves; stipulas linear, semi-sagittate, dentate; peduncles very long, many-flowered; flowers distant; calycine teeth lanceolate, length of the tube; style clavate, bearded at the apex; legumes lanceolate.

$\mathcal{U}$ . II. Native of Europe, in the mountainous parts. Sturm, deutschl. fl. 1. fasc. 31. with a figure. All. pedem. t. 42. no. 1198. Sims, bot. mag. 2206. Flowers purplish blue.

*Var.  $\beta$ , angustissima* (Ser. mss. in D. C. prod. 2. p. 358.) leaflets setaceous, and shorter.  $\odot$ . H. Native about Montpellier.

*Saintfoin-like Vetch.* Fl. Ju. July. Clt. 1759. Pl. cl.

37 *V. ATROPURPUREA* (Desf. fl. atl. 2. p. 164.) plant villous; stems tetragonal; tendrils very trifid; leaflets oblong, mucronate, numerous, opposite, and alternate; stipulas lanceolate, semi-sagittate, usually toothed at the base; peduncles many-flowered, hardly the length of the leaves; flowers secund, approximate; calycine teeth setaceous, pilose, longer than the tube; style elongated, somewhat clavate, bearded at the apex; legumes oblong, compressed, very hairy; seeds globose, black, rather velvety.  $\odot$ . H. Native of Algiers. Vent. hort. cels. t. 84. Lindl. bot. reg. 871. Flowers dark purple.

*Dark-purple-flowered Vetch.* Fl. Ju. July. Clt. 1815. Pl. cl.

38 *V. GIGANTEA* (Hook. fl. bor. amer. p. 157.) plant pubescent, black when dried; stems furrowed; leaflets 20-26, oblong, petiolulate, obtuse, mucronate; stipulas large, semi-sagittate, profoundly toothed at the base; peduncles 5-10-flowered, much shorter than the leaves; flowers crowded; style hardly bearded; legume broad, oblong, glabrous, obscurely reticulated.  $\mathcal{U}$ . H. Native of North America, in open woods on the Columbia. Flowers purple, about the size of those of *V. Americana*. Stems hardly one-third of an inch broad, hollowed, and herbaceous. Stipulas an inch and a half in length. The plant turns black on drying.

*Giant Vetch.* Pl. trailing.

39 *V. STRICANS* (Hook. in Beech. bot. p. 20.) plant pubescent; stems tetragonal; leaflets oblong-elliptic, obtuse, alternate; tendrils divided; stipulas semi-sagittate; peduncles twice the length of the leaves, many-flowered; flowers crowded, the 2 superior teeth of the calyx almost wanting, lower ones subulate, middle one elongated, and exceeding the tube; stigma bearded.  $\mathcal{U}$ . H. Native of Chili about Concepcion. Leaflets more than an inch long. Plant becoming very black on drying.

*Blackish Vetch.* Pl. cl.

40 *V. BENGAL'ENSIS* (Lin. spec. 1036.) leaflets elliptic, obtuse, stipulas entire; peduncles usually bearing only 5 flowers, length of leaves; legumes turgid, hairy.  $\odot$ . H. Native of the Storchades Islands.—Herm. ludg. 624. t. 625. Flowers deep purple, having the keel tipped with black. Plant downy.

*Bengal Vetch.* Fl. June, July. Clt. 1792. Pl. cl.

41 *V. PERENNIS* (D. C. cat. hort. monsp. 155. and fl. fr. 5. p. 578.) plant villous; stems tetragonal; tendrils simplish; leaflets oblong-linear, mucronate, villous, opposite or alternate; stipulas lanceolate, semi-sagittate, and usually toothed at the base; peduncles few-flowered, length of leaves; flowers secund, rather lax; calycine teeth setaceous, pilose, length of tube; style elongated, rather clavate, bearded at the apex; legumes oblong, compressed, pubescent, reticulated; seeds orbicular, compressed, bay-coloured.  $\mathcal{U}$ . H. Native of France, about Perpignan. Flowers purple.

*Var.  $\beta$ , suffruticosa* (Ser. mss. in D. C. prod. 2. p. 359.) stems smaller, diffuse, suffruticose at the base; leaves and leaflets smaller.

*Perennial Vetch.* Fl. June, July. Clt. 1820. Pl. cl.

42 *V. LONGIFOLIA* (Poir. dict. 8. p. 567.) stems tetragonal; tendrils branched; leaflets numerous, narrow, very long, glabrous; stipulas semi-sagittate, entire; peduncles many-flowered, longer than the leaves; flowers drooping; calycine teeth unequal, acute, superior ones very small.  $\odot$ . ? H. Native of Syria. Flowers cream-coloured.

*Long-leaved Vetch.* Fl. June, July. Clt. 1818. Pl. cl.

43 *V. ARGENTEA* (Lapeyr. abr. 417.) plant canescent; stems

tetragonal, never climbing; tendrils wanting; leaves clothed with silvery-grey down; leaflets oblong-linear, mucronate; stipulas lanceolate, semi-sagittate; peduncles many-flowered, about the length of the leaves; flowers secund, loose; calycine segments almost equal, length of the tube; style elongated, rather clavate, bearded at the apex; legumes oblong, compressed, tomentose. *U. H.* Native of the Pyrenees, on the Spanish side. *D. C.* fl. fr. suppl. no. 4011. *Hook. bot. mag.* 2946. Calyx reddish with green teeth. Flowers with the vexillum and wings yellowish-white, streaked with purple, but the keel is white. Root fusiform.

*Silvery Vetch.* Fl. June, July. Clt. 1827. Pl. 1 foot.

44 *V. TRICHOCA'LYX* (Moris, elench. sard. ex Schlecht. *Linnaea*. 5. p. 96.) plant pubescent; leaflets elliptic-oblong, mucronulate; tendrils branched; stipulas lanceolate, semi-sagittate, toothed; peduncles many-flowered, about equal in length to the leaves; flowers secund, crowded; calyx very villous, with setaceous teeth, which are much longer than the tube; legumes hairy. *U. H.* Native of Sardinia, in corn-fields. This plant is very like *V. atropurpurea* of Desf. but differs in flowering later, and in every part being much larger, in the calyx being more villous, and, lastly, in the corolla being white, and only rose-coloured at the apex.

*Hair-calyx red Vetch.* Pl. cl.

45 *V. VILLOSA* (Roth. fl. germ. 2. p. 182. but not of Brot.) plant clothed with villi; stems tetragonal; tendrils almost simple; leaflets oblong, mucronulate, opposite or alternate; stipulas lanceolate, entire, semi-sagittate; peduncles many-flowered, length of the leaves; flowers secund, rather loose; calycine teeth setaceous, pilose, longer than the tube; style villous at the apex; legumes oblong, compressed, glabrous; seeds globose, variegated. *U. H.* Native of Germany. *Sturm, deutsch. fl.* 1. fasc. 31. with a figure. Flowers purple. Like *V. atropurpurea*, but differs in the stipulas being entire, and in the legumes being smooth.

*Villous Vetch.* Fl. June, July. Clt. 1815. Pl. cl.

46 *V. DISPERMA* (*D. C.* cat. hort. monsp. 154. and fl. fr. 5. p. 578.) plant rather pilose; stems tetragonal; tendrils simple; leaves with 8-10 pairs of linear-oblong mucronate leaflets; stipulas semi-sagittate, entire; peduncles 2-3-flowered, shorter than the leaves; flowers small; calycine teeth nearly equal, lanceolate-subulate, length of the tube, and about equal in length to the corolla; style villous at the apex; legumes oblong, compressed, glabrous, reticulated, transversely 2-seeded; seeds globose, black. *U. H.* Native of the south of France. *V. parviflora*, *Lois. fl. gall.* 466. but not of Michx. Flowers and fruit like those of *Ervum lens*.

*Two-seeded Vetch.* Fl. June, July. Clt. 1820. Pl. cl.

47 *V. ALTISSIMA* (Desf. fl. atl. 2. p. 163.) leaflets elliptic, quite smooth, truncate at the apex; petioles usually bearing 10 leaflets; stipulas dentate; peduncles many-flowered, longer than the leaves; flowers nodding; calycine teeth unequal, superior ones minute, lower ones acute and longer; style bearded; legumes lanceolate, compressed, many-seeded. *U. H.* Native of Barbary. Flowers pale blue, about the size of those of *V. sepium*.

*Tallest Vetch.* Fl. June, July. Clt. 1820. Pl. cl.

48 *V. POLYSPERMA* (Tenore, prod. append. 5, 1826. ex Schlecht. *Linnaea*. 3. p. 102.) stem branched; leaves cirriferous; leaflets ovate-oblong, obtuse, entire, mucronate, glabrous; tendrils branched; stipulas toothed; peduncles 8-10-flowered, longer than the leaves; flowers erect, loosely racemose; calycine teeth unequal, upper ones shorter, lower ones setaceous, longer; legumes linear-lanceolate, 3 inches long, flat, glabrous, 14-20-seeded. *U. H.* Native of Naples, in hedges. Flowers the size of those of *V. sativa*, pale blue. Very nearly allied to *V. altissima*, but in it the legume does not exceed an inch in

length, the leaflets are also elliptic and truncate at the apex, lines long and 3 broad, but in the present plant they are 8 lines long and 5 broad. Flowers densely racemose.

*Many-seeded Vetch.* Pl. cl. 8 feet.

49 *V. BIENNIS* (Lin. spec. 1036.) leaflets about 12, lanceolate, glabrous; petioles furrowed, cirriferous; stipulas semi-sagittate, acute; peduncles many-flowered, hardly longer than the leaves; calycine teeth unequal; legumes ascending, compressed, glabrous, short. *U. H.* Native of Siberia. *Poir. dict.* 5. p. 558.—*Gmel. sib.* 4. p. 10. t. 2. Leaves involute. Flowers pale blue. Seeds globular, dirty yellow, spotted with black. This promises to become an useful plant for fodder, the stalks growing to a great length, and being well furnished with leaves, which do not decay in autumn, but continue green through the winter, in defiance of the most severe frost; so that in February and March, when there is often a scarcity of green food for ewes and lambs, this may be of great service.

*Biennial Vetch.* Fl. July, Aug. Clt. 1753. Pl. cl.

50 *V. NISSOLIA'NA* (Lin. spec. 1036.) plant downy; petioles cirriferous; leaflets oblong, hardly retuse, rather downy; stipulas lanceolate, entire, very narrow; peduncles many-flowered; flowers small, dark purple; legumes ovate-oblong, villous, nodding, 5-seeded. *U. H.* Native of the Levant. Stem anguineous. The plant in the gardens under this name is a very shewy species, with dark-purple, elegant, crowded, secund flowers, and is the plant figured in bot. reg. t. 871. under the name of *V. atropurpurea*.

*Nissol's Vetch.* Fl. June, July. Clt. 1773. Pl. cl.

51 *V. PELLUCIDA* (Jacq. hort. schœnbr. 2. p. 220. t. 222.) stems branched; leaflets obovate, emarginate; stipulas oblong; peduncles usually 4-flowered, shorter than the leaves, which are without tendrils; calycine teeth equal, spreading; style bearded at the apex; legumes oblong, compressed, falcate, membranous; rather villous; seeds kidney-shaped, compressed. *U. G.* Native of the Cape of Good Hope. Flowers purple, but with the vexillum variegated. Leaves impari-pinnate.

*Pellucid Vetch.* Fl. July, Aug. Clt. 1812. Pl. 1 foot.

52 *V. HOOKERI*; plant sparingly pilose; leaves with 3-4 pairs of narrow, linear, acuminate leaflets; tendrils almost simple; stipulas semi-sagittate, linear, entire; peduncles shorter than the leaves, few-flowered; calyx short, campanulate; the teeth lanceolate and equalling the tube; corolla glabrous; legumes lanceolate, 6-seeded, compressed, with pilose sutures. *U. F.* Native of Chili, about Concepcion. *V. parviflora*, *Hook. in Beech. bot.* p. 20. but not of Cav. Habit of *Ervum tetraspermum*.

*Hooker's Vetch.* Pl. cl.

53 *V. MITCHELLI* (Rafin. prec. 37. and in Desv. journ. bot. 1814. p. 269.) plant glabrous; stems weak, striated; leaves for the most part with 7 pairs of leaflets; leaflets oblong, cuneiform, retuse, mucronate; stipulas entire or multifid, small; peduncles many-flowered; vexillum pubescent; legumes 2-seeded, pilose. *U. H.* Native of North America, in Long Island. Ell. sketch. car. et geogr. 2. p. 224. Seeds edible.

*Mitchell's Vetch.* Pl. cl.

54 *V. PARVIFLORA* (Cav. annal. sci. nat. 4. p. 73. but not of Michx. nor Lois.) stems filiform; leaves cirriferous; leaflets linear, mucronate; stipulas normal; peduncles elongated, 2-4-flowered. *U. H.* Native about Mogodor.

*Small-flowered Vetch.* Pl. cl.

55 *V. BIDENTATA* (Hort. bot. misc. 2. p. 215.) plant quite smooth; leaves with 2-3 pairs of opposite and alternate, cuneate leaflets, which are bidentate at the apex, and with a mucrone in the centre; tendrils simple; stipulas broad, semi-sagittate, a little toothed; peduncles 3-4-flowered, equal in length to the leaves; legumes oblong, glabrous. *U. H.* Native of Peru, near Lima.

*Bidentate-leaved Vetch.* Pl. 1 foot.

56 *V. BIFLORA* (Desf. atl. 2. p. 166. t. 197.) leaves tendrilled; leaflets numerous, linear-lanceolate; stipulas semi-sagittate, entire; peduncles 2-flowered, shorter than the leaves; calycine teeth nearly equal, small. ☉. H. Native of Algiers. Flowers blue.

*Two-flowered Vetch.* Fl. June, Aug. Clt. 1801. Pl. cl.

57 *V. GRAMINEA* (Smith, in Rees' cycl. vol. 37.) plant almost smooth; leaflets 3 pairs, linear, pointed; stipulas ovate, entire, slightly sagittate; peduncles 4-flowered, shorter than the leaves; tendrils simple or divided; legumes smooth, compressed, not an inch in length, elliptic-oblong, with an oblique, incurved point; seeds 6-7, small, round. ♀. H. Native of Buenos Ayres. Flowers very small, pale, apparently tinged with purple. Calyx rather downy, with the teeth shorter than the tube.

*Grassy-leaved Vetch.* Pl. cl.

§ 2. *Flowers pedunculate, solitary.*

58 *V. CALCARATA* (Desf. fl. atl. 2. p. 166.) stems rather tetragonal, decumbent; leaflets linear-lanceolate, obtuse; stipulas furcate; peduncles 1-flowered, bracteolate at the apex, much shorter than the leaves; calycine teeth small, acute; legumes compressed, glabrous. ☉. H. Native of Algiers. *V. monantha*, Retz. obs. 3. p. 39. Willd. spec. 3. p. 1109. and enum. p. 704. Flowers blue and veined.

*Spurred Vetch.* Fl. July, Aug. Clt. 1790. Pl. cl.

59 *V. BITHYNICA* (Lin. spec. 1038.) stems weak, leafy, an-  
nular, slightly branched; leaves with 2 pairs of lanceolate, mucronate leaflets, hairy beneath; stipulas semi-sagittate, with leop fringed teeth; peduncles axillary, 1-flowered; calyx hairy, stith very long rather unequal fringed teeth; legumes erect, broad, slightly tumid, clothed with rigid tawny hairs. ♀. H. Native of the south of Europe. In Britain in bushy places, on gravelly soil, often near the sea, near Doncaster, Yorkshire; in woods, near Clifton-upon-Teme, Worcestershire; between Rockenhall and Sandbury, in the same county; in a field half way between Weymouth and Portland Ferry, near the sea, and on the coasts of Dorsetshire and Hampshire. Smith, engl. bot. 1842. Jacq. hort. vind. 2. p. 69. t. 147. Flowers with a purplish vexillum, and the keel and wings white, the former tipped with violet.

*Bithynian Vetch.* Fl. July, Aug. Britain. Pl. prostrate.

60 *V. SYRIACA* (Weinm. hort. dorp. 162.) plant glabrous; stems decumbent; leaves with 4-5 pairs of ovate-oblong, mucronate leaflets; stipulas linear, entire, small; legumes pedunculate, solitary, reflexed, 4-5-seeded. ☉. H. Native of Syria. Flowers violaceous. Very like *V. calcarata*.

*Syrian Vetch.* Fl. June, July. Clt. 1816. Pl. cl.

61 *V. HUMILIS* (H. B. et Kunth, nov. gen. amer. 6. p. 498. t. 581.) stems weak; leaves with 2-3 pairs of linear-lanceolate, obtuse, mucronate, glabrous leaflets; tendrils simple; stipulas linear, acute, semi-sagittate; peduncles 1-flowered, shorter than the leaves; calycine segments long; legumes lanceolate; calyx and rachis clothed with adpressed down. ☉. H. Native of Mexico, near Moran, at the height of 3990 feet above the level of the sea. Flowers rose-coloured.

*Humble Vetch.* Pl. cl.

§ 3. *Flowers nearly sessile, solitary.*

62 *V. INTERMEDIA* (Viv. fl. lyb. p. 42. t. 19. f. 1.) leaves with 3-4 pairs of leaflets, lower ones obcordate, cuneated, superior ones linear, emarginate and mucronulate; tendrils obsolete; stipulas semi-sagittate; flowers solitary; calyx 10-nerved, gibbous at the base; legumes hairy, rather compressed. ☉. H. Native of Cyrenaica, in meadows. Allied to *V. lathyroides* and *V. sativa*, according to Viviani. Flowers purple.

*Intermediate Vetch.* Fl. June, July. Pl.  $\frac{1}{2}$  foot.

63 *V. PIMPINELLOIDES* (Mauri, pl. rom. cent. 13. p. 35.) leaf-

lets deeply crenated, superior ones quite entire; stipulas spotted, a little toothed, semi-sagittate; flowers usually solitary and almost sessile; calycine teeth elongated, ciliated; legumes erect, oblong, glabrous; seeds roundish, compressed. ☉. H. Native of Italy, about Rome. Flowers purple?

*Pimpernel-like Vetch.* Fl. June, July. Pl. cl.

64 *V. REPENS* (D'Urv. enum. pl. arch. p. 88.) stems diffuse, branched at the base, trailing; leaflets usually 6, alternate, very narrow and acute; stipulas small; flowers axillary, solitary, almost sessile; legumes compressed, glabrous, 4-seeded. ♀. H. Native of the island of Melos, in dry places. Flowers pale purple, twice or thrice the length of the calyx. Root creeping.

*Creeping Vetch.* Pl. trailing.

65 *V. GLOBOSEA* (Retz. obs. 3. p. 39.) leaves tendrilled; leaflets 4-8, pubescent, each ending in a reflexed bristle; stipulas spotted, 4-toothed; flowers solitary, erect, almost sessile; calycine teeth linear-lanceolate, ciliated; legumes terete, spreading, glabrous; seeds globose. ☉. H. Native country unknown. Very like *V. sativa*, but differs from it in the stipulas, in the longer calyx, in the form of the legume, and lastly in the fewer leaflets. Flowers blue.

*Globose-seeded Vetch.* Fl. June, Aug. Clt. 1804. Pl. cl.

66 *V. FILOSA* (Bieb. fl. taur. 2. p. 161.) plant hairy; leaves hardly cirrhiferous, upper leaflets linear-lanceolate, acute, or truncate and mucronulate, hairy; stipulas semi-sagittate, a little toothed; flowers solitary, sessile; calyxes cylindrical, with linear, parallel, nearly equal segments, length of the tube; style bearded at the apex. ☉. H. Native of Tauria. Flowers purple. Seeds globose, black.

*Pilose Vetch.* Fl. June, July. Clt. 1818. Pl.  $1\frac{1}{2}$  foot.

67 *V. PEREGRINA* (Lin. spec. 1038.) leaves tendrilled; leaflets 10-12, linear, truncate, and mucronate; stipulas semi-sagittate, linear, entire; flowers solitary, pedunculate; calyxes campanulate, with lanceolate-linear, nearly equal, diverging segments, which are about the length of the tube; style bearded at the apex; legumes compressed, lanceolate, reticulated, inclined, broad, puberulous; seeds nearly globose. ☉. H. Native of the south of Europe. Hoppe in Sturm, deutschl. fl. 1. fasc. 32. with a figure. Flowers of a dusky violet colour.

*Foreign Vetch.* Fl. July, Aug. Clt. 1779. Pl. cl.

68 *V. MEGALOSPERMA* (Bieb. fl. taur. 2. p. 161. and suppl. 471.) leaves cirrhiferous, leaflets linear, retuse, mucronate; stipulas semi-sagittate, entire, small; flowers solitary, almost sessile; style bearded at the apex; legumes pubescent, reflexed; seeds large, globose, brown, with more obscure confluent spots. ☉. H. Native of Tauria. Flowers purple.

*Large-seeded Vetch.* Fl. June, July. Clt. 1798. Pl. cl.

69 *V. MICHAUXII* (Spreng. cat. hort. hal. ex Willd. enum. 764.) leaflets linear, truncate, mucronate; stipulas lanceolate, undivided; peduncles very short, tufted; calycine teeth unequal, upper ones very short, lower ones length of the tube; legumes finely pubescent, 3-4-seeded. ☉. H. Native country unknown. Corolla white. Nearly allied to *V. peregrina*, but the calyxes are very distinct.

*Michaux's Vetch.* Fl. June, July. Clt. 1803. Pl.  $1\frac{1}{2}$  foot.

70 *V. LINEARIFOLIA* (Hook. in Beech. bot. p. 20.) plant pilose; stems angular; leaves with 5 pairs of linear retuse leaflets; tendrils usually simple, or almost so; stipulas broad, semi-sagittate, toothed at the base, dotless; flowers almost sessile, solitary; calyx campanulate, villous; teeth subulate, about equal; corolla glabrous; legumes hairy. ☉. H. Native of Chili, about Conception. Flowers not half the size of those of *V. sativa*. Like *V. Michauxii*.

*Linear-leafletted Vetch.* Pl. cl.

71 *V. AMPHICARPA* (Dorth. journ. phys. 35. p. 131.) leaves tendrilled; lower leaflets obcordate, mucronate, upper ones linear, retuse, and mucronate; stipulas semi-sagittate, entire or

toothed; flowers solitary, almost sessile; calyxes cylindrical with equal, linear, parallel segments, which are shorter than the tube; style bearded at the apex; legumes reticulated, puberulous, stem ones linear-oblong, inclined, under-ground or root ones ovate, compressed, and short. ☉. H. Native of the south of France, in gravelly places. Ger. mag. enc. ann. 6. vol. 3. p. 344. with a figure. D. C. fl. fr. no. 4021. Flowers crimson, hardly the size of those of *V. sativa*.

*Both-sided-fruited* or *Underground-podded* Vetch. Fl. May, June. Clt. 1815. Pl. cl.

72 *V. PYRENAICA* (Pour. act. toul. 3. p. 333.) leaves tendrilled; leaflets obcordate, mucronate; stipulas semi-sagittate, entire or denticulated; flowers solitary, almost sessile; calyxes somewhat campanulate, with unequal, lanceolate, somewhat spreading segments, which are shorter than the tube; style bearded at the apex; legumes oblong-linear, reticulated, smoothish, and inclined. ☿. H. Native of the Pyrenees, in meadows. D. C. fl. fr. no. 4022. icon. rar. 1. p. 10. t. 33. Flowers purplish. Root creeping.

*Pyrenean* Vetch. Fl. May. Clt. 1818. Pl.  $\frac{1}{2}$  foot.

73 *V. LATHYROIDES* (Lin. spec. 1037.) plant downy; stems branch. 1; leaves cirriferous; leaflets 4-6, elliptic-oblong; lower ones obcordate, tendrils simple; stipules semi-sagittate, entire; flowers solitary, sessile; calyx cylindrical, with nearly equal, linear, parallel segments, which are shorter than the tube; style bearded at the apex; legumes compressed, reticulated, glabrous or wrinkled, inclined; seeds globose, dotted with warts. ☉. H. Native of the south of Corsica, and Britain, in fallow fields on a gravelly soil, in chalky pastures, or on banks; about Norwich, and in Hyde-park, also in the King's-park, and various other places round Edinburgh. Sturm, deutschl. fl. 1. fasc. 31. Smith, engl. bot. 30. Oed. fl. 98. Jacq. misc. 2. p. 299. t. 18. *Ervum Soloniense*, Lin. spec. 1040. Flowers small, bluish purple, occasionally white.

*Lathyrus-like* Vetch. Fl. May, June. Britain. Pl. tr.

74 *V. LEVIGATA* (Smith, engl. bot. 483. fl. brit. 2. p. 773.) plant quite smooth; stems nearly erect, quadrangular, branched; leaves cirriferous; leaflets 8, elliptic-lanceolate, rounded, and mucronulate; stipulas green or brownish, cloven; calycine segments linear, equal, about the length of the tube; legumes compressed, short, lanceolate-oblong, quite smooth. ☿. H. Native of the south of England, among pebbles by the sea-side, at Weymouth, Dorsetshire. *V. hybrida*, Huds. fl. angl. 319. Flowers of a whitish or pale blue, seldom yellowish.

*Smooth* Vetch. Fl. July, Aug. Britain. Pl.  $\frac{1}{2}$  foot.

75 *V. LUTEA* (Lin. spec. 1037.) plant pilose; stems branched; leaves cirriferous; leaflets elliptic-lanceolate, sometimes retuse, hairy beneath; flowers solitary, almost sessile; calycine segments unequal, diverging, superior ones short, lower ones shorter than the tube; vexillum emarginate, glabrous; style bearded at the apex; legumes compressed, ovate-oblong, finely reticulated, pilose, bent down as it ripens; seeds oval, smooth. ☉. H. Native of the south of Europe; in Britain on stony ground, chiefly near the sea; upon the pebbly beach at Orford, Suffolk; at Aldburgh; near Weymouth; Shoreham, Sussex; in a chalk pit on the side of Glastonbury Torhill; in Scotland, in Mearnsire. Sturm, fl. germ. 1. fasc. 31. with a figure. Smith, engl. bot. 481. Corolla pale yellow, rarely white.

*Var.  $\beta$ , muricata* (Ser. mss. in D. C. prod. 2. p. 363.) fruit mucronated. ☉. H. Native about Tangiers.

*Yellow-flowered* Vetch. Fl. June, Aug. Britain. Pl. cl.

76 *V. HIRTA* (Balb. misc. alt. Pers. ench. 2. p. 308.) stems hairy; leaves cirriferous; leaflets linear, mucronate; vexillum glabrous; legumes sessile, solitary, pilose, reflexed. ☉. H. Native about Nice, in fields. This plant comes very near *V. lutea*, but differs in being more hairy, in the leaflets being nar-

rower, and in the flowers being white or very pale cream-colored.

*Hairy* Vetch. Fl. June, July. Clt. 1816. Pl. cl.

77 *V. HYBRIDA* (Lin. spec. 1037.) plant pilose; stems branched; leaves cirriferous; leaflets obcordate, mucronulate; stipulas semi-sagittate, a little toothed; flowers solitary, almost sessile, somewhat deflexed; calycine segments narrow, nearly equal, length of the tube; vexillum emarginate, pilose; style bearded at the apex; legumes lanceolate-oblong, compressed, finely reticulated, pilose, reflexed. ☉. H. Native of Europe; in the south of England but very rare; on Glastonbury Torhill. Sturm, fl. germ. 1. fasc. 32. with a figure. Smith, engl. bot. 482. Jacq. hort. vind. 2. t. 446. Flowers pale yellow, streaked a little with red.

*Hybrid* Vetch. Fl. June, July. Britain. Pl. cl.

#### § 4. *Flowers solitary, pedunculate.*

78 *V. SPURIA* (Rafin. cart. p. 72.) stems procumbent, rather angular; leaves with 5-6 pairs of obovate, retuse, mucronate, pilose leaflets; stipulas ovate-lanceolate, spotless; flowers axillary, solitary, pedunculate, drooping; vexillum villous; legumes linear, compressed, 2-4-seeded. ☉. H. Native of Sicily, near Palermo, and on mount Etna. Flowers yellowish.

*Spurious* Vetch. Pl. procumbent.

79 *V. PUSILLA* (Muhl. in Willd. spec. 3. p. 1106.) upper leaves furnished with long tendrils; leaflets usually 6, lanceolate, mucronate; stipulas quite entire, semi-sagittate; peduncles long, solitary, 1-flowered; legumes oblong, small, glabrous. ☉. H. Native of Pennsylvania. Perhaps the same as *Ervum tetraspermum*. Flowers small, white with a tinge of red.

*Small* Vetch. Pl. cl.

80 *V. CILIARIS* (Smith, fl. græc. t. 700. ex prod. 2. p. 71.) leaflets about 7 pairs, emarginate; stipulas setaceous-multifid; peduncles 1-flowered, awned, length of the leaves. ☿. H. Native of Asia Minor. Tendrils many-parted. End of pedicels drawn out beyond the flower. Flowers pale blue, streaked with purple. Legumes 1 inch long, compressed, 2-seeded.

*Ciliated-stipuled* Vetch. Pl. cl.

81 *V. MELANOPS* (Smith, fl. græc. t. 701. ex prod. 2. p. 72.) stems diffuse; stipulas marked with black; wings depressed, incumbent; legumes solitary, reflexed, linear, glabrous. ☿. H. Native of Laconia. Flowers of a dull greenish-yellow; their wings, which converge horizontally, tipped with very dark brown. Very like *V. hybrida*.

*Black-marked* Vetch. Pl. cl.

82 *V. BAETRA* (Zucc. obs. bot. cent. 1. no. 83. A.) stem 2-edged, striated; leaflets wedge-shaped, retuse; stipulas toothed, upper segments dotted; legumes solitary, almost sessile. ☉. H. Native country unknown.

*Baetra* Vetch. Pl. cl.

#### § 5. *Flowers almost sessile, twin.*

83 *V. INCISA* (Bieb. fl. taur. suppl. p. 471.) leaflets obovate, retuse, mucronate, deeply serrated; stipulas toothed, semi-sagittate; legumes sessile, usually twin, pubescent. ☉. H. Native of Tauria. Very like *V. sativa*, but differs in the leaflets being very deeply cut into 2-4 opposite serratures on each side. Flowers purple.

*Cut-leafletted* Vetch. Fl. June, July. Clt. 1820. Pl. cl.

84 *V. CORNIGERA* (Chaub. in Saint Amans fl. agen. p. 294.) leaflets linear, very narrow, villous; stipulas entire, lower ones semi-sagittate, superior ones lanceolate; flowers almost sessile, twin; vexillum subulate, convolute, spiral. ☉. H. Native of sandy places, near Agen. Flowers purple. It is perhaps only a narrow leafletted variety of *V. sativa*.

*Horn-bearing* Vetch. Pl. 1 foot.

T t

85 *V. CANADENSIS* (Zucc. obs. bot. cent. 1. no. 83.) leaves with 7 pairs of retuse mucronate leaflets; upper stipulas simple, marked above, lower ones ciliate 4-toothed; superior legumes solitary, lower ones twin, and horizontal; seeds globose, lentiform, yellowish. ☉. H. Native of Canada. Flowers purple?

*Canada Vetch.* Pl. cl.

86 *V. CORDATA* (Wulf. ex Hoppe in Sturm, deutschl. fl. 1. fasc. 32.) leaves cirriferous; leaflets 10-12, oblong-obcordate, mucronate; stipulas semi-sagittately-toothed; flowers usually twin, sessile; calyx cylindrical, with lanceolate-linear, nearly equal, somewhat parallel segments, which are about the length of the tube; legumes oblong, rather torulose, puberulous; seeds globose, variegated. ☉. H. Native of Germany. Flowers purple. This plant comes very near *V. sativa*, but still it is very distinct.

*Cordate-leafletted Vetch.* Fl. June, July. Clt. 1816. Pl. cl.

87 *V. DU'RIA* (Schultes, obs. 149.) leaves with 6 pairs of linear-truncate or linear-lanceolate, mucronate, ciliated leaflets; stipulas marked, profoundly toothed; flowers usually twin; calyx striated, nerved, pubescent, with subulate teeth; legumes glabrous, terete, erect; seeds round, cream-coloured. ☉. H. Native country unknown.

*Doubtful Vetch.* Pl. cl.

88 *V. SATIVA* (Lin. spec. 1037.) leaves cirriferous: leaflets 6-10, obovate, or elliptic-oblong, retuse, mucronulate, pilose or smoothish; stipulas semi-sagittately-toothed; flowers usually twin, sessile; calyx cylindrical, with lanceolate-linear, nearly equal parallel segments, which are about the length of the tube; style bearded at the apex; legumes compressed, somewhat torulose, oblong, reticulated, erectish; seeds nearly globose, smooth, variable in colour. ☉. H. Native of Europe, in corn or cultivated fields; plentiful in Britain; also of North America about Fort Vancouver. Flowers purple. This is a very variable plant in the form of the leaflets, in the size of the stems, and in the colour and size of the seeds.

*Var. α, oborata* (Ser. mss. in D. C. prod. 2. p. 361.) leaflets obcordate, pilose; legumes pubescent. *V. sativa*, Hoppe in Sturm, deutschl. fl. 1. fasc. 31. with a figure. *V. sativa nemoralis*, Pers. ench. 2. p. 307. *V. Helvética*, Hort. prag. ex Gerhard. Flowers reddish purple.

*Var. β, segetalis* (Ser. l. c.) leaflets oblong, truncate, pointed, pilose; legumes pubescent. ☉. H. *V. segetalis*, Thunb. fl. par. ed. 2. p. 367. et Hoppe in Sturm. l. c. with a figure. *V. sativa*, Smith, engl. bot. 334. Oed. fl. dan. t. 522. Mart. fl. rust. 116. *V. Laganensis*, Schleich. in herb. Balb. Flowers reddish purple.

The *tare*, *vetch* or *fitch*, is called in French *vesce*; in German *wicke*; and in Italian *loglio*. It has been cultivated for its stems and leaves from time immemorial. Ray, in 1686, informs us that the common *tare* or *vetch* was then sown almost all over Europe; that it was chiefly used in England mixed with peas and oats to feed horses, but that it was sometimes sown separately for soiling cattle, and was reputed to cause milch cows to yield much milk. The *tare*, Brown observes, is of hardy growth, and when sown upon rich land will return a large supply of green fodder, for the consumption of horses or for fattening cattle.

The varieties of the *tare* are chiefly two, the *winter* and *spring-tare*: both have local names, as *gore-vetch*, *rath-ripe-vetch*, &c. Professor Martin observes, that there appears a material difference in the constitution of the two plants in question. Not to say any thing of a trifling difference in the colour and size of their seeds, the only visible mark of distinction seems to be a disparity in the first leaves of the upright stalks, which in the *spring-tare* are elliptic and rounded, or notched at the end, but in the *winter-tare* linear, and drawn to a point. The leaves of

the branches, which afterwards issue below, and in time form the bulk of the plants, are the same in both the varieties. But whatever the difference may be, it is evident that the seeds of the two sorts ought to be kept separate, since each sown out of its proper season is found not to prosper. Numerous other species of *Vicia* might be cultivated with advantage, as the *V. Narbonensis* and *V. serratifolia*, which are cultivated in Germany. Dr. Anderson has recommended the *V. sepium*, and a writer in the Bath Agricultural Transactions the *V. cracca*.

In choosing between the *spring* and *winter tare* every thing must depend on the intention of the crop. If the object is to have early food, the winter variety is undoubtedly to be preferred; but where the land is foul, and requires to be two or three times ploughed in spring, or where a late crop is desired, or a crop for seed, then the spring variety will generally deserve the preference. The soil preferred by the *tare* is clay; but it will grow in any rich soil, not over dry. In a moist climate, the haulm grows so luxuriant as to rot at the bottom, and in one over dry it is deficient of strength. A dry season is upon the whole more favourable than a moist one, as the crop soon covers the surface.

The preparation of the soil seldom consists of more than one ploughing if for autumn sowing, and of a winter and spring ploughing when to be sown in spring. If in the latter case the land is very foul, several ploughings are given. In general *tares* succeed some of the corn crops. In England, manure is sometimes given, either with a view to eating them off early, and following with a crop of turnips, or to the enriching the soil for a crop of wheat.

The time of sowing depends on the kind of *tare*, and the purpose in view. The winter variety is sown in September and October, and the first sowing in spring ought to be as early as the season will permit. If they are to be cut green for soiling throughout the summer and autumn, which is the most advantageous method of consuming them; successive sowings should follow till the end of May. Summer *tares*, when meant for seed, ought to be sown early, otherwise the return will be imperfect, but when for green food any time betwixt the first of April and the end of May will answer, provided crops in succession from the first to the last mentioned period be regularly cultivated. In Middlesex, the winter sowing is commenced about the beginning of August; in the northern counties no winter sowings are made, as the *tare* there will not endure the severity of that season.

The mode of sowing *tares* is mostly broad-cast, which should be performed as early as possible over well prepared land, the seeds being afterwards covered in by proper harrowing. It has been suggested, that in rich soil it is probable the row method would succeed well with this sort of crop, as Marshal states is the practice in some of the southern districts of the island. After the seed is sown, and the land carefully harrowed, a light roller ought to be drawn across, so that the surface may be smooth, and the scythe permitted to work without interruption. It is proper also to guard the field for several days against the depredations of pigeons, who are remarkably fond of *tares*, and will pick up a great part of the seed unless constantly watched.

The quantity of seed to an acre is from  $2\frac{1}{2}$  to  $3\frac{1}{2}$  bushels, according to the time of sowing, and as they are to be consumed green or left to stand for a crop. When *tares* are intended for seed less seed is required. A writer in the Farmer's magazine, vol. 1. has suggested that the most productive manner of sowing this crop when intended for seed, is to mix them amongst beans when drilled, at the rate of one firlot of *tares* to one boll of beans, and by this means the quality of *tares* is vastly improved, as by clinging to the beans they are kept from the ground, and enjoy the full benefit of the sun in ripening them in the most perfect

manner. The beans at the same time answer for bands to tie the principal crop, and the produce in this way on an average of seasons is considered at least double. A little rye sown with the *winter-tares*, and a few oats with the *spring-tares*, not only serves to support the weak climbing stems, but adds to the bulk of the crop, by growing up through the interstices.

*In the choice of the seed.* It is hardly possible to distinguish the grain of the winter from that of the spring variety; the former is said to be rather smaller and lighter coloured, but the only reliance must be on the honesty of the vender.

*The after culture* given to tares, consists merely in pulling out the larger weeds, unless they are in rows, in which case the horse or hand-hoe is applied; or intended for seed, in which case the weeding must be more particularly executed.

*In reaping tares for soiling*, they ought always to be cut with the scythe, as the sickle by breaking asunder the stalks, and tearing up a number of the roots, renders the second crop of little value. When sown early, they will sometimes produce three mowings, but generally two. In reaping *tares* for seed, they may be either mown or cut down with the sickle, and treated like peas in drying, stalking, and threshing.

*Tares are catched off the ground* in some places by different kinds of live stock, particularly by sheep; and as the winter-sown variety comes very early in spring, the value of this rich food is then very considerable. The waste, however, in this way must be very great, even though the sheep be confined by hurdles, and must be still greater when consumed by horses or cattle.

*Tare crops are sometimes made into hay*, in which case great attention is necessary in drying it properly. The best time for cutting *tares* for hay is when the blossoms have begun to decline and the *tares* begin to fall and lie flat. When well made the hay is of the best and most nutritious properties.

*The produce of tares cut green* is, according to Middleton, 10 to 12 tons the acre, which is a large crop, and when made into hay about 3 tons the acre, which shows the disadvantage of making these crops into hay. And it is found that the *spring-tare* crops are lighter and more likely to be injured by a dry season.

*The produce in seed* is likewise found to be considerable, being by some stated to be at from 3 to 6 sacks, but in other instances 40 bushels or more have been obtained from the acre.

*In the application of tares* they are found to be a most nourishing food for all sorts of cattle. Cows give more butter when fed with this plant than with any other food whatsoever. Horses thrive better upon *tares* than they do upon clover or rye-grass; and the same remark is applicable to the fattening of cattle, who feed faster upon this article of green fodder than upon any kind of grass or esculent plant whatever. Danger often arises from their eating too much, especially when the *tare* is podded, as colics and other stomach disorders are apt to be produced by the excessive loads which they devour, in consequence perhaps of the great quantity of fixed air contained in the plant. When the *tares* are over succulent, fewer dangers would follow if the *tares* were mixed with oat-straw in the stalls. If the plants are cut green and given to live stock, either on the field or in the fold-yards, there is perhaps no green crop of greater value, nor any better calculated to give a succession of herbage from May to November. The winter-sown *tare*, in a favorable situation, is ready for cutting before clover. The first spring crop comes in after the clover must be all consumed or made into hay, and the successive spring sowings give a produce more nourishing for the larger animals than the after math of clover, and may afford green food at least a month longer. In the county of Sussex, Young observes, "*tare* crops are of such use and importance, that not one-tenth of

the stock could be maintained without them: horses, cows, sheep, hogs, all feed upon them: hogs are soiled upon them without any other food. This plant maintains more stock than any other plant whatsoever. Upon an acre, Davies maintained 4 horses in much better condition than upon 5 acres of grass. Upon 8 acres he has kept 12 horses and 5 cows for three months, without any other food whatever. No artificial food is equal to this excellent plant." This statement must be coupled with the usual produce of turnips in Sussex, 10 or 15 tons per acre, hence the superiority of *tares* to every other green crop. *Tares* cut green, Professor Thaer observes, draw no nourishment from the soil whatever, while made into hay they afford a fodder preferred by cattle to peas-straw, and more nutritive than hay or any other herbage.

*The use of the grain of tares*, is usually for sowing; but they are also given to pigeons, by whom they are highly relished, and it is thought they would form a very good food for poultry. In Germany they are given to horses, cows, sheep, and swine.

*The diseases of tares* are so few as to be of no consequence. A crop is sometimes, but rarely, lost by the mildew.

Common or Cultivated Vetch or Tare. Fl. May, July. Britain. Pl. cl.

89 *V. ANGUSTIFOLIA* (Roth. tent. fl. germ. p. 310.) leaves cirriferous; leaflets 10-12, linear-lanceolate, lower ones obcordate, mucronulate, pilose, or smoothish; stipulas semi-sagittately toothed; flowers twin, sessile; calycine segments linear, nearly equal: legumes compressed, somewhat torulose, erectish, reticulated; seeds globose, black. ☉. H. Native of Europe, in corn-fields. Engl. bot. suppl. 2614. *V. sativa* β, Lin. l. c. Smith, engl. fl. 3. p. 381.—Sturm, deutsch. fl. 1. fasc. 31. with a figure. *V. Luganensis*, Schleich. exsicc. ex herb. D. C. *V. lathyroides*, Huds. angl. ed. 2. p. 318. but not of Lin. Flowers purplish-crimson.

*Narrow-leaved Vetch.* Fl. May, June. Britain. Pl. cl.

90 *V. GLABRA* (Schleich. ex pl. exsicc.) leaflets oblong-ovate, rather truncate and mucronate, glabrous, as well as the legumes and calyxes; the rest as in *V. sativa*. ☉. H. Native of Switzerland, in fields. *V. sativa*, var. ε, glabra, Ser. in D. C. prod. 2. p. 361. Flowers purple.

*Glabrous Vetch.* Fl. May, July. Clt. 1819. Pl. cl.

91 *V. BOBARTII* (Forst. in Lin. trans. vol. 16. p. 442.) leaves cirriferous, rather hairy; leaflets 6-7 linear, lower ones obcordate; stipulas small, narrow, toothed, with a pale depression beneath; flowers solitary, nearly sessile; legume nearly upright, narrow, downy; finally blackish; seed globose, smooth. ☉. H. Native of England, in grassy pastures, on a chalky or gravelly soil; in Essex; on Shotover-hill, Oxfordshire; in Stow wood; in Hyde-park; among the grass in Richmond Gardens; also in Scotland. *V. angustifolia*, Smith, eng. fl. 3. p. 382. *V. angustifolia* β, Pers. *V. lathyroides*, Dicks. *V. lathyroides* β, Huds. *V. sativa* γ, Smith, fl. brit. 770. Flowers crimson, white at the keel and lower edge of the wings.

*Bobart's Vetch.* Fl. May, July. Britain. Pl. cl.

92 *V. LEUCOSPERMA* (Mærch. meth. 148.) leaves cirriferous; leaflets 10-12, obcordate, pilose or glabrous; stipulas semi-sagittately toothed; flowers usually twin, sessile; calyx cylindrical, with linear-lanceolate, nearly equal segments; legumes somewhat torulose; seeds globose, white, or yellow. ☉. H. Native of Europe. *V. alba*, Mærch. meth. 148. Flowers white or purple.

*White-seeded Vetch.* Fl. May, July. Clt. 1810. Pl. cl.

93 *V. GRANDIFLORA* (Scop. fl. carn. 2. p. 65. t. 42.) leaves cirriferous; leaflets obcordate, mucronate, 10-12, approximate; stipulas ovate; flowers usually twin, inclined; calycine segments nearly equal, length of tube; vexillum obovate, mucronulate; style bearded at the apex; legumes oblong, com-

pressed, glabrous, brown; seeds globose, blackish red. ☉. H. Native of Carniola, and other parts of Europe. Flowers large, yellow. The vexillum edged with red.

*Great-flowered Vetch.* Fl. June, July. Clt. 1818. Pl. cl.

94 V. *SO'RDIDA* (Waldst. et Kit. pl. rar. hung. 2. p. 133. t. 133.) stems branched; leaves cirriferous; leaflets 10-12, obovate, retuse, mucronate; stipulas semi-sagittate, entire, spotted; flowers usually twin, inclined; calyx cylindrical; the segments hardly unequal, linear, a little shorter than the tube, parallel; vexillum large, somewhat obcordate and mucronulate; style bearded at the apex; legumes lanceolate, compressed, declinate, smoothish, reticulated; seeds somewhat globose. ☉. H. Native of Hungary. Sturm, fl. germ. 1. fasc. 31. with a figure. Flowers large, yellow tinged with green, pedicellate.

*Var. β, rotundata* (Ser. mss. in D. C. prod. 2. p. 363.) leaflets roundish-obcordate.

*Sordid-flowered Vetch.* Fl. June, July. Clt. 1802. Pl. cl.

95 V. *BIEBERSTEINII* (Besser. in Bieb. fl. taur. suppl. 492.) leaves cirriferous; leaflets 8-10, linear, rather truncate and mucronulate; stipulas semi-sagittate, lanceolate, spotted; flowers usually twin; calyx cylindrical, with hardly unequal, linear segments, which are a little shorter than the tube; legumes nearly sessile, usually solitary and spreading, glabrous. ☉. H. Native of Podolia. V. *sordida*, Bieb. fl. taur. 2. p. 161. exclusive of the synonymes. Flowers yellow.

*Bieberstein's Vetch.* Fl. June, July. Clt. 1820. Pl. cl.

96 V. *LINEATA* (Bieb. fl. taur. suppl. 473.) leaflets linear-elliptic, pilose; stipulas spotted, lower ones deeply toothed; flowers usually twin, almost sessile; calycine teeth broadish, shorter than the tube, glabrous; style bearded at the apex; vexillum glabrous, lined; legumes very pilose. ☉. H. Native of Tauria. Flowers pale yellow?

*Lined-flowered Vetch.* Pl. 1½ foot.

97 V. *HIPAÏTITA* (Mœnch. meth. p. 149.) leaves cirriferous; leaflets 5-7, linear, obtuse, acuminate; stipulas lanceolate, bipartite; peduncles twin, longish; calycine teeth lanceolate; legumes terete, glabrous, 6-8-seeded. ☉. H. Native country unknown.

*Bipartite-stipuled Vetch.* Pl. cl.

98 V. *BAÏTA* (Mœnch. meth. p. 148.) leaflets oblong, obtuse, and mucronulate; stipulas semi-lunate, toothed; flowers twin; legumes erect, smooth; calyx glabrous; seeds somewhat compressed, olive-coloured. ☉. H. Native country unknown.

*Baïta Vetch.* Pl. cl.

99 V. *BICOLOR* (Willd. enum. suppl. p. 51. ex Horn. hort. hafi. suppl. p. 81.) leaflets oblong, obtuse; stipulas subulate, with one tooth at the base; peduncles naked, usually twin? shorter than the leaves. ☉. H. Native country unknown. Flowers mixed with purple and white.

*Two-coloured-flowered Vetch.* Fl. Ju. Aug. Clt. 1820. Pl. cl.

§ 6. *Flowers almost sessile, 2-4-together, on very short pedicels, or few flowers on very short peduncles.*

100 V. *TRICOLOR* (Sebast. et Mauri, prod. fl. rom. p. 245. t. 4.) stems simple; leaves cirriferous; leaflets numerous, oblong, retuse, and mucronulate, villous; stipulas semi-sagittate, lanceolate, spiculate; flowers 3-together, inclinate; calyx obliquely-campanulate, with unequal, diverging teeth, which are shorter than the tube; vexillum dotted with rust colour; style bearded at the apex; legumes lanceolate, glabrous, ciliated, reflexed. ☉. H. Native about Naples. Vexillum yellowish. Wings purplish.

*Var. α, obcordata* (Ser. in D. C. prod. 2. p. 364.) leaflets obcordate, truncate, clothed with silky villi beneath.

*Var. β, oblonga* (Ser. l. c.) leaflets oblong, somewhat truncate, and mucronulate.

*Three-coloured-flowered Vetch.* Fl. Ju. Aug. Clt. 1818. Pl. cl. 101 V. *SEPIUM* (Lin. spec. 1038.) stems branched; leaves cirriferous; leaflets 10-12, ovate, retuse, and somewhat mucronulate, hairy, ciliated; stipulas semi-sagittate, lower ones toothed, each marked with a brown spot; flowers 3-4-together, leaning one way; calyx hairy, tubular, with unequal teeth, which are deflexed at the apex and shorter than the tube; style bearded at the apex; legumes smooth, lanceolate-oblong, inclinate, a little ciliated, reticulated; seeds globose, smooth. ☉. H. Native of Europe, in shady places. In Britain in thickets and under hedges, common. Sturm, fl. germ. 1. fasc. 31. with a figure. Smith, engl. bot. 1515. Oed. fl. dan. 699. Riv. tetr. irr. t. 56. Flowers dull bluish purple. This plant shoots earlier in spring than any other plant eaten by cattle, vegetates in the autumn, and continues green all the winter. A patch sown in drills in a garden was cut five times in the course of the second year, and produced at the rate of 24 tons an acre of green food, which when dry would weigh near four tons and a half. Though palatable to all kinds of cattle, it would be difficult to cultivate on a large scale, the seeds being generally devoured by the larvæ of a species of *Attelabus*, which larvæ are the prey of a species of *ichneumon*.

*Var. α, ochroleuca* (Bast. suppl. no. 8. D. C. fl. fr. 5. p. 581.) flowers cream-coloured.

*Var. γ, subrotunda* (Ser. mss. in D. C. prod. 2. p. 364.) leaflets ovate-roundish; flowers violaceous.

*Var. ζ, capsella* (Ser. l. c.) leaflets obcordate, similar in shape of the pods to *Capsella*; flowers 1-3-together, white? Native of the Levant.

*Hedge Vetch.* Fl. May, July. Britain. Pl. cl.

102 V. *PANNONICA* (Jacq. fl. aust. t. 34.) plant pilose; stems simple; leaves cirriferous; leaflets oblong, mucronate; stipulas lanceolate, marked; flowers from 2-4-together, inclinate, almost sessile; calycine segments setaceous, nearly equal, length of the tube or longer; vexillum pilose and emarginate; style bearded at the apex; legumes oblong-lanceolate, compressed, pilose, deflexed. ☉. H. Native of Hungary and Austria. Sturm, fl. germ. 1. fasc. 31. with a figure. Flowers dirty white.

*Pannonian Vetch.* Fl. June, July. Clt. 1658. Pl. cl.

103 V. *STRIATA* (Bieb. fl. taur. 2. p. 162.) plant beset with hairs; leaves cirriferous; leaflets elliptic, oblong, acute, clothed with silky pili beneath; stipulas lanceolate, marked; vexillum clothed with silky pili; legumes pedunculate, 2 or 3-together, reflexed, clothed with silky pili. ☉. H. Native of Tauria. Visciolides hirsuta, Mœnch. meth. 137. V. *Pannonica β*, Willd. spec. 3. p. 1107. V. *purpurascens*, D. C. hort. monsp. 155. V. *Pannonica β*, *purpurascens*, Ser. in D. C. prod. 2. p. 364. Flowers violaceous and streaked, wings and keel paler.

*Var. β, linearifolia*; flowers purple; leaflets linear-oblong, mucronulate. V. *Pannonica γ*, *linearifolia*, Ser. l. c.

*Striated-flowered Vetch.* Fl. June, July. Clt.? Pl. cl.

104 V. *TRUNCATULA* (Fisch. cat. hort. gorenk. 1812. p. 72. ex Bieb. fl. taur. suppl. p. 473.) stems almost simple, striated, glabrous; leaflets elliptic, truncate, and mucronulate at the apex, puberulous, with numerous diverging nerves; tendrils almost obsolete; stipulas semi-sagittate, ovate, small, acuminate; peduncles almost sessile, few-flowered; calyx pilose, black, with nearly equal teeth, which are shorter than the tube; style bearded; legumes lanceolate. ☉. H. Native of Caucasus. Flowers cream-coloured. This plant is nearly allied to *V. sepium*, but with the leaves impari-pinnate, as in *V. Cassubica*.

*Var. β, glabriuscula* (Ser. in D. C. prod. 2. p. 364.) plant less pubescent, teeth of calyx short and rather spiculate. Native of Iberia.

*Truncate-leafletted Vetch.* Fl. June, Aug. Clt. 1818. Pl. 1 foot.

§ 7. *Annual plants, with broad leaflets, resembling the common bean.*

105 *V. NARBONENSIS* (Lin. spec. 1038.) stem tetragonal, striated, quadrifuriously pilose; leaves cirriferous; leaflets ovate, entire; stipulas semisagittately toothed, ciliated, lower ones entire; flowers 2-3-4-together, on short pedicels; calyx campanulate, with ovate, 3-nerved segments, having the sides reflexed above; style bearded at the apex; legumes oblong, compressed, obliquely reticulated, glabrous, with ciliate-serrated sutures; seeds nearly globose. ☉. H. Native of the south of Europe. Flowers dark purple. Knor. del. 2. t. 1. 1. Riv. tet. t. 40. This plant might be cultivated with advantage as tares. Leaflets 4.

*Narbonne Vetch.* Fl. June, July. Clt. 1596. Pl. cl.

106 *V. SERRATIFOLIA* (Jacq. fl. aust. append. t. 8.) stem tetragonal, striated, pilose; leaves cirriferous; leaflets ovate, serrated; peduncles short, 2-3-flowered; stipulas toothed; calyx campanulate, with ovate, 3-nerved segments, which are inflexed at the sides above; style bearded at the apex; legumes lanceolate, compressed, with ciliate-serrated sutures; seeds nearly globose. ☉. H. Native of Austria and Hungary. Sturm, fl. germ. 1. fasc. 32. with a figure. Flowers deep purple. *V. Narbonensis*, var. *a*, *serratifolia*, Ser. in D. C. prod. 2. p. 365. Very like *V. Narbonensis*, but differs in the serrated leaflets.

*Serrate-leafletted Vetch.* Fl. June, Aug. Clt. 1723. Pl. cl.

107 *V. PLATYCARPOS* (Roth. abandl. 10. t. 1.) leaflets ovate, toothed at the apex; stipulas ciliate toothed; style bearded at the apex; legumes almost sessile, solitary, compressed, a little inflated; seeds with scabrous margins. ☉. H. Native country unknown. Flowers deep purple. J. Bauh. hist. 2. p. 286. with a figure. Perhaps only a variety of *V. Narbonensis*. Leaflets 2 or 4.

*Broad-fruited Vetch.* Fl. June, Aug. Clt. 1723. Pl. cl.

108 *V. MONADELPHIA* (Roth, cat. bot. part 2. p. 97. ex Poir. dict. 8. p. 568.) leaves cirriferous; leaflets oval, repand-toothed; stipulas semi-lunate, laciniately-toothed, upper ones entire at the apex; peduncles 6-flowered; calycine segments unequal, 2 superior ones lanceolate, and rather falcate, lower one very long and linear, and ciliated at the apex; legumes terete. ♂. H. Native of America. Flowers deep purple.

*Monadelphous Vetch.* Fl. June, Aug. Clt. 1820. Pl. cl.

† The names of species mentioned in various garden catalogues, but not described. Most of them are probably synonymous with those described above.

1 *V. Baetica*, Fisch. 2 *V. Còris*, Thouin. 3 *V. ferruginea*, Bess. 4 *V. grácilis*, Russell. 5 *V. hirsuta*, Fisch. 6 *V. hirsutissima*, Cyrill. 7 *V. Musquinez*, Bosc. 8 *V. nodosa*, Fisch. 9 *V. Thouini*, Martius. 10 *V. torulosa*, Desf. 11 *V. Virginica*, Martius.

*Cult.* The species grow in any common soil. The perennial ones are increased by dividing the roots or by seeds. The seed of the annual kinds only require to be sown in the open border in spring. All those belonging to the first division of the genus are worth cultivating for the beauty of their blossoms.

CLXX. ERVUM (from *ern*, tilled land, in Celtic; some of the species are a pest in cultivated fields). Lin. gen. 874. D. C. fl. fr. 4. p. 598. prod. 2. p. 366.

LIN. SYST. *Diadélphia*, *Décándria*. Calyx 5-cleft, with linear acute segments, about equal in length to the corolla. Stigma glabrous. Legume oblong, 2-4-seeded.

SECT. I. LE'NS (the Latin name of the lentil, which is the Celtic name for the plant). Ser. mss. in D. C. prod. 2. p. 366. —Léns, Tourn. inst. t. 210. Légumes somewhat inflated, broad, oblong, 2-seeded.

1 *E. LE'NS* (Lin. spec. 1039.) stems branched; leaflets oblong, usually 8, nearly glabrous; stipulas lanceolate, ciliated; tendrils nearly simple; peduncles 2-3-flowered, about equal in length to the leaves; legumes broad, short, somewhat truncate, finely reticulated, glabrous, 2-seeded; seeds compressed. ☉. H. Native of Europe, in corn-fields. Sturm, fl. germ. 1. fasc. 32. with a figure. Riv. tetr. irr. t. 35. Léns esculenta, Mönch. meth. p. 131. *Cicer punctulatum*, Hortul. Flowers small, pale blue, with the vexillum veined. There are varieties of this plant with fulvous, bay-coloured, and black seeds, varying in size. The lentil is called *Les lentils* in French, *Lentzen* in German, and *Lentiggia* in Italian. It is a legume of great antiquity, being in esteem in Esau's time, and much prized in eastern countries ever since. In Egypt and Syria the seeds are parched in a frying-pan and sold in the shops, and considered by the natives as the best food for those who undertake long journeys. The lentil is considered a native of France, but has been known in England from the earliest agricultural records. In Gerarde's time they were sown like tares, their haulm given to cattle, and the grain to pigeons, and used in meagre soups.

There are three varieties of lentil cultivated in France and Germany; the small brown, which is highest flavoured, and the best for haricots and soups; the yellowish, which is the largest and the next best; and the *Lentil of Provence*, which is almost as large as a pea, with luxuriant straw, and more fit to be cultivated as a tare, than for the grains as human food. A dry warm sandy soil is requisite for the lentil; it is sown rather later than the pea, at the rate of a bushel or a bushel and a half per acre, in other respects its culture and harvesting are the same, and it ripens sooner. The lentil, Young observes, is a crop not uncommon about Chesterford, in Essex, where they sow a bushel an acre on one ploughing in the beginning or middle of March. It is there the custom to make hay of them, or seed them for cutting into chaff for trough-meat for sheep and horses, and they sow them on both heavy and dry soils. It is, however, added, that the whole county is of a calcareous nature. It is likewise stated, that attention should be paid not to water horses soon after eating this sort of food, as it is apt to hove them. They are likewise asserted to be cultivated for the same purposes in Oxfordshire, and probably in other districts. The produce of the lentil in grain is about one-fourth less than that of the tare, and in straw it is not a third as much, the plants seldom growing above 1 or 1½ foot in length. The straw is, however, very delicate and nourishing, and preferred for lambs and calves, and the grain on the Continent sells at nearly double the price of peas. Einhoff obtained from 3840 parts of lentils, 1260 parts of starch, and 1433 of matter analogous to animal matter.

The use of the lentil on the Continent is very general, and particularly by Roman Catholics in time of Lent, both in soups and dressed in butter sauce as haricot. They are imported from Hamburgh and sold in London for the same purposes.

*Lentil.* Fl. May, Aug. Clt. 1548. Pl. cl.

2 *E. NIGRICANS* (Bieb. fl. taur. 2. p. 164.) plant pubescent; leaflets oblong; stipulas semi-sagittate, denticulated at the base; tendrils nearly obsolete; peduncles usually 2-flowered, longer than the leaves; calycine segments rather diverging, subulate, longer than the corolla; tube of calyx very short; legumes black, glabrous, 2-seeded; seeds black. ☉. H. Native of the south of Tauria and of Lucania. *E. lentoides*, Tenor. prod. suppl. 2. p. 68. and cat. 1819. p. 56. Flowers pale blue.

*Black-podded Lentil.* Fl. June, July. Clt. 1817. Pl. cl. 1 ft.

3 *E. LENTICULA* (Schreb. herb. ex Sturm, fl. germ. 1. fasc. 32. with a figure) leaflets oblong-linear; stipulas small, lanceolate, acute; tendrils almost wanting; peduncles 1-flowered, longer than the leaves; calycine segments lanceolate-linear, equal, ciliated; legumes somewhat ovate, compressed, rather

truncate, puberulous, 2-seeded; seeds globose, dotted with black. ☉. H. Native of Carinthia, in fields. E. Soloniense, Wulf. in Schrank, pl. rar. t. 48. E. uniflorum, Tenore, prod. suppl. 2. p. 68. Sebast. pl. rom. fasc. 2. p. 13. t. 4. Cicer ervoides, Brig. pl. foro-juliens, 27. Flowers blue.

*Small Lentil.* Fl. June, July. Clt. 1820. Pl. 1 foot.

4 E. VICIOIDES (Desf. fl. atl. 2. p. 168. t. 198.) plant hairy; leaves cirriferous, with many leaflets; leaflets oval-oblong, obtuse, and mucronate; stipulas subulate; peduncles few-flowered; calyx very pilose, with the segments longer than the tube; legumes hairy, rhomboid, reticulated, 2-seeded; seeds roundish, black. ☉. H. Native of Algiers, in hedges. E. viciæforme, Spreng. syst. 3. p. 270. Corolla pale blue, twice the length of the calyx.

*Vetch-like Lentil.* Pl. cl.

5 E. HIRSETUM (Lin. spec. 1039.) leaves cirriferous; leaflets linear, retuse, mucronulate; stipulas semi-sagittate, narrow; peduncles 3-7-flowered, shorter than the leaves; calycine segments lanceolate-linear, equal, longer than the tube; legumes oblong, compressed, rather truncate, hairy, finely reticulated, nodding, 2-seeded; seeds globose, variegated. ☉. H. Native of Europe, in cultivated fields; plentiful in Britain; also of North America, at Fort Vancouver. Sturm, fl. germ. 1. fasc. 32. with a figure. Smith, engl. bot. 971. Curt. fl. lond. 54. Oed. fl. dan. 639. V. Michelli, Rafin. ex Ell. car. 2. p. 224. D. C. prod. 2. p. 360? Flowers small, pale blue, or almost white. This is a very troublesome weed in corn-fields; in wet seasons whole crops are overpowered by it. All sorts of cattle will eat it. In some parts of England it is known by the name of *Time-tare*.

*Hairy Lentil or Time-tare.* Fl. June, July. Brit. Pl. cl.

6 E. COCHINCHINENSIS (Pers. ench. 2. p. 309.) leaflets 3, nearly lanceolate, wrinkled, and pilose; peduncles many-flowered; legumes terete, acuminate, 2-seeded; seeds globose. ☉. H. Native of Cochinchina. E. hirsutum, Lour. cochin. p. 461. Flowers purplish.

*Cochin-china Lentil.* Pl. 2 feet.

7 E. TERRENNI (Tenore, fl. neap. prod. append. 5. 1826.) leaves cirriferous, with 8 pairs of linear-elliptic, truncate, rather mucronate, glabrous leaflets; peduncles awned, 4-8-flowered, much shorter than the leaves; calycine segments lanceolate-linear, equal, pubescent, and about the length of the corolla; legumes glabrous, ovate, truncate, inflated, reticulated; seeds bay-coloured. ☉. H. Native of Naples, in hedges. This plant differs from *E. dispernum* in being smooth, and in the peduncles being many-flowered.

*Terrone's Lentil.* Pl. cl.

8 E. DISPERNUM (Roxb. in Willd. enum. p. 766.) leaflets linear-lanceolate, pubescent; peduncles 2-flowered, awned; legumes glabrous, 2-seeded. ☉. H. Native of the East Indies. Peduncles and calyxes pubescent.

*Two-seeded Lentil.* Fl. June, July. Clt. 1802. Pl. cl.

9 E. CAMELORUM (Spreng. syst. 3. p. 270.) peduncles 1-flowered, nodding, awned; legumes 2-seeded, glabrous; leaves pubescent, upper ones cirriferous, with 6-8 pairs of leaflets, lower ones oblong, upper ones linear, mucronate. ☉. H. Native country unknown.

*Camel's Lentil.* Pl. cl.

SECT. II. ERVILIA (an alteration from the generic name). Ser. mss. in D. C. prod. 2. p. 366.—Ervilia, Link. enum. vol. 2. Legumes somewhat inflated, oblong-linear, 4-6-seeded.

10 E. ERVILIA (Lin. spec. 1040.) plant glabrous; leaves cirriferous; leaflets numerous, oblong, mucronulate; flowers usually twin, pedunculate; stipulas sub-lanceolate, toothed; calycine segments equal, very narrow, much longer than the tube;

legumes torulose, 4-seeded, glabrous, transversely and finely reticulated; seeds roundish, angular. ☉. H. Native of the south of Europe, in cultivated fields. Sturm, fl. germ. 1. fasc. 32. with a figure. Riv. tetr. irr. t. 6. Blackw. icon. t. 208. t. 3. Vicia Ervilia, Willd. spec. 3. p. 1103. Ervilia sativa, Link. enum. 2. p. 240. Flowers pale purple. The seeds of this plant ground into flour are sometimes used in medicines abroad, and the green herb is employed for feeding cattle in some countries, but the plant is not worth cultivating for that purpose in England.

*Ervil or Bastard Lentil.* Fl. June, July. Clt. 1596. Pl. cl.

11 E. MONANTHOS (Lin. spec. 1040.) stems tufted, simple; leaflets numerous, linear, truncate, and mucronulate; tendrils almost simple; stipulas unequal, one of which is linear-lanceolate, and entire; the other very narrow, and fringed; peduncles 1-flowered, about equal in length to the leaves; calycine segments linear, equal, longer than the tube; legumes oval, compressed, glabrous, with transverse reticulated veins, torulose, 3-4-seeded. ☉. H. Native of the south of Europe. Sturm, fl. germ. 1. fasc. 32. with a good figure. Vicia articulata, Willd. spec. 3. p. 1109. Lathyrus monanthos, Willd. enum. 760. but not of his spec. pl. Vicia multifida, Wallr. fl. hal. suppl. 3. p. 85. Flowers purple, with blue veins.

*One-flowered Lentil.* Fl. June, July. Clt. 1798. Pl. cl.

12 E. TETRASPERMUM (Lin. spec. 1039.) stems tufted, branched; leaves cirriferous; leaflets 4-6 pairs, oblong, bluntish, mucronulate; stipulas lanceolate, semi-sagittate; peduncles 1-4-flowered, but usually 2-flowered, filiform; calycine segments unequal, broadish, shorter than the tube; legumes oblong, compressed, glabrous, nerveless, rather torulose; seeds nearly globose, black. ☉. H. Native of Europe, in cultivated fields; also of North America, in Upper Canada, in grassy meadows. Sturm, fl. germ. 1. fasc. 32. with a good figure. Curt. lond. 1. t. 55. abr. 15. Smith, engl. bot. 1223. Oed. fl. dan. t. 95. Flowers very pale grey. The keel tipped with deep blue.

*Var. β, phyllocarpon* (Ser. mss. in D. C. prod. 2. p. 367.) leaflets numerous, transformed into legumes.

*Four-seeded Lentil.* Fl. June, July. Britain. Pl. cl.

13 E. GRACILE (D. C. cat. hort. monsp. 109. et fl. fr. 5. p. 581.) stems ascending, angular, with the angles pubescent above; tendrils simple; leaflets 6-8, linear-lanceolate, acuminate, rather pubescent; stipulas semi-sagittate, entire, narrow; peduncles 3-flowered; flowers secund, pendulous; calycine teeth unequal, 2-superior ones short, broad, and a little recurved, the lower 3 equal, awl-shaped, and acute; corolla one-half longer than the calyx; legumes pendulous, compressed, torulose, glabrous; seeds of a testaceous colour, nearly globose. ☉. H. Native of France and Spain, in corn-fields. Vicia gracilis, Lois. fl. gall. p. 460. f. 12. E. tenuifolium, Lagasc. nov. gen. p. 22. E. tenuissimum, Pers. ench. 2. p. 309. E. longifolium, Tenor. prod. p. 59. Vicia laxiflora, Brot. phyt. 123. E. tetraspermum β, gracile, Ser. Flowers white, having the vexillum streaked with purple or red.

*Slender Lentil.* Fl. June, July. Clt. 1822. Pl. cl. 1 foot.

14 E. PUBESCENS (D. C. cat. hort. monsp. p. 109. fl. fr. 5. p. 582.) stems tufted, branched; leaves cirriferous; tendrils forked; leaflets 4-6, elliptic, mucronulate; stipulas linear; peduncles 1-4-flowered, filiform; calycine segments unequal, broadish, shorter than the tube; legumes oblong, compressed, rather villous, nerveless, and a little torulose. ☉. H. Native of Provence, and about Naples. Flowers purplish?

*Var. β, leiocarpon* (Moricand, herb.) legumes glabrous; stems smaller. Native about Naples.

*Pubescent Lentil.* Fl. June, July. Clt. 1820. Pl. cl.

15 E. LOISELEURI (Bieb. fl. taur. suppl. p. 475. exclusive of the synonymic of Lois.) leaflets oblong-linear; lower stipulas semi-hastate, upper ones subulate; peduncles usually 2-flow-

ered, shorter than the leaves; teeth of calyx setaceous, longer than the tube; legumes glabrous, 4-seeded; seeds globose. ☉. H. Native of Tauria. This is perhaps nothing else but *E. tetraspermum*.

*Loisleur's Lentil*. Pl. cl.

16 *E. ARISTATUM* (Rafin. prec. p. 38. and in Desv. journ. bot. 1814. p. 270.) stems weak, angular; leaves with 3 pairs of linear acute leaflets; tendrils simple; peduncles axillary, very long, awned, and for the most part bearing 2 flowers each; legumes 2-6-seeded. ☉. H. Native of Sicily, on mount Etna, and near Messina.

*Annel-peduncled Lentil*. Pl. cl.

17 *E. DIPHYLLUM* (Besser in Balb. cat. hort. taur. 1813. append. 1. p. 11.) leaflets unknown; stipulas lanceolate; tendrils obsolete, having 2, rarely 4 leaflets; peduncles 1-flowered, longer than the leaves; legumes finely pubescent. ☉. H. Native country unknown. Besser. cat. hort. lyc. volh. suppl. mss. no. 24.

*Two-leaved Lentil*. Pl. cl.

18 *E. VARIVM* (Brot. fl. lus. 2. p. 152.) leaflets linear, acutish, pubescent beneath; peduncles 3-4-flowered; legumes glabrous; seeds 4-5, globose. ☉. H. Native of Portugal, about Coimbra. Flowers purplish?

*Variable Lentil*. Pl. cl.

*Cult.* None of the species of this genus are worth cultivating unless in botanical gardens. The seeds of them only require to be sown in the open border in spring.

CLXXI. PISUM (*pis* in Celtic means a pea, hence *pisum* in Latin). Tourn. inst. 394. t. 215. D. C. prod. 2. p. 368.—Pisum spec. of Lin.

LIN. SYST. *Diadelphia, Decandria*. Calyx with foliaceous segments, the 2 superior ones shortest. Vexillum ample, reflexed. Style compressed, carinated, villous above. Legume oblong, rather compressed, but not winged. Seeds globose, numerous, with a roundish hylum. Annual herbs, with abruptly-pinnate cirrhiferous leaves, having 3 pairs of leaflets, and large foliaceous stipulas.

1 *P. SATIVUM* (Lin. spec. 1026.) petioles terete, bearing 3 pairs of ovate, entire, glaucous leaflets, with undulated margins, usually opposite and mucronulate; stipulas ovate, somewhat cordate, crenated at the base; peduncles 2 or many-flowered; legumes rather fleshy. ☉. H. Native of the south of Europe, and now cultivated in fields and gardens throughout the world. Lam. ill. 633. Flowers white or red.

*Var. α, saccharatum* (Ser. mss. in D. C. prod. 2. p. 368.) stem tall; legumes rather coriaceous, between terete and compressed; seeds globose, distant. Lam. ill. 633. Tourn. inst. t. 215. Called in France *Petits-pois* and *Pois-sucres*, and in England *sugar-pea*.

*Var. β, macrocarpum* (Ser. l. c.) stems large; legumes large, falcate, very much compressed, not coriaceous, every part edible; seeds large, distant. Pisum sine cortice durior, C. Bauh. pin. 343. Called in France *Pois-goulus*, *Pois-sans-parchemin*, and *Pois-mange-tout*.

*Var. γ, umbellatum* (Lin. spec. 1027.) stipulas quadrifid, acute; peduncles many-flowered, terminal, somewhat umbellate. —Tabern. icon. t. 459. *P. umbellatum*, Mill. dict. no. 3. Seeds large, round, bay-coloured. Called in French *Pois-à-bouquet*, and *crown-pea* in English. Perhaps a proper species.

*Var. δ, quadratum* (Lin. spec. 1027.) seeds very dense, square. Pisum majus quadratum fructu ceneri coloris. C. Bauh. pin. 342. Called in French *Pois-carré*.

*Var. ε, humile* (Poir. dict. 5. p. 436.) stem weak, dwarf; legumes smaller, rather coriaceous; seeds approximate, roundish. *P. humile*, Mill. dict. no. 2. Called in French *Pois-nains*, and *dwarf-pea* in English.

The varieties of the *pea* are very numerous, but the following are the names of the principal sorts cultivated in gardens.

1 *Early Charlton*; an excellent early sort, nearly equal to the genuine frame.

2 *Nimble-tailor*; an excellent early kind.

3 *Early golden-Charlton*.

4 *Early Nichol's golden-Charlton*.

5 *Common-Charlton*.

6 *Early single-blossomed*.

7 *Reading Hotspur*; long pods.

8 *Dwarf marrowfat*; large long pods.

9 *Tall marrowfat*; large long pods.

10 *Green marrowfat* or *Calagonian*.

11 *Knight's wrinkled* or *marrow*; a white-blossomed, tall luxuriant grower; the seeds of excellent flavour, cream-coloured and shrivelled when ripe and dried.

12 *Spanish moratto*; rather large.

13 *Prussian blue*; a great bearer.

14 *Egg*; rather large.

15 *White rouncival*; large fine pods.

16 *Green rouncival*; large fine pods.

17 *Grey rouncival*; large fine pods.

18 *Tall sugar*; large crooked pods.

19 *Dwarf sugar*.

20 *Bishop's dwarf*; a very excellent early prolific kind.

21 *Crown* or *rose*; a tall strong grower, producing its blossoms and fruit in an umbel at the top of each peduncle.

22 *Leadman's dwarf*; a great bearer, but small in the pods; good for a late crop, or as required for succession.

23 *Spanish dwarf*; of low growth and small pods.

24 *Early dwarf-frame*; the best kind for forcing.

The *pea* has been cultivated in this country time immemorial. It was not, however, very common in Elizabeth's time, when, as Fuller informs us, peas were brought from Holland, and were "fit dainties for ladies, they came so far, and cost so dear." The use of the *pea* in cookery is familiar to every one. In one variety, called the *sugar-pea*, the inner tough film of the pods is wanting, and such pods when young are frequently boiled with the seeds or peas within them, and eaten in the manner of kidney-beans. This variety is comparatively new, having been introduced about the middle of the 17th century.

*Estimate of sorts.* The varieties, besides differing in the colour of the blossoms, height of stalks, and mode of growth, are found to have some material differences in hardness to stand the winter, time of coming in, and flavour of the seeds. The *Charltons* are not only very early, but great bearers, and excellent peas for the table, and are therefore equally well fitted for the early crop, and forward succession crops, and inferior to few even for the main summer crops. The *frame-pea* may, indeed, be raised without the assistance of heat for a forward crop, and if a genuine sort will fruit a few days sooner than the *Charltons*, but it grows low and bears scantily. The *Hotspur* is hardy and prolific, and makes returns nearly as quick as the *Charltons*, and about a fortnight before the *marrowfat*. *Bishop's dwarf-pea* is an early kind and a great bearer. The sorts already specified, therefore, embrace the best for sowings made from the end of October till the middle of January, and for late crops raised between the middle of June and the beginning of August.

The fine flavour of the *marrowfat* is well known. A few dwarf *marrowfats* may be sown in December and January, as mild weather may occur; but the time for sowing full crops of the larger kinds of *peas*, is from the beginning of February till the end of April. *Knight's-pea* and *Bishop's dwarf*, two of the hardiest varieties, are very prolific, and retain their fine sweet flavour when full grown. The *egg*, the *maratto*, the *Prussian blue*, and the *rouncivals*, the *large sugar*, and the *crown*, are

all very fine eating peas in a young growth, and like the *marrow-fat* may be sown freely according to the demand, from the third week of February to the close of April, and in smaller crops, until the middle of June. For late crops, in addition to the early sorts already mentioned, the *dwarf sugar*, *Leadman's dwarf*, *Bishop's dwarf*, and *Spanish dwarf* are very suitable. The *Leadman's* as well as *Bishop's dwarf*, are small, delicious peas, great bearers, and in high request at genteel tables, but as the fruit of *Leadman's dwarf* is long of coming in, it is not advisable to sow it after the third week in June; rather sow it in March, April, and May, and then it will be later than the *Charltons* raised five weeks afterwards. The *Charltons* and *Hotspurs* may be sown in May, for late full crops, in June for a smaller supply, and in July, along with the *frame*, for the last returns.

*Times of sowing.* Much that relates to this has been incidentally mentioned in the estimate of sorts. To try for a crop as early as possible, sow of the sort preferred as hardy and forward, a small portion on a sheltered south border, or other favourable situation, at the close of October, or rather in the course of November. Follow with another sowing in December, that if the former should be casually cut off in winter, this, coming up later, may have a better chance to stand; and if both survive the frost, they will succeed each other in fruit in May and June. For more considerable and less uncertain returns, either in succession to the above, or as first early and intermediate crops, sow larger portions in December or January, if open temperate weather. To provide for main crops, make successive sowings of the suitable sorts from February till the end of May. It frequently proves that the fruit from a sowing at the beginning of February is not a week later than that from a crop sown in November; nay, the February-sown crop sometimes surpasses all that have stood the winter, in forward returns as well as quantity. From the middle of February, make successive sowings every three weeks in the course of March, April, and May, or twice a month in summer, when a continued succession is to be provided till the latest period. At the close of the sowing season, July and the first week of August, sow a reduced quantity each time, because the returns will depend on a fine mild autumn following, and whatever fruit is obtained will be small and scanty.

*Quantity of seed.* Of the small early kinds, one pint will sow a row of 20 yards; for the larger sorts for main crops, the same measure will sow a row of 33 yards.

*Process of sowing.* For early sorts make the drills  $1\frac{1}{2}$  inch deep; and let parallel drills be  $2\frac{1}{2}$  or 3 or 4 feet asunder. Peas that are to grow without sticks require the least room. For summer crops and large sorts, make the drills 2 inches deep and 4, 5, or 6 feet asunder. As to the distances along the drill, distribute the peas according to their size and the season; the *frame* 3 in the space of an inch; the *Charltons*, *Hotspur*, and *dwarf marrowfat*, 2 in an inch; the *Prussian-blue* and the middle-sized sorts 3 to 2 inches; the large *marrowfats* and *Knight's* a full inch apart; the *marrowfat*, *rouncivals*, and most larger sorts  $1\frac{1}{2}$  inch apart; and the *Patagonian* 2 inches.

*Soil and situation.* The soil should be moderately rich, and deeper and stronger for the lofty growers. Peas are not assisted but hurt by unreduced dung, recently turned in. A fresh sandy loam or road-stuff, and a little decomposed vegetable matter, is the best manure. The soil for early crops should be very dry, and rendered so where the ground is moist, by mixing sand with the earth of the drills. For early crops, put in from October till the end of January, let the situation be sheltered, and the aspect sunny. Before the end of December, every one or two rows should stand close under a south or south-eastern fence. In January, several parallel rows may be extended, under a good aspect, further from the fence. After January till the end

of May, sow in an open situation. For the late crops, return again to a sheltered sunny border.

*Subsequent culture.* As the plants rise from half an inch high to 2 or 3 inches, begin to draw earth to the stems, doing this when the ground is in a dry state, and earthing gradually higher as the stems ascend. At the same time with the hoe loosen the ground between the young plants, and cut down rising weeds. Early crops should be protected during hard frosts by dry straw or other light litter, laid upon sticks or brushwood, but remove this covering as soon as the weather turns mild. If in April, May, and the course of summer, continued dry weather occurs, watering will be necessary, especially to plants in blossom and swelling the fruit, and this trouble will be repaid in the produce. Rows partly cut off may be made up by transplanting. This is best done in March. In dry weather water, and in hot days shade until the plants strike. All peas fruit better for sticking, and continue longer productive, especially the larger sorts. Stick the plants when from 6 to 12 inches high, as soon as they begin to vine. Provide branching sticks, of such a height as the sort will require; for the *Frame* and *Leadman's dwarf* 3 feet high; for the *Charltons* and middle-sized sorts 4 or 5 feet; for the *marrowfat* and larger kinds 6 or 8 feet; for the *rouncivals* and *Knight's marrow-pea* 9 or 10 feet. Place a row of sticks to each line of the plants on the sunny side, that the attraction of the sun may incline the plants towards the sticks. Place about half the number on the opposite side, and let both rows stand rather wider at top than at the ground. Some gardeners stop the leading shoots of the most early crop when in blossom, a device which accelerates the setting and maturing of the fruit.—*Abercrombie*.

*Rotation of crops of garden peas.*—In January sow on an early border or other warm situation, if the weather be open and the ground sufficiently dry. The *true-early-frame*, *nimble-tailor*, and *Charlton* are the best for this sowing. In February a full crop of *Charltons* may be sown about the beginning of the month, and of *marrowfats* and other larger sorts towards the end in the open quarters of a garden. It frequently happens that the fruit of a sowing made the beginning of this month is not a week later than that of a crop sown in November, and often surpasses all that have stood the winter, both in forward returns, as well as quantity. From the middle of this month make successive sowings every three weeks during the months of March and April, and twice in each of the months of June, July, and August, reducing the quantity each time from the end of June till the middle of August. In February sow peas of the early sorts in pots and flat boxes, and place them in a hot-house, and if for extensive crops sow on a light hot-bed. This has been practised by Mr. Bishop, an experienced gardener, and is the most rational plan of transplanting peas ever practised. In March sow peas as before directed, and transplant those that were sown in boxes or pots, or on hot-beds last month. In October, peas for the early crop next season may be sown, about the end of the month, in a warm south border, fully exposed to the sun. For this sowing the *early-frame*, *Charlton*, *nimble-tailor*, and *Hotspur* are the best sorts. If the ground is cold and wet, it is best to draw the mould up in ridges 2 feet high, both this and the three following months. In November and December sow the same kind of peas as are recommended for last month.

To forward an early crop, "sow or plant in lines from east to west, and stick a row of spruce-fir branches along the north side of every row, and sloping so as to bend over the plants, at 1 foot or 18 inches from the ground. As the plants advance in height, vary the position of the branches, so as they may always protect them from perpendicular colds or rain, and yet leave them open to the full influence of the winter and spring sun. Some cover during nights and in severe weather, with two

boards nailed together lengthwise at right angles, which form a very secure and easy-managed covering, but excludes light. A better plan would be to glaze one of the sides, to be kept to the south, and to manage such row-glasses, as they might be called, when over *peas*, *beans*, *spinach*, &c. as hand-glasses are managed when over *cauliflowers*, that is, to take them off in fine weather, or raise them constantly or occasionally, by brick-bats or other props, as the weather and the nature of the crop might require."

—*Loudon. ency. gard.* p. 691.

**Management of a late crop.** The best variety for this purpose is Knight's *marrow-pea*, which may be sown at intervals of 10 days from the beginning to the end of June. "The ground is dug over in the usual way, and the spaces to be occupied by the future rows of *peas* are well soaked with water. The mould upon each side is then collected so as to form ridges 7 or 8 inches above the previous level of the ground, and these ridges are well watered. The seeds are now sown in single rows along the tops of the ridges. The plants grow vigorously, owing to the depth of soil and abundant moisture. If dry weather at any time set in, water is supplied profusely once a week. In this way the plants continue green and vigorous, resisting mildew, and yielding fruit till subdued by the frost."—*Hort. trans.* vol. 2.

**Taking the crop.** "The early crops are generally gathered in very young growth, often too young, when the pods are thin and the *peas* small, for the sake of presenting some at table as soon as possible. In the main crops there is no cause for precipitation; take them as they become pretty plump, while the *peas* are yet green and tender. Leave none on to grow old, the young pods will then fill in greater perfection, and the plants will continue longer in bearing."

**To save seed.** "Either sow approved sorts in the spring, for plants to stand wholly for seed, to have the pods ripen in full perfection; or occasionally leave some rows of any main crop; let all the early pods ripen, and gather the later formed ones for the table, as the last gleanings of a crop seldom afford good full seed. For public supply extensive crops are commonly raised in fields. Let the seed attain full maturity, indicated by the pods turning brown and the *peas* hardening; then to be hooked up and prepared for threshing out, in due time cleansed and housed."—*Abercrombie*.

**Forcing *peas*.** "*Peas*," Nicol observes, "are often raised in forcing-houses, and are brought to perfection very early."

**For forcing *peas* in a pit,** sow as directed for French beans, *Phaseolus vulgaris*, in pots or boxes, and transplant when 1½ or 2 inches high into the pit in rows 15 inches asunder, and 3 inches from each other in the row.

**Temperature** may be progressive, beginning at 40° or 50° and rising to 52° or 66° from the origin of the plant to the state of flowering, and after flowering increase from 55° to 70°, or in a regular heat between the latter limits. For hot-beds the temperature may be 50°, or 55° for the nursery-bed, and 55° to 65° for fruiting.

**The best sort of *pea* to force,** is the genuine *early-frame*.

**Forcing *peas* in a peach or cherry-house.** For the earliest crop some of the true *early-frame* sort may be sown in October, in the borders of a cherry-house, peach-house, or vinery, intended to be forced from the beginning of the year. By the time the forcing commences they will be fit for transplanting, which is to be done in the same borders, either in a single row, or in more rows, according to the room. The distance between the rows may be 15 or 18 inches, and 2 inches in the line.

"In forcing *peas*," Nicol observes "they should always be transplanted. They become more prolific, and run less to straw by that management than when they are sown where they are to remain. Indeed, it would be worth while to trans-

plant the earliest crops in the open ground."—*Nicol, kal.* p. 29.

Beans may be forced in a similar manner, though this is seldom attempted.

**Field *peas*, their culture and uses.**

The *pea* is the most esteemed legume in field cultivation, both for its seed and haulm, and was cultivated by the Greeks and Romans, and in this country from time immemorial, though its culture appears to have diminished since the more general introduction of herbage plants and roots; and, excepting near large towns for gathering green, and in a few places for boiling, the *pea* has given way to the bean, or to a mixture of *peas* and beans. There are various inducements, however, to the cultivation of *peas* in dry warm soils near large towns. When the crop is good and gathered green, few pay better. The ground, after the *peas* have been removed, is readily prepared for turnips, which also pay well as a retail crop near towns, and the haulm is good fodder.

The varieties of *peas* cultivated in fields are numerous, but they may be divided into two classes, those grown for the ripened seed, and those grown for gathering in a green state. The culture of the latter is chiefly near large towns, and may be considered as in part belonging to horticulture rather than agriculture. The grey varieties are, the *early-grey*, the *late-grey*, the *purple-grey*, *Marlborough-grey*, and the *horn-grey*. The white varieties grown in fields are, the *pearl*, *early Charlton*, *golden Hotspur*, the *common white* or *Suffolk*, and other *Suffolk* varieties. New varieties are readily procured by selection or impregnation.

**In the choice of sorts,** where it is desired to grow grey *peas* for the sake of the seeds, the early variety is to be preferred in late situations, and the late variety in early ones; but when it is intended to grow them chiefly for covering the ground, and for haulm, then the late varieties claim the preference, and especially the *purple-grey*. Of white *peas* to be grown for gathering green, the *Charlton* is the earliest, and the *pearl* or *common Suffolk* the most prolific. When white *peas* are grown for boilers, that is, for splitting, the *pearl* and *Suffolk* are also the best sorts. It is supposed by some to be of considerable importance to the economy of a farm, when the nature of the soil is suitable, to have recourse to the early sorts, as by such means the crops may be in many cases cut, and secured while there is leisure, before the commencement of the wheat harvest. And where the nature of the soil is dry and warm, and the *pea* crop of a sufficiently forward kind, it may be easy to obtain a crop of turnips from the same land in the same year, as has already been suggested. But with this view it is the best practice to sow the crops in the row method, and keep them perfectly clean by means of attentive hand or horse-hoeing, as in that way the land will be in such a state of preparation for a crop of turnips, as only to require a slight ploughing, which may be done as soon as the *pea* crop is removed, and the turnip-seed drilled in as quickly as possible upon the newly turned up earth. In some particular districts a third crop is even put into the same land, the turnips being cleared off in the autumn, and replaced by cole-worts, for the purpose of greens in the following spring. This, according to Middleton, is the practice in some places in Middlesex. But it is obviously a method of cultivation that can only be attempted on the warm and fertile kinds of turnip soil, and where the *pea* crops are early; on the cold, heavy, and wet descriptions of land it is obviously impracticable, and wholly improper. *Loudon, encycl. agri.* p. 766.

The soil best suited for *peas* is a dry calcareous sand; it should be in good tilth, not too rich, nor dunged along with the crop. In Norfolk and Suffolk, *peas* are often sown after clover-leys, after one furrow, or after corn crops on two furrows, one given in autumn, and the other early in spring.

*The climate required by the pea is dry and not very warm, for which reason as the seasons in this country are very often moist, and sometimes exceedingly dry and hot in June and July, the pea is one of the most uncertain of field crops.*

*The season of sowing must differ considerably, according to the intention of the cultivator. When they are grown for podding early for sale green, they should be sown at different times from January to the end of March, beginning with the dryest and most reduced soils, and with this intention they are sown in the autumn in some southern counties. For the general crops, from February to April, as soon as the lands can be brought into proper order; the grey sorts being employed in the early sowings, and the white in the later. It is always best to sow early, in order to get the crop off in time for a crop of turnips to follow, being a profitable kind of husbandry which should never be neglected.*

*The quantity of seed must be different in different cases and circumstances, and according to the time and manner in which the crop is sown; but in general it may be from  $2\frac{1}{2}$  to 3 bushels, the early sowings having the largest proportion of seed.*

*The most common mode of sowing field peas is broad-cast, but the advantages of the row culture in the case of a crop so early committed to the soil must be obvious. The best farmers, therefore, always sow peas in drills, either after the plough, the seed being deposited in every second or third furrow, or if the land is in a pulverized state, by drawing drills with a machine, or by ribbing. In Norfolk and Suffolk peas are generally dibbled on the back of the furrow, sometimes one, and sometimes 2 rows on each, but this method has no particular advantage. In Kent, where immense quantities of peas are grown, both for gathering green, and for selling ripe to the seedsman, they are generally sown in rows, from 18 inches to 3 feet asunder according to the kind, and well cultivated between; 4 to 6 inches is a proper depth for peas to be sown, but they will vegetate if sown at 1 foot in depth.*

*The after culture given to field peas is that of hoeing, either by the hand-hoe or the horse-hoe. Where the hand culture prevails, it is the general custom to give two hoeings; the first when the plants are about 2 or 3 inches in height, and again just before the period of their flowering. At the last of these operations, the rows should be laid down, and the earth well placed up to them. In Kent it is the custom, where this sort of crop is much grown, when the distance of the rows is sufficiently great to prevent the vegetation of weeds, to forward the growth of the pea crops by occasional horse-hoeing and the use of the brake-harrow, the mould being laid up to the roots of the plants at the last operation, by fixing a piece of wood to the harrow. This should, however, only be laid up on one side, the peas being always placed up to that which is the most fully exposed to the sun.*

*In harvesting the pea considerable care is requisite, both on account of the seed and haulm. When pea crops become ripe they wither and turn brown in the haulm, and the pods begin to open. In this state they should be cut as soon as possible, in order to prevent loss from shedding. In early crops the haulm is generally laid up into loose open heaps, which when dry are removed and stacked. In the general crops they are generally put into small heaps, called wads, which are formed by setting small parcels against each other, in order that they may be more perfectly dried both in seed and stem; these wads or bundles should be turned as often as possible. When wet weather happens whilst the peas lie in wads, it occasions a considerable loss, many of them being shed in the field, and of those that remain a great part will be so considerably impaired, as to render the sample of little value. This inability of peas to resist a wet harvest, together with the great uncertainty throughout their growth, and the frequent inadequate return in proportion to the length of the haulm, has discouraged many farmers from sowing so large a*

portion of this pulse as of other grain, though in light lands which are in tolerable heart the profit in a good year is far from inconsiderable.

*In gathering green peas for the market, it is frequently a practice with the large cultivators of early green pea crops in the neighbourhood of London, to dispose of them by the acre to inferior persons, who procure the podders; but the smaller farmers, for the most part, provide this description of persons themselves. It is sometimes the custom to pick the crops over twice, after which the rest are suffered to stand till they become ripe, for the purpose of seed; but being the worst part of the crop are very improper for seed. This sort of crop affords the most profit in those pea seasons which are inclined to be cool, as under such circumstances the peas are most retarded in their ripening, and of course the markets kept from being over abundantly supplied, but in some warm dry seasons when their ripening is hastened they scarcely repay the expenses.*

*The threshing of peas requires less labour than that of any other crop. Where the haulm is wished to be preserved entire it is best done by hand, as the threshing machine is apt to reduce it to chaff. But where the fodder of peas is to be given immediately to horses on the spot, the breaking it is of no disadvantage.*

*The produce of the pea in ripened seed is supposed by some to be from  $3\frac{1}{2}$  to 4 quarters an acre; others, however, as Donaldson, imagine the average of any two following crops not to be more than about 12 bushels, and therefore may be considered as a less profitable crop than most others. But as a means of ameliorating, and improving the soil at the same time, it is esteemed as of great value. With respect to the produce of green peas in the husk, the average of the early crops in Middlesex is supposed to be from about 25 to 30 sacks the acre, which selling at from 8 to 10 shillings per sack, affords 18l. the acre. The author of the "Synopsis of Husbandry," however, states the produce about Dartford in Kent at about 40 sacks per acre, though he says 50 sacks have been gathered from that space of land.*

*The produce of peas in straw is very uncertain, depending so much on the sort and the season, in general it is more bulky than that of grasses, but may be compressed into less room.*

*The produce of peas in flour is as 3 to 2 of the bulk of grain, and husked and split for soups as 4 to 2. A thousand parts of pea-flour afforded Sir H. Davy 574 parts of nutritive matter, viz. 501 of mucilage, 22 of sugar, 25 of gluten, and 16 of extract or matter rendered insoluble during the operation.*

*The use of peas for soups, puddings, and other culinary purposes is well known. In some places porridge, brose, and bread are made of pea-flour, and reckoned very wholesome and substantial. In Stirlingshire it is customary to give pease or bean biscuits to horses while in the yoke as a refreshment. The portion of peas that is not consumed as human food is mostly appropriated to the purposes of fattening hogs and other sorts of domestic animals, and in particular instances they are given to laboring horses in place of beans, but care should be taken when used in this way that they be sufficiently dry, as they are otherwise apt to occasion bowel complaints in those animals. For feeding swine the pea is much better adapted than the bean, it having been demonstrated by experience that hogs fatten more kindly when fed with this grain than on beans; and what is not easy to be accounted for, the flesh of swine which have been fed on peas, it is said, will swell on boiling, and be well tasted, whilst the flesh of the bean-fed hog will shrink on boiling, the fat will boil out, and the meat be less delicate in taste.*

*Peas straw cut green and dried is reckoned as nourishing as hay, and is considered as excellent for sheep.*

*In the sowing of any particular sorts for seed, they should be carefully looked over while in flower, in order to draw out all*

such plants as are not of the right sort, which if left to mix will degenerate the kind. As many rows as may be thought sufficient to furnish the desired quantity of seed should be marked out, and left till their pods turn brown and begin to split, when they should immediately be gathered up with the haulm; they may then be either stacked or threshed out as soon as they are dry; but care should be taken not to let them remain too long abroad after they are ripe, as wet would rot them, and heat after a shower of rain making their pods burst in such a manner, that the greater part of their seeds would be lost.

The diseases of peas are few, and chiefly the worm in the pod, and the fly on the leaves and flowers. They are also liable to be mildewed or blighted. None of these evils, however, are very common, and there is no known method of preventing them but by judicious culture.

*Cultivated or Common Pea.* Fl. June, Sept. Pl. cl.

2 P. ELA'TIUS (Bieb. fl. taur. 2. p. 151.) stems erect; petioles terete, bearing 6 lanceolate-oblong leaflets; stipulas rounded and crenated below; peduncles 2-flowered, longer than the leaves. 2. ? H. Native of Iberia. Internodes naked, striated. Stipulas nearly like those of *P. sativum*, but the leaflets are more oblong. Peduncles very long, erect. Flowers pale red, with the lamina of the wings dark purple. Legume unknown.

*Taller Pea.* Fl. June, Sept. Clt. 1820. Pl. cl.

3 P. ARV'ENSE (Lin. spec. 1027.) petioles terete? bearing 2-3 pairs of ovate, roundish, crenulated, mucronulate leaflets; stipulas ovate, semi-cordate, denticulated; peduncles usually 1-flowered, very short. ☉. H. Native country unknown. *P. sativum arvense*, Poir. dict. 5. p. 456.—Moris. hist. 2. p. 47. sect. 2. t. 1. f. 4. Bram. icon. chin. t. 15. Called in French *Bisaille* and *Pois de Pigeon*. In English *field-pea* or *grey-pea*. Flowers red, the vexillum darkest. Seeds grey. For the culture and uses of *Pisum arvense*, see *field-peas*, and their culture under *Pisum sativum*, of which all the grey varieties belong to this species.

*Field Pea.* Fl. June, Sept. Pl. cl.

4 P. MARITIMUM (Lin. spec. 1027.) stem angular; petioles flattish above; leaflets 5-8, elliptical, mucronate, smooth, alternate; stipulas triangular, semi-sagittate, toothed towards the base; peduncles many-flowered, length of leaves; legumes oblong, small, obliquely-reticulated; seeds small, 6-8, approximate, roundish, rather bitter. 2. H. Native of France, Denmark, and other parts of Europe, and Kamtschatka. In Britain on the stony sea beach; on the pebbly beach between Aldburgh and Orford, Suffolk; also near Hastings, Sussex; on the west side of Dungeness near Lyd, in Kent; on the sharp ridge running from Portland island to Bridport. Oed. fl. dan. 338. Smith, spicel. t. 9. engl. bot. t. 1046.—Moris. hist. 2. p. 47. sect. 2. t. 1. f. 5. Flowers large, purple, variegated with crimson veins. The seeds are very bitter. We learn from the epistles of Caius that the *sea-pea* was first observed in the year 1555, when in a great scarcity the poor people on the coast of Suffolk, about Orford and Aldburgh, supported themselves with it for some time. This legend is retailed by Stow and Camden, with the addition, that they supposed it to spring up opportunely in that year of dearth, from a ship-wrecked vessel loaded with peas, whereas the *sea-pea* is a very different species from all other peas. The legend of the miraculous arrival of these peas in a time of scarcity is still believed among the country people. Cattle are very fond of the herb.

*Var. β, glabrum* (Ser. in D. C. prod. 2. p. 368.) leaves glabrous. Native of Canada.

*Sea Pea.* Fl. July. Britain. Pl. trailing.

5 P. AMERICANUM (Mill. dict. no. 5.) stem angular, procumbent; leaves with one pair of leaflets; lower leaflets lanceolate, acutely-toothed, upper ones sagittate. 2. H. Native of South

America, at Cape Horn. Peduncles 4-5-flowered. Flowers blue. Legumes tapering, near 3 inches long. Seed about the size of those of tares. Miller calls this the Cape Horn pea, from its having been brought by Lord Anson's cook when he passed that Cape, where this pea was a great relief to the sailors, but it is not so good for eating as the worst sort cultivated in England.

*American Pea.* Fl. June, Sept. Clt. 1800. Pl. proc.

6 P. JOMARDI (Schrank, in flora, p. 309.) plant quite smooth and glaucous; stem angular; petioles terete; stipulas toothed at the base, as well as the leaflets, which are ovate. ☉. H. Native of Egypt. Flowers white.

*Jomard's Pea.* Fl. July, Aug. Clt. 1820. Pl. cl.

7 P. FULVUM (Smith, fl. grac. t. 688.) petioles terete; stipulas rounded below, and acutely-toothed; peduncles 2-flowered; legumes short. ☉. H. Native of Asia Minor. Flowers of a beautiful fulvous colour, marked with deep or almost scarlet veins. Legume semi-elliptic, an inch long. Leaflets 2 or 4.

*Fulvous-flowered Pea.* Pl. cl.

8 P. THEBAICUM (Willd. enum. suppl. p. 51. ex Link. enum. 2. p. 236.) peduncles shorter than the leaves. ☉. ? H. Native of Upper Egypt.

*Thebes Pea.* Fl. July, Aug. Clt. 1825. Pl. cl.

*Cult.* The seeds of all kinds of peas only require to be sown in the open ground in spring for common purposes, and the plants staked to support them.

CLXXII. LATHYRUS (from λαθύρος of Theophrastus, which is said to be from λα, *la*, augmentative, and θύρος, *thouros*, any thing exciting; in reference to the qualities of the seeds). Lin. gen. no. 1186. D. C. prod. 2. p. 369.—Lathyrus, Clymenum, and Alphaca, Tourn. inst. p. 394. 396. t. 216, 217, 218, 219, and 220. Cicerella, Mænoch. meth. 163.

LIN. SYST. *Diadelphia, Decandria*. Calyx campanulate, 5-cleft, the 2 superior lobes shortest. Corolla papilionaceous. Stamens diadelphous. Style complanate, dilated at the apex, villous or pubescent in front. Legumes oblong, many-seeded, 2-valved, 1-celled. Seeds globose or angular.—Usually climbing herbs, with semi-sagittate stipulas, and having the petioles terminating in branched tendrils, and furnished with 1 to 3 pairs of leaflets. Peduncles axillary.

SECT. I. EULATHYRUS (from *eu*, well, and *lathyrus*; genuine species). Ser. mss. in D. C. prod. 2. p. 369. Vexillum toothless at the base. Leaflets opposite or wanting from abortion. Petioles furnished with a narrow wing.

§ 1. *Perennial plants, with many-flowered peduncles.*

\* *Leaves with only one pair of leaflets.*

1 L. TOMENTOSUS (Lam. dict. 2. p. 709.) plant clothed with rufescent tomentum; stems tetragonal, striated; leaves with one pair of linear-lanceolate leaflets; stipulas semi-sagittate, much shorter than the leaves; peduncles many-flowered, approximate, longer than the leaves; calycine teeth nearly equal, lanceolate, acute, length of the tube; legumes linear, clothed with silky tomentum; style very long, twisted at the base, linear-spatulate. 2. G. Native of Buenos Ayres. Flowers large, purple?

*Tomentose Lathyrus.* Pl. cl.

2 L. SERICEUS (Lam. dict. 2. p. 708.) plant clothed with silky rufescent down; stems tufted, simple; leaves with one pair of linear leaflets; stipulas narrow, semi-sagittate, length of leaflets; tendrils very short; peduncles many-flowered. 2. G. Native of Monte Video.

*Silky Lathyrus.* Pl. cl.

3 L. SYLVESTRIS (Lin. spec. 1033.) plant quite glabrous; stems winged; leaves with one pair of lanceolate, attenuated, coriaceous leaflets; stipulas very narrow, semi-sagittate, shorter

than the leaves; peduncles 3-8-flowered, length of leaves; legumes compressed, reticulated lengthwise; seeds roundish, covered with wart-like dots. *♀*. H. Native of Europe, in woods and hedges. In England in moist hedges and groves in chalky counties, but rare in Scotland. Corolla red, variegated with pale crimson, violet, and tints of green; the wings violet. Smith, engl. bot. 805. Curt. lond. 6. t. 52. Root creeping.

*Var. a, ensifolius* (Ser. mss. in D. C. prod. 2. p. 369.) leaflets very narrow, and very much elongated. *L. ensifolius*, Bidaro in diar. phys. chem. papiens. an. 1821.

*Var. β, oblongus* (Ser. l. c.) leaflets shorter, elliptic-oblong. Oed. fl. dan. 325.

*Wood Lathyrus* or *Narrow-leaved Everlasting-pea*. Fl. July, Sept. Britain. Pl. cl.

4 *L. PUBESCENS* (Hook. in Beech. voy. p. 21.) plant clothed with soft pubescence above; stems winged; leaves cirrhiferous, having one pair of oblong-lanceolate leaflets, which are twice the length of the petiole; stipulas ovate, semi-sagittate, nearly one-half shorter than the petioles; peduncles many-flowered, longer than the leaves; calyx tubular, pubescent, with lanceolate teeth. *♀*. H. Native of Chili, about Concepcion and Valparaiso. This species has many points in common with *L. sylvestris*.

*Pubescent Everlasting-pea*. Pl. cl.

5 *L. INTERMEDIUS* (Wallr. sched. crit. p. 386.) plant quite glabrous; stems winged; leaves with one pair of oblong-lanceolate, self-coloured, mucronulate leaflets, which are obtuse at both ends; stipulas linear; peduncles many-flowered. *♀*. H. Native of Germany. Flowers rose-coloured, larger than those of *L. sylvestris*, as well as the legumes. *L. sylvestris*, Muhl. fl. dan. 785. Perhaps only a variety of *L. sylvestris*.

*Intermediate Everlasting-pea*. Fl. Ju. Sept. Clt. 1820. Pl. cl.

6 *L. MAGELLANICUS* (Lam. dict. 2. p. 708.) plant glabrous and blackish; stems a little branched, tetragonal, but not winged; leaves with one pair of ovate or ovate-oblong leaflets; stipulas broad, cordately-sagittate, broader than the leaves; tendrils trifid; peduncles long, 3-4-flowered; legumes unknown. *♀*. H. Native of the Straits of Magellan. Flowers bluish purple.

*Magellan Everlasting-pea*. Fl. Ju. Sept. Clt. 1744. Pl. cl.

7 *L. HOOKERI*; plant glabrous, blackish; stems angular, hardly winged; leaves with one pair of linear-lanceolate leaflets; petioles furnished with a short tendril each; stipulas semi-sagittate, ovate, much shorter than the leaflets; peduncles twice the length of the leaves, usually 5-flowered; calyx campanulate, nerved, with nearly equal teeth. *♀*. H. Native of Chili, about Concepcion. *L. sessilifolius*, Hook. in Beech. voy. 1. p. 20. but not of Tenore. Closely allied to *L. pratensis* and *L. sylvestris*. From *L. Magellanicus* it seems to differ principally in the shape of the leaflets.

*Hooker's Everlasting-pea*. Pl. cl.

8 *L. LATIFOLIUS* (Lin. spec. 1083.) plant quite glabrous; stems winged; leaves with one pair of elliptic, rather glaucous, 3-5-nerved, obtuse, and mucronate leaflets; stipulas broad, ovate, semi-sagittate; peduncles many-flowered, longer than the leaves; legumes long, compressed, reticulated lengthwise. *♀*. H. Native of Europe, in woods. In England, in Madingly, and other woods near Cambridge; on the rock by Red Neese, near Whitehaven, Cumberland; in Severn Stoke Copse, Worcestershire; and at Hawnes and Bromham, Bedfordshire. Smith, engl. bot. 1108. Mart. fl. rust. t. 8. Garid. prov. t. 108. Mill. fig. 52. Oed. fl. dan. 708. exclusive of the synonymes. Flowers large, rose-coloured. This is a shewy plant for shrubberies, arbours, wilderness quarters, and trellis-work. Bees resort much to it, and the flowers afford them abundance of honey.

*Var. β, monstruosus* (D. C. mem. legum. 1. t. 2.) calyx of 5 sepals; sepals linear; petals and stamens abortive; legumes foliaceous; seeds abortive.

*Broad-leaved Everlasting-pea*. Fl. Ju. July. Britain. Pl. cl. 9 *L. PEDUNCULARIS* (Poir. suppl. 2. p. 775.) stems thick, cylindrical, striated, winged, branched; leaves with one pair of oval, nerved, mucronate leaflets; stipulas semi-sagittate, lanceolate, setaceous at the apex; peduncles stiff, many-flowered, striated, very long; bracteoles setaceous. *♀*. H. Native country unknown. Flowers pale rose-coloured.

*Peduncled Everlasting-pea*. Pl. cl.

10 *L. NERVOSUS* (Lam. dict. 2. p. 708.) plant quite smooth; stems almost simple, striated; leaves with 1 pair of ovate, acute, nerved leaflets, which are longer than the internodes; petioles very short; tendrils trifid; stipulas sagittate, nerved; peduncles many-flowered; legumes long, linear, glabrous. *♀*. G. Native of Monte Video. Flowers purple.

*Nerved-leaved Everlasting-pea*. Pl. cl.

11 *L. ROTUNDIFOLIUS* (Willd. spec. 3. p. 1088.) plant quite glabrous; stems winged, branched; leaves with 1 pair of ovate-roundish, 3-5-nerved leaflets; stipulas semi-sagittate, a little toothed; peduncles many-flowered, longer than the leaves; calycine teeth broad and short; legumes compressed, reticulated lengthwise, dotted; seeds globose, obscurely dotted. *♀*. H. Native of Tauria. Bieb. fl. taur. 2. p. 156. cent. pl. rar. ross. 1. t. 22. Flowers rose-coloured, very shewy, like those of *L. latifolius*.

*Var. β, ellipticus* (Ser. mss. in D. C. prod. 2. p. 370.) stem with broader wings; stipulas larger; leaflets elliptic; corolla vermilion-coloured. *♀*. H. Native in woods, on Mount Beschtau. Bieb. fl. taur. suppl. 466.

*Round-leafletted Everlasting-pea*. Fl. May, July. Clt. 1822. Pl. cl.

12 *L. PRATENSIS* (Lin. spec. 1033.) plant smoothish; stems tetragonal; leaves with 1 pair of oblong-linear or lanceolate, 3-nerved leaflets; tendrils usually simple; stipulas sagittate, ovate, shorter than the leaflets; peduncles many-flowered, twice the length of the leaves; calyx nerved, with nearly equal teeth, which are about the length of the tube; legumes compressed, obliquely reticulated; seeds globose, smooth. *♀*. H. Native of Europe, in humid meadows. In England, in meadows, pastures, and thickets, very common. Curt. lond. fasc. 3. t. 44. Smith, engl. bot. 670. Mart. fl. rust. 52. Oed. fl. dan. 527. Flowers yellow. The plant is called in England *Tare everlasting*, *Meadow vetchling*, or *Common yellow vetchling*. In old authors it is much reprobated as a vile weed, that spreads much by means of its creeping roots. Many later writers, however, recommend it as an excellent food for cattle, and not without reason, since its quality is good and it bears a large burden of succulent leafy stalks. Among its patrons we may reckon Linnaeus, Haller, Schreber, Curtis, and Young.

*Var. β, velutinus* (D. C. fl. fr. 5. p. 575.) stem and leaves velvety; legumes rather pilose. Native of arid places.

*Meadow Lathyrus*. Fl. June, Aug. Brit. Pl. cl. 1 to 2 ft.

13 *L. TUBEROSUS* (Lin. spec. 1033.) stems tetragonal; leaves with 1 pair of oblong-elliptic, rather mucronulate leaflets; stipulas semi-sagittate, narrow, acute, about equal in length to the petioles; peduncles 3-6-flowered, 2 or 3-times the length of the leaves; calyxes veinless, with almost equal, broad teeth, which are about equal in length to the tube; style arched; legumes compressed, reticulated lengthwise; seeds roundish, smooth. *♀*. H. Native of Europe, on the margins of fields. Curt. bot. mag. 111. *L. arvensis*, Riv. tetr. 42. *L. attenuatus*, Viv. fragm. t. 19. ex Poir. suppl. 2. p. 776. ?—Lob. icon. 2. p. 70. f. 2.—Moris. hist. sect. 2. t. 2. f. 1. Root creeping, putting out irregular, brown tubers. Flowers large, rose-coloured. The plant is cultivated in Holland for its roots, which are eaten there. Gerarde calls it *Peas-earth-nut*.

*Tuberous-rooted Everlasting-pea*. Fl. Ju. Jul. Clt. 1596. Pl. cl.

14 *L. sessilifolius* (Tenore, fl. neap. prod. append. 5. 1826.) root tuberous and fibrous; stems ascending, simple; leaves with 1 pair of leaflets, without a petiole; leaflets lanceolate-linear, mucronate; peduncles usually 3-flowered, longer than the leaves; calyx about equal in length to the tube of the corolla; the segments lanceolate and equal; legumes flat, many-seeded.  $\mathcal{U}$ . II. Native of Naples, in Lucania, in hedges. *L. attenuatus*, Tenore, prod. but not of Viv. Plant glabrous. Corolla blue, with the wings longer than the keel. Style flat, dilated in front, and rather villous. It differs from *L. tuberosus*, in the leaflets being sessile and linear-lanceolate.

*Sessile-leafletted Lathyrus*. Pl. ascending.

15 *L. roseus* (Stev. in mem. soc. mosc. 4. p. 51. and Bieb. fl. taur. suppl. p. 466.) plant quite smooth; stem slender, not winged; leaves with 1 pair? of ovate-roundish leaflets; tendrils very short; stipulas small, subulate; peduncles filiform, longer than the leaves; calycine teeth acute, superior ones shortest.  $\mathcal{U}$ . II. Native of Iberia. Flowers beautiful rose-coloured, rather smaller than those of *L. tuberosus*.

*Rose-coloured-flowered Everlasting-pea*. Fl. Ju. Aug. Clt. 1822. Pl. cl.

16 *L. grandiflorus* (Sims, bot. mag. 1938.) hairy; stems tetragonal, winged; leaves with 1 pair of large, ovate, obtuse, waved leaflets; stipulas small, semi-sagittate, lanceolate; peduncles 2-3-flowered, longer than the leaves; teeth of calyx acute, longer than the tube; legumes long, linear, puberulous.  $\mathcal{U}$ . H. Native of the south of Europe, in hedges and among bushes. In Sicily, about Palermo and on Mount Etna. *Pisum biflorum*, Rafin. car. di piant. p. 71. Perhaps *L. grandiflorus*, Smith, fl. græc. t. 698. Flowers very large, rose-coloured, with an emarginate vexillum.

*Great-flowered Everlasting-pea*. Fl. June, Aug. Clt. 1814. Pl. cl.

17 *L. pusillus* (Ell sketch. car. geogr. 2. p. 223.) tendrils simple; leaflets 2, linear-lanceolate; stipulas falcate; peduncles 1-flowered, elongated. Native of Carolina, at Cooper's River.

*Small Lathyrus*. Pl. cl.

\* \* *Leaves with 2-3-4 or more pairs of leaflets.*

18 *L. pisiformis* (Lin. spec. 1034. but not of Houtt.) plant smoothish; leaves with 3-4 pairs of oval leaflets; stipulas unequally cordate, hastate, with the angles acute, equal in length to the leaflets; peduncles many-flowered, rather shorter than the leaves; the 2 upper segments of the calyx short; legumes linear-oblong, compressed, rather falcate, acute at the apex on the upper suture.  $\mathcal{U}$ . H. Native of Europe, Siberia, and throughout North America, in the plains. *L. maritimus*, Begel. fl. hort. ed. 2. p. 262. *L. Californicus*, Dougl. in bot. reg. 1144. *L. venosus*, Sweet, fl. gard. 2. ser. t. 37. but not of Willd. Begel. fl. hort. ed. 1. p. 167. but not of ed. 2. *Pisum maritimum*, Rich. in Frankl. 1. jour. ed. 2. append. p. 28. Gmel. fl. sib. 4. p. 7. t. 1. *Astragalus Chinensis*, Buch. cent. 10. dec. 2. t. 5. Flowers purple. We have followed Dr. Hooker, in his recent publication, in adding the numerous synonyms, but we have some reason to believe that he is perfectly wrong with regard to some of the species.

*Pea-formed Lathyrus*. Fl. June, July. Clt. 1795. Pl. cl.

19 *L. Californicus* (Dougl. in bot. reg. 1144.) stems tetragonal, glabrous; leaves glaucous, with 4-5 pairs of ovate-oblong, glabrous, mucronulate leaflets; tendrils 3-parted; stipulas semi-sagittate, about the size of the leaflets; peduncles many-flowered, about equal in length to the leaves; root creeping.  $\mathcal{U}$ . H. Native of North California and the north-west coast of America. Flowers purple, elegantly veined, twice the size of those of *V. pisiformis* or *V. mutabilis*. Legumes oblong, rather falcate, inflated.

*Californian Lathyrus*. Fl. July, Sept. Clt. 1826. Pl. cl.

20 *L. mutabilis* (Sweet, fl. gard. 194.) stems flexuous, winged; wings ciliate pubescent; leaves with 3-4 pairs of ovate, obtuse, glaucescent leaflets; stipulas semi-sagittate, ovate, acute, angularly toothed at the base; peduncles many-flowered, shorter than the leaves; calycine segments ovate-lanceolate, ciliated, unequal, length of tube; legumes convex, narrow, dotted, pubescent.  $\mathcal{U}$ . H. Native of Siberia. Flowers changeable in colour, at first purplish pink, striped with numerous dark purple branching lines, but at length changing to a brownish green. Very like *L. pisiformis*.

*Changeable-flowered Lathyrus*. Fl. June, Aug. Clt. 1825. Pl. cl.

21 *L. ochroleucus* (Hook. in fl. bor. amer. p. 159.) plant quite glabrous; leaves with 3-4 pairs of broad, oval, or ovate leaflets; stipulas toothed, broad, semi-cordate, rather hastate, hardly smaller than the leaves, with the angles sometimes acute, and sometimes obtuse; peduncles many-flowered, about equal in length to the leaves; the 2 upper calycine segments short; legumes in an immature state, linear-elongated, acuminate, compressed, quite smooth.  $\mathcal{U}$ . H. Native of North America, Hudson's Bay, and from the Red River, in lat. 49° through the whole woody country to Bear Lake, in lat. 66°. *L. pisiformis*, Richards. in Frankl. 1st jour. edit. 2d append. p. 28. Flowers cream-coloured.

*Cream-coloured-flowered Lathyrus*. Pl. cl.

22 *L. decaphyllus* (Pursh, fl. amer. sept. 2. p. 471.) plant glabrous or pubescent; leaves with 4-6 pairs of elliptic, rarely ovate or oblong leaflets; stipulas small, semi-sagittate, lanceolate, with the lobe deflexed and about equal in length to the stipulas; peduncles many-flowered, about equal in length to the leaves; calyx pubescent, with the superior teeth very short.  $\mathcal{U}$ . H. Native of North America, on the banks of the Saskatchewan, abundant in bushy places in north-west America. Hook. bot. mag. 3123. Flowers purple.

*Ten-leafletted Lathyrus*. Fl. June. Clt. 1827. Pl. cl.

23 *L. speciosus*; plant glabrous; leaves with 4 pairs of broad, elliptic, mucronate leaflets; stipulas as large as the leaflets; tendrils simple; peduncles many-flowered, longer than the leaves; segments of the calyx ovate-lanceolate, upper ones broadest and shortest, all mucronate.  $\mathcal{U}$ . H. Native of Mexico. Flowers purplish-blue. (v. s. herb. Lamb.)

*Sherry Lathyrus*. Pl. cl.

24 *L. japonicus* (Willd. spec. 3. p. 1092.) stems acute-angular; leaves with 4 pairs of elliptic, acute leaflets; stipulas sagittate, stem-clasping, breadth of the leaflets, but shorter; peduncles many-flowered.  $\mathcal{U}$ . H. Native of Japan. *L. pisiformis*, Houtt. fl. syst. 8. t. 63. f. 1. but not of Lin. Flowers purple, or rose-coloured.

*Japan Lathyrus*. Pl. cl.

25 *L. venosus* (Muhl. in Willd. spec. 3. p. 1092.) stems tetragonal, not winged; leaves with many pairs of ovate, obtuse, nearly opposite, mucronulate, glabrous leaflets; tendrils trifid; stipulas semi-sagittate, ovate; peduncles many-flowered, shorter than the leaves.  $\mathcal{U}$ . H. Native of Pennsylvania, and common throughout the great chain of lakes in Upper Canada; plentiful on the Red River and the river Winnipeg. *Oxypogon elegans*, Rafin. in jour. phys. aug. 1819. p. 98, but the legume is said to be falciform and the ovary stipitate. Said to be like *L. pisiformis*, but the stipulas are much smaller, and the leaflets are broader, ovate, and the corolla is larger. Flowers purple, veined.

*Viney Lathyrus*. Pl. cl.

26 *L. stipulaceus* (Leconte, in cat. pl. new york, p. 92.) plant quite smooth; stems acutely tetragonal, hardly winged; leaves with 3 pairs of elliptic, mucronate leaflets; stipulas ovate, semi-sagittate, acuminate, large; peduncles 4-6-flowered, rather

longer than the leaves; legumes, when immature, linear, acuminate, compressed, glabrous.  $\mathcal{U}$ . II. Native of North America, in meadows about New York, also of Upper Canada and about Lake Huron. Flowers large, purple.

*Large-stipuled Lathyrus*. Fl. July, Aug. Clt. 1816. Pl. cl.

27 *L. MYRTIFOLIUS* (Muhl. gen. amer. 3. p. 1091.) stem weak, flexuous, tetragonal, not winged; leaves with 2-3 pairs of oblong-lanceolate, bluntish, stiffish, glabrous, mucronate leaflets, which are striated with veins; tendrils trifid; stipulas semi-sagittate, lanceolate, acuminate, with scabrous margins; peduncles 3-4-flowered, longer than the leaves.  $\mathcal{U}$ . II. Native of North America, in Pennsylvania and the state of New York, and on the banks of the Niagara to Queenstown. This species has the habit of *L. palustris*, but differs in the calycine teeth being broad at the base, with the upper ones short. Flowers red.

*Myrtle-leaved Lathyrus*. Fl. July, Aug. Clt. 1822. Pl. cl.

28 *L. POLYMORPHUS* (Nutt. gen. amer. 2. p. 97.) stem tetragonal, not winged; leaves with many pairs of oblong or somewhat linear, obtuse, mucronate leaflets; stipulas semi-sagittate, lanceolate; peduncles many-flowered, longer than the leaves.  $\mathcal{U}$ . II. Native on the grassy plains of the Missouri. *Vicia stipulacea*, Pursh, fl. amer. sept. p. 471. Allied to *L. palustris*. Flowers purple, streaked with deeper veins.

*Polymorphous Lathyrus*. Fl. June, July. Clt. 1824. Pl. cl.

29 *L. MACRÆI* (Hook. in Beech. voy. p. 21.) plant rather pilose; stems angular; leaves with 6 pairs of elliptic, retuse, feather-nerved leaflets, which are reticulate veined, white beneath, also full of pellucid dots; stipulas small, semi-sagittate, entire; peduncles many-flowered, longer than the leaves; lower segments of calyx very long and subulate, upper ones very short; style linear, pilose at the apex on all sides, but more conspicuous on the upper side.  $\mathcal{U}$ . II. Native of Chili, about Valparaiso and Concepcion.

*Mac Rae's Lathyrus*. Pl. cl.

30 *L. PALUSTRIS* (Lin. spec. 1034.) plant quite glabrous; stems winged, erectish; leaves with 2-3 pairs of oblong, mucronulate leaflets; petioles subulate; tendrils bifid or trifid; stipulas semi-sagittate, acute, small; peduncles 3-5-flowered, hardly longer than the leaves; calycine segments unequal, nearly linear, length of tube; legumes compressed.  $\mathcal{U}$ . II. Native of the north of Europe, in meadows and marshes; plentiful in Britain. Smith, engl. bot. t. 169. Oed. fl. dan. t. 399. Mart. fl. rust. t. 8. Garid. prov. t. 108. *L. Narbonensis*, Riv. tetr. t. 40. Flowers variegated with blue and purple.

*Var.  $\beta$ , linearifolius* (Ser. mss. in D. C. prod. 2. p. 371.) leaflets and stipulas very narrow. Native of Denmark and Switzerland.

*Var.  $\gamma$ , subcristatus* (Ser. mss. in D. C. prod. 2. p. 371.) leaves with 2 pairs of linear-oblong leaflets; stipulas small, scabrous. *L. palustris*, Nestl. ex herb. D. C.

*Marsh Lathyrus*. Fl. July, Aug. Britain. Pl. cl.

31 *L. HETEROPHYLLUS* (Lin. spec. 1034.) stem erect, rigid, winged; leaves with 1 or 2 pairs of lanceolate, mucronulate leaflets; petioles winged at the base; tendrils branched; stipulas lanceolate, semi-sagittate; peduncles 6-8-flowered; legumes compressed, glabrous.  $\mathcal{U}$ . II. Native of Europe, at the bottom of mountains.—J. Bauh. hist. 2. p. 304. f. 1. Flowers large, with the standard and wings flesh-coloured and the keel whitish. By the leaves, the wings of the stem, and the size of the flowers, it appears to be intermediate between *L. latifolius* and *L. sylvestris*.

*Various-leaved Lathyrus*. Fl. July, Sept. Clt. 1731. Pl. cl.

32 *L. VICIÆFORMIS* (Wallr. schred. crit. p. 388.) stems simple, and are as well as the petioles winged; leaves with 6 pairs of linear-lanceolate, acuminate, mucronate leaflets; stipulas semi-

sagittate, lanceolate; peduncles many-flowered, longer than the leaves.  $\mathcal{U}$ . II. Native of Germany, in bushy places. Flowers violaceous, about the size of those of *O'robis vërnis*.

*Fetch-formed Lathyrus*. Pl. cl.

§ 2. *Annual plants, having the peduncles bearing from 1-3 flowers.*

\* *Petioles leafless.*

33 *L. A'PHACA* (Lin. spec. 1029.) stems erect; tendrils cylindrical, filiform, leafless (rarely with 2 leaflets); stipulas ovate, sagittate, large; peduncles 1-flowered (rarely 2-flowered), articulated at the apex, furnished with a pair of small, narrow bracteas; calycine segments twice the length of the tube; legumes much compressed, broad, few-seeded; seeds compressed.  $\odot$ . H. Native of Europe, in cultivated fields. In Britain, on the borders of sandy or gravelly fields, but rare; in Cambridgeshire and Oxfordshire; about Tottenham and Enfield; in a gravel-pit between Norwich and Brooke; and near Fornect, Norfolk. Smith, engl. bot. 1167. Curt. fl. lond. 5. t. 51.—Mill. fig. t. 43. Flowers small, yellow, with a paler keel. A smooth, glaucous herb.

*Yellow-vetchling*. Fl. June, July. Brit. Pl. cl. 1 foot.

34 *L. NISSOLIA* (Lin. spec. 1029.) stem erect; petioles dilated, foliaceous, grass-like, 3-5-nerved; stipulas small, subulate, usually wanting; flowers solitary, on long peduncles; peduncles articulated at the apex, and downy on the upper part, where they bear 2 little awl-shaped bracteas; legumes compressed, narrow, nerved, reflexed.  $\odot$ . II. Native of Europe, in corn-fields. In Britain, in bushy places and grassy borders of fields. Smith, engl. bot. 112.—Magn. hort. t. 112. Curt. lond. fasc. 6. t. 51. Buxb. cent. 3. p. 84. t. 45. f. 1.—Moris. hist. sect. 2. t. 3. f. 7. Flowers beautiful crimson, variegated with purple and white. The plant, when young, very much resembles a grass.

*Nissol's Lathyrus* or *Crimson Grass-vetch*. Fl. May, June. Britain. Pl.  $\frac{1}{2}$  to 1 foot.

\* \* *Leaves with 1 pair of leaflets.*

35 *L. SUBULATUS* (Lam. dict. 2. p. 707.) plant pilose; stems tufted, filiform, tetragonal; leaves on short petioles; tendrils very short; leaflets linear, acute; stipulas linear, semi-sagittate, nearly the length of the leaflets; peduncles 1-3-flowered; calycine segments narrow, acute, nearly equal, length of tube.  $\odot$ . H. Native of Monte Video. Flowers purple, like those of *L. tomentosus*, but much smaller.

*Subulate-leafletted Lathyrus*. Pl. 1 foot.

36 *L. INCONSPICUUS* (Lin. spec. 1030.) stems obsoletely triquetrous; leaflets lanceolate, striated beneath, acuminate; stipulas semi-sagittate, lanceolate; tendrils on the lower leaves almost wanting, on the upper ones filiform and elongated; peduncles very short, 1-flowered.  $\odot$ . H. Native of the Levant. Jacq. hort. vind. 1. t. 86. Corolla small, red, very little longer than the calyx. Legumes glabrous, straight, about the length of the leaflets, but broader.

*Var.  $\beta$ , oblongus* (Ser. mss. in D. C. prod. 2. p. 372.) leaflets broad, elliptic; legumes finely reticulated, puberulous.  $\odot$ . H.

*Inconspicuous-flowered Lathyrus*. Fl. June, Aug. Clt. 1739. Pl.  $\frac{1}{2}$  to 1 foot.

37 *L. SPIÆRICUS* (Retz. obs. 3. p. 39.) plant smoothish; stems erect, tetragonal, subulate at the apex; leaflets ensiform, mucronate, nerved; stipulas semi-sagittate, linear, length of peduncles and petioles; peduncles 1-flowered, thickish; calycine teeth narrow, longer than the tube; legumes somewhat torulose, nerved lengthwise; the nerves numerous and thick; seeds spherical.  $\odot$ . H. Native of the south of Europe, in cultivated fields. D. C. icon. rar. f. p. 10. t. 32. *L. coccineus*, All. pedem. no. 1222. *L. axillaris*, Lam. dict. 2. p. 706.

Flowers beautiful crimson, about the size of those of *L. Nissolia*.

*Var. β, pilosus* (D. C. prod. 2. p. 372.) stems hairy; leaflets ciliated. ☉. H. Native of Tauria. *L. angulatus*, Stev. in litt.

*Round-seeded Lathyrus*. Fl. June, July. Clt. 1801. Pl. 1 ft.

38 *L. MICRANTHUS* (Gerard. in Lois. not. 106.) stems tetragonal; tendrils simple, very short; leaflets linear-lanceolate; peduncles very short, 1-flowered?; stipulas?; calycine segments about equal in length to the corolla; legumes almost sessile, straight, spreading, cylindrical, rather villous. ☉. H. Native of Provence, in corn-fields. Flowers purplish. Perhaps only a variety of *L. inconspicuus*.

*Small-flowered Lathyrus*. Fl. Ju. Jul. Clt. 1816. Pl.  $\frac{1}{2}$  to 1 ft.

39 *L. ANGULATUS* (Lin. spec. 1031.) plant glabrous; stems erect, tetragonal; leaflets linear, acuminate; tendrils trifid; stipulas semi-sagittate, linear, acute, hardly longer than the petiole; peduncles filiform, 1-flowered, hardly equal in length to the leaves, somewhat cirriferous; bracteas ovate, very short; calycine teeth acute, length of tube; legumes narrow, compressed, veinless; seeds angular. ☉. H. Native of the south of Europe, in cultivated fields.—Buxb. cent. 3. p. 23. t. 42. f. 2. Flowers small, red, or purple.

*Angular-seeded Lathyrus*. Fl. June, July. Clt. 1683. Pl.  $\frac{1}{2}$  to 1 foot.

40 *L. LONGIPEDUNCULATUS* (Ledeb. hort. dorp. suppl. 1824. p. 5.) leaflets linear; tendrils trifid; peduncles 1-flowered, awned, exceeding the leaves; legumes cylindrical, nerveless; seeds angular. ☉. H. Native country unknown. Perhaps *A. angulatus*, Roth. cat. 3. p. 68. Flowers red.

*Long-peduncled Lathyrus*. Fl. Ju. Jul. Clt. 1817. Pl. 1 ft.

41 *L. LEPTOPHYLLUS* (Bieb. fl. taur. 2. p. 155. suppl. p. 465.) stems erect; leaflets linear-lanceolate; tendrils branched; stipulas narrow, subulate, semi-sagittate; peduncles short, 1-flowered; calycine teeth lanceolate; legumes lanceolate, glabrous; seeds globose, tubercled. ☉. H. Native of eastern Caucasus. Flowers purple but with the keel white.

*Slender-leaved Lathyrus*. Fl. June, Jul. Clt. 1818. Pl. 1 ft.

42 *L. SETIFOLIUS* (Lin. spec. 1031.) plant glabrous; stems erect, tetragonal; leaflets linear, very narrow; stipulas very narrow, semi-sagittate, length of petiole; tendrils trifid; peduncles 1-flowered, filiform, shorter than the leaves, jointed at the apex, furnished each with a small bractea; calycine teeth acute, length of tube; tendrils trifid; legumes ovate-oblong, short, reticulated; seeds globose, warted, purple. ☉. H. Native of the south of Europe; Italy, and France. *L. prostratus*, Brign. pl. foro-juliens. 1. p. 28. ?—J. Bauh. hist. 2. p. 308. with a figure. Flowers small, rose-coloured, or scarlet.

*Bristle-leaved Lathyrus*. Fl. Ju. Jul. Clt. 1739. Pl.  $\frac{1}{2}$  to 1 ft.

43 *L. AMPHICARPOS* (Lin. spec. 1029.) stems winged, diffuse; leaflets lanceolate; tendrils simple; stipulas semi-sagittate, 1-toothed, longer than the petioles; peduncles 1-flowered, longer than the leaves; cauline as well as subterraneous legumes ovate, 2-winged in front, and a little compressed on the sides, 2-seeded. ☉. H. Native of Syria. Brot. fl. lus. 162. t. 66. Sweet, fl. gard. 236.—Moris. hist. 2. p. 61. sect. 2. t. 25. f. 1. Flowers pink, tinged with blue. In this singular plant there are underground stems, which are whitish, and bear flowers and legumes absolutely perfect, and resembling those on the stems above-ground, except that the flowers are smaller and do not expand.

*Both-sides-fruited Lathyrus*, or Underground or Earth-pea. Fl. June, July. Clt. 1680. Pl.  $\frac{1}{2}$  to 1 foot.

44 *L. SATIVUS* (Lin. spec. 1030.) plant smoothish; stems winged; leaflets linear-oblong; tendrils trifid; stipulas semi-sagittate, ovate, ciliated, hardly the length of the petioles; peduncles 1-flowered, longer than the petioles, bracteolate and articulated at the apex; calycine segments lanceolate, foliaceous,

almost 3-times the length of the tube; legumes ovate, broad, short, irregularly reticulated, winged on the back; seeds trigonal, smooth, rather truncate. ☉. H. Native of Spain, France, and Italy. Jacq. fil. ecl. 116. Curt. bot. mag. t. 115. —Riv. tetr. irr. t. 47. *Cicercula alata*, Mönch. meth. p. 163. Flowers white.

*Var. β, angustatus* (Ser. mss. in D. C. prod. 2. p. 373.) leaflets and stipulas linear, and very narrow.

*Var. γ, coloratus* (Ser. mss. l. c.) corolla white, having the vexillum violaceous on the under side in front, and with deeper veins, and with the wings having each a large blue spot. ☉. H. Native of Teneriffe. *L. sativus β*, Hoffm. verz. fl. 1824. p. 235.

The seeds of *L. sativus* are commonly sown in Switzerland for soiling horses, under the name of *Gesse*. In several parts of the continent a white, light, pleasant bread is made from the flour of the pulse, but it produced such dreadful effects in the seventeenth century, that the use of it was forbidden by an edict of George, duke of Wirtemberg, in 1671, and was enforced by two other edicts under his successor Leopold, in 1705 and 1714. Mixed with wheat-flour in half the quantity makes a very good bread, and appears to be harmless. But bread made with this flour exclusively has brought on a most surprising rigidity of the limbs in those who have used it for a continuance, inasmuch that the exterior muscles could not by any means be reduced, or have their natural action restored. These symptoms usually appeared on a sudden without any previous pain. The disease was regarded as incurable, and being neither very painful nor fatal, those who were seized with it usually submitted to it with patience. "Swine fattened with this meal lost the use of their limbs, but grew very fat lying on the ground. A horse fed some months on the dried herb was said to have his legs perfectly rigid. Kine are reported to grow lean on it, but sheep not to be affected. Pigeons, especially young ones, lose the power of walking by feeding on the seeds. Poultry will not readily touch it, but geese eat it without any apparent damage. In some parts of Switzerland cattle feed on the herb without any apparent harm." Duvernoy Fabbioni, of Florence, says, that the government there had cautioned the peasants against the use of *Lathyrus sativus*, in 1786, swine having lost the use of their limbs, and become pitiable monsters, by being fed on this pulse exclusively. The peasants, however, eat it boiled or mixed with wheat flour, in the quantity of one-fourth, without any harm.

*Cultivated Lathyrus* or Chickling-vetch. Fl. June, July. Clt. 1640. Pl. cl.

45 *L. CICERA* (Lin. spec. 1030.) plant smoothish; stems diffuse, winged; leaflets linear-oblong; tendrils trifid or quadrifid; stipulas semi-sagittate, lanceolate, a little toothed, ciliated, length of the petiole; peduncles 1-flowered, longer than the stipulas; bracteoles small; calycine segments lanceolate, foliaceous, nearly 3 times the length of the tube; legumes oblong, irregularly-reticulated, channelled on the back, not winged; seeds trigonal, somewhat truncate, bay-coloured, smooth. ☉. H. Native of Spain. Jacq. fil. eclog. t. 115. *L. sativus β*, Lam. dict. 2. p. 705. *Cicercula anceps*, Mönch. meth. 163. Flowers purple or red, rather variable.

*Cicer-like* or Flat-podded Lathyrus or Dwarf Chickling-vetch. Fl. June, July. Clt. 1633. Pl. cl. 1 to 2 feet.

46 *L. ANSERUS* (Lin. spec. 1032.) plant glabrous; stems diffuse, winged; leaflets linear, elongated; tendrils trifid; stipulas semi-sagittate, very narrow, much shorter than the petioles; peduncles 1-2-flowered, length of the leaves; bracteoles small; calycine segments lanceolate, hardly longer than the tube; legumes oblong-linear, densely-reticulated, not winged; seeds roundish. ☉. H. Native of Spain.—Buxb. cent. 3. t. 42. f. 1. —Riv. tetr. irr. t. 42. Flowers small, yellow.

*Annual Lathyrus*. Fl. June, July. Clt. 1621. Pl. cl.

47 *L. hirsutus* (Lin. spec. 1032.) stems winged; leaflets linear-lanceolate, 3-nerved; stipulas semi-sagittate, linear, about equal in length to the petiole; peduncles usually 2-flowered, hardly longer than the leaves; calyx hairy; segments ovate, acuminate, length of the tube; legumes oblong, hairy; seeds globose, warted. ☉. H. Native of the south of Europe, in corn-fields. In Britain, but rare, in various places, at Rochford Hundred, Essex; at Southend, Essex; between Bath and Bristol. Sims, bot. mag. 1255. Smith, engl. bot. 1255. J. Bauh. hist. 2. p. 305. with a figure.—Riv. tetr. irr. t. 41. Corolla with a bright crimson standard, pale blue wings, and whitish keel.

*Hairy Lathyrus.* Fl. June, July. Britain. Pl. cl.

48 *L. nictus* (Lam. dict. 2. p. 706.) stems tetragonal, not winged; leaflets oblong or obovate; stipulas semi-sagittate, linear, about equal in length to the petioles, or sometimes shorter; peduncles 1-flowered, hardly longer than the leaves; calycine segments ovate, length of the tube; legumes oblong-obovate, hairy; seeds globose, warted with dots. ☉. H. Native country unknown. Flowers purplish. Perhaps a variety of *L. hirsutus*, with short pods, and 1-flowered peduncles. Habit of *L. tuberosus*.

*Hairy-podded Lathyrus.* Fl. Ju. Aug. Clt. 1800. Pl. cl.

49 *L. odoratus* (Lin. spec. 1032.) plant hairy; stems winged; leaflets ovate, mucronulate; stipulas semi-sagittate, lanceolate, much shorter than the petioles; peduncles 2-3-flowered, much longer than the leaves; calycine teeth broad, longer than the tube; legumes oblong-linear, compressed, hairy; seeds roundish. ☉. H. Native of Sicily. Flowers sweet-scented.

*Var. α, purpureus*; vexillum purple. Native of Sicily. Curt. bot. mag. t. 60.

*Var. β, roseus*; vexillum rose-coloured. Native of Ceylon. New Painted Lady Sweet-pea.

*Var. γ, albus*; flowers white. White Sweet-pea.

*Var. δ, pictus*; wings and keel white; vexillum flesh-coloured. Old Painted Lady-pea.

*Var. ε, caeruleus*; wings and keel pale blue; vexillum dark purple.

*Var. ι, violaceus*; wings and keel pale violet; wings deep violet; vexillum dark purple.

*Sweet-peas* are a great ornament to flower-borders in autumn. The seeds only require to be sown in drills or in clumps in April. Gardeners who raise *Sweet-peas* for the London markets, sow them in the autumn in pots, and secure them from severe weather by placing them in hot-bed frames, by which means they can bring them early to market. They may be continued in flower the whole summer by repeated sowings in the spring. When sown in pots they require to be frequently refreshed with water.

*Sweet-pea* or Sweet-scented Lathyrus. Fl. July. Aug. Clt. 1700. Pl. cl.

50 *L. tingitanus* (Lin. spec. 1032.) plant quite smooth; stems winged; leaflets ovate, obtuse, mucronulate; stipulas ovate, semi-sagittate, much shorter than the petioles; peduncles 2-flowered, longer than the leaves; calycine teeth nearly equal, shorter than the tube; legumes oblong-linear, much reticulated, compressed, tomentose, with the sutures thick; seeds hardly angular, variegated with black and brown. ☉. H. Native of the north of Africa, at Tangiers. Curt. bot. mag. t. 100. Jacq. hort. vind. t. 46. Flowers with a large purple vexillum, and with the wings and keel bright red. This species of *Lathyrus* is usually sown in gardens with other annuals, but the flowers have not the agreeable scent or variety of colours of the sweet-pea.

*Tangier Pea.* Fl. June, July. Clt. 1680. Pl. cl.

51 *L. brutius* (Tenore, ex Spreng. syst. append.) leaflets 2, elliptic-oblong; stipulas semi-sagittate, setaceous; stem angular, smooth; legumes glabrous. ☉. H. Native of Calabria.

*Brutian Lathyrus.* Pl. cl.

\* \* \* *Leaves with 2 or 3 pairs of leaflets.*

52 *L. clymenoides* (D. C. prod. 2. p. 374.) plant smoothish; stems winged; leaves with 2 pairs of linear-lanceolate mucronate leaflets; stipulas semi-sagittate, lanceolate, much shorter than the petioles; peduncles 1-flowered, filiform, shorter than the leaves; calycine segments lanceolate, twice the length of the tube; legumes lanceolate. ☉. H. Native of the Mauritius. Flowers purple.

*Clymenum-like Lathyrus.* Pl. cl.

53 *L. cirrhosus* (Ser. mss. in D. C. prod. 2. p. 374.) plant quite smooth; stems tetragonal, winged; petioles winged, bearing 5 or 6 leaflets; tendrils much branched; leaflets alternate, elliptic, mucronulate, reticulately veined; stipulas semi-sagittate, linear, acute; peduncles many-flowered, longer than the leaves; calycine segments unequal, narrow, shorter than the tube; legumes oblong, finely reticulated; style arched. ☉. H. Native of the Pyrenees, about Olette.

*Tendrilled Lathyrus.* Pl. cl.

54 *L. turgidus* (Lam. dict. 2. p. 706.) plant pilose; stems tetragonal; lower leaves with one pair of ovate-oblong mucronate leaflets, upper ones with 2 pairs of linear-lanceolate leaflets; stipulas semi-sagittate, toothed; peduncles short or elongated, 1-2-flowered; calycine segments linear, length of tube or longer; style bearded; legumes oblong, compressed, villous, reticulated, turgid; seeds roundish. ☉. H. Native of the Levant, and the south of France. *L. tumidus*, Willd. spec. 3. p. 1082. Flowers with a purple vexillum, and white wings.

*Turgid-podded Lathyrus.* Fl. June, Jul. Clt. 1817. Pl. cl.

55 *L. purpureus* (Presl. del. prag. p. 39. Guss. pl. rar. 297.) leaves with 2 pairs of linear leaflets; stipulas semi-sagittate; peduncles 1-flowered, bracteate, articulated beyond the middle, longer than the stipulas; legumes lanceolate. ☉. H. Native of Calabria, in corn-fields. Flowers purplish.

*Purple-flowered Lathyrus.* Fl. May. Pl. cl.

56 *L. ciliatus* (Guss. pl. rar. p. 296.) leaves with 2, rarely with 3, pairs of leaflets; leaflets cuneiform-obovate, retuse, mucronate, ciliated, superior ones linear, elongated, acute; petioles ending in a bristle; peduncles 1-flowered, articulated beyond the middle, shorter than the petioles; legumes linear, compressed, 4-5-seeded; seeds small, globose, smooth. ☉. H. Native of Calabria, on hills. Corolla small, with a greenish vexillum marked with purple veins; the keel and wings greenish-yellow.

*Ciliated-leaved Lathyrus.* Fl. May. Pl. dec. or cl.

SECT. II. *CLYMENUM* (the Latin name for *Water Betony*, or from *κλυμενος*, *clymenos*, clear). D. C. prod. 2. p. 375. Vexillum furnished with a conical gibbosity on each side at the base. Lower petioles leafless, upper ones bearing 2-6, usually alternate leaflets. Petioles usually winged.

57 *L. diffusus*; plant glabrous; stems furrowed; leaves with numerous alternate leaflets, which are lanceolate or elliptic-lanceolate, retuse, and mucronate; stipulas small, semi-sagittate, bidentate on one side; racemes shorter than the leaves; flowers secund; calycine segments short and broad, lower one elongated; calyx pubescent. ☉. H. Native of North America, on the Missouri. *Orobis diffusus*, Nutt. in Fraser. cat. Flowers large, bluish-purple.

*Diffuse Lathyrus.* Pl. cl.

58 *L. incurvus* (Roth. abh. 13. t. 4.) stems tetragonal, subulate; leaflets elliptic-lanceolate, mucronulate, glabrous, rugged from dots; stipulas semi-sagittate; peduncles many-flowered, longer than the leaves; calycine teeth unequal, much shorter

than the tube; legumes curved.  $\gamma$ . H. Native of Siberia. Willd. spec. 3. p. 1091.—Buxb. cent. 4. p. 27. t. 46. This plant is said to have the habit of and flowers of *Orob. tuberosus*. Two of the angles of the stem are more winged than the other two, but all ciliated.

*Incurved-podded Lathyrus*. Fl. Ju. Jul. Clt. 1808. Pl. cl.

59 *L. ALATUS* (Tenore, prod. 42. but not of Smith,) stems tetragonal, winged; leaflets 6-8, oblong-lanceolate, mucronulate, alternate; petioles winged; stipulas lanceolate, unequal, somewhat sagittate; peduncles 2-3-flowered, longer than the leaves; calycine teeth unequal, shorter than the tube; legumes compressed, flat, many-seeded.  $\odot$ . H. Native of Italy. Flowers large, purple. This plant comes very near *L. Clymenum*.

*Winged-stemmed Lathyrus*. Fl. Ju. Aug. Clt. 1823. Pl. cl.

60 *L. CLYMENUM* (Lin. spec. 1032.) stem tetragonal, winged; lower petioles dilated, leafless, linear-lanceolate, upper ones bearing 5-6 linear leaflets; stipulas semi-sagittate, linear; peduncles 1-6-flowered, about equal in length to the leaves; calycine teeth unequal, longer than the tube; legumes oblong, compressed, finely reticulated, with the seminiferous suture tumid; seeds compressed, variegated.  $\odot$ . H. Native of the south of Europe. *Clymenum uncinatum*, Mœnch. meth. 150. Flowers blue. There is also a variety having the vexillum red and the wings blue.

*Clear Vetchling*. Fl. June, July. Clt. 1713. Pl. cl.

61 *L. ARTICULATUS* (Lin. spec. 1031.) stem tetragonal, winged; lower petioles leafless, linear, acuminate, upper ones bearing 5-6 linear leaflets; stipulas lanceolate, semi-sagittate; peduncles 1-3-flowered, about equal in length to the leaves; calycine teeth nearly equal, shorter than the tube; legumes rather turgid, finely reticulated and nodose at the seeds, having the seminiferous suture tumid; seeds compressed, dark purple, rather velvety.  $\odot$ . H. Native of the south of Europe. Gärtn. fruct. 2. p. 331. t. 152. f. 2: Curt. bot. mag. 253. Tourn. inst. t. 218. Mill. fig. t. 96. *Clymenum bicolor*, Mœnch. meth. 150.—Riv. tetr. irr. t. 48. Corolla with a bright red standard, and white wings and keel.

*Articulated-podded Lathyrus*. Fl. Ju. Jul. Clt. 1640. Pl. cl.

62 *L. AURICULATUS* (Bert. pl. rar. dec. 2. p. 38.) stem tetragonal, winged; lower petioles leafless, broadly auricled; upper ones with 5-6 linear leaflets; stipulas lanceolate, semi-sagittate; peduncles few-flowered; calycine teeth unequal; legumes torulose, thickened at the seminiferous suture; seeds velvety.  $\odot$ . H. Native of Italy. *L. articulatus*  $\beta$ , *auriculatus*, Ser. in D. C. prod. 2. p. 375. Flowers purple, but at length becoming blue.

*Auriculate-petioled Lathyrus*. Fl. Ju. Jul. Clt. 1800. Pl. cl.

63 *L. SPURIUS* (Willd. enum. 760.) stems winged; petioles broadly winged, bearing about 4 leaflets, terminating in a branched tendril; stipulas lanceolate; peduncles 1-flowered; legumes compressed.  $\odot$ . H. Native country unknown. Perhaps only a variety of *L. articulatus*. Flowers purplish-blue.

*Spurious Lathyrus*. Fl. June, July. Clt. 1815. Pl. cl.

64 *L. TENUIFOLIUS* (Desf. fl. atl. 2. p. 160.) stem simple, tetragonal, winged; lower petioles leafless, linear, acuminate, upper ones bearing 4 or 6 linear leaflets; lower stipulas small or wanting, upper ones large, semi-sagittate; peduncles usually 2-flowered, longer than the leaves; calycine teeth unequal, shorter than the tube; legumes oblong, compressed, glabrous.  $\odot$ . H. Native of Algiers. Corolla blue, about the size of those of *L. sativus*.

*Fine-leaved Lathyrus*. Fl. June, Aug. Clt. 1820. Pl. cl.

65 *L. PURPUREUS* (Desf. cor. p. 81. t. 61.) stem and petioles winged; lower petioles leafless, lanceolate; upper ones bearing 4-6 ovate-lanceolate leaflets; stipulas lanceolate, semi-sagittate; peduncles 1-flowered, shorter than the leaves.  $\odot$ . H. Native

of Greece and Candia. *L. alatus*, Smith, fl. græc. t. 697. prod. 2. p. 66. ? but not of Tenore. Flowers purple, about the size of those of *L. odoratus*.

*Purple-flowered Lathyrus*. Fl. June, Aug. Clt. ? Pl. cl.

66 *L. CORNUTUS* (Horn. hort. hafn. 686.) stems unknown; lower petioles leafless, winged, upper ones bearing 4-6, lanceolate alternate leaflets; legumes unknown.  $\odot$ . H. Native country unknown. Flowers purple.

*Horned Lathyrus*. Fl. June, Aug. Clt. 1818. Pl. cl.

† *Species not sufficiently known*.

67 *L. AMERICANUS* (Mill. dict. no. 19.) stems procumbent; leaves kidney-shaped, simple, veiny beneath; peduncles 2-flowered.  $\gamma$ . H. Native of North America. Flowers yellow. Perhaps *Baptisia perfoliata*.

*American Lathyrus*.

68 *L. PARISIENSIS* (Mill. dict. no. 4.) leaves with many pairs of leaflets; stipulas lanceolate; peduncles 1-flowered.  $\odot$ . H. Native country unknown.

*Parisian Lathyrus*. Fl. July. Clt. ? Pl. cl.

69 *L. MAGNOFLÔRE* (Mill. dict. no. 14.) stems winged; leaves with one pair of ovate-lanceolate leaflets; peduncles many-flowered.  $\gamma$ . H. Perhaps only a variety of *L. latifolius*.

*Large-flowered Lathyrus*. Fl. June, Aug. Clt. ? Pl. cl.

70 *L. ERECTUS* (Lag. nov. gen. 22.) leaflets linear; peduncles awnless, 1-flowered, short; legumes linear, many-seeded.  $\delta$ . H. Native about Madrid.

*Erect Lathyrus*. Pl. 1 foot.

† *Species only known by name from the catalogues of gardens, which are probably identical with some of those described above.*

1 *L. Hallersteinii*, Baumg. 2 *L. helodes*, Link. 3 *L. Italicus*, Fisch. 4 *L. Lusitanicus*, Martius. 5 *L. Sinensis*, Martius.

*Cult.* The greater part of the species of *Lathyrus* are very handsome when in bloom, the larger kinds are very fit for arbours or shrubberies, and being mostly climbing plants, should be supported by branches stuck in round their roots, or other supports. They all grow in any common soil, and are increased by seeds, and some of the perennial kinds by dividing at the root.

CLXXIII. OCHRUS (from  $\omega\chi\rho\omicron\varsigma$ , *ochros*, yellow; in reference to the colour of the flowers, which are of a pale yellow). Pers. ench. 2. p. 305.

LIN. SYST. *Diadelphia*, *Dicandria*. Calyx campanulate, 5-cleft, the 2 superior lobes the shortest and conniving. Stamens diadelphous. Vexillum furnished with a tooth on each side. Style flattened, villous in front at the apex. Legumes with a longitudinal membranous wing on each side of seminiferous suture, few-seeded. Seeds globular.—A herb, with bifoliate tendrilled leaves, and axillary, solitary, cream-coloured flowers and ovate stipulas.

1 *O. PALLIDA* (Pers. l.c.) stem prostrate, tetragonal, winged; petioles winged, lower ones for the most part leafless, upper ones bearing usually 2 leaflets, cirrhiferous; lower stipulas wanting, upper ones ovate; teeth of calyx rather unequal, length of tube.  $\odot$ . H. Native of the south of Europe. *Pisum ochrus*, Lin. spec. 1027. *Lathyrus ochrus*, D. C. fl. fr. 4. p. 578.—Tourn. inst. t. 219. Flowers pale yellow. Leaves glaucous.

*Pale-flowered Yellow-pea*. Fl. Ju. Aug. Clt. 1790. Pl. cl. 1 ft.

*Cult.* The seeds of this plant only require to be sown in the open border, in any light soil.

CLXXIV. OROBUS ( $\omicron\rho\omicron\beta\omicron\varsigma$  of Theophrastus and Dioscorides, from  $\omicron\rho\omega$ , *oro*, to excite, and  $\beta\omicron\upsilon\varsigma$ , *bous*, an ox; the present genus, however, has nothing to do with the plant of Theophrastus and Dioscorides, which whatever it was, was used

for fattening oxen). Tourn. inst. t. 214. Lin. gen. no. 871. D. C. fl. fr. 4. p. 586. D. C. prod. 2. p. 376.

**LIN. SYST.** *Diadelphia, Decandria*. Calyx campanulate, 5-cleft, the 2 superior lobes shortest. Corolla papilionaceous. Stamens diadelphous. Style slender, linear, villous at the apex. Legume cylindrical, oblong, 1-celled, 2-valved, many-seeded. Seeds with a linear hylum.—Erect herbs, with semi-sagittate stipulas. Petioles ending in a short simple bristle. Leaves abruptly pinnate, with few pairs of leaflets. Racemes of flowers axillary, pedunculate.

§ 1. *Leaves with only one pair of leaflets, which are either ovate, lanceolate, or linear.*

1 *O. LAXIFLORUS* (Desf. cor. p. 83. t. 62. ann. mus. par. 12. p. 57. t. 8.) plant villous; leaflets ovate, acute, with parallel nerves; stipulas unequally ovate-sagittate, rather larger than the leaflets; racemes axillary, few-flowered; calycine segments nearly equal, setaceous-subulate, much longer than the tube, but much shorter than the corolla; legumes compressed, villous, many-seeded.  $\mathcal{U}$ . II. Native of Candia. Flowers violaceous.

*Loose-flowered Bitter-Vetch.* Fl. May, Jul. Clt. 1820. Pl. 1 ft.

2 *O. HIRSHUTUS* (Lin. spec. 1027.) plant hairy; leaflets ovate, acute, with parallel nerves; stipulas unequally sagittate, lanceolate, about the size of the leaflets; racemes axillary, few-flowered, longer than the leaves; calycine segments nearly equal, setaceous-subulate, much longer than the tube, but much shorter than the corolla; legume compressed, hairy.  $\mathcal{U}$ . II. Native of Thrace. Sims, bot. mag. 2345. Buxb. cent. 3. p. 22. t. 41. Flowers red or purple.

*Var.  $\beta$ , glabriusculus* (Ser. mss. in D. C. prod. 2. p. 376.) stems, leaves, and peduncles quite smooth; calyx pilose.  $\mathcal{U}$ . II. Native of Tauria.

*Hairy Bitter-Vetch.* Fl. May, June. Clt. 1822. Pl. 1 ft.

3 *O. FORMOSUS* (Stev. mem. soc. mosq. 4. p. 50. Lin. soc. trans. 11. p. 413. t. 36.) plant quite smooth; leaflets ovate, mucronulate; stipulas small, semi-sagittate, acute, denticulated, with diverging nerves; peduncles axillary, usually 2-flowered, longer than the leaves; calycine segments lanceolate, length of tube, but much shorter than the corolla; legumes lanceolate, glabrous.  $\mathcal{U}$ . II. Native of the alps of Caucasus. Corollas beautiful purple, about the size of those of *O. vernalis*.

*Var.  $\beta$ , microphyllus* (Ser. mss. in D. C. prod. 2. p. 377.) leaflets roundish, much smaller; stipulas hardly toothed.  $\mathcal{U}$ . II.

*Beautiful Bitter-Vetch.* Fl. May, Jul. Clt. 1818. Pl.  $\frac{3}{4}$  ft.

4 *O. LATHYROIDES* (Lin. spec. 1027.) plant smoothish; leaflets ovate, mucronate, with divaricate nerves; stipulas semi-sagittate, a little toothed, smaller than the leaflets; peduncles many-flowered, axillary, about equal in length to the leaves; calycine teeth shorter than the tube; legumes compressed, glabrous, 2-3-seeded.  $\mathcal{U}$ . II. Native of Siberia.—Amm. ruth. 151. t. 7. f. 2. Stems branched a little. Flowers crowded, of a beautiful blue colour, usually 3 or 4 racemes standing together. An elegant plant, with broad, shining leaflets and black roots.

*Lathyrus-like Bitter-Vetch.* Fl. Ju. Jul. Clt. 1758. Pl. 1 to 2 ft.

5 *O. SESSILIFLORUS* (Smith, in Rees' cycl. vol. 25.) root creeping, branched; stems weak, undivided, angular, but not winged; leaflets narrow, almost linear, nearly sessile; stipulas very narrow, semi-sagittate, entire; racemes few-flowered.  $\mathcal{U}$ . II. Native country unknown. Flowers purple.

*Sessile-flowered Bitter-Vetch.* Pl.  $\frac{1}{2}$  to 1 foot.

6 *O. FISCHERI* (Sweet, fl. gard. t. 289.) stem tetragonal, almost simple, smoothish; leaflets linear, bluntish, mucronulate, nerved lengthwise, rather silky beneath; stipulas linear, acute, a little toothed, with one auricle at the base; racemes pedunculate, many-flowered; flowers secund; legumes reticulately veined, 6-7-seeded.  $\mathcal{U}$ . H. Native of Siberia. *O. atropurpureus*, Fisch. in litt. but not of Desf. Flowers large, beautiful purple.

*Fischer's Bitter-Vetch.* Fl. May, Jul. Clt. 1827. Pl. 1 ft. 7 *O. QUADRANGULUS* (Spreng. syst. 3. p. 258.) stem simple, quadrangular; leaves with 1 pair of linear, glabrous leaflets; stipulas semi-sagittate, setaceous; peduncles many-flowered; flowers secund.  $\mathcal{U}$ . H. Native of Sicily.

*Quadrangular-stemmed Bitter-Vetch.* Pl. 1 foot.

§ 2. *Leaves with many pairs of broadish leaflets. Stipulas much smaller than the leaflets.*

8 *O. VERNUS* (Lin. spec. 1028.) plant rather pubescent; stems simple, flexuous; leaves with 2-3 pairs of ovate-lanceolate, acuminate, shining leaflets, with rather parallel nerves; stipulas semi-sagittate, entire; peduncles axillary, many-flowered, shorter than the leaves; flowers secund, nodding; calycine segments broad, hardly the length of the tube, lower one longest; legumes rather compressed, obliquely and reticulately veined, many-seeded; style jointed; seeds roundish, smooth.  $\mathcal{U}$ . H. Native of Europe, in groves, in many parts, particularly in the south. Sturm, deutschl. fl. 7. with a figure. Curt. bot. mag. 521. Riv. tetr. irr. t. 58. Schmidel, t. 59. f. 79. Flowers handsome, singular in the different shades of colour, the upper part of the vexillum is purple, with blood-red veins; the wings blue, and the keel is blue tinged with green; the colours change as the corolla advances, and becomes blue. The roots are black.

*Var.  $\beta$ , ruscifolius* (Ser. mss. in D. C. prod. 2. p. 377.) leaflets stiff, elongated, taper-pointed. *O. ruscifolius*, Willd. in herb. Desf. ex Poir. suppl. 4. p. 203.

*Var.  $\gamma$ , flaccidus* (Ser. mss. in D. C. l. c.) leaflets very narrow and flaccid.  $\mathcal{U}$ . II. Native of Croatia and Switzerland.

*Spring Bitter-Vetch.* Fl. Mar. April. Clt. 1629. Pl.  $\frac{3}{4}$  to 1 ft.

9 *O. VENOSUS* (Willd. herb. ex Link. enum. 236.) stem simple; leaves with 2 pairs of lanceolate, taper-pointed leaflets, with divaricate veins; stipulas semi-sagittate; racemes few-flowered.  $\mathcal{U}$ . II. Native of Siberia.—Gmel. fl. sib. t. 5. f. 1. Flowers blue and veined with purple.

*Finey-flowered Bitter-Vetch.* Fl. May, Ju. Clt. 1820. Pl. 1 ft.

10 *O. ALPESTRIS* (Waldst. et Kit. hung. 2. p. 133. t. 126.) plant glabrous; stems angular, simple; leaves with 2-3 pairs of oblong-lanceolate, acuminate leaflets, with somewhat parallel nerves; stipulas semi-sagittate, entire, or toothed; peduncles axillary, many-flowered, about equal in length to or a little longer than the leaves; flowers secund, nodding; calycine segments broad, hardly the length of the tube; legumes rather compressed; style hooked; seeds roundish, brown.  $\mathcal{U}$ . II. Native of Hungary. Flowers purple, having the vexillum veined with crimson, fading to blue.

*Alp Bitter-Vetch.* Fl. June, Jul. Clt. 1817. Pl. 1 to 2 ft.

11 *O. MULTIFLORUS* (Sieb. in fl. 1821. p. 97.) stem almost simple; leaves with 3-4 pairs of ovate, acuminate leaflets; stipulas semi-sagittate; peduncles elongated, incurved, many-flowered.  $\mathcal{U}$ . II. Native of Italy, near Naples. Flowers pale red, about the size of those of *O. niger*.

*Many-flowered Bitter-Vetch.* Fl. My. Jul. Clt. 1820. Pl. 1 to 2 ft.

12 *O. VARIEGATUS* (Tenore, prod. suppl. 1. p. 62. and cat. 1819. p. 57. fl. neap. t. 68. but not of Lapeyr.) plant pilose; stems simple, flexuous; leaves with 2-3 pairs of lanceolate, acuminate leaflets, with parallel nerves; stipulas ovate, semi-sagittate, quite entire, acute, much smaller than the leaflets; calycine segments narrow, acute, length of tube; legumes compressed, nerveless, dotted; style straight.  $\mathcal{U}$ . II. Native near Naples, in woods. Column. phytob. p. 59. with a figure. *O. serotinus*, Presl. according to Gussone in litt. Flowers purple and variegated.

*Variegated-flowered Bitter-Vetch.* Fl. Ju. Jul. Clt. 1821. Pl. 1 ft.

13 *O. VICTOIDES* (D. C. prod. 2. p. 377.) plant smoothish; stems simple, flexuous; leaves with 2-3 pairs of ovate-lanceolate,

acuminate leaflets, with diverging nerves; stipulas ovate-lanceolate, small; peduncles few-flowered, axillary, shorter than the leaves; calycine segments narrow, acute, deflexed, length of tube; legumes compressed, almost nerveless; style flexuous, bearded at the apex; seeds globose. *U. H.* Native of the alps of Croatia and Carniola. *Vicia oroboides*, Wulf. in Jacq. coll. 4. p. 323. Waldst. et Kit. hung. 3. p. 269. t. 242. *O. Clusii*, Spreng. syst. 3. p. 259. Flowers yellow.

*Vicia-like Bitter-Vetch.* Fl. June, July. Clt. 1819. Pl. 2 ft.

14 *O. LU'VEUS* (Lin. spec. 1028.) plant smoothish; stems simple, angular; leaves with 3-5 pairs of elliptic-lanceolate, mucronulate leaflets, which are glaucous beneath; stipulas roundish, semi-sagittate, toothed at the base, much smaller than the leaflets; peduncles elongated, many-flowered, about equal in length to the leaves; calyx smoothish, with short unequal teeth; legumes compressed, longitudinally and reticulately veined, sessile; seeds globose, variegated. *U. H.* Native of the alps of Switzerland, France, Italy, and Siberia. Lodd. bot. cab. 783. Sweet, fl. gard. 2. series t. 115. Mill. fig. t. 193. f. 1. *O. Gmelini*, Fisch. in litt.—Gmel. sib. 4. p. 13. no. 17. t. 4. Flowers from orange to pale yellow.

*Yellow-flowered Bitter-Vetch.* Fl. June, July. Clt. 1759. Pl. 1 to 2 feet.

15 *O. TOURNEFORTII* (Lapeyr. mem. mus. 2. p. 298. t. 10.) plant glabrous; stem quadrangular, simple; leaves with usually 4 pairs of alternate, elliptic, lanceolate, parallel-nerved leaflets, which are glaucous beneath; stipulas large, roundish, semi-sagittate, stem-clasping, undulated; peduncles many-flowered, rather longer than the leaves; calycine segments linear, the two superior ones very short; legumes linear, flat. *U. H.* Native of the Pyrenees. Flowers purple; the wings and keel having a white base.

*Tournefort's Bitter-Vetch.* Fl. Ju. Jul. Clt. 1821. Pl. 1 to 2 ft.

16 *O. LEVIGATUS* (Waldst. et Kit. hung. 3. p. 270. t. 243.) plant quite smooth; stem simple; leaves with 3-4 pairs of ovate, mucronate leaflets; stipulas semi-sagittate, toothed at the base, much smaller than the leaflets; peduncles elongated, many-flowered, inclined, shorter than the leaves; calyx with short teeth; legumes erect, compressed, flat, smooth; style jointed. *U. H.* Native of Hungary. Flowers pale yellow. Very like *O. luteus*.

*Smooth Bitter-Vetch.* Fl. May, Jul. Clt. 1820. Pl. 1½ ft.

17 *O. TRANSYLVANICUS* (Spreng. syst. 3. p. 260.) stem villous; leaves with usually 4 pairs of oblong, obtuse, mucronate rather ciliated leaflets; stipulas broad, semi-sagittate, quite entire; peduncles axillary, few-flowered; superior teeth of calyx very short. *U. H.* Native of Transylvania. *O. lævigatus*, Baumg. but not of Waldst. ex Kit.

*Transylvanian Bitter-Vetch.* Pl. 1 foot.

18 *O. AURANTIUS* (Stev. in Bieb. fl. taur. suppl. 462.) plant pilose; stems simple, angular; leaves with 5-6 pairs of lanceolate, bluntish leaflets, with diverging nerves; peduncles elongated, shorter than the leaves; calyx pilose, with unequal teeth, 4 very short and 1 very long; legumes pedicellate. *U. H.* Native of western Iberia. Corolla deep yellow. Very like *O. luteus*.

*Orange-coloured-flowered Bitter-Vetch.* Fl. June, Jul. Clt. 1818. Pl. 1½ foot.

19 *O. CRŒVEUS* (Desf. cor. p. 85. t. 63. ann. mus. 12. p. 59. t. 9.) plant pilose; stem simple, angular; leaves with 3 pairs of leaflets, floral ones deflexed; leaflets ovate, obtuse; stipulas unequal, ovate; peduncles many-flowered, about equal in length to the leaves; calycine teeth nearly equal; length of tube; style jointed. *U. H.* Native of Cappadocia. Flowers copper-coloured, about the size of those of *O. luteus*.

*Copper-coloured-flowered Bitter-Vetch.* Pl. 2 foot.

20 *O. SYLVATICUS* (Lin. amœn. 4. p. 284. spec. 1029.) stems

branched, decumbent, hairy as well as the leaves; leaves with many pairs of small, ovate-oblong, acute, or elliptic mucronate leaflets; stipulas semi-sagittate, single-toothed; peduncles many-flowered, about equal in length to the leaves; calycine teeth unequal, short; legumes ovate-oblong, glabrous, pedicellate; style jointed. *U. H.* Native of several parts of Europe. In Britain, in mountainous woods and thickets, at Gamblesby, Cumberland, about 6 miles from Penrith, on the way to Newcastle; plentiful in several parts of Wales and the lowlands of Scotland; also of Ireland. Smith, engl. bot. 518. Lightf. fl. scot. t. 16. Petioles ending in tufts of hairs. Three lower teeth of calyx fringed. Flowers crowded, cream-coloured, streaked and tipped with purple on the outside, white and veined within.

*Wood Bitter-Vetch.* Fl. May, July. Britain. Pl. proc.

21 *O. OCHROLEUCUS* (Waldst. et Kit. hung. 2. p. 123. t. 118.) stems branched, rather ascendent, villous; leaves hairy, usually with about 10 pairs of ovate-lanceolate, obtuse leaflets; stipulas ovate, upper ones linear; peduncles many-flowered, shorter than the leaves; teeth of calyx unequal, short; legumes compressed, sessile; style jointed; seeds globose, brown. *U. H.* Native of Hungary. Flowers cream-coloured.

*Cream-coloured-flowered Bitter-Vetch.* Fl. May, July. Clt. 1816. Pl. 2 to 3 feet.

22 *O. NIGER* (Lin. spec. 1028.) plant smoothish; stem branched, angular, flexuous; leaves with 3-6 pairs of elliptic, mucronulate leaflets, with parallel nerves; stipulas linear-lanceolate, acute; peduncles many-flowered, longer than the leaves; calycine teeth unequal, shorter than the tube; legumes compressed, obsoletely and reticulately veined; style jointed; seeds globose. *U. H.* Native of many parts of Europe in sub-alpine places. In Scotland in the den of Airly, Forfarshire, and on Craiganain near Moy-house, Inverness-shire. Oed. fl. dan. t. 1170. Sims, bot. mag. 2261.—Riv. tetr. irr. t. 60. Flowers purple, easily changing colour. Herb turning black on drying.

*Black Bitter-Vetch.* Fl. June, July. Britain. Pl. 2 feet.

23 *O. JORDANI* (Tenore, fl. neap. prod. append. 5.) root tuberously fasciculate; leaves with 3-4 pairs of oblong-lanceolate, cuspidate leaflets; stipulas semi-sagittate, subulate; peduncles 4-6-flowered, twice the length of the leaves; style jointed. *U. H.* Native of Lucania, in humid meadows. Flowers blue.

*Jordan's Bitter-Vetch.* Fl. May, June. Clt. 1830. Pl. pr.

24 *O. HUMILIS* (Ser. mss. in D. C. prod. 2. p. 378.) plant quite smooth; stem simple, striated; leaves with 3 pairs of ovate, mucronulate leaflets, with diverging nerves; stipulas semi-hastate; peduncles few-flowered, about equal in length to the leaves; calycine teeth unequal, shorter than the tube. *U. H.* Native of Dahuria. *Lathyrus humilis*, Fisch. in litt.

*Humble Bitter-Vetch.* Fl. July, Aug. Clt. 1825. Pl. ½ ft.

25 *O. TUBEROSUS* (Lin. spec. 1028.) plant quite smooth; stem winged, erect, or prostrate, tuberculate at the base; leaves with 2-3 pairs of elliptic-lanceolate, mucronulate, dotted leaflets, with rather parallel nerves; stipulas semi-sagittate, jagged at the base; peduncles few-flowered, hardly exceeding the leaves; calycine teeth unequal, ovate, bluntish, shorter than the tube; legumes terete, obsoletely and reticulately veined; style jointed, seeds globose. *U. H.* Native of almost every part of Europe, in woods and among bushes; plentiful in Britain. Sturm, deutschl. fl. fasc. 21. Oed. fl. dan. 781. Smith, engl. bot. 1153.—Riv. tetr. irr. t. 59. Roots creeping, swelling into tubers at irregular intervals. Calyx purple. Corolla elegant, variegated and veined with purple crimson, and shades of blue and flesh-colour, changing to blue as it fades. The highlanders of Scotland have a great esteem for the tubercles of the roots; they dry and chew them to give a better relish to their whisky;

they also affirm that they are good against most diseases of the thorax, and that by the use of them, they are enabled to repel hunger and thirst for a long time. In Breadalbane and Rosshire, they sometimes bruise and steep them in water, and make an agreeable fermented liquor with them. They have a sweet taste, something like the roots of liquorice, and when boiled are well flavoured and nutritive, and in times of scarcity have served as a substitute for bread. Boiled well a fork will pass through the tubers, and dried slightly and roasted they are served up in Holland and Flanders in the manner of chestnuts. The plant is called *Wood-pea* or *Heath-pea* in England, and *Knap-perts* in the lowlands of Scotland. In Gaelic it is called *Cor-mille*.

*Tuberous-rooted Bitter-Vetch.* Fl. May, July. Britain. Pl.  $\frac{1}{2}$  to 1 foot.

26 *O. TENUIFOLIUS* (Roth. fl. germ. 1. p. 305.) plant quite smooth; leaves with 2-3 pairs of very narrow, linear leaflets; stem winged, erect; stipulas narrow, semi-sagittate, ciliated, bidentate behind; peduncles few-flowered, hardly longer than the leaves; calycine teeth unequal; legumes terete; roots swelling in tubers at intervals.  $\mathcal{U}$ . H. Native of most parts of Europe, in woods, along with *R. tuberosus*. *O. tuberosus*, var.  $\gamma$ , *tenuifolius*, Ser. mss. in D. C. prod. 2. p. 376. Roots and flowers like those of *O. tuberosus*. Leaflets channelled above, and mucronate.

*Fine-leafletted Bitter-Vetch.* Fl. May, Jul. Brit. Pl.  $\frac{1}{2}$  to 1 ft.

27 *O. PYRENAÏCUS* (Lin. spec. 1029.) stem simple, terete; leaves with 2-3 pairs of ovate, nerved, mucronate leaflets, which are glaucous beneath; stipulas semi-sagittate, linear, awned on both sides; peduncles 1-2-flowered; teeth of calyx triangular, the lowest one the longest; style jointed.  $\mathcal{U}$ . H. Native of the Pyrenees. *O. Plukenetii*, Lapeyr. mem. mus. 2. p. 299.—*O. tuberosus* var.  $\beta$ , *Pyrenæicus*, Ser. in D. C. prod. 2. p. 376.—Pluck. phyt. t. 200. Flowers pure purple.

*Pyrenean Bitter-Vetch.* Fl. May, July. Clt. 1622. Pl. 1 ft.

28 *O. DIVARICATUS* (Lapeyr. in mem. mus. 2. p. 302. t. 2.) stem branched, divaricate, winged in the middle, but naked at both extremities; leaves with 2-3 pairs of elliptic-lanceolate, obtuse, mucronate leaflets; stipulas of the lower leaves acute, entire, of the upper ones sharply and deeply toothed at the base; peduncles few-flowered; calycine segments triangular, acute, lower one longest.  $\mathcal{U}$ . H. Native of the Pyrenees. *O. tuberosus*  $\gamma$ , *divaricatus*, Ser. in D. C. prod. 2. p. 376. Flowers purple.

*Divaricate Bitter-Vetch.* Fl. May, July. Clt. 1816. Pl.  $\frac{3}{4}$  ft.

29 *O. ERECTUS* (Poir. in Lam. dict. 4. p. 627.) stem branched; leaves with 4-6 pairs of elliptic, glabrous, mucronate leaflets; stipulas semi-sagittate, acute; peduncles villous, 4-6-flowered.  $\mathcal{U}$ . H. Native country unknown.

*Erect Bitter-Vetch.* Fl. July, Aug. Pl. 1 foot.

30 *O. VICIÆFORMIS* (Lag. gen. et spec. p. 22.) leaves pinnate; leaflets oblong, bluntish; stipulas bifid, somewhat stipitate; peduncles 1-7-flowered; legumes lanceolate, glabrous.  $\mathcal{U}$ . H. Native of Spain. Flowers pale blue.

*Var. a, calcaratus*; peduncles 1-flowered, furnished with a short awn. *Vicia calcarata*, Desf. fl. atl. 2. p. 166. Lagasc. l. c.

*Var.  $\beta$ , multiflorus*; peduncles 2-7-flowered. Lagasc. l. c.

*Vicia-flowered Bitter-Vetch.* Pl. decumbent.

31 *O. ? PISCIDIA* (Spreng. pl. min. cogn. 1. p. 47.) stem unknown; leaves impari-pinnate; leaflets cuneate, retuse; stipulas subulate; peduncles racemose, few-flowered, longer than the leaves.—Native of New Caledonia. *Vicia Piscidia*, Forst. mss. The plant from the name appears to be used in New Caledonia for intoxicating fish.

*Fish-poison Bitter-Vetch.* Pl.

§ 3. *Leaves with many pairs of very narrow leaflets.*

32 *O. VARIVUS* (Soland. in Sims's bot. mag. t. 675.) stems

simple, angular; leaves with 3-4 pairs of linear-lanceolate, mucronate leaflets; stipulas semi-sagittate; peduncles many-flowered, longer than the leaves; calycine teeth lanceolate, unequal, shorter than the tube; style almost filiform.  $\mathcal{U}$ . H. Native of Italy. *O. versicolor*, Gmel. syst. 2. p. 1108. Flowers having the vexillum rose-coloured, and the keel and wings yellowish.

*Various-flowered Bitter-Vetch.* Fl. May, June. Clt. 1759. Pl.  $1\frac{1}{2}$  foot.

33 *O. CANESCENS* (Lin. fil. suppl. p. 327.) stem tetragonal; leaves with usually 2-3 pairs of linear, bluntish, pubescent, or dotted leaflets, with parallel nerves; stipulas semi-sagittate, linear, acute; peduncles many-flowered, longer than the leaves; calycine teeth lanceolate, unequal, shorter than the tube; legumes straight, compressed, glabrous, reticulately veined lengthwise; style jointed, rhomboid.  $\mathcal{U}$ . H. Native of the south of Europe. *O. filiformis*, Lam. fl. fr. 2. p. 568. Flowers white, with a tinge of blue.

*Var.  $\beta$ , tenniss* (Ser. l. c.) leaflet linear; flowers dark-purple.  $\mathcal{U}$ . H. Native of the Pyrenees. *O. atropurpureus*, Lapeyr. abr. 413.

*Canescent Bitter-Vetch.* Fl. May, June. Clt. 1816. Pl.  $1\frac{1}{2}$  ft.

34 *O. PALLÉSCENS* (Bieb. fl. taur. 2. p. 152. suppl. p. 463.) stem simple, pubescent, tetragonal; leaves with 2 pairs of linear, subulate, pubescent leaflets; stipulas semi-sagittate, subulate, almost entire; peduncles many-flowered, longer than the leaves; style very thick at the apex.  $\mathcal{U}$ . H. Native of Tauria. *O. canescens*  $\beta$  *palléscens*, Ser. in D. C. prod. 2. p. 376. Flowers white. Perhaps a species of *Platystylis*.

*Pale-flowered Bitter-Vetch.* Fl. May, Ju. Clt. 1823. Pl. 1 ft.

35 *O. ENSIFOLIUS* (Lapeyr. in mem. mus. 2. p. 303. t. 12.) stem terete, striated; leaves with 2-3 pairs of ensiform, acute, erect, nerved, crowded leaflets; stipulas semi-sagittate, acute; peduncles many-flowered, twice the length of the leaves; calycine teeth ovate, acute, lower ones longest; wings and keel coadunate.  $\mathcal{U}$ . H. Native of the Pyrenees. *O. canescens* var.  $\gamma$ , *ensifolius*, Ser. in D. C. prod. 2. p. 376. Flowers white.

*Sword-leafletted Bitter-Vetch.* Fl. May, June. Pl. 1 foot.

36 *O. ALBUS* (Lin. fil. suppl. 327.) stem simple; leaves with 2-3 pairs of linear mucronate leaflets, with parallel nerves; stipulas broadish, semi-sagittate, shorter than the petiole, which is winged; peduncles many-flowered, longer than the leaves; calycine teeth lanceolate, very unequal, lower ones much the longest; legumes compressed, glabrous, rather flexuous; style linear.  $\mathcal{U}$ . H. Native of the south of Europe, Austria, Hungary, &c. Sweet, fl. gar. t. 22. *O. Pannonicus*, Jacq. austr. 1. t. 39. *O. lævis*, Bieb. fl. taur. 2. p. 152.—J. Bauh. hist. 2. p. 326. f. 2. Flowers white, tinged with rose-colour.

*Var.  $\beta$ , asphodeloides* (Ser. in D. C. prod. 2. p. 376.) leaflets shorter and broader, tubers of root oblong. *O. asphodeloides*, Gouan. ill. p. 48. Perhaps a distinct species.

*White-flowered Bitter-Vetch.* Fl. May, June. Clt. 1794. Pl. 1 foot.

37 *O. ANGUSTIFOLIUS* (Lin. spec. 1028.) stem simple; leaves with 2 pairs of narrow, ensiform, acute leaflets; stipulas subulate, semi-hastate; peduncles many-flowered, longer than the leaves.  $\mathcal{U}$ . H. Native of Siberia.—Gmel. fl. sib. 4. p. 14. t. 5. Flowers yellow. The leaflets are remarkably narrow.

*Narrow-leafletted Bitter-Vetch.* Fl. May, June. Clt. 1766. Pl. 1 foot.

38 *O. ATRO-PURPUREUS* (Desf. fl. atl. 2. p. 157. t. 196. but not of Lapeyr.) stem simple or branched, striated or angular; leaves with 3 pairs of linear acute leaflets; stipulas semi-sagittate, very narrow, awned; peduncles many-flowered, longer than the leaves; flowers secund, drooping; teeth of calyx almost equal, obtuse, and very short; style filiform, crowned by a glo-

bose stigma; legumes compressed, somewhat elliptic, irregularly and reticulately veined. *U. H.* Native of Algiers, in uncultivated fields, and of Calabria. *O. Siculus*, Rafin. *O. Rafinésquii*, Presl. del. pr. p. 41. Petals elongated, purple.

*Dark-purple-flowered Bitter-Vetch.* Pl. 1 to 2 feet.

39 *O. SAXA'TILIS* (Vent. hort. cels. t. 94.) stems simple, weak; leaves with 2 pairs of linear leaflets; stipulas small, semi-sagittate; peduncles 1-flowered, much shorter than the leaves, articulated, and bracteolate; calycine segments lanceolate, nearly equal, shorter than the tube; legumes nearly cylindrical, grey. *U. H.* Native of Provence, on arid hills. *D. C.* fl. fr. 4. p. 589. Flowers blue and white mixed.

*Rock Bitter-Vetch.* Fl. June, Aug. Clt. 1820. Pl.  $\frac{1}{2}$  foot.

40 *O. LONGIFOLIUS* (Nutt. gen. amer. 2. p. 95.) plant clothed with silky villi; leaves ternate, and with 2 pairs of leaflets, uppermost ones simple; leaflets very long, filiform-linear; stipulas undivided, ovate-lanceolate, acuminate; racemes pedunculate, filiform, shorter than the leaves; 2 upper teeth of calyx shortest. *U. H.* Native of North America, on the plains of the Missouri. *Psoralea longifolia*, Pursh. fl. sept. amer. 2. p. 741. Racemes usually solitary. Flowers pale-red. Roots creeping.

*Long-leafletted Bitter-Vetch.* Pl. 1 foot.

41 *O. ? DISPAR* (Nutt. gen. amer. 2. p. 95.) leaves unequally pinnate, with 6-8 pairs of linear obtuse leaflets; stipulas simple, ovate; racemes sessile, twin or tern; segments of the calyx equal, the superior indenture, however, more profound and wider than the rest; legumes, glabrous. *U. H.* Native of North America, on arid hills about Fort Mandan. Flowers cream-coloured, having the wings longer than the keel. Habit of a species of *Astragalus*.

*Unlike Bitter-Vetch.* Pl. decumbent.

† *Species not sufficiently known.*

42 *O. ? PROCUMBENS* (Mill. dict. no. 11.) stems procumbent; leaves impari-pinnate, tomentose; outer leaflets largest; leaflets 5 pairs. Native of Mexico, about Vera Cruz. Flowers bright purple, disposed in short axillary racemes. Legumes compressed. Seeds 6, roundish.

*Procumbent Bitter-Vetch.* Pl. procumbent.

43 *O. VERNUS* (Mill. dict. no. 8. fig. t. 193. f. 2.) stems simple; leaves with 4 pairs of ovate acute leaflets; legumes tumid, containing 3-4 roundish seeds; peduncles 4-flowered. *U. H.* Native of Germany and Italy. Flowers purple. Perhaps a variety of *O. vernus*.

*Venetian Bitter-Vetch.* Fl. March, April. Pl. 1 foot.

44 *O. MONTANUS* (Scop. fl. carn. 2. p. 80. t. 41.) stem simple, striated; leaves with 3-4 pairs of ovate leaflets; racemes 5-6-flowered, a little longer than the leaves; legumes glabrous, purple. *U. H.* Native of Carniola. Flowers yellowish-white. Perhaps a variety of *O. vernus*.

*Mountain Bitter-Vetch.* Pl. 1 foot.

45 *O. ? COCCINEUS* (Mill. dict. no. 12.) stems procumbent; flowers axillary and terminal; leaves abruptly-pinnate, with 3-4 pairs of linear villous leaflets. *U. S.* Native of Mexico, about Vera Cruz. Peduncles short, 3-4-flowered. Flowers small, scarlet, succeeded by short taper pods, containing 3-4 small roundish seeds each.

*Var. β, unijugus* (Ser. in *D. C.* prod. 2. p. 380.) stipulas semi-hastate; leaves with one pair of linear-lanceolate leaflets; flowers solitary, length of the pedicels. *Lodd. bot. cab.* 883.

*Scarlet-flowered Bitter-Vetch.* Fl. April, May. Pl. procumbent.

46 *O. ? ARGENTEUS* (Mill. dict. no. 10.) stems erect, tomentose; leaves pinnate; leaflets oblong-ovate, silky beneath; flowers disposed in terminal spikes. *U. S.* Native of Mexico, about Vera Cruz. Leaves with 4-8 pairs of leaflets, hairy on

the upper surface. Flowers deep purple, succeeded by long, woolly, compressed pods, each containing 4-5 seeds.

*Silvery Bitter-Vetch.* Shrub 5 to 6 feet.

47 *O. ? AMERICANUS* (Mill. dict. no. 9.) stem much branched, frutescent; leaves pinnate, with 5-6 pairs of linear-lanceolate leaflets, which are tomentose beneath; legumes compressed, glabrous. *U. G.* Native of Jamaica. Flowers pale purple, disposed in loose terminal spikes.

*American Bitter-Vetch.* Clt. 1731. Shrub 3 feet.

*Cult.* *Orobis* is a genus of very elegant pea-flowering plants, and being all hardy, deserve to be cultivated in every flower border. They thrive best in light soil, and are easily propagated by seeds, or by dividing the plants at the roots in spring.

CLXXV. PLATYSTYLIS (from *πλατυς*, *platys*, broad, and *στυλος*, *stylos*, a style; in reference to the dilated style, which separates the genus from *Orobis*). Sweet. fl. gard. 239.

*Lin. syst.* *Diadelphia*, *Decandria*. Calyx campanulate, 5-cleft, the 2 upper lobes shortest. Corolla papilionaceous. Stamens diadelphous. Style broad, spatulate, villous at the apex. Legumes oblong, many-seeded; seeds nearly globose.—Erect herbs, with semi-sagittate stipulas. Leaves abruptly-pinnate, with few pairs of leaflets. Petioles ending in a bristle.

1 *P. CYANEA* (Sweet, fl. gard. 239.) stem simple, striated; leaves with 2-3 pairs of approximate, linear-lanceolate, acute leaflets; stipulas about equal in length to the petioles; peduncles few-flowered, longer than the leaves; calycine segments lanceolate, hardly the length of the tube. *U. H.* Native of Eastern Caucasus, in subalpine places. *Orobis cyanus*, Stev. in mem. soc. cur. mosq. 4. p. 51. Bieb. fl. taur. suppl. p. 464. Flowers large, bluish purple.

*Blue-flowered Platystylis.* Fl. May, June. Clt. 1823. Pl. 1 ft.

2 *P. SESSILIFOLIA* (Sweet. l. c. in a note.) stems simple, striated; leaves with 1 pair of linear-subulate approximate leaflets; stipulas semi-sagittate, subulate, much longer than the petioles; peduncles few-flowered, longer than the leaves; calycine segments linear, hardly the length of the tube; style jointed, spatulate; legumes narrow. *U. H.* Native of Tauria, in woods, and about Athens in Greece. *Orobis sessilifolius*, Smith, fl. græc. t. 692. ex prod. 3. p. 64. *O. digitatus*, Bieb. fl. taur. 2. p. 153. et suppl. 462.—Buxb. cent. 2. p. 36. t. 38. Flowers large, bluish purple.

*Sessile-leafletted Platystylis.* Fl. May, Ju. Clt. 1823. Pl. 1 ft.

3 *P. STIPULACEA*; stem erect, angular, branched above; leaves with 2-3 pairs of linear, attenuated, very long leaflets, which are obscurely 3-nerved, and glabrous; stipulas large, semi-sagittate; peduncles axillary and terminal, few-flowered, shorter than the leaves; calycine teeth unequal, lower ones the longest. *U. H.* Native of Siberia? *Orobis stipulaceus*, Hook. bot. mag. 2937. Flowers with a purple vexillum, blue wings, and purple keel.

*Large-stipuled Platystylis.* Fl. May. Pl. 1 foot.

*Cult.* Elegant plants, well adapted for the front of flower borders. A light sandy soil suits them best, and they are easily increased by seeds, or by dividing the plants at the roots in spring.

#### Tribe V.

PHASEOLEÆ (plants agreeing with *Phaseolus* in some important characters). Bronn. diss. p. 133. *D. C.* legum. mem. ix. prod. 2. p. 381.—*Phaseoli* Adans. fam. 2. p. 325. exclusive of numerous genera. Corolla papilionaceous (f. 47. c. f. 48. b.). Stamens monadelphous (f. 49. a.), but usually diadelphous (f. 48. c. f. 47. g.), 9 joined together, and 1 free. Legume many-seeded, dehiscent, continuous, usually subdivided internally into

1-seeded cells by cellular transverse membranes, never truly articulated. Radicle curved back upon the fissure formed by the cotyledons (f. 21. e. f.). Cotyledons thick, filled with fecula, and destitute of cortical pores, and do not undergo any change at the time of germination, but nourish the young plant by means of that supply of food they already contain; they rise above the earth, and are usually protruded from the spermatoderm. Primordial leaves opposite, all the rest of the leaves are furnished with an odd leaflet; the leaflets always pinnately disposed, rarely disposed palmately. This tribe of plants is more natural than the preceding; it is allied to *Hedysæreæ*, from the pods being divided into transverse cells by cellular membranes, and to *Viciæ* in the cotyledons being thick, and protruding from the spermatoderm.

CLXXVI. ABRUS (from *αβρος*, *abros*, soft; in reference to the extreme tenderness of the leaves). Lin. gen. no. 1286. Gærtn. fruct. 2. p. 328. t. 151. D. C. prod. 2. p. 381.

LIN. SYST. *Monadelphina*, *Enneandria*. Calyx bluntly 4-lobed, upper lobe broadest. Corolla papilionaceous, with an acute vexillum. Stamens 9, monadelphous at the base, having the tube or sheath gaping in front. Stigma obtuse. Legume oblong, compressed, 4-6-seeded. Seed roundish, separated by cellular membranes.—A delicate twining shrub, with abruptly-pinnate leaves, bearing many pairs of leaflets. This genus differs from the rest of the present tribe in the leaves being abruptly-pinnate.

1 A. PRECATORIUS (Lin. syst. 533.) *h. . S.* Native of the East Indies, from whence it has probably migrated to the tropical parts of Africa and America.—Rumph. amb. 5. t. 32.—Rheed. mal. 8. t. 39. Flowers pale purple, disposed in axillary bunches. There are different varieties of this plant, varying in the colour of the seeds, which are probably as many distinct species; some are red, with a black spot, some blood-coloured, others white, rufous, and black. The leaves and roots of this plant taste like liquorice, whence the inhabitants of the West Indies call it *mild liquorice*, and they use the roots for the same purposes as we do liquorice. The seeds of the commonest variety are of a glossy scarlet-colour, with a black spot or eye at the hylum, or that part which is fixed to the pod; they are commonly strung, and used as ornaments by the inhabitants of those countries where the herb grows wild; they are frequently brought to Europe from Guinea, and the West and East Indies, bored, and used as beads, with other hard seeds and shells; they are also used as beads for rosaries, hence the trivial name, and in Egypt as pulse, but they are the hardest and most indigestible of the whole pea tribe.

*Prayer* Wild-liquorice. Fl. March, May. Clt. 1686. Sh. tw.

*Cult.* This plant requires a strong heat to keep it in a growing healthy condition. A mixture of sand and loam is the best soil for it, and it is increased by cuttings under a hand-glass in sand, or by seeds, which should be raised on a hot-bed.

CLXXVII. SWEETIA (named by De Candolle in honour of Robert Sweet, F.L.S. author of *Hortus Suburbanus Londinensis*, *Hortus Britannicus*, *British Flower-garden*, and *Flora Australasica*, &c.) D. C. legum. mem. ix. prod. 2. p. 381.

LIN. SYST. *Diadelphina*, *Decandria*. Calyx 4-cleft, naked at the base, with lanceolate, acuminate, nearly equal lobes. Corolla papilionaceous, with an obtuse wedge-shaped vexillum, and an obtuse 2-edged keel. Stamens diadelphous. Ovary sessile. Legumes linear, compressed, many-seeded, 1-celled.—Slender twining herbs, which are frutescent at the base. Leaves pinnately-trifoliate. Stipulas subulate. Peduncles axillary, filiform. Flowers purple. Legumes pubescent. Style filiform, glabrous.

1 S. LONGIFOLIA (D. C. prod. 2. p. 381.) leaflets oblong-lan-

ceolate; legume straight; racemes axillary, few-flowered. *h. . S.* Native of South America. *Galèga longifolia*, Jacq. icon. rar. t. 572. coll. 2. p. 349. *Tephrosia longifolia*, Pers. Spreng. *Long-leafletted Sweetia*. Fl. June, Aug. Clt. 1818. Pl. tw. 2 S. FILIFORMIS (D. C. prod. 2. p. 382.) leaflets oval-oblong, hardly twice the length of the breadth; legumes falcate; peduncles few-flowered. *h. . S.* Native of South America. *Galèga filiformis*, Jacq. coll. 2. p. 348. icon. rar. 573.

*Filiform Sweetia*. Fl. July, Aug. Clt. 1820. Shrub tw.

3 S. VELUTINA; leaflets oblong, obtuse, villous on both surfaces; racemes few-flowered; legumes lanceolate, pubescent. *h. . S.* Native of St. Domingo. *Tephrosia velutina*, Spreng. syst. 3. p. 232.

*Velvety Sweetia*. Shrub tw.

4 S. ? ULIGINOSA; leaflets oblong, acuminate, glabrous; peduncles 3-flowered. *h. . S.* Native of the East Indies. *Robinia uliginosa*, Roxb. Willd. *Tephrosia uliginosa*, Spreng. syst. 3. p. 232.

*Bog Sweetia*. Shrub tw.

5 S. ? LIGNOSA (D. C. prod. 2. p. 382.) leaflets cuneate-obovate, emarginate, rather coriaceous, glabrous; racemes longer than the leaves; bractæ setaceous; legumes rather falcate. *h. . S.* Native of St. Domingo. *Glycine lignosa*, Turp. in Pers. ench. 2. p. 301. Calycine segments 4, acute, of these the two lateral ones are the shortest. Vexillum very broad, green at the base.

*Woody Sweetia*. Clt. 1824. Shrub tw.

*Cult.* See *Abrus* for culture and propagation.

CLXXVIII. MACRANTHUS (from *μακρος*, *makros*, long, and *ανθος*, *anthos*, a flower; in reference to the long flowers). Poir. suppl. 3. p. 569. D. C. prod. 2. p. 382.—*Marcanthus*, Lour. fl. coch. p. 461. from a typographical error.

LIN. SYST. *Diadelphina*, *Decandria*. Calyx tubular, coloured, permanent, 4-cleft; lobes acute, the 2 lateral ones the shortest. Corolla papilionaceous, with an ovate, concave, emarginate vexillum, which is not half the length of the oblong wings. Stamens 10, diadelphous, of these 4 are thicker than the rest, bearing ovate anthers, and the other 6 slender, bearing oblong anthers. Style filiform, pilose, crowned by an obtuse stigma. Legume straight, nearly terete, thick, acuminate, many-seeded.—Twining herbs, with trifoliate leaves, ovate-rhomboid pilose leaflets, filiform stipulas, axillary peduncles, bearing many white flowers, and eatable legumes.

1 A. COCHINCHINENSIS (Lour. l. c.) *h. . G.* Native of Cochin-china, and where also it is cultivated for the legumes, which are dressed and eaten by the inhabitants, as we do French beans.

*Cochin-china Long-flowered Bean*. Fl. July, Aug. Pl. tw.

*Cult.* A mixture of loam and peat will suit this plant. It is increased by seeds, which should be raised on a hot-bed.

CLXXIX. ROTHIA (in honour of Alb. Wilh. Roth, of Bremen, author of *Tentamen Floræ Germanicæ*, 3 vols. 8vo. Leipsic, 1788, 1789, 1793, and 1801, and a great number of other botanical works). Pers. ex D. C. prod. 2. p. 382. *Dillwynia*, Roth, cat. bot. 3. p. 71. Pers. ench. 2. p. 302. but not of Smith.

LIN. SYST. *Monadelphina*, *Decandria*. Calyx 5-cleft, the 2 superior segments arched, falcate, and coadunate, pressing down upon the vexillum, which is deflexed. Corolla papilionaceous, with a 2-edged keel. Stamens monadelphous, with the tube or sheath gaping on the back. Legume linear-ensiform, many-seeded. Seeds reniform.

1 R. TRIFOLIATA (Pers. l. c.) *○. H.* Native country unknown. *Dillwynia trifoliata*, Roth, l. c. *Glycine humifusa*, Willd. enum. 756. ex Roth, nov. spec. 349. *Cleome prostrata*,

**Hortul. ex Steud. nom.** Herb prostrate. Leaflets rather fleshy, oval, shining. Flowers usually solitary, at first sulphur-coloured, but at length changing to reddish.

**Trifoliolate Rothia.** Fl. June, July. Pl. prostrate.

**Cult.** The seeds of this plant only require to be sown in a warm border, in the front of a stove or green-house.

**CLXXX. TERA'MNUS** (from *τεραμνος*, *teramnos*, soft; in reference to the soft pods and leaves of the species). P. Browne, jam. 290. Swartz, fl. ind. occid. 3. p. 1238. t. 25. D. C. prod. 2. p. 382.

**Lin. syst.** *Monadelphina, Decandria*. Calyx bilabiate, upper lip the longest, and bifid, lower lip 3-parted, with all the lobes acute. Corolla papilionaceous, with a small keel, which is hidden by the calyx.\* Stamens 10, monadelphous, the 5 alternate ones sterile. Stigma capitate, sessile on the top of the ovary. Legume linear, compressed, 2-valved, many-seeded.—Twining subshrubs, natives of the West Indies, with angular branches, pinnately-trifoliolate leaves, stipellate leaflets, axillary racemes, which are longer than the leaves, and small remote reddish flowers.

1 **T. UNCINATUS** (Swartz, l. c.) branches clothed with retrograde silky down; leaves clothed with silky down beneath, and pubescence above; leaflets ovate or oblong. *h. C. S.* Native of Jamaica, in arid bushy places. *Dolichos uncinatus*, Lin. spec. 1019.—Plum. ed. Burm. t. 221.

**Hooked Teramnus.** Clt. 1822. Shrub tw.

2 **T. VOLUBILIS** (Swartz, l. c.) branches clothed with fine retrograde hairs; leaves pubescent beneath; leaflets lanceolate. *h. C. S.* Native of Jamaica, in humid bushy places on the mountains, and of New Granada, near Mompos, on the banks of the river Magdalena. All the synonymes cited under this plant by Willdenow are referrible to the first species.

**Twining Teramnus.** Clt. 1824. Shrub tw.

**Cult.** See *Abrus*, p. 342. for culture and propagation.

**CLXXXI. AMPHICARPÆA** (from *αμφι*, *amphi*, on both sides, and *καρπος*, *karpus*, a fruit; the plants bear pods both on the roots and the stems). D. C. legum. mem. ix. prod. 2. p. 383.—*Amphicarpa*, Ell. journ. act. sci. philad. 1818. vol. 1. p. 372. Nutt. gen. amer. 2. p. 113.—*Savia*, Rafin. *Falcata*, Gmel. syst. 2. p. 1131.

**Lin. syst.** *Diadelphina, Decandria*. Calyx campanulate, 4-toothed, bractless at the base, the teeth equal, and rather bluntish. Corolla papilionaceous. Petals oblong. Vexillum broad, incumbent, and nearly sessile. Stamens diadelphous. Style filiform. Stigma capitate. Stipe of ovary covered by a cylindrical sheath. Legume compressed, stipitate, 2-4-seeded.—Plants, with herbaceous twining stems, pinnately-trifoliolate leaves, ovate glabrous leaflets, and axillary racemes, having 2 flowers to each bractea. Flowers usually apetalous, those on the stems sterile, or bearing legumes dissimilar to those on the root; those on the roots usually fertile.

1 **A. MONICA** (Ell. et Nutt. l. c.) racemes pendulous; flowers with petals. *h. C. S.* Native of North America, from New York to Carolina, on the sides of rivulets, and in shady humid places. *Glycine monoica*, Lin. spec. 1023. Wendl. in Rœm. arch. 1. p. 3. t. 103. f. 2. *Glycine bracteata*, Lin. spec. ed. 1. p. 754. *Glycine comosa*, Lin. spec. 1024. ex Nutt. Stem covered with retrograde villi. Radical flowers apetalous. Flowers with a pale violet vexillum, and white keel and wings.

**Monoecious Amphicarpea.** Fl. June, Sept. Clt. 1781. Pl. tw.

2 **A. SARMENTOSA** (Ell. et Nutt. l. c.) racemes filiform, 3-flowered; flowers apetalous. *h. C. S.* Native of Carolina and Virginia, in low places among bushes. *Glycine sarmentosa*, Roth, cat. p. 87. Willd. spec. 3. p. 1055. *Glycine monoica*, Schkuhr, ann. bot. 12. p. 20. t. 2. *Glycine heterocarpa*, Hegetschw. comm.

p. 5. t. 5. Gl. elliptica, Smith in Abbot, hist. nat. geogr. t. 21. ex Rœm. arch. 2. p. 402. Perhaps *Glycine filiosa*, Horp. cat. hort. hafn. is sufficiently distinct from this plant.

**Sarmentose Amphicarpea.** Fl. July, Sept. Clt. 1820. Pl. tw.

**Cult.** The seeds of these plants only require to be sown in the open border in spring, in a warm sheltered situation.

**CLXXXII. KENNEDYA** (a name given by Ventenat in honour of Mr. Kennedy, formerly of the firm of Lee and Kennedy, Nurserymen, Hammersmith). Vent. malm. t. 104. R. Brown, in hort. kew. ed. 2. vol. 4. p. 299. D. C. prod. 2. p. 383. *Caulinia*, Mœnch. suppl. 47. but not of D. C. nor Willd.

**Lin. syst.** *Diadelphina, Decandria*. Calyx bilabiate, upper lip bidentate, lower one trifid, equal (f. 47. a.). Corolla papilionaceous (f. 47. c.), with the vexillum emarginate, recurved (f. 47. b.), but not bent back from the carina. Stamens diadelphous (f. 47. g.). Stigma obtuse (f. 47. f.). Legume linear (f. 47. e.), compressed, transversely many-celled from cellular membranous dissepiments. Seeds strophiolate.—Twining shrubs, native of New Holland, with axillary peduncles, and scarlet or violaceous flowers, having the vexillum bimaculate at the base.

§ 1. *Leaves trifoliolate. Keel straight, rather longer than the vexillum.*

1 **K. RUBICUNDA** (Vent. malm. t. 104.) leaflets 3, ovate; stipulas ovate-lanceolate, spreadingly reflexed; peduncles usually 3-flowered; legumes hairy. *h. C. G.* Native of the eastern and southern coasts of New Holland. *Glycine rubicunda*, Curt. bot. mag. 268. *Caulinia rubicunda*, Mœnch. Keel about equal in length to the wings, 15 lines long, acute. Flowers dark red.

**Rubicund-flowered Kennedyia.** Fl. March, May. Clt. 1788. Shrub tw.

2 **K. PROSTRATA** (R. Br. in Ait. hort. kew. 1. p. 299.) leaflets 3, obovate, villous, undulated, and rather repand; stipulas and bracteas cordate, apiculated, spreading; peduncles 1-2-flowered; legumes pubescent. *h. C. G.* Native of New Holland, on the eastern coast. *Glycine coccinea*, Curt. bot. mag. 270. Willd. spec. 2. p. 1065. Carina 8-9 lines long, longer than the wings. Leaflets hardly 6 lines long. Flowers scarlet.

**Var. β, major** (D. C. prod. 2. p. 383.) leaflets obovate, emarginate, when young they are hairy, as well as the branches. *h. C. S.* Native of New Holland, on the eastern coast. Carina 10-12 lines long. Leaflets an inch long. Flowers scarlet.

**Prostrate Kennedyia.** Fl. March, June. Clt. 1790. Shrub prostrate.

§ 2. *Leaves trifoliolate. Keel shorter than the vexillum and wings.*

3 **K. BRACTEATA** (Gaud. in Freycenet, voy. part. bot. p. 486. t. 113.) leaflets elliptic, obtuse, somewhat emarginate, with undulately curled margins, clothed with silky pubescence beneath; stipulas broad, ovate, acute; peduncles few-flowered, bracteate; bracteas connate, funnel-shaped. *h. G.* Native of the western coast of New Holland. Shrub apparently erect.

**Bracteate Kennedyia.** Shrub cl.?

4 **K. SERICEA**; leaflets obovate, emarginate, mucronate, clothed with silky hairs, particularly when young; peduncles clon-

FIG. 47.

gated, many-flowered; calyx very villous. *h. . G.* Native of New Holland. Flowers scarlet. Keel shorter than the vexillum.

*Silky Kennedyya.* Fl. March, June. Clt. 1823. Shrub tw.

5 *K. COCCI'NEA* (Vent. malm. t. 105. exclusive of the synonymes,) leaflets 3, obovate; stipulas lanceolate, spreading; peduncles bearing 3-9 flowers, in an umbellate head; legumes smoothish. *h. . S.* Native of New Holland, on the western coast. Flowers scarlet.

*Scarlet-flowered Kennedyya.* Fl. May, Aug. Clt. 1803. Sh. twining.

6 *K. COMPTONIA'NA* (Link. enum. 2. p. 235.) leaflets 3, oblong-ovate, obtuse, with a mucrone; stipulas ovate, ending in an awn-like acumen; racemes many-flowered, longer than the leaves. *h. . G.* Native of New Holland. *Glycine Comptoniana*, Ker. bot. reg. 298. Flowers bluish purple.

*Compton's Kennedyya.* Fl. March, June. Clt. 1803. Sh. tw.

7 *K. TABACI'NA* (Labill. cal. p. 70. t. 70.) leaflets 3, ovate-oblong, acuminate, rather pilose; flowers racemose; stems, petioles, and peduncles beset with retrograde hairs; legume hairy. *h. . G.* Native of New Caledonia.

*Tabacco-like Kennedyya.* Shrub tw.

8 *K. INOPHY'LLA* (Cunningh. mss. Lindl. bot. reg. t. 1421.) leaflets 3, cuneate, mucronate, attenuated at the base, rather pilose above, and silky beneath; stipulas ovate, acute; peduncles longer than the leaves; flowers 15-20, disposed in dense umbellate heads at the apexes of the peduncles; calyx clothed with black hairs. *h. . G.* Native of New Holland. *K. dilatata*, Cunningh. mss. Flowers beautiful scarlet; the vexillum with a greenish yellow mark at the base.

*Nerved-leaved Kennedyya.* Fl. May, Jul. Clt. 1824. Sh. tw.

§ 3. *Leaves simple. Keel of flowers shorter than the wings and vexillum.*

9 *K. MONOPHY'LLA* (Vent. malm. t. 106.) leaves ovate, glabrous, rather cordate at the base; stipulas lanceolate, erect; racemes many-flowered, much longer than the petioles. *h. . G.* Native of New Holland, on the eastern coast. *Glycine bimaculata*, Curt. bot. mag. 263. Flowers bluish-purple or violaceous. There are varieties of this species with narrow oblong leaves, and cordate lanceolate leaflets.

*Var. β, longiracemosa* (Lindl. bot. reg. 1336.) racemes slender, longer than the leaves; flowers smaller.

*One-leaved Kennedyya.* Fl. Mar. June. Clt. 1790. Sh. tw.

10 *K. OVA'TA* (Sims, bot. mag. 2169.) leaves broad-ovate, cordate, acute; upper stipulas ovate, erect; racemes many-flowered, longer than the petioles. *h. . G.* Native of New Holland. *K. cordata*, Lindl. bot. reg. t. 944. Flowers bluish violet. Habit of *K. monophylla*.

*Ovate-leaved Kennedyya.* Fl. May, Aug. Clt. 1818. Sh. tw.

*Cult. Kennedyya* is an elegant genus of shrubs, well fitted for the climbers of a conservatory or greenhouse. A mixture of sandy loam and peat is the best soil for them, and young cuttings root freely if planted in a pot of sand, in a little bottom heat, with a bell-glass placed over them.

CLXXXIII. RHYNCHOSIA (from *ῥυγχος*, *rhynchos*, a beak; in reference to the keel, which ends in a beak). Lour. coch. p. 460. D. C. legum. mem. ix. prod. 2. p. 384.—*Arcyphyllum*, Ell. in Journ. act. sc. philad. 1818. vol. 1. no. 13. p. 371.—*Glycine*, Nutt. gen. amer. 2. p. 114. H. B. et Kunth, nov. gen. amer. 6. p. 419.—*Glycine spec. of Lin. and others.*

LIN. SYST. *Diadelpia*, *Decandria*. Calyx 5-cleft, somewhat bilabiate. Corolla papilionaceous, usually shorter than the calyx. Stamens diadelphous, having the free filament jointed at the base. Style filiform, usually variously bent. Legume sessile, compressed, 2-valved, 1-celled, rather falcate, 2-seeded.—Climbing subshrubs or herbs, with simple, but usually trifoliate

liate leaves, having the terminal leaflet petiolulate. Flowers yellow, axillary, racemose or solitary.

§ 1. *Leaves all, or for the most part, simple, roundish, standing on long petioles.*

1 *R. MENISPERMOIDES* (D. C. in ann. sc. nat. 4. p. 102. legum. mem. ix. t. 55.) stems trailing, covered with spreading pubescence; stipulas ovate; leaves reniform, very obtuse; racemes few-flowered, almost sessile; calycine segments lanceolate, acutish, 3-nerved. *h. . S.* Native of Mexico, near Acapulco and Vera Cruz, on sandy hills. Legume oval-lanceolate, compressed, acute, 1-2-seeded, hardly pubescent.

*Moon-seed-like Rhynchosia.* Pl. cl.

2 *R. RENIFORMIS* (D. C. prod. 2. p. 384.) stem erect, humble, hairy; stipulas oblong-lanceolate; leaves roundish; racemes sessile, many-flowered, conglomerate; calycine segments lanceolate, acuminate. *h. . H.* Native of North America, from Carolina to Florida, in the pine forests. *Trifolium simplicifolium*, Walt. car. 184. *Glycine tomentosa monophylla*, Michx. fl. bor. amer. 2. p. 63. *Glycine reniformis*, Pursh. fl. sept. amer. 2. p. 86. *Glycine monophylla*, Nutt. gen. amer. 2. p. 115. but not of Lin. *Arcyphyllum simplicifolium*, Ell. l. c. Flowers yellow.

*Reniform-leaved Rhynchosia.* Fl. July, Aug. Clt. 1806. Pl.  $\frac{1}{2}$  foot.

3 *R. DIFFORMIS* (D. C. prod. 2. p. 384.) stem twining, velvety; stipulas oblong-lanceolate, lower leaves simple, upper ones trifoliate; racemes on long peduncles; flowers crowded, spicate; segments of the calyx lanceolate, acuminate. *h. . H.* Native of Carolina, in dry and cultivated places. *Glycine tomentosa*, var. *volubilis*, Michx. fl. bor. amer. 2. p. 63. This appears an intermediate species between this and the following division.

*Difformed Rhynchosia.* Fl. June, Sept. Clt. 1732.

§ 2. *Leaves all on long petioles, trifoliate. Phaseoloideæ.*

4 *R. ERÉCTA* (D. C. prod. 2. p. 384.) stem erect, angular, velvety; branches twining a little; leaflets ovate, rather obtuse, reticulately veined; racemes axillary, longer than the leaves; calycine segments linear, acute. *h. . H.* Native of North America, from Carolina to Florida. *Trifolium erectum*, Walt. car. 184. *Glycine tomentosa erecta*, Michx. fl. bor. amer. 2. p. 63. *Glycine erecta*, Nutt. gen. amer. 2. p. 114. *Arcyphyllum erectum*, Ell. l. c. Flowers fulvous. Leaves clothed with silky villi.

*Erect Rhynchosia.* Fl. June, Sept. Clt. 1820. Pl. 2 $\frac{1}{2}$  feet.

5 *R. CARIBÆA* (D. C. prod. 2. p. 384.) twining, pubescent; leaflets ovate-rhomboid, acute, covered with resinous dots beneath; racemes longer than the leaves; legumes acinaciform, hispid. *h. . S.* Native of the West Indies and on the banks of the river Orinoco, according to Kunth, nov. gen. amer. 6. p. 125. as well as of Western Florida. *Glycine Caribæa*, Jacq. icon. rar. t. 146. coll. 1. p. 66. *Glycine reflexa*, Nutt. gen. amer. 2. p. 115. ex Nutt. in Sill. Journ. Flowers yellow, with the vexillum striated. Legume 12-16 lines long, tapering at the base.

*Caribbean Rhynchosia.* Fl. Sept. Oct. Clt. 1742. Pl. tw.

6 *R. PUNCTATA* (D. C. mem. leg. ix. t. 56.) stem twining, angular, beset with retrograde pubescence; leaflets ovate-rhomboid, acute, dotted beneath; racemes filiform, longer than the leaves; flowers deflexed; legumes pubescent. *h. . S.* Native of Cayenne. *Glycine littoralis*, Vahl. ined. in herb. Puer. Legumes 6 lines long. Style filiform, inflexed. Flowers 3 lines long; vexillum not striated. This species comes very near *R. minima*, but the down on the stems is turned backwards, and the flowers are larger.

*Dotted-leaved Rhynchosia.* Pl. cl.

7 *R. MINIMA* (D. C. prod. 2. p. 385.) stem twining, slender, angular, and rather pubescent; leaflets rhomboid, acute, smoothish, dotted beneath; racemes longer than the leaves; flowers reflexed; legumes oblong, tapering at the base, clothed with fine velvety down. 2. ∪. S. Native of the West Indies. *Dolichos minimus*, Lin. spec. 1020. Jacq. obs. 1. t. 22.—*Glycine Lamarekii*, H. B. et Kunth, nov. gen. amer. 6. p. 424.—Sloan. hist. jam. t. 115. f. 1. Flowers yellow.

*Smallest-flowered Rhynchosia.* Fl. July, Aug. Clt. 1776. Pl. tw.

8 *R. NU'DA* (D. C. legum. mem. ix.) stems twining, angular, having the angles beset with retrograde pubescence; leaflets roundish, mucronulate, glabrous, dotted beneath; racemes filiform, longer than the leaves; flowers deflexed; legumes pubescent. 2. ∪. S. Native of the East Indies, at Nandaradah. *Hedysarum nudum*, Rottl. in herb. Puer. Legumes 9 lines long.

*Naked Rhynchosia.* Pl. tw.

9 *R. VOLUBILIS* (Lour. coch. p. 460.) stems herbaceous, twining, terete; leaflets roundish-obovate, reticulated, clothed with velvety down; racemes longer than the leaves; legumes ovate, rather velvety. 2. ∪. G. Native of China, in the suburbs of Canton. Peduncles twin (Lour.). Flowers yellow. Legume black. Seeds 2, black, shining.

*Twining Rhynchosia.* Pl. tw.

10 *R. PHASEOLOIDES* (D. C. prod. 2. p. 385.) stems twining, terete, pubescent; leaflets broad-ovate, acuminate, glabrous above, but villous and dotless beneath; racemes axillary and somewhat terminal; legumes tightened in the middle. 2. ∪. S. Native of Cayenne, Jamaica, and St. Domingo. *Glycine phaseoloides*, Swartz. fl. ind. occ. 3. p. 1248. Sims, bot. mag. 2284. Abrus, Lam. ill. t. 608. f. 2. *Dolichos pyramidalis*, Lam. dict. 2. p. 296. *Austrium*, Poit. in herb. Deless. Seeds compressed, partly red and partly black. Legumes clothed with rusty velvety down, but at length becoming glabrous. Racemes longer than the leaves, rarely shorter. Flowers brown.

*Kidney-bean-like Rhynchosia.* Fl. Ju. Jul. Clt. 1818. Pl. tw.

11 *R. PRECATORIA* (D. C. prod. 2. p. 385.) stems twining, villous; leaflets rhomboid-ovate, acuminate, obtuse at the base, and 3-nerved, clothed with soft pubescence; racemes axillary, many-flowered, about equal in length to the leaves; legumes oblong. 2. ∪. S. Native of Mexico, near Acapulco. *Glycine precatória*, Humb. in Willd. enum. 755. H. B. et Kunth, nov. gen. amer. 6. p. 425. *Indigofera volubilis*, Wendl. obs. 55. ex Willd. The hairs on the plant are tipped with glands, but the legumes are articulated, according to Wendland; according to Kunth the seeds are scarlet, and are strung for rosaries, whence the specific name.

*Prayer or Rosary Rhynchosia.* Fl. June, Aug. Clt. 1825. Shrub. tw.

12 *R. MACROPHYLLA* (D. C. prod. 2. p. 385.) branches twining, triangular, clothed with soft villi; leaflets rhomboid-ovate, acuminate, somewhat cordate, 3-nerved, clothed with soft pubescence on both surfaces, canescent and beset with glandular dots beneath; racemes many-flowered, on short peduncles; calyxes silky. 2. ∪. S. Native of Cuba, near Havannah. *Glycine macrophylla*, H. B. et Kunth, nov. gen. amer. 6. p. 426. Allied to *R. reticulata*, but the terminal leaflet is 4 inches long and about 2 inches broad.

*Large-leafletted Rhynchosia.* Shrub tw.

13 *R. ERYTHRINOIDES* (Schlecht. et Cham. in Linnæa. vol. 5. p. 587.) shrubby, climbing, smoothish; leaflets ovate-rhomboid, acuminate, acute, 3-nerved, beset with resinous dots on both surfaces; racemes axillary, when in fruit about equal in length to the leaves; calyx 5-cleft; legume sessile, 2-seeded, torulose; seeds nearly globose, a little compressed, girdled at the hylum

by a scarlet arillus. 2. ∪. S. Native of Mexico, between Masantla and Nantla, in woods. Plant pubescent in its parts when young.

*Coral-tree-like Rhynchosia.* Shrub tw.

14 *R. RETICULATA* (D. C. prod. 2. p. 385.) stems twining, angular; leaflets ovate-rhomboid, acuminate, velvety, reticulately veined beneath; racemes axillary, shorter than the leaves; legumes rather pubescent. 2. ∪. S. Native of Jamaica, Santa Cruz, and Guadaloupe, on the mountains among bushes, and of Mexico, near Jalapa. *Glycine reticulata*, Vahl. symb. 3. p. 88. Swartz, prod. 105. Corolla brownish yellow, shorter than the calyx.

*Reticulated-leaved Rhynchosia.* Fl. July, Sept. Clt. 1779. Shrub tw.

15 *R. PARVIFOLIA* (D. C. legum. mem. ix. prod. 2. p. 385.) stem twining; branches angular, and are as well as the leaves clothed with soft, short, velvety down; leaflets elliptic, very blunt, reticulately veined beneath; peduncles 2-flowered; legumes clothed with short down, intermixed with a few stiff hairs. 2. ∪. S. Native of St. Domingo. Leaflets hardly 4-5 lines long. Legumes 2-seeded, hardly half an inch long.

*Small-flowered Rhynchosia.* Shrub tw.

16 *R. PUBESCENS* (D. C. legum. mem. ix. prod. 2. p. 386.) stems twining, villous, terete; leaflets broad-ovate, acuminate, pubescent on both surfaces, and reticulated beneath; racemes few-flowered, axillary, about equal in length to the leaves; legumes oblong, rather pubescent, 2-seeded. 2. ∪. S. Native of Abyssinia. *Glycine pubescens*, Balb. ined. *Glycine Abyssinica*, Juss. ex Lher. herb.? Corolla longer than the calyx. Vexillum velvety on the outside. Legume about an inch long. Seeds brown.

*Pubescent Rhynchosia.* Shrub tw.

17 *R. MEMNONIA* (D. C. prod. 2. p. 386.) stems twining, terete, and are as well as the leaves clothed with soft, hoary, velvety down; leaflets obovate, obtuse, reticulately veined beneath; racemes axillary, longer than the leaves; flowers nodding; legumes compressed, constricted in the middle, villously tomentose. 2. ∪. G. Native of Egypt, about Thebes. *Glycine Memnonia*, Delil. fl. aegypt. 100. t. 38. f. 3. Vexillum rather pubescent, yellow, lined with black veins.

*Memnon's Rhynchosia.* Pl. tw.

18 *R. DENSIFLORA* (D. C. prod. 2. p. 386.) stem twining, clothed with short hoary down; leaflets ovate-roundish, acuminate, pubescent on both surfaces, and full of resinous dots; racemes axillary, ovate, dense-flowered, on short peduncles; corolla smaller than the calyx. 2. ∪. S. Native of the East Indies. *Glycine densiflora*, Roth. nov. spec. 348. Corolla glabrous. Legume unknown.

*Dense-flowered Rhynchosia.* Pl. tw.

19 *R. CAPITATA* (D. C. prod. 2. p. 386.) stems twining, angular, hairy; leaflets roundish, puberulous on the nerves and margins; peduncles axillary, length of leaves, bearing branches under the capitate raceme; corolla length of calyx; legumes sessile within the calyx, almost orbicular, compressed, 2-seeded, pilose. 2. ∪. S. Native of the East Indies. *Glycine capitata*, Roth. nov. spec. 346.

*Capitate-flowered Rhynchosia.* Pl. tw.

20 *R. ELONGATA* (D. C. prod. 2. p. 386.) stems twining; leaflets roundish, somewhat acuminate; racemes axillary, somewhat capitate, shorter than the petioles; lower tooth of calyx elongated, longer than the corolla; legumes pedicellate within the calyx, nearly orbicular, compressed, 2-seeded, pilose. 2. ∪. S. Native of the East Indies. *Glycine elongata*, Roth. nov. spec. 347. Allied to *R. nummularia*.

*Elongated Rhynchosia.* Shrub tw.

21 *R. NUMMULARIA* (D. C. prod. 2. p. 386.) stems twining,

angular, pubescent; leaflets cuneate-orbicular, very obtuse, rather pubescent; racemes filiform; flowers twin; legumes sessile within the calyx, orbicular, compressed, 1-seeded.  $\mathcal{U}$ .  $\odot$ . S. Native of the East Indies. *Glycine nummularia*, Lin. mant. 571. The racemes are said to be longer than the leaves, but according to the specimens they are shorter.

*Money-wort Rhynchosisia*. Pl. tw.

22 *R. ERVOIDEA* (D. C. legum. mem. ix. prod. 2. p. 386.) stems twining, rather angular, and a little pubescent; leaflets cuneate-roundish, very blunt, smoothish, dotted beneath; racemes few-flowered, sessile, or on short peduncles, and branching; legumes oblong, glabrous, 2-seeded, rather falcate, compressed.  $\mathcal{U}$ .  $\odot$ . S. Native of the East Indies, where it is called *Kata-arc*, according to Leschenault.

*Errum-like Rhynchosisia*. Pl. tw.

23 *R. AUREA* (D. C. prod. 2. p. 386.) leaflets roundish-rhomboid; racemes shorter than the petioles; legumes villous, 1-seeded.  $\mathcal{U}$ .  $\odot$ . S. Native of the East Indies. *Glycine aurea*, Willd. nov. act. nat. cur. berol. 4. 1803. p. 18. *Hedysarum aureum*, Koen. Rottl. Flowers golden yellow.

*Golden-flowered Rhynchosisia*. Pl. tw.

24 *R. RHOMBIFOLIA* (D. C. prod. 2. p. 386.) stems twining, terete, and are as well as the leaves glabrous; leaflets roundish-rhomboid, dotted beneath; racemes filiform, longer than the leaves; legumes oblong, 2-seeded, glabrous.  $\mathcal{U}$ .  $\odot$ . S. Native of the East Indies. *Glycine rhombifolia*, Willd. spec. 3. p. 1065.

*Var.  $\beta$ , Timoriensis* (D. C. prod. 2. p. 386.) leaflets acuminate, lateral ones an inch long.  $\mathcal{U}$ .  $\odot$ . S. Native of the Island of Timor.

*Rhomb-leafletted Rhynchosisia*. Fl. May, Aug. Clt. 1815. Pl. tw.

25 *R. CANA* (D. C. prod. 2. p. 386.) stem erect, pubescent; leaflets ovate-roundish, clothed with hoary tomentum beneath; peduncles axillary, 2-flowered, shorter than the petioles; legumes oblong, smoothish, 2-seeded.  $\mathcal{U}$ . S. Native of the East Indies. *Glycine cana*, Willd. spec. 3. p. 1063.

*Hoary Rhynchosisia*. Shrub 1 to 2 feet.

26 *R. MEDICAGINEA* (D. C. prod. 2. p. 386.) stems twining, filiform; leaflets obovate, obtuse, glabrous; racemes longer than the leaves; legumes oblong, mucronate, glabrous, constricted between the seeds.  $\odot$ .  $\odot$ . S. Native of Ceylon. Burm. zeyl. 188. t. 88. *Dolichos medicagineus*, Lam. dict. 2. p. 297. Allied to *R. minima*. Legume 2-seeded.

*Medick-like Rhynchosisia*. Pl. tw.

27 *R. SUAVEOLENS* (D. C. prod. 2. p. 378.) stem erect, clammy; leaflets ovate, acute, clothed with clammy pili; peduncles 1-2-flowered, filiform, articulated in the middle; legumes oblong, 2-seeded, hoary.  $\mathcal{U}$ . S. Native of the East Indies, on rocks near Madras. *Glycine suaveolens*, Lin. fil. suppl. 326. *Hedysarum venosum*, Rottl. Calyx 4-parted, with the upper segment bifid, and it is therefore probably a species of *Cylista*. The whole shrub is sweet-scented. The vexillum is streaked with red.

*Sweet-scented Rhynchosisia*. Fl. July, Sept. Clt. 1816. Sh. 1 to 3 feet.

28 *R. VISCIDA* (D. C. prod. 2. p. 387.) stems? leaflets ovate-roundish, clothed beneath with silky hoary down; racemes axillary, very long; legumes pubescent.  $\mathcal{U}$ .  $\odot$ . S. Native of the East Indies. *Glycine viscida*, Willd. in nov. act. nat. cur. 4. 1803. p. 208. Pers. ench. 2. p. 300. *Hedysarum viscidum*, Lin. Rottl.

*Viscid Rhynchosisia*. Pl. tw.?

29 *R. VISCOSA* (D. C. l. c.) stems twining, clothed with clammy pili; leaflets ovate-roundish, acuminate, scabrous on both surfaces, lateral ones broadest on the outside; racemes axillary, shorter than the leaves; corolla with a pilose vexillum;

legumes oblong, setose, compressed, 2-seeded.  $\mathcal{U}$ .  $\odot$ . S. Native of the East Indies. *Glycine viscosa*, Roth. nov. spec. 349. *Hedysarum glutinosum*, Rottl. in herb. Puer. *Dolichos glutinosus*, Leschen. herb. Legume an inch long, apiculated by the style.

*Clammy Rhynchosisia*. Fl. July, Sept. Clt. 1820. Sh. tw.

30 *R. FRIDERICIANA* (D. C. prod. 2. p. 387.) stems twining, decumbent, angular; leaflets ovate-rhomboid, obtuse, clothed with soft pubescence on both surfaces; racemes longer than the leaves; legumes pubescent, 2-seeded.  $\mathcal{U}$ .  $\odot$ . S. Native of the Island of Manilla. *Glycine Fridericiana*, Weimm. in flora. 1821. p. 29. Flowers small, yellow.

*Frideric's Rhynchosisia*. Fl. July, Aug. Clt. 1820. Sh. tw.

31 *R. ROSEA* (D. C. prod. 2. p. 387.) stems twining; leaflets ovate, cordate, acute, quite entire; peduncles 3-flowered; legumes compressed, keeled, 1-seeded.  $\mathcal{U}$ .  $\odot$ . G. Native of the Society Islands. *Glycine rosea*, Forst. prod. no. 271.

*Rose-coloured-flowered Rhynchosisia*. Pl. tw.

32 *R. LUCIDA* (D. C. l. c.) stems twining; leaflets ovate, acuminate, quite entire; racemes terminal, glandular; pedicels tern; legumes inflated, 2-seeded.  $\mathcal{U}$ .  $\odot$ . G. Native of the Society Islands. *Glycine lucida*, Forst. prod. no. 272. Perhaps this plant belongs to a different genus.

*Lucid Rhynchosisia*. Pl. tw.

33 *R. CROTALARIOIDES* (D. C. l. c.) branches terete; leaflets oblong-ovate, 3-nerved, pubescent beneath; racemes axillary, aggregate, shorter than the petioles; legumes oblong, acute, usually 1-seeded.  $\mathcal{U}$ .  $\odot$ . S. Native of the East Indies. *Crotalaria macrophylla*, Willd. spec. 3. p. 982.

*Crotalaria-like Rhynchosisia*. Shrub tw.

34 *R. RUFESCENS* (D. C. l. c.) leaflets roundish-ovate, clothed with hoary pubescence; racemes axillary; legumes ovate, 1-seeded, longer than the calyx.  $\mathcal{U}$ .  $\odot$ . S. Native of the East Indies. *Glycine rufescens*, Willd. nov. act. nat. cur. berol. 4. 1803. p. 222. *Hedysarum rufescens*, Rottl. ex Willd.

*Rufescent Rhynchosisia*. Pl. tw.

35 *R. GLABRA* (D. C. prod. 2. p. 387.) stems twining, filiform, angular; leaflets lanceolate, ciliated, beset with resinous dots beneath, and hairy on the nerves; racemes axillary, usually 1-flowered; legumes oblong, mucronate, 2-5-seeded.  $\mathcal{U}$ .  $\odot$ . G. Native of the Cape of Good Hope. *Glycine glabra*, Spreng. neue. entd. 3. p. 54. Flowers yellow.

*Glabrous Rhynchosisia*. Pl. tw.

36 *R. ? GALACTIOIDES* (D. C. prod. 2. p. 387.) stems twining; branches beset with retrograde pili; leaflets oval-oblong, obtuse at the base and mucronate at the apex, glabrous and shining above, but pubescent beneath; racemes shorter than the leaves, 5-8-flowered; legumes villous, 3-seeded, somewhat constricted between the seeds.  $\mathcal{U}$ .  $\odot$ . S. Native of South America, near Hacienda de Blandin, in Caracas. *Glycine galactioides*, H. B. et Kunth, nov. gen. amer. 6. p. 427. t. 575. Lobes of calyx nearly equal, much acuminate.

*Galactia-like Rhynchosisia*. Shrub tw.

37 *R. ? SCARABEOIDES* (D. C. l. c.) stems twining, scabrous; leaflets ovate, obtuse at both ends, clothed with soft silky down on both surfaces; veins beneath; peduncles 1-flowered; legumes oblong, constricted between the seeds; seeds furnished with a thick bifid arillus.  $\odot$ .  $\odot$ . S. Native of the East Indies, Madagascar, and the Mauritius. *Dolichos scarabaeoides*, Lin. suppl. 1020. Burm. ind. 159. exclusive of the synonyme of Garcin. *Cajan scarabaeoides*, Pet. Th. dict. sc. nat. 6. p. 167. —Pluk. alm. t. 52. f. 3. Lin. fl. zeyl. no. 182. According to the figure in Plukenet alm. the legume is 1-seeded, and the seeds separated by cellular substance, but according to M. Petit Thouars, it is 9 lines long and 2 lines broad.

*Beetle-like-seeded Rhynchosisia*. Fl. Ju. Jul. Clt. 1773. Pl. tw.

38 *R. DE'BILIS*; plant twining, villous; leaflets roundish, almost glabrous; petioles long; racemes axillary, sessile, crowded with small flowers; legumes short, villous.  $\mathcal{U}$ .  $\odot$ . S. Native of Guinea and of the Island of St. Thomas. Flowers small, yellow.

*Weak Rhynchosia*. Pl. tw.

39 *R. STRIATA*; plant twining; leaflets ovate, acuminate, entire, glabrous, 3-nerved at the base; racemes lateral, sessile; calyx 4-cleft, and is as well as the pedicels hairy; corolla about equal in length to the calyx.  $\mathcal{U}$ .  $\odot$ . S. Native of Sierra Leone. Flowers yellow and striped with red.

*Striated-flowered Rhynchosia*. Pl. tw.

40 *R. BIFLORA* (D. C. l. c.) stems twining, clothed with velvety villi; leaflets oval, acutish at both ends, reticulated above, but clothed with soft velvety villi beneath; racemes 2-flowered, shorter than the petioles; legumes ovate, mucronate, villous, constricted between the seeds; seed furnished with a thick bifid arillus.  $\odot$ .  $\odot$ . S. Native of the East Indies. *Dolichos scarabæoides*, Roxb. hort. beng. 57. Legume 5-6 lines long and 3 lines broad, 2-seeded. Seeds ovate, blackish brown, separated by cellular transverse membranes.

*Two-flowered Rhynchosia*. Fl. Jul. Aug. Clt. 1816. Pl. tw.

41 *R. GARCINI* (D. C. prod. 2. p. 388.) stems twining, clothed with velvety villi; leaflets roundish-obovate, very blunt, clothed with soft villi on both surfaces; racemes shorter than the leaves; legumes oblong, covered with fine velvety down, mucronate, 2-seeded, not constricted between the seeds.  $\odot$ .  $\odot$ . G. Native of Persia. *Phaseolus Persicus mollis*, Garcin, in herb. Burm. Flowers yellow, striated.

*Garcin's Rhynchosia*. Pl. tw.

42 *R. ANGUSTIFOLIA* (D. C. l. c.) stems twining, terete, villous; stipulas ovate, acute; leaflets linear-lanceolate, silky; pedicels axillary, very short, 1-flowered; segments of the calyx subulate; legumes pubescent, 2-seeded.  $\mathcal{U}$ .  $\odot$ . G. Native of the Cape of Good Hope. *Glycine angustifolia*, Jacq. hort. schœnbr. 2. t. 231. Flowers yellow. Anthers pilose.

*Narrow-leafletted Rhynchosia*. Fl. June, Aug. Clt. 1795. Shrub tw.

43 *R. GLANDULOSA* (D. C. prod. 2. p. 388.) stems twining, rather angular, smoothish; leaflets oblong, glabrous, but full of resinous dots beneath as well as the calyx; peduncles axillary, 1-3-flowered, longer than the leaves.  $\mathcal{U}$ .  $\odot$ . G. Native of the Cape of Good Hope. *Phaseolus Capensis*, Burm. cap. p. 81. but not of Thunb. *Glycine glandulosa*, Thunb. cap. prod. 131. fl. cap. 591. Pedicels nearly an inch long, according to Thunb.

*Glandular Rhynchosia*. Shrub tw.

44 *R. TÓTTA* (D. C. l. c.) stems twining, terete, glabrous; branches clothed with adpressed silky down; leaflets ovate or oblong, mucronate, rather puberulous, fringed a little at the base, dotless beneath; pedicels axillary, jointed in the middle, 1-flowered, length of petioles; segments of the calyx and stipulas subulate.  $\mathcal{U}$ .  $\odot$ . S. Native of the Cape of Good Hope. Burch, cat. pl. afr. aust. no. 2040. *Glycine Tóttá*, Thunb. fl. cap. 591. Flowers yellow.

*Hottentot Rhynchosia*. Shrub tw.

45 *R. MOLLÍSSIMA*; plant twining, very soft and hoary from down; leaflets ovate-roundish, mucronate, 3-nerved at the base; racemes axillary, spike-formed.  $\mathcal{U}$ .  $\odot$ . S. Native of Guinea, very common among grass. Flowers small, brown.

*Very-soft Rhynchosia*. Pl. tw.

46 *R. HOOKEÏ*; plant pubescent; stems twining; leaflets ovate, acute, somewhat rhomboidal, dotted; racemes shorter than the leaves; legumes scymitar-shaped, swollen, 2-seeded.  $\mathcal{U}$ .  $\odot$ . S. Native of the West Indies. *Glycine mollis*, Hook. exot. fl. t. 201. Flowers yellow.

*Hooker's Rhynchosia*. Fl. July, Aug. Clt. 1824. Pl. tw.

47 *R. MÓLLIS* (D. C. prod. 2. p. 388.) stems twining; leaflets elliptic, obtuse at both ends, pubescent above but tomentose and reticulately veined beneath; pedicels 1-flowered, one-half shorter than the petioles; legumes 3-seeded, clothed with rufous villi.  $\mathcal{U}$ .  $\odot$ . S. Native of Guinea. *Glycine mollis*, Willd. spec. 3. p. 1063. Lateral leaflets about an inch long, and the middle one about an inch and a half long. Flowers yellow.

*Soft Rhynchosia*. Fl. Jul. Aug. Clt. 1823. Pl. tw.

48 *R. RIGÍDULA* (D. C. l. c.) stems erect, clothed with retrograde, hoary pubescence; leaflets linear, mucronate, pubescent, and beset with resinous dots beneath; pedicels axillary, 1-flowered, bent in the middle, length of petioles; legumes rather villous, oblong, 1-seeded.  $\mathcal{U}$ . G. Native of the Cape of Good Hope. Burch. cat. afr. aust. no. 2587.

*Stiffish Rhynchosia*. Shrub 1 to 2 feet.

*Cult.* This genus is composed of plants of no beauty. For the culture and propagation of the species see *Eriosema*, p. 348.

CLXXXIV. ERIOSEMA (from *εριον*, *erion*, wool, and *σμη*, *sema*, a standard; in reference to the vexillum, which is clothed with silky hairs). Desv. in Schlecht. *Linnaea*. vol. 2. p. 512.

*LIN. SYST.* *Diadélphia*, *Decándria*. Calyx 5-cleft, somewhat bilabiate, usually inclosing the corolla. Stamens diadelphous. Style filiform. Vexillum clothed with silky villi. Legume straight, 1-celled, 1 or few-seeded. Erect subshrubs, with digitately trifoliate leaves, with the 3 leaflets rising from the same dot or centre from the tip of the petiole, rarely solitary. Racemes or fascicles of flowers axillary. Flowers yellow.

1 *E. GRANDIFLORA* (Schlecht. et Cham. in *Linnaea*. 5. p. 588.) shrubby, erect; branches angular, somewhat trigonal; petioles very short, and are as well as the nerves and veins on the under surface of the leaves clothed with silky rufous down, but the calyxes and legumes are clothed with silky rufous villi; leaves and corollas covered with soft pubescence on both surfaces; leaflets oblong-elliptic, mucronate; bractæas roundish-ovate, acute, rather silky, ciliated and bearded; racemes terminal and axillary, panicle; legumes ovate, compressed, obliquely beaked.  $\mathcal{U}$ . S. Native of Mexico, near La Hacienda de la Laguna. Very like *E. rufa*.

*Great-flowered Eriosema*. Fl. Oct. Shrub 1 to 2 feet.

2 *E. RUFA*; plant suffruticose, erect; branches somewhat tetragonal, clothed with rufous velvety down as well as the petioles, which are very short; leaflets 3, elliptic-oblong, clothed with soft velvety down on both surfaces, but with rufous down on the nerves on the under surface, which are rather prominent, the odd leaflet remote from the lateral ones; racemes many-flowered, shorter than the leaves; legumes oval, compressed, mucronate, clothed with rufous villi.  $\mathcal{U}$ . S. Native of New Andalusia, in humid places near Caripe, and on Cerro del Collar. *Glycine rufa*, H. B. et Kunth, nov. gen. amer. 6 p. 423. t. 574. *Rhynchosia rufa*, D. C. prod. 2. p. 388.

*Var. β, macrostachya* (D. C. prod. 2. p. 388.) racemes longer than the leaves.

*Rufous Eriosema*. Shrub 2 to 3 feet.

3 *E. VIOLACEA*; plant suffruticose, erect; branches and leaves clothed with very short ferruginous villi; leaflets 3, oblong-linear, acute, greenish above and velvety, but clothed with rusty villi beneath, the odd leaflet rather remote from the lateral ones; racemes axillary and terminal, many-flowered; legumes ovate, villous, 2-seeded.  $\mathcal{U}$ . S. Native of Guiana, in meadows. *Cytisus violaceus*, Aubl. guian. 2. p. 766. t. 306. *Crotalaria lineata*, Lam. dict. 2. p. 200. *Glycine picta*, Vahl. symb. 2. p. 814. *Rhynchosia violacea*, D. C. prod. 2. p. 388. Flowers violaceous.

*Violaceous Eriosema*. Fl. July, Aug. Clt. 1820. Sh. 4 ft.

4 *E. DIFFUSA*; branches diffusely procumbent, tetragonal,

when young clothed with hoary adpressed villi; leaflets 3, lanceolate, somewhat mucronate, pubescent above and glabrous beneath, and a little dotted, but having the nerves clothed with hoary villi; the terminal leaflet hardly remote from the lateral ones; racemes very short, crowded, axillary; legumes ovate, mucronate, beset with rufous villi. *h. S.* Native of South America, on the mountains of Popayan, near the river Putes, and of Mexico. *Glycine diffusa*, H. B. et Kunth, nov. gen. amer. 6. p. 420. t. 572. *Rhynchösia diffusa*, D. C. prod. 2. p. 388. Flowers yellow.

*Var. β, oblongifolia* (D. C. prod. 2. p. 389.) leaflets oblong and a little broader.

*Diffuse Eriosema.* Shrub 3 to 4 feet.

5 *E. CRINITA*; plant suffruticose, erect, pilose; hairs long, spreading, and soft; stems angular; leaflets 3, linear-lanceolate, acute, mucronate; racemes short. *h. S.* Native of New Andalusia, on Cerro del Cocollar, in open places. *Glycine crinita*, H. B. et Kunth, nov. gen. amer. 6. p. 421. t. 573. *Rhynchösia crinita*, D. C. prod. 2. p. 389. Flowers yellow.

*Hairy Eriosema.* Shrub 2 to 3 feet.

6 *E. PULCHÉLLA*; plant suffruticose, erect? branches angular, clothed with silky pili; leaflets 3, oblong-lanceolate, acute, rounded at the base, and clothed with soft pubescence on both surfaces; peduncles short, usually 6-flowered; calyx beset with soft pili. *h. S.* Native of New Granada, near Honda, and on the banks of the Orinoco. *Glycine pulchella*, H. B. et Kunth, nov. gen. amer. 6. p. 422. *Rhynchösia pulchella*, D. C. prod. 2. p. 389. Flowers yellow.

*Neat Eriosema.* Shrub 2 feet.

7 *E. PSORALEOIDES*; stem flexuous, angular, velvety at the apex; leaflets 3, oblong, obtuse, clothed with silky tomentum beneath; stipulas lanceolate, length of the petiole, which is very short; spikes axillary, slender, longer than the leaves; legumes ovate-rhomboid, villous. *h. S.* Native of Madagascar. *Crotalaria psoraleoides*, Lam. dict. 2. p. 201. H. B. et Kunth, nov. gen. amer. 6. p. 418. in a note. *Rhynchösia psoraleoides*, D. C. prod. 2. p. 389. Flowers yellow.

*Psoralea-like Eriosema.* Shrub 2 to 3 feet.

8 *E. SESSILIFLORA*; plant suffruticose, erect; branches terete, clothed with silky villi as well as the under side of the leaflets; petioles almost wanting; leaflets 3, oblong-linear, obtuse, quite smooth above; flowers 2-3, axillary, almost sessile. *h. S.* Native of Porto Rico. *Cytisus sessiliflorus*, Poir. suppl. 2. p. 439. *Rhynchösia sessiliflora*, D. C. l. c. Flowers yellow.

*Sessile-flowered Eriosema.* Shrub 1 to 2 feet.

9 *E. SIMPLICIFOLIA*; stems diffuse, angular, clothed with adpressed pili; petioles very short; leaves linear-lanceolate, rather mucronate, cordate, glabrous; peduncles short, 3-4-flowered; calyx clothed with adpressed pili. *h. S.* Native near Atures, at the cataracts of the Orinoco. *Glycine simplicifolia*, H. B. et Kunth, nov. gen. amer. 6. p. 419. *Rhynchösia simplicifolia*, D. C. l. c. Flowers yellow.

*Simple-leaved Eriosema.* Shrub diffuse.

*Cult.* None of the species of this genus are worth cultivating except in botanical gardens; they grow well in any light rich soil, and are easily increased by cuttings or seeds.

CLXXXV. FAGELIA (evidently the name of some botanist or naturalist). Neck. elem. no. 1257. D. C. legum. mem. ix. prod. 2. p. 389. but not of Schwenk.

LIN. SYST. *Diadelphia, Decandria*. Calyx cleft into 5 parts beyond the middle, with the segments linear, acute, and straight, the two superior ones joined together a little higher up than the others. Corolla with a reflexed vexillum, and a very blunt keel, which is longer than the wings. Stamens diadelphous. Legume ovate-cylindrical, turgid, 6-seeded, 1-celled, 2-valved. Seeds ovate,

with a lateral hylum.—A decumbent twining subshrub, clothed with glandular clammy hairs, and rather hairy on the stems, leaves, calyxes, and legumes. Stipulas ovate, acuminate. Leaves petiolate, pinnately-trifoliate; leaflets rhomboid, the terminal one remote from the lateral ones. Racemes axillary, longer than the leaves. Flowers yellow, but with the carina tipped with violet, on long distant pedicels, which are at length deflexed.

1 *F. BITUMINOSA* (D. C. prod. 2. p. 389.) *h. C. G.* Native of the Cape of Good Hope. Herm. lugd. 493. with a figure. *Glycine bituminosa*, Lin. spec. 1024. Lam. ill. t. 609. f. 2. Burm. fl. cap. prod. 21. Thunb. fl. cap. 591. Ker. bot. reg. 261. *Glycine viscosa*, Moench. *Dolichos hirtus*, Hortul. *Crotalaria glycinea*, Lam. dict. 2. p. 200. ex herb. Juss. and mus. par. *Clammy Fagelia*. Fl. April, Sept. Clt. 1774. Shrub tw. *Cult.* See *Kennedy*, p. 344. for culture and propagation.

CLXXXVI. WISTARIA (in honour of Caspar Wistar, late professor of anatomy in the university of Pennsylvania). Nutt. gen. amer. 2. p. 115. D. C. legum. mem. ix. prod. 2. p. 389.—Thyranthus, Ell. journ. acad. sci. philad. 1818. 1. no. 13. p. 371. but not of Schrank.—Kraunhia, Rafin.

LIN. SYST. *Diadelphia, Decandria*. Calyx campanulate, somewhat bilabiate (f. 48. a.), upper lip with 2 short teeth, lower one with 3 subulate teeth (f. 48. a.). Corolla papilionaceous (f. 48. b.). Vexillum bicallose. Wings conforming to the keel, which is 2-edged. Stamens diadelphous (f. 48. c.). Nectariferous tube girdling the stipe of the ovary. Legume standing on a short stipe, coriaceous, 2-valved, 1-celled, rather torulose at the seeds.—Shewy climbing shrubs, with impari-pinnate exstipulate leaves, and terminal and axillary racemes of bluish lilac flowers, which when in a young state appear like aments from bracteas, which fall off before the flowers expand.

1 *W. FRUTESCENS* (D. C. prod. 2. p. 390.) wings of flower biarticulate; ovary glabrous. *h. C. H.* Native of Virginia, Carolina, and Illinois, in boggy places. Sweet, fl. gard. 2d series, t. 104. *Glycine frutescens*, Lin. spec. 1067. Sims, bot. mag. 2103. *Apios frutescens*, Pursh. fl. amer. sept. 2. p. 474. *Wistaria speciosa*, Nutt. l. c. *Thyranthus frutescens*, Ell. l. c. *Phaseoloides*, hort. ang. 55. t. 15. Flowers sweet-scented, bluish purple; the vexillum with a greenish yellow spot at the base. An elegant climber when in flower. (f. 48.)

*Shrubby Wistaria.* Fl. Ju. Sept. Clt. 1724. Shrub cl.

2 *W. CHINENSIS* (D. C. l. c.) wings of flower with one auricle each; ovary villous. *h. C. H.* Native of China. Sweet, fl. gard. 211. *Glycine Chinensis*, Sims, bot. mag. 2083. *G. Sinensis*, Ker. bot. reg. t. 650. Lodd. bot. cab. 773. *Wistaria Consequana*, Loudon, hort. brit. p. 315. Flowers larger than those of the preceding species, of a bluish purple-colour. This is a most elegant climber when in flower.

*China Wistaria.* Fl. May, June. Clt. 1818. Shrub cl.

3 *W. FLORIBUNDA* (D. C. prod. 2. p. 390.) stems and leaves glabrous. *h. C. H.* Native of Japan. Too vulgo Fudsi, Kœmpf. amœn. 5. p. 856. *Dolichos polystachyos*, Thunb. jap. 281. Houtt. pl. syst. 8. p. 563. t. 64. f. 2. but not of Lin. *Glycine floribunda*, Willd. spec. 3. p. 1066. *Dolichos Japonicus*, Spreng. syst. 3. p. 252. Racemes of flowers long, very elegant. Corolla purple and white mixed.

FIG. 48.

*Bundle-flowered Wistaria.* Shrub cl.

*Cult.* All the species of *Wistaria* are very elegant when in flower, and being all hardy climbers, deserve to be cultivated in every collection of plants. They grow best in light rich earth, and they should be nailed against a south wall, where they will flower in great profusion. The China species being an early flowerer, has a beautiful appearance when planted in a border in the green-house, and the shoots trained to the rafters. They are all easily increased by cuttings planted either in sand or mould, but they are generally propagated by layers.

CLXXXVII. APIOS (from *apios*, *apion*, a pear; in reference to the form of the tubers of the roots). Boerh. lugd. 2. p. 53. Moench. meth. 165. Pursh. fl. amer. sept. 2. p. 459. Nutt. gen. amer. 2. p. 113.—Glycine, sect. 1. Ell. act. soc. phil. 1818. vol. 1. p. 385.—Bradlea, Adans. fam. 2. p. 324.

LIN. SYST. *Diadélphia*, *Decándria*. Calyx campanulate, with 4 almost obsolete teeth, and one acute elongated one under the keel. Corolla papilionaceous, with a falcate linear carina, bent back upon the top of the vexillum. Stamens diadelphous. Stipe of ovary sheathed by a little tube. Stigma emarginate. Legume many-seeded, and 2-celled; the seeds intercepted by dissepiments.—Climbing smooth herbs, with tuberous eatable roots, impari-pinnate leaves, and axillary racemes of brownish-purple sweet-scented flowers. Bracteoles closely adpressed to the calyx, but very soon falling off.

1 A. TUBEROSA (Moench. l. c.)  $\mathcal{U}$ .  $\odot$ . II. Native from Pennsylvania to Carolina, on the mountains, in hedges, and among bushes. Glycine Apios, Lin. spec. 1067. Sims, bot. mag. 1198. Schkuhr, handb. 198.—Moris. hist. 2. t. 9. f. 1. Flowers brown, sweet-scented. Tubers of the roots edible, and farinaceous, much like those of *Lathyrus tuberösus* sold in some of the German markets, and seldom larger, though more numerous, growing, however, sometimes to a large size.

*Tuberous-rooted Apios.* Fl. Aug. Sept. Clt. 1640. Pl. tw.

*Cult.* Apios is an elegant climbing plant, which grows freely in common garden soil, and is easily increased by the tubers from the roots. Its branches require to be supported by stakes like peas.

CLXXXVIII. PHASEOLUS (from *phaselus*, a little boat; supposed resemblance in pods). Lin. gen. 866. Lam. ill. 610. Savi. diss. in 8vo. 1824. D. C. prod. 2. p. 390.

LIN. SYST. *Diadélphia*, *Decándria*. Calyx campanulate, bilabiate; upper lip bidentate, lower one 3-parted. Corolla papilionaceous. Keel, style, and stamens spirally twisted together, rarely incurved. Stamens diadelphous. Style of ovary sheathed by the tubular torus. Legume compressed or cylindrical, 2-valved, many-seeded; the seeds separated by a kind of cellular substance, and furnished with an oval-oblong hylum.—Herbs or subshrubs, with usually twining stems. Leaves pinnately-trifoliate, with the leaflets stipellate at the base. Racemes axillary. Pedicels usually twin, always 1-flowered. The most part of the species are not well defined.

SECT. I. EUPHASEOLUS (from *eu*, well, and *phaseolus*; this section contains the genuine species). D. C. prod. 2. p. 390. Legumes compressed.

§ 1. *Caracalla* (from the Celtic words *car*, a head, and *cal*, a covering; was the name of a hooded dress worn by the Gauls). *Stems frutescent.* *Roots fasciculately-tuberous.* *Leaflets entire.* *Vexillum twisted.*

1 P. CARACALLA (Lin. spec. 1017.) plant twining, hardly pubescent; leaflets ovate-rhomboid, acuminate; racemes longer than the leaves; teeth of calyx nearly equal; vexillum and carina spirally twisted; legumes straight, torulose, pendulous.  $\mathcal{U}$ .  $\odot$ . S.

Native of the East Indies. Andr. bot. rep. t. 341. Delaun. herb. amat. t. 31. Savi. mem. p. 11.—Triumph. obs. t. 94.—Trew. pl. rar. p. 14. t. 10. Flowers large, purple and yellowish mixed. This plant is cultivated in many parts of the south of Europe and north of Africa. It is a very curious plant, and will grow and flower freely, if kept free of the red spider. It was named *caracalla* by the Portuguese, who first brought it from South America, in consequence of its hooded flower.

*Caracalla Kidney-bean or Snail-flower.* Fl. Aug. Sept. Clt. 1690. Pl. tw.

2 P. TUBEROSUS (Lour. coch. p. 434.) plant twining, shrubby; leaflets unknown; stipulas 2-horned; racemes almost terminal; upper lip of calyx emarginate, lower one 3-parted, nearly equal; vexillum revolute; legume compressed.  $\mathcal{U}$ .  $\odot$ . G. Native of CochinChina. Roots tuberous; tubers large, in fascicles, eatable. Flowers yellow.

*Tuberous-rooted Kidney-bean.* Shrub tw.

3 P. ROSTRATUS (Wall. pl. asiat. rar. 1. p. 50. t. 63.) plant perennial, pilose; leaflets ovate, acute; racemes axillary, few-flowered, on long peduncles; wings variously twisted; keel with a very long spiral beak; legume flat, linear, arched.  $\mathcal{U}$ .  $\odot$ . S. Native of the mountains contiguous to Bengal, and of the Burman empire on mountains near the banks of the Irawaddi, at Paghamew and Frome. Flowers pale violet; wings ornamented with white veins.

*Beaked-flowered Kidney-bean.* Pl. tw.

§ 2. *Perénnes* (*perennis*, perennial; roots permanent). *Stems herbaceous.* *Roots perennial.* *Racemes of flowers somewhat panicled.* *Leaflets entire.*

4 P. PERENNIS (Walt. fl. car. 182.) plant twining, pubescent; leaflets ovate, acuminate, triple-nerved; racemes 1-3-together, axillary, panicled, longer than the leaves; bracteoles small; legumes broad, pendulous, falcate, mucronate.  $\mathcal{U}$ .  $\odot$ . II. Native of Carolina and Georgia. Ell. sketch. 2. p. 228. P. paniculatus, Michx. fl. bor. amer. 2. p. 60. Dolichos polystachyus, Lin. spec. 1022. Flowers purplish-violet. Vexillum bicallous.

*Perennial Kidney-bean.* Fl. July, Aug. Clt. 1824. Pl. tw.

5 P. MACROSTACHYUS (Ell. in journ. sc. nat. phil. 1818. p. 384.) plant twining, pubescent; leaflets ovate, acuminate, villos beneath; racemes very long, simple; pedicels in fascicles.  $\mathcal{U}$ .  $\odot$ . II. Native of North America. Like *P. perennis*, but more robust, and with the leaflets thick, not membranous. Racemes of flowers 12-14 inches long. Flowers purplish violet.

*Long-spiked Kidney-bean.* Pl. tw.

§ 3. *Macropòdii* (from *makros*, *makros*, long, and *πους*, *podos*, a foot; in reference to the peduncles being longer than the leaves). *Roots annual.* *Leaflets entire.* *Peduncles longer than the leaves.*

6 P. BRACTEATUS (Spreng. syst. 3. p. 250.) branches angular, pubescent; leaflets obovate-oblong, glabrous, rather coriaceous, reticulately-veined; peduncles axillary, few-flowered; bractees lanceolate, few-nerved; legumes linear.  $\odot$ .  $\odot$ . S. Native of Brazil. Flowers purple.

*Bractate-flowered Kidney-bean.* Pl. tw.

7 P. ALATUS (Lin. spec. 1017.) plant twining, rather pilose; leaflets ovate, acuminate; peduncles very long, spicate; flowers twin, sessile; upper lip of calyx broad, entire; wings of corolla equal to the vexillum in length; legume linear, compressed, deflexed.  $\odot$ .  $\odot$ . II. Native country unknown.—Dill. hort. elth. p. 314. t. 235. f. 303. Flowers at first purple, but at length becoming violaceous. Seeds compressed, of a brownish red-colour, with a white eye.

*Winged Kidney-bean.* Fl. July. Clt. 1732. Pl. tw.

8 P. BRACTEOLATUS (Nees et Mart. in nov. act. henn. 12. p.

27.) plant twining, hairy; leaflets ovate-trapezoid, mucronate; peduncles spicate, longer than the leaves, bearing a fascicle of sterile bracteas on both sides at the base; legumes linear, hairy, many-seeded. ☉. ☿. S. Native of Brazil. Flowers dark purple.

*Bracteolate Kidney-bean.* Pl. tw.

9 *P. LEPTOSPERMUS* (Lag. nov. gen. 22.) plant twining, hairy, much branched; leaflets deltoid, obtuse; spikes axillary, and terminal; peduncles many-flowered. ☉. ? ☿. S. Native of New Spain.

*Slender-seeded Kidney-bean.* Pl. tw.

10 *P. LINEARIS* (H. B. et Kunth, nov. gen. amer. 6. p. 445.) plant twining a little; branches and petioles beset with retrograde stiff hairs; leaflets linear, obtuse, mucronate, somewhat cordate at the base; the odd leaflet 3-toothed and acuminate; peduncles very long, few-flowered; bracteoles oblong, 5-nerved. ☉. ☿. S. Native of South America, on the banks of the Orinoco. Pedicels alternate. Flowers purplish, about the size of those of *Lathyrus odoratus*. Peduncles 6-8 inches long.

*Linear-leafletted Kidney-bean.* Pl. tw.

11 *P. LEPTOMYLIUS*; plant twining; stems smooth; leaflets linear, obtuse, mucronate, with revolute margins; peduncles long, hispid, few-flowered; stipulas small, ovate; bracteas small, sagittate from 2 descending auricles at the base; pedicels opposite; legume linear, pubescent. ☿. ☿. S. Native of Mexico. *P. linearis*, Sesse et Moc. in herb. Lamb. Flowers about the size of those of *Vicia sativa*, apparently purplish.

*Slender-leafletted Kidney-bean.* Pl. tw.

12 *P. TRUXILLIENSIS* (H. B. et Kunth, nov. gen. amer. 6. p. 451.) plant twining; branches and petioles beset with retrograde pili; leaflets ovate, ending in a narrow acumen, obsoletely cordate at the base, and clothed with adpressed pubescence; racemes on long peduncles, upper lip of calyx broad, emarginate, lower lip 3-lobed, acute, lateral lobes falcate. ☉. ☿. S. Native of Peru, near Truxillo. Flowers about the size of those of *Lathyrus odoratus*, of a pale rose-colour or yellowish violet.

*Truxillo Kidney-bean.* Pl. tw.

13 *P. PILOSUS* (H. B. et Kunth, nov. gen. amer. 6. p. 453.) plant twining; branchlets and petioles beset with retrograde pili; leaflets rhomboid-ovate, obtuse, cuneate at the base, and clothed with adpressed pili on both surfaces; racemes pedunculate, many-flowered, longer than the leaves; bracteoles linear, and are, as well as the calyxes, hairy; upper lip of calyx broad, emarginate, lower one 3-lobed, acute; legumes villous. ☉. ☿. S. Native of South America, on the banks of the river Magdalena near Morales. Corolla yellow.

*Pilose Kidney-bean.* Pl. tw.

14 *P. PORTORICENSIS* (Spreng. syst. 3. p. 352.) plant climbing, smooth; racemes rather compound, elongated; pedicels somewhat verticillate, villous; calyxes bractless, truncate; wings about equal in length to the vexillum. ☉. ? ☿. S. Native of Porto-Rico.

*Porto-Rico Kidney-bean.* Pl. cl.

15 *P. SPECIOSUS* (H. B. et Kunth, nov. gen. amer. 6. p. 452.) plant twining; branches and petioles pubescent; leaflets ovate, somewhat acuminate-mucronate, puberulous above, and tomentosely pubescent beneath; peduncles long, few-flowered; lobes of calyx ciliated, superior one broad, emarginate, lower ones acute, lateral ones falcate. ☉. ☿. S. Native on the banks of the Orinoco, and of Mexico near Misantla. *P. grandiflorus*, Sesse et Moc. Flowers large, shewy. Legumes unknown.

*Shewy Kidney-bean.* Fl. July, Aug. Clt. 1830. Pl. tw.

16 *P. PEDUNCULARIS* (H. B. et Kunth, nov. gen. amer. 6. p. 447.) plant twining; branches scabrous from retrograde stiff hairs; leaflets ovate, acuminate; racemes on very long, ascending peduncles; upper lip of calyx short, emarginate, lower one

3-lobed, acute; legume elongated, erect, linear, pubescent, mucronate. ☉. ☿. S. Native of New Granada. Allied to *P. semi-erecta*.

*Long-peduncled Kidney-bean.* Pl. tw.

17 *P. CIRRHOSUS* (H. B. et Kunth, nov. gen. amer. 6. p. 448.) plant twining, cirrhiferous, glabrous; leaflets ovate, obtuse, roughish, rounded at the base; racemes on long peduncles; two upper lobes of calyx rounded and short, lateral ones falcate, and the one under the keel straight. ☉. ☿. H. Native of Mexico, near Vera-Cruz. Legume unknown.

*Tendrilled Kidney-bean.* Pl. tw.

18 *P. SYLVESTRIS* (H. B. et Kunth, nov. gen. amer. 6. p. 450.) plant twining; branches beset with retrograde pili; leaflets deltoid-ovate, acuminate-mucronate; racemes twin, on long peduncles; bracteoles large, elliptic; upper lip of calyx broad, entire, lower one 3-parted, obtuse. ☉. ☿. H. Native of Mexico, in woods between Valladolid and Ario. Flowers scarlet. Legumes unknown. Very like *P. multiflorus*.

*Wood Kidney-bean.* Fl. July, Aug. Clt. 1825. Pl. tw.

19 *P. COCCINEUS* (Sesse et Moc. in herb. Lamb.) plant twining; leaves and peduncles pubescent; leaflets broad-ovate, oblique, acuminate, strongly 3-nerved; stipulas lanceolate; peduncles length of leaves; flowers umbellate; bracteas forming an involucre to the umbel of flowers; upper segment of the calyx very broad, and much nerved. ☿. ☿. S. Native of Mexico. Flowers about the same size and colour as those of the scarlet-runner.

*Scarlet-flowered Kidney-bean.* Pl. tw.

20 *P. FORMOSUS* (H. B. et Kunth, nov. gen. amer. 6. p. 449.) plant twining; branches beset with retrograde hairs; leaflets deltoid-ovate, acutish, mucronate; racemes on long peduncles; bracteoles ovate-orbicular; upper lip of calyx broad, entire, lower one 3-parted, acute; young legumes hairy. ☉. ☿. H. Native of New Spain, in frigid places near Toluca. Fl. scarlet. Very nearly allied to *P. multiflorus*.

*Beautiful Kidney-bean.* Pl. tw.

21 *P. MULTIFLORUS* (Willd. spec. 3. p. 1030.) plant twining, smoothish; leaflets ovate, acuminate; racemes pedunculate, longer than the leaves; pedicels twin; bracteoles rather shorter than the calyx, and adpressed to it; legumes pendulous, rather falcate, torulose, scabrous. ☉. ☿. H. Native of South America. Savi, diss. 2. p. 11. The scarlet-bean was only regarded as a variety of the kidney or French-bean by Linnæus, but now found to be specifically distinct. The seeds are large, purple, marked with black, and sometimes pure white. The culture and use of the scarlet-bean are the same as that of *P. vulgaris* or French-bean, which see, no. 22.

*Var. α, coccineus*; corolla deep scarlet. *P. vulgaris coccineus*, Lin. *P. coccineus*, Kniph. cent. 12. no. 71. Lam. dict. 3. p. 70. Moris. hist. 52. t. 5. f. 4.—Corn. can. t. 185. Ger. emac. 1215. This variety is called the scarlet-runner.

*Var. β, albiflorus*; flowers white. To this variety belong the white-runner, white-Dutch-runner, and perhaps the variable-runner.

*Many-flowered Kidney-bean or Scarlet-runner.* Fl. Jul. Sep. Clt. 1633. Pl. tw.

§ 4. *Brachypodii* (from βραχυς, brachys, short, and ποὺς ποδός, pous podos, a foot; in reference to the peduncles being shorter than the leaves). *Roots annual. Leaflets entire. Peduncles shorter than the leaves. Most of the species of this division are cultivated in the gardens under the name of French-beans or kidney-beans.*

22 *P. VULGARIS* (Savi, mem. 3. p. 14.) plant twining, smoothish; leaflets ovate, acuminate; racemes pedunculate, shorter than the leaves; pedicels twin; legumes pendulous, straight,

rather torulose, ending in a long mucrone; seeds ovate, a little compressed. ☉. ♀. H. Native of the East Indies, but has been cultivated in the gardens from time immemorial. It is a very variable plant, either twining or dwarf, with white or lilac flowers, and the seeds are very variable both in colour and shape. *P. vulgaris* and *P. nana*, Lin.—Lob. icon. t. 59. Moris. oxon. sect. 2. t. 5. f. 1. Riv. tetra. irr. t. 30 and 29. f. 1, 2, and 3.—Park. par. t. 523. f. 2.—Savi, mem. 3. p. 14. where he distributes the varieties into the three following series, marked A. B. C.

*A. unicolor*; seeds of one colour only, black, blue, white, cream-coloured, lilac, yellow, pale red, greenish yellow, or reddish, but never with the colours mixed. *P. Nigerrimus* and *P. lilacinus* of Zucc. obs. no. 81. To this series belong the *early-yellow*, *dwarf*, *early-black* or *negro*, *early-white*, *Battersea-white*, *Canterbury-white*, *dun-coloured*, *tawny*, *large white-dwarf*, *Canterbury* and *Battersea small-white runners*, &c.

*B. fasciatus*; seed lined with different colours, the lines broad and curved. The ground-colour of the seeds is either bluish, cream-coloured, bay colour, grey or liver-coloured, &c. To this series belong the *Zebra*, *streaked* or *striped*, and the *variable runner*, &c.

*C. variegatus*; seeds variegated, white spotted with rust colour, lead colour, or violet, blue spotted with olive colour, or yellow spotted with brown. To this series belong *early-red-speckled*, *black-speckled*, and *brown-speckled*, &c.

The common *dwarf kidney-bean* or *French-bean*, *Haricot* of the French, *Schminkbohne* of the Germans, and *Pagiuolo* of the Italians, is a rather tender annual plant, flowering from June to September. The *scarlet* and *white runners*, *P. multiflorus*, are rather tenderer than the varieties of *P. vulgaris* or *kidney-bean*; they produce flowers from July to September. The stems of both species twine more or less, though little of this propensity is shown by the dwarf kinds. The flowers are white, red, or purple. The pods swelling slightly over the seeds, which are generally kidney-shaped, smooth, and shining; when ripe varying much in colour and shape, according to the variety, and either white, black, blue, or spotted; some of the most distinct of these have been considered by Savi as distinct species, which we have described as such. The pods of both the *kidney-beans* and *runners* may be had in perfection from June to October. Speechly suggests (Practical Hints on Domestic Economy, p. 15.), that the culture of the *kidney-bean* might become an object of national or field culture in this country, and be particularly useful in times of scarcity, more especially as on good land it will flourish and grow luxuriantly even in a dry parching season; in which respect it differs from most other culinary vegetables. It is an article of field culture in most warm countries, especially France and America.

*Use.* The unripe pods are chiefly used in Britain as a legume, for which they are in great estimation throughout the year, being produced by forcing when they cannot be grown in the natural ground. They are also used as a pickle. On the continent the ripe seeds are much used in cookery, forming what are called *Haricots*, of different kinds, and entering into some sorts of soups. In the end of the season, when frost is expected, the haulm of the *kidney-bean* crop is gathered and dried like that of the pea in this country, and the ripe beans afterwards threshed out, and preserved for use through the winter.

*Constitution and habit.* The varieties of both species, *P. vulgaris* and *P. multiflorus*, and all those belonging to the present division of the genus, are tender in their nature, unable to grow freely in the open garden before April or May, the seeds being liable to rot in the ground from the effects of wet and cold, if planted before the beginning of the former month, even in a dry soil. The plants make but little progress till settled warm weather.

However, when sown in the proper season from April or May through the course of summer till the beginning of August, they succeed well, making liberal returns of fruit from June or July to October. The dwarf kinds require no support; but the runners, rising with twining stems 8 or 10 or more feet, require tall sticks or poles to climb upon, or lines suspended from a contiguous building or fence, or from poles. They produce pods their whole length. It deserves notice, that the tendrils of the twining stems turn to the right, or in a direction contrary to the apparent diurnal course of the sun, a circumstance, however, not uncommon among papilionaceous twiners.

*Estimate of sorts.* The dwarf kinds, or the varieties of *P. vulgaris*, bear sowing a little sooner than the runners, or varieties of *P. multiflorus*, and make quicker returns. They are besides more convenient to cultivate on a large scale, and the smaller pods which they produce are esteemed by many to have more delicacy of flavour. On this account it is usual to raise the larger supply from the varieties of *P. vulgaris*, or dwarf kinds. The *early-yellow*, *early-black*, and *early-red-speckled* are among the most hardy and most forward: the *early-white* comes in a few days later, but it is of superior flavour. The *Canterbury*, *Battersea*, *black-speckled*, *brown-speckled*, *dun-coloured*, *striped*, and *tawny* are plentiful lasting bearers. Growers for sale in general depend on the *Canterbury* and *Battersea* for main crops; but the others just named are also profitable sorts, and acceptable to the consumer. The dwarf *kidney-bean* continues to produce young pods in abundance and in perfection only about 3 weeks or a month. The runners, or varieties of *P. multiflorus*, yield a succession of fruit from the same sowing a much longer time than the dwarfs. The *scarlet-runner* ranks first for its prolific property and long continuance in fruit; the pods are thick, fleshy, tender, and good, if gathered while moderately young. The *white* variety is equally eligible for the principal crop. The *Dutch-runner* is also a great bearer, in fine long pods, but not so lasting as the former. As to the smaller runner kinds, they are rather degenerate varieties of the *Canterbury* and *Battersea white-dwarfs*, casually shooting into runners; they bear in tolerable abundance slender neat pods, which are very good and tender eating, though not so eligible for the principal crop of runners as the scarlets.

*Quantity of seed.* Half a pint will sow a row 80 feet in length, the beans being placed from  $2\frac{1}{2}$  to 3 inches apart.

*Soil.* The soil for all the kinds should be light and mellow, inclining to a dry sand for the early sowings, and to a moist loam for the sowing in summer.

*Culture of dwarf kidney-beans, or varieties of P. vulgaris.* About the beginning of April, if the weather be temperate, fair, and settled, make the first sowing, in a dry south border, or other sheltered compartment with a good aspect, or sow in a single row close under a south fence, beginning with a small proportion of the most hardy early sorts. It is a good method to follow in a week with a second sowing, in case the former should fail. You may sow for a larger crop about the middle or 20th of April. For the early crops make the drills 2 feet asunder. The common depth is an inch or inch and a half for the smaller sized beans. Drop in the beans in each row at this season pretty close together, as many may fail, from 1 to 2 inches apart. Cover them in evenly the full depth of the drill. For the main crops you may sow more fully towards the end of April; and in full crops in May and June, a portion once every fortnight or three weeks of the *Canterbury* or other sorts approved, for a main supply. Draw drills 2 or  $2\frac{1}{2}$  feet asunder, an inch and a half or 2 inches deep. Drop the beans 3 inches apart, and cover them with earth the full depth of the drills. For supplies in succession, sow in July once or twice, and make a moderate sowing at the beginning of August for a late and last crop. In

the drought of summer it is advisable to accelerate the germination of the seed, by laying it in damp mould till it begins to sprout, or by soaking it in soft water for 6 or 8 hours previous to sowing, and by watering the drills to receive them. Crops sown after the middle of July should be favoured in situation, or the time of their bearing will be much shortened by the decline of summer. From this course of sowings, a regular succession of young green pods will be produced from June and July till October. As the plants of the different crops advance in growth, occasionally hoe and stir the ground between the rows. Cut down all weeds as they spring. Draw some earth to the stems of the plants as they rise in height, which will strengthen and forward them considerably. When advanced to full bearing, it is advisable to gather the pods in moderate, young, or medium growth.

*Culture of runners, or varieties of P. multiflorus.* The runners may be sown in a small portion towards the end of April, if the weather is tolerably warm and dry; but as the seeds of the runners are rather more tender than those of the dwarf kidney-beans, they are more liable to rot in the ground by wet or cold, especially those of the scarlet and white runners, therefore the beginning or middle of May will be time enough to sow a considerable crop, and you may sow a full crop about the beginning of June. Allot principally the scarlet and large white runners. Some Dutch-runners are very eligible as a secondary crop. The first crops should have the assistance of a south wall. Intermediate crops may be sown in any open compartment, or against any fence, not looking north. The latest-sown will continue bearing the longer under a good aspect and shelter. In sowing, draw drills about 1½ or 2 inches deep. Let parallel rows be at least 4 feet asunder, to admit in the intervals tall sticks or poles for the plants to climb upon. Place the beans in the drills 4 inches apart, and earth them in evenly, the depth of the drills. A row contiguous to a fence or building may ascend upon lines. Some may be sown in a single row along a border, or on each side of a walk; and have the support of a slight trellis of laths and laces, or poles may be placed at certain distances, having a rope drawn along their tops, having lines suspended from it, or they might be arched over with similar materials, so as to form a shady walk or bower. In cold wet seasons, or when requisite to have a few plants more forward than the general crop, some scarlet-runners may be sown in April, either in a slight hot-bed, or in pots under frames or hand-glasses, to raise and forward the plants till 2 or 3 inches high, then, at the end of May, transplant them into a garden. As the plants in the open ground advance from 3 to 6 inches in growth, hoe up some earth to the stems, cutting down all weeds at the same time, and when they begin to send forth runners, place suitable supports to each, such as are mentioned above, and conduct the tendrils to the sticks or lines, turning the stems in a contrary direction to the sun. The ascending stems will soon come into flower, podding at the joints in long succession. They are so prolific that the returns, from 3 sowings made in May, June, and July, will last from July till October.

*Taking the crop.* Gather the pods, both from the dwarfs and runners, while they are young, fleshy, brittle, and tender, for then are they in highest perfection for the table; and the plants will bear more fully, and last longer in fruit, under a course of clean gathering, not leaving any superabundant pods to grow old.

*To save seed.* Either sow a portion for that object, or leave rows wholly ungathered of the main crops, or preserve a sufficiency of good pods promiscuously. The beans saved should be the first fruits of a crop sown at a period which throws the entire course of growth into the finest part of summer. Let them hang upon the stalks till they are fully ripe, till August or September; then let the haulm be pulled up and placed in the

sun to dry and harden the seed, which should be afterwards cleared out of the husks, bagged up, and housed.

*Forcing the kidney-bean.* It is often partially forced in hot-houses or frames, with a view to its fruiting in the open garden; and supplies of green pods are also kept up throughout the winter and spring months, by forcing in hot-houses and pits. The kidney-bean may be successfully forced in pits, hot-houses or forcing-houses, and hot-beds. The more general mode is to force in pine-stoves; the same heat which suits the pine-apple suits the kidney-bean, which is a native of India. Nicol prefers a flued pit, such as that used for nursing pine-apple plants; and Abercrombie says, "Where there are not hot-houses, or where kidney-beans are to be raised in quantities for the market, the most economical and successful mode will be found a flued pit, with rather a strong bottom heat, and covering the bed with light vegetable mould."

*Sorts.* Abercrombie recommends the *Early-speckled*, *Early-negro*, and *Dun-coloured dwarfs*. Nicol says the *Speckled-dwarf* is the best sort.

*Sowing.* Sow in flat boxes or pans filled with fine light earth, and cover the seed the depth of an inch. Let them be placed in a stove or hot-bed, and have moderate supplies of water, and they will be fit to transplant when about 3 inches in height. Plant them in rows across the bed of the pit, 16 inches apart and 3 inches distant in the line.

*Culture.* Water after planting, and afterwards as required; give abundance of air every fine day, and earth up the plants as they advance in growth, in order to give them strength.

*Time of beginning to force.* M'Phail says, "if you wish to endeavour to have kidney-beans green all the year, you should plant the seeds and begin to force in August." Abercrombie observes, "some forcers, quite in opposition to the season, raise kidney-beans in August, and thence to the 21st of December, which day may be regarded as the boundary between late and early forcing."

*Temperature.* The heat by fire at night need not exceed 50°, according to Nicol, but Abercrombie recommends 60° for the minimum, and 75° for the maximum.

*Successional supplies,* are to be obtained by sowing every month or 6 weeks, for which purpose the pits may be divided, in a temporary way, by fitting a board neatly under the middle rafter. By this means the one half of the pit may be kept cooler by matting or not matting, or by the admission of more or less air; this will protract the growth of the beans more in one part than the other.

*Forcing kidney-beans in a hot-house.* "The most early fruit in perfection is obtained by culture in a stove, sowing from mid-winter till the end of March. Sow in pots or oblong boxes, containing a mixture of light fresh earth and vegetable mould, depositing the seeds either in a triangular or quincunx order, and fill an inch deep. If the plants are to fruit where sown, the cradles should be 10 inches deep; but if they are to be transplanted, which admits a greater number in the same space, the seed-pots or boxes may be shallow. Do not fill the cradles with mould at first, to allow of gradually earthing up. When the beans have germinated, sprinkle the earth with water; after the plants have risen, give moderate waterings every other day; the last crops may want water every day. Sprinkle also the leaves with water, warmed by standing some time in the house. Those plants raised in shallow pans should be transplanted for fruiting when 2 or 3 inches high. It is sometimes proper to stop luxuriant runners. These incidental crops may stand in rows on the flues, or on shelves; but take care that they do not shade the pines and other principal plants. For succession sow every fortnight or 3 weeks."—Abercrombie.

*Insects.* Nicol observes "that the thrips often attack French

beans in the hot-house, and therefore the plants should be fumigated with tobacco, which destroys that insect.

**Forcing kidney-beans in a peach or cherry-house.** French-beans, Nicol observes, may be successfully planted out in the borders of an early cherry-house or peach-house, so that they may not be overmuch shaded by the trees; but they seldom do much good in a vine, where they are shaded by the foliage of the vines.

**Forcing kidney-beans in a common hot-bed.** "Under the deficiency of a house, you may have recourse to a hot-bed and frame, but the culture will be attended with more trouble, the course will be longer, and the fruit rarely so fine or so plentiful; nor without fire-heat can the difficulties of late or very early forcing be so well contended with. From the middle of February to the beginning of April, is the most successful period for forcing the kidney-bean in a hot-bed. The *Early-white-dwarf*, from its low growth, is to be sown in preference to the kinds recommended for the stove, unless it be intended to fruit the plants in a deeper frame than ordinary. The *Early-yellow* and *Early-black* are next, as not growing very high. The temperature for the kidney-bean is 60° for the minimum and 75° for the maximum of the fruiting-bed. In forcing soon in the spring, raise the plants on a smaller bed, earthed over with light rich compost, 6 inches deep. Sow the beans thickly, covering them to the depth of an inch. The second hot-bed should be earthed over to the depth of 8 or 9 inches. Into this transplant the seedlings, as soon as they are 2 or 3 inches high, setting them in cross rows 12 or 15 inches asunder, and 2 or 3 inches in the line, or when the season is so far advanced that one bed, with the help of linings, will bring the plants well into fruit, you may sow at once, at the full distance, in a similar hot-bed, to continue for podding. Cover the glasses every night with garden-mats, also particularly in severe weather. Admit fresh air moderately every mild day, and give occasional gentle waterings. The plants raised in February will come into bearing in April and May, making moderate returns; a new crop every three weeks will keep up the succession; those sown at the beginning of April will last till the middle or end of June, when they will be succeeded by the early half-sheltered crops in the open garden." *Abercrombie*.

**Crop raised under glass, to fruit in the open garden.** At the end of March you may sow a small portion under glasses, for transplanting into the open ground in the first or second week of May. It is not so well to sow in patches on the surface of the ground, as in small pots, because the plants can be turned from the latter with less check to their growth, when transplanted. Sow 3 beans in each pot, and when the seedlings are 2 or 3 inches high, harden them by degrees to the full air, and plant them on a good open border as soon in May as the season will suit. They will yield about a fortnight sooner than the earliest raised under exposure to the weather.

**Crop raised on slight heat.** A crop to fruit early in the open garden may be accelerated with more certainty by plunging the pots containing the seed beans in a gentle hot-bed, or some sown in shallow pans or boxes may be set on the shelves of a stove. Just at the opening of April will be early enough to begin, as the plants will otherwise get too forward for the weather to proceed well without a continuance of artificial heat. Having nursed them to the proper stage, plant out under a south fence, either 3 inches apart, if in a single line, or 18 inches by 3 if in 2 lines; or it may be better to set the plants in patches of 7 or 9, to receive the temporary shelter of a hand-glass, lest the transition from a hot-bed all at once to the fluctuating air of spring be too violent. *Abercrombie*.

**Field culture of the kidney-bean.** In this country the culture of the kidney-bean has been confined to gardens, but it might

be grown equally well in dry, warm, rich, and sheltered soils, being grown in the fields of Germany, Switzerland, and similar climates. The sort generally used for this purpose is the small *Dwarf-white*. The ground is prepared by several turnings, and the seed is dibbled in rows 18 inches or 2 feet asunder, in the beginning of May. The ground is hoed and weeded during the summer, and the crop is ripe in August. It is usually harvested by pulling up the plants, which being dried are stacked or threshed. The haulm is of little bulk or use, but the grain is used in making the esteemed French dish called haricot, which it were desirable the cottagers of this country were made acquainted with. There is perhaps no dish so easily cooked, and at the same time so agreeable and nourishing. The beans are boiled and then mixed with a little salt and butter, or other fat, and a little milk or water and flour. From 3840 parts of kidney-beans, Einhoff obtained 1805 parts of matter analogous to starch, 851 of vegeto-animal matter, and 799 parts of mucilage. Haricots and lentils are much used in all Catholic countries during Lent and magre days, as they, from their peculiar constituents, form so excellent a substitute for animal food. During the prevalence of the Roman religion in this country they were probably much more generally used than at present.

**Common Kidney-bean or French-bean.** Fl. June, Sept. Clt. 1597. Pl. 1 foot or tw.

23 *P. COMPRESSUS* (D. C. prod. 2. p. 392.) plant twining a little, smoothish; leaflets ovate, acuminate; racemes pedunculate, shorter than the leaves; pedicels twin; legumes compressed, somewhat torulose, mucronate; seeds compressed. ☉. II. Native country unknown. Legume 5-6 inches long. Flowers white. Seeds white, ovate, obtuse, straight, or concave on the side of the hilum. *P. Romanus*, Savi, mem. 3. p. 17. t. 10. f. 20. This plant is called *Haricot de Soissons*, and *Haricot d'Hollande*, in French.

*Var. α, humilis* (D. C. l. c.) stem humble, erect; seeds smaller. Called in French *Le Soissons nain*.

*Var. β, major* (D. C. l. c.) stems taller; legumes twisted a little.

**Compressed-seeded Kidney-bean.** Fl. Ju. Sept. Clt.? Pl. 1 ft.

24 *P. OBLONGUS* (Savi, mem. 3. p. 17. t. 10. f. 14.) plant twining a little, smoothish; leaflets ovate, acuminate; racemes shorter than the leaves; legumes straight, rather cylindrical, ending in a long acumen; seeds rather cylindrical, obtuse, or truncate. ☉. II. Native country unknown. Flowers usually of a pale violet colour. Seeds of one colour or variegated, twice the length of the breadth, purple, whitish, or chestnut-coloured.

**Oblong-seeded Kidney-bean.** Fl. June, Sept. Pl. 1 to 2 ft.

25 *P. SAPONACEUS* (Savi, mem. 3. p. 19. t. 10. f. 15.) plant humble, glabrous; leaflets ovate, acuminate; racemes shorter than the leaves; legumes straightish, mucronate, more or less torulose; seeds oblong, obtuse, compressed, spotted on the side next the hilum. ☉. II. Native country unknown. Seeds convex on the back, and rather concave in front, marbled, or clouded with black, red, and bay-coloured marks. Flowers white. Legume 5-6 inches long.

**Soapy Kidney-bean.** Fl. June, Sept. Clt.? Pl. 1 foot.

26 *P. TUMIDUS* (Savi, mem. 3. p. 19. f. 16.) plant dwarf, climbing a little, and smoothish; leaflets ovate, acuminate; racemes shorter than the leaves; legumes straightish, more or less torulose; seeds spheroidal, or ovate, turgid, white, spotless, with a convex front. ☉. II. Native country unknown. Flowers white. Legumes 3 inches long. To this species belong the garden French-beans called *Princess*, *Nain flageolet*, *Nain d'Amérique*.

**Tumid-seeded Kidney-bean.** Fl. Ju. Sept. Clt.? Pl. cl. 2 ft.

27 *P. HEMATOCARPUS* (Savi, mem. 3. p. 20. f. 17.) plant twining, tall, smoothish; leaflets ovate, acuminate; racemes

shorter than the leaves; legume straight, torose, mucronate, when in an immature state it is spotted with blood colour; seeds ovate, turgid, variegated. ☉. ☉. H. Native country unknown. Flowers pale violet. Legume 4-5 inches long. Called the *Cape kidney-bean* by gardeners.

*Bloody-fruited Kidney-bean.* Fl. July, Sept. Clt. ? Pl. tw.

28 *P. SPILÆRICUS* (Savi, mem. 3. p. 20. f. 17.) plant tall, twining, smoothish; leaflets ovate, acuminate; racemes shorter than the leaves; legumes straightish, torose, mucronate; seeds roundish. ☉. ☉. S. Native country unknown. Flowers pale violet. Legume 4-5 inches long. Seeds red, brown, flesh-coloured, or violaceous, zonate, with an areola round the margin. To this species belong the garden *kidney-beans* called *Haricot d'Orleans*, *Haricot de Prague*, &c.

*Spherical-seeded Kidney-bean.* Fl. Jul. Aug. Clt. ? Pl. tw.

29 *P. GONOSPERMIS* (Savi, mem. 3. p. 21. f. 19.) plant tall, twining, smoothish; leaflets ovate, acuminate; racemes shorter than the leaves; legumes torulose, hairy as the 2. 3. 4. of the *rub.*; seeds compressed, irregularly angled. ☉. ☉. H. Native country unknown. Flowers white or very pale violet. Legume 3-4 inches long, sometimes spotted with red. Seeds small, white, flesh-coloured, or chestnut-coloured.

*Angular-seeded Kidney-bean.* Fl. July, Aug. Clt. ? Pl. tw.

30 *P. DERA'SUS* (Schrank, hort. mon. 1. t. 89.) plant twining, smoothish; leaflets ovate, acuminate; peduncles 2-4-flowered, shorter than the leaves; bracteoles small; vexillum concave, roundish, shorter than the wings; legumes linear-oblong. ☉. ☉. H. Native of Brazil. Corolla greenish white. Seeds black, with a white hylum.

*Scraped-off or Black-seeded Kidney-bean.* Fl. June, Aug. Clt. 1819. Pl. tw.

31 *P. LUNATUS* (Lin. spec. 1016.) plant twining, smoothish; leaflets ovate, acuminate; racemes pedunculate, shorter than the petioles; pedicels twin; bracteas small, adpressed; vexillum concave, roundish; legume acinaciform, rather lunate, smooth, 2-4-seeded. ☉. ☉. S. Native of Bengal. Houtt. pfl. syst. 8. t. 63. *P. rufus*, Jacq. hort. vind. 1. t. 34. *P. lunatus*, of Lour. probably distinct from the plant of Linnaeus. Flowers small, white. Seeds dark purple, streaked with white, large. The seeds are cooked and eaten in Cochin-china as well as in the East Indies, but the plant is grown more for the beauty of the seeds than for their flavour.

*Lunate-podded Kidney-bean.* Fl. Ju. Jul. Clt. 1779. Pl. tw.

32 *P. INAMENUS* (Lin. hort. cliff. 359.) plant twining, glabrous; leaflets ovate-lanceolate, much taper-pointed; racemes pedunculate, shorter than the leaves; pedicels twin or tern; vexillum concave, shorter than the wings; legume acinaciform, acuminate. ☉. ☉. H. Native of Africa. Jacq. hort. vind. t. 66. *P. macrocarpus*, Mœrch. meth. 141. but not of Poir. Flowers with a greenish vexillum and whitish wings. Seeds compressed, variegated with white and blood-red or scarlet.

*Unpleasing Kidney-bean.* Fl. July, Aug. Clt. 1794. Pl. tw.

33 *P. XUARE'SII* (Zucc. cent. no. 81. A.) plant twining, pubescent; leaflets ovate-lanceolate, ending each in a long taper point, lateral ones dependent; racemes pedunculate, shorter than the leaves; wings of corolla elongated; legume acinaciform; seeds compressed. ☉. ☉. H. Native country unknown. Nearly allied to *P. inamœnus*.

*Xuare's Kidney-bean.* Fl. June, Aug. Clt. 1818. Pl. tw.

34 *P. PUBERULUS* (H. B. et Kunth, nov. gen. amer. 6. p. 151.) plant twining; branches and leaves pubescent; leaflets ovate, acuminate-mucronate; peduncles many-flowered, shorter than the leaves; legumes lanceolately-cultriform, glabrous. ☉. ☉. S. Native of South America, at Rio Guayre, near Caracas. Flowers bluish white. Seeds chestnut-coloured.

*Puberulous Kidney-bean.* Pl. tw.

35 *P. ADENANTHUS* (Meyer, prim. esseq. 239.) plant twining, glabrous; leaflets ovate, acuminate cuspidate, middle one lanceolate-oblong; racemes rather longer than the leaves; pedicels twin, rising from the base of glands; bracteoles ovate-roundish; legumes incurved, with scabrous margins. ☉. ☉. S. Native of Guiana, in shady humid places. Flowers large, white painted with blue.

*Gland-flowered Kidney-bean.* Pl. tw.

36 *P. TUNKINENSIS* (Lour. coch. 435.) plant twining, branched, glabrous; leaflets small, thick; racemes axillary; legume somewhat lunate, compressed, smooth, pendulous, 3-seeded. ☉. ☉. H. Native of Cochin-china. Flowers white, but the vexillum is revolute and greenish. Seeds ovate, pale, variegated with red. The plant is cultivated in Cochin-china for the sake of the seeds, which are dressed and eaten by the inhabitants.

*Tunquin Kidney-bean.* Fl. June, July. Pl. tw.

37 *P. MACROCARPUS* (Poir. suppl. 3. p. 6.) plant twining, smoothish; leaflets ovate-roundish, or acuminate; peduncles axillary, short, few-flowered; legume very long, glabrous, ending in a hooked mucrone. ☉. ☉. H. Native country unknown. Flowers and seeds white.

*Seedling-fruited Kidney-bean.* Pl. tw.

38 *P. ANACARDIUS* (Wall. pl. asiat. rar. 1. p. 6. t. 6.) plant annual, clothed with hoary pubescence and pili, twining, much branched; root fibrous; branches filiform, furrowed; leaflets ovate, acute, entire; racemes pedunculate, shorter than the leaves; flowers lurid on the outside; calyx beset with resinous dots, 4-toothed, lower tooth elongated; keel a little beaked, incurved; legume hairy, flat, linear. ☉. ☉. S. Native of the Burman Empire, at Prome. Flowers crowded; the vexillum dark brown beneath and shining, but opaque above and yellowish, with brown lines. Keel and wings yellow.

*Brown-flowered Kidney-bean.* Pl. tw.

§ 5. *Heterophylli* (from *heteros*, and *φυλλον*, *phyllon*, a leaf; in reference to the variable shape of the leaflets, some being lobed and others entire). *Leaflets all or some of them lobed.*

39 *P. MICROSPERMUS* (Ort. dec. 130.) stem erect, angular, and is as well as the leaves glabrous; leaflets rhomboid-ovate, 3-lobed; peduncles axillary, very long, racemose; bracteoles subulate; wings of corolla orbicular, legumes linear, compressed, pendulous. ☉. S. Native of Cuba. Flowers of a dirty purple colour. Seeds grey, lined with black.

*Small-seeded Kidney-bean.* Fl. Jul. Aug. Clt. 1825. Pl. 1 ft.

40 *P. GIBBOSIFOLIUS* (Ort. dec. 25.) plant twining, hairy; leaflets rhomboid-ovate, lateral ones gibbously 2-lobed on the outer side; peduncles 3 times the length of the leaves; flowers twin, disposed in something like a spike; bracteoles coloured; legume linear, dependent, incurved. ☉. ☉. S. Native of Cuba. Corolla vermilion-coloured. Seeds small, olive-coloured, and variegated.

*Gibbous-leafletted Kidney-bean.* Pl. tw.

41 *P. HETEROPHYLLUS* (Willd. enum. 753. H. B. et Kunth, nov. gen. amer. 6. p. 446.) plant twining; branches beset with retrograde pili; leaflets hispid beneath and on the margins, middle one oblong and repand, lateral ones ovate-oblong, having one lobe each above the base; peduncles longer than the petioles; flowers somewhat spicate; bracteoles small; lobes of calyx 5, acute, nearly equal; legumes linear-falcate. ☉. ☉. H. Native of Mexico, near Valladolid. Flowers small, red.

*Various-leaved Kidney-bean.* Fl. Jul. Aug. Clt. 1820. Pl. tw.

42 *P. VESTITUS* (Hook. bot. misc. 2. p. 216.) plant twining, and clothed with dense pubescence; leaflets rhomboid, retuse, lateral ones somewhat lobed; racemes twice the length of the leaves; teeth of calyx broad-subulate, nearly equal; legumes

linear, acuminate, very villous. ☉. ☉. S. Native of Peru, near Lima.

*Clothed Kidney-bean.* Pl. tw.

43 *P. ACONITIFOLIUS* (Jacq. obs. 3. p. 2. t. 52.) plant twining a little, hairy; leaflets palmatifid beyond the middle, lateral ones 3-4-lobed, terminal one 5-lobed; peduncles usually 3-flowered, shorter than the leaves. ☉. ☉. S. Native of Tranquebar. *Dolichos disséctus*, Lam. dict. 3. p. 300. *Dolichos palmatus*, Forsk. ex Steud. nom.—Pluk. alm. t. 120. f. 7. Legume unknown. Perhaps belonging to the following section.

*Aconite-leaved Kidney-bean.* Fl. Jul. Aug. Clt. 1731. Pl. tw.

SECT. III. STROPHOSTYLES (from *στροφος*, *strophos*, a twist, and *στυλος*, *stylos*, a style; in reference to the style, which is twisted). Ell. sketch. 2. p. 229.—*Phaseolus* and *Phaseellus*, Moench. meth. 240. Legume terete.

§ 1. *Lobatifolii* (from *lobatus*, lobed, and *folium*, a leaf; leaflets lobed). *Leaflets all or some of them lobed.*

44 *P. DIVERSIFOLIUS* (Pers. ench. 2. p. 296.) stems prostrate, scabrous; leaflets angular, 2 or 3-lobed; peduncles many-flowered, longer than the leaves; flowers capitate; legumes terete, pubescent. ☉. H. Native of Carolina, by the sea-side. *Glycine angulata*, Muhl. in Willd. spec. 3. p. 1056. *P. trilobus*, Michx. fl. bor. amer. 2. p. 60. but not of Roth. *Strophostyles angulosa*, Ell. sketch. 2. p. 229. Flowers purplish. Seeds reniform, cylindrical.

*Diverse-leaved Kidney-bean.* Fl. Ju. Jul. Clt. 1806. Pl. pr.

45 *P. TRILOBUS* (Roth. nov. spec. 344.) stem almost erect; branches prostrate, glabrous; lateral leaflets 2-lobed, terminal one 3-lobed; peduncles usually 3-flowered, longer than the leaves; legume declinate, cylindrical; stipulas ovate. ☉. S. Native of the East Indies. *Dolichos trilobus*, Lin. spec. 1021. *Burm. ind. t. 50. f. 1.* *Dolichos stipularis*, Lam. dict. 2. p. 300. *Glycine triloba*, Lin. mant. 516.—Pluk. alm. t. 214. f. 3. Flowers green? The leaves are considered by the native practitioners of India to be cooling, sedative, antibilious, and tonic, and useful as an application to weak eyes.

*Three-lobed-leaved Kidney-bean.* Fl. July, Aug. Clt. 1777. Pl. prostrate.

46 *P. ANGULOSUS* (Ort. dec. p. 24.) plant twining, hairy; leaflets ovate, lateral ones gibbous or 2-lobed on the outside, middle one 3-lobed; peduncles angular, rather longer than the leaves; flowers capitate; bracteoles ovate; wings shorter than the carina; legumes linear, terete, drooping a little, glabrous; seeds tetraquetrous. ☉. ☉. H. Native of North America. Flowers pale flesh-coloured and white. Savi, diss. 2. p. 1.

*Angular-seeded Kidney-bean.* Fl. Ju. Aug. Clt. 1820. Pl. tw.

47 *P. FARINOSUS* (Lin. spec. 1017.) stems twining; leaflets rhomboid-ovate, acute, somewhat 3-lobed; peduncles axillary, rather longer than the petioles; flowers subcapitate; legumes terete, smooth; seeds cylindrical, truncate at both ends, covered with farinose tomentum. ☉. ☉. S. Native of the East Indies. Niss. act. acad. par. 1730. p. 557. t. 42. Savi, diss. p. 3. *P. lunatus*, Moench. meth. 140. Flowers rose-coloured, but the vexillum is deep red.

*Mealy-seeded Kidney-bean.* Fl. Jul. Aug. Clt. 1759. Pl. tw.

48 *P. STIPULARIS* (Lam. dict. 3. p. 74.) stem erect, glabrous; leaflets oval, obtuse, lateral ones sinuated, terminal one 3-lobed; peduncles spicate, longer than the leaves; stipulas ovate; legumes terete, horizontal, smoothish. ☉. H. Native of Peru. Flowers with a brown vexillum, yellow wings, and a white keel. Like *P. trilobum*.

*Stipular Kidney-bean.* Fl. July, Aug. Clt. 1805. Pl. 1 ft.

49 *P. ATROPURPUREUS* (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 395.) stem twining, clothed with adpressed pu-

bescence; leaflets ovate-lanceolate, acuminate, mucronate, lateral ones 2-lobed; peduncles bearing something like spikes of flowers, longer than the leaves; wings of corolla stipitate, orbicular, longer than the vexillum; legumes terete, pendulous. ☉? ☉. H. Native of New Spain, on the mountains of Chilapa. Flowers rose-coloured, but the wings are dark purple.

*Dark-purple-flowered Kidney-bean.* Pl. tw.

§ 2. *Integrifolii* (from *integer*, entire, and *folium*, a leaf; in allusion to the leaflets being entire). *Leaflets entire.*

50 *P. HELVOLUS* (Lin. spec. 1017.) stems twining; leaflets deltoid-oblong, a little sinuated; peduncles longer than the leaves, bearing 3 flowers at the apex; vexillum short, but the wings are expanded, and large; legumes terete, erect. ☉. ☉. H. Native of North America, from Carolina to New York. *Strophostyles helvola*, Ell. sketch. 2. p. 230. *Glycine helvola*, Ell. Journ. act. sc. phil. 1818. 1. p. 385. *Glycine umbellata*, Willd. spec. 3. p. 1058.—Dill. hort. elth. 312. f. 300. Flowers of a pale rose-colour. Seed small, turgid, of a blackish bay colour.

*Pale-red-flowered Kidney-bean.* Fl. July, Aug. Clt. 1732. Pl. tw.

51 *P. VEXILLATVS* (Lin. spec. 1017. Jacq. hort. vind. t. 102.) stems prostrate, twining, rather pilose; leaflets oblong-ovate; peduncles very long; flowers 5-7 in a head; vexillum large, emarginate; wings small; legumes terete, rather pilose; seeds woolly. ☉. ? ☉. H. Native of Carolina and about Havannah, on the sea coast. *P. helvolus*, Michx. fl. bor. amer. 2. p. 60. *P. vexillatus*, Pursh, fl. amer. sept. 2. p. 470. *Strophostyles pedunculâris*, Ell. sketch. 2. p. 230. *Glycine pedunculâris*, Muhl. cat. 64.—Dill. hort. elth. 313. f. 302. Perhaps the Carolina plant is the same as that from Havannah. Flowers green before expansion, afterwards very pale purple; as they fade the purple changes to pale violet, and finally to a dusky lurid-colour or yellowish brown.

*Large-bannered Kidney-bean.* Fl. July, Aug. Clt. 1732. Pl. tw.

52 *P. TUBEROSUS* (Sesse et Moc. in herb. Lamb.) plant canescent; stems beset with retrograde villi; petioles, and under side of leaves strigose; leaflets small, elliptic, entire, sometimes the lateral ones are slightly 2-lobed; peduncles longer than the leaves; stipulas ovate-lanceolate; stipels and bracteas subulate; teeth of calyx setaceous; root tuberous. ☉. ☉. S. Native of Mexico.

*Tuberous-rooted Kidney-bean.* Pl. tw.

53 *P. MUNGO* (Lin. mant. 101.) stem flexuous, terete, hispid; leaflets ovate, acute, rather repand; peduncles a little longer than the leaves; flowers 6-7 in a head; carina putting forth a little horn from the left side; legume terete, hairy, rather torulose; seeds cylindrical, truncate. ☉. H. Native of the East Indies. Savi, diss. 1. p. 9. *P. hirtus*, Retz, obs. 3. p. 38.—Mungo, garc. arom. 1. 2. c. 21. Flowers yellow. Seeds eatable, Lour. *Muong-an* is the vernacular name of the plant.

*Mungo Kidney-bean.* Fl. June, July. Clt. 1790. Pl. 1½ ft.

54 *P. GLYCINEFORMIS* (Weinm. in flora, 1821. p. 29.) stem decumbent, twining, pilose, rather scabrous; leaflets oblong, obtuse; peduncles axillary, 1-2-flowered, longer than the leaves; legumes terete, pilose. ☉. ☉. S. Native of Chili and Peru. Flowers with a bluish violet vexillum, marked with yellow at the base. Said to be allied to *P. Mungo*.

*Glycine-formed Kidney-bean.* Pl. tw.

55 *P. HERNANDESI* (Savi, diss. L. p. 11.) stem flexuous, hispid; leaflets ovate-rhomboid, somewhat repand; peduncles shorter than the petioles, 4-6-flowered; legumes rather torulose, pilose, beaked, straightish; seeds oblong, cylindrical. ☉. H. Native of Mexico. Hern. mex. 887. with a figure. Vex-

illum yellow on the inside, and the wings are yellow. Seeds chestnut-coloured.

*Hernandez's Kidney-bean.* Pl. 1½ foot.

56 *P. PAUCIFLORUS* (Sesse, et Moc. in herb. Lamb.) plant twining; stems villous; leaflets ovate, mucronate, pubescent, entire; stipulas broad-cordate, ciliated, as well as the bracteas; peduncles more than twice the length of the leaves, 2-flowered; segments of the calyx lanceolate, ciliated, upper one emarginate; vexillum obovate, emarginate; stigma broad, spiral.  $\gamma$ .  $\odot$ . S. Native of Mexico. Flowers large, with the wings and keel blue, and the vexillum pale.

*Few-flowered Kidney-bean.* Pl. tw.

57 *P. CHRYSANTHOS* (Savi, diss. 1. p. 15.) stem flexuous, glabrous; leaflets rhomboid-ovate; peduncles a little longer than the leaves, many-flowered; legumes terete, glabrous, rather torulose, horizontal, acuminate by a beak; seeds almost cylindrical.  $\odot$ . H. Native country unknown. Flowers yellow. Seeds rust-coloured.

*Golden-flowered Kidney-bean.* Fl. July, Aug. Pl. 1 to 2 ft.

58 *P. RADICATUS* (Lin. spec. 1017.) stem erect, terete, beset with retrograde pili; leaflets ovate, acute; peduncles hardly longer than the leaves; flowers 7-8 in a head; legumes terete, hairy, horizontal.  $\delta$ . S. Native of China and Ceylon.—Dill. hort. elth. 315. f. 304. Flowers pale purple, but changing to ochraceous as they fade.—Reich, act. stockh. 1742. p. 202. t. 7. f. 2. Seeds greenish yellow, ovate, small.

*Rayed Kidney-bean.* Fl. June, July. Clt. 1732. Pl. 1 to 2 ft.

59 *P. SCABER* (Steud. nom. 610.) stem erect, hispid; leaflets broad-ovate; peduncles very short, hispid; flowers somewhat capitate; legumes erect, terete, scabrous; seeds cylindrical.  $\odot$ . H. Native country unknown.—Moris. oxon. sect. 2. t. 5. f. 8. Phasellus scaber, Mœnch. meth. 140. Flowers greenish yellow. Seeds rusty.

*Scabrous Kidney-bean.* Pl. 1 to 2 feet.

60 *P. LATHYROIDES* (Lin. spec. 1018.) stem erect, glabrous; leaflets oblong, acuminate; peduncles longer than the leaves; flowers somewhat spicate; vexillum concave, much shorter than the wings; legumes terete, subulate.  $\odot$ . H. Native of Jamaica, in humid sandy places.—Sloan. hist. 1. t. 116. f. 1. Phasellus lathyroides, Mœnch. meth. 140. Flowers red; the keel whitish.

*Lathyrus-like Kidney-bean.* Fl. July, Aug. Clt. 1786. Pl. 2 ft.

61 *P. SEMIERECTUS* (Lin. spec. 1016.) stems twining at the apex, terete, pubescent; leaflets ovate-lanceolate, acute, glabrous; peduncles elongated; flowers twin, disposed in a kind of spike; keel of flower awnless, hooked, turned to the right; legumes rather spreading, straight, subulate, compressed, acuminate by a beak; seeds oblong.  $\odot$ .  $\odot$ . H. Native of South America. Savi, diss. 2. p. 6. Jacq. icon. rar. t. 558.—Dill. hort. elth. t. 233. f. 301. Ker, bot. reg. 743. Phascolus semi-erectus, Mœnch. meth. 141. Flowers with a greenish vexillum, tinged with purple, and with the keel purple in the middle, but white on the sides, but the wings are deep purple. Seeds brown, spotted with black.

*Half-erect Kidney-bean.* Fl. July. Clt. 1781. Pl. tw.

62 *P. VIOLACEUS* (Steud. nom. 610.) stem erect, flexuous, glabrous; leaflets ovate-lanceolate, acute; peduncles 2-3-flowered, length of the petioles; legumes erect, linear, terete.  $\odot$ . H. Native of Africa. Phasellus violaceus, Mœnch. meth. 141. *P. Abyssinicus*, Hortul. Flowers sessile, white, but with the vexillum and wings violaceous on the outside.

*Violaceous-flowered Kidney-bean.* Fl. July, Aug. Clt. 1808. Pl. 2 feet.

† *Species not sufficiently known.*

63 *P. MAX* (Lin. spec. 1017. exclusive of the synonyme of Hern.) stem erect, angular, hispid; leaflets ovate, acute; le-

gumes torulose, pendulous, hairy, 3-4-seeded, beaked.  $\odot$ . H. Native of Moluccas.—Rumph. amb. 5. p. 388. t. 140? Flowers greenish yellow. Seeds black, about the size of coriander-seeds. *Max* is the Spanish name of the plant.

*Max Kidney-bean.* Fl. June, July. Clt. 1758. Pl. 1½ ft.

64 *P. CAPE'NSIS* (Thunb. fl. cap. 589. but not of Burm.) plant filiform, decumbent, flexuous, villous; leaflets ovate or lanceolate; peduncles 1-flowered, flexuous, axillary, longer than the petioles.—Native of the Cape of Good Hope. Corolla large, flesh-coloured. Legume unknown.

*Cape Kidney-bean.* Pl. decumbent.

65 *P. PALLAR* (Mol. chili. ed. gall. p. 335.) stem twining, very pilose; leaflets obliquely-oblong, villous; peduncles racemose, very long; flowers small, remote; legumes pendulous, cylindrical, torulose, villous.—Native of Chili.

*Pallar Kidney-bean.* Pl. tw.

66 *P. ASELLUS* (Mol. l. c.) stem twining; leaflets sagittate; seeds globose.—Native of Chili.

*Ass's Kidney-bean.* Pl. tw.

*Cult.* The species of this genus are not worth cultivating for ornament. They all grow well in light rich soil, and the perennial, herbaceous, and shrubby kinds are easily increased by cuttings.

CLXXXIX. CYRTO'TROPIS (from *κυρτος*, *kyrtos*, curved, and *τροπις*, *tropis*, a carina; in allusion to the carina of the flower, which is much curved). Wall. pl. asiat. rar. 1. p. 49. t. 62.

*Lin. syst.* *Diadelphia*, *Decandria*. Calyx bilabiate; upper lip unidentate, lower one tridentate. Corolla papilionaceous. Vexillum reflexed, bicallous at the base; keel linear, falciform, very long, ascending, 2-petalled; wings cuneiform, short, divaricate. Stamens diadelphous. Legume sessile, linear, compressed, covered on the inside by a spongy membrane, which afterwards separates from it, the seeds intercepted by cellular spongy dissepiments.—A tall climbing herb, with perennial roots, impari-pinnate leaves, loose axillary racemes of flesh-coloured flowers, and long, pendulous, many-seeded legumes.

1 *C. CARNEA* (Wall. pl. asiat. rar. 1. p. 50. t. 62.)  $\gamma$ .  $\odot$ . G. Native of Nipaul, on the high mountains of Sheopore and Chundaghry. Shrub quite smooth. Leaflets 5. Flowers large, pale red, showy; the vexillum ornamented with dark feathered lines.

*Flesh-coloured-flowered Cyrtotropis.* Shrub tw.

*Cult.* An elegant twining plant, very proper for a greenhouse conservatory. It will grow in rich light soil, and cuttings will strike root in sand under a hand-glass.

CXC. SOJA (*soja* is the name of a sauce prepared from the seeds by the Japanese). Mœnch. meth. 153. Savi, diss. 1824. p. 16. D. C. legum. mem. ix. prod. 2. p. 396.

*Lin. syst.* *Diadelphia*, *Decandria*. Calyx bibracteolate at the base, 5-cleft, the 3 lower segments straight and acute, but the 2 upper ones are joined together beyond the middle. Corolla with an ovate vexillum, which stands on a short stipe, and with an oblong straight keel. Stamens diadelphous, the tenth one approximate, but certainly distinct. Stipe of ovary not surrounded by a sheath at the base. Style short. Legume oblong, 2-5-seeded, membranous; the seeds intercepted by cellular dissepiments. Seeds ovate, compressed.—A hispid erect herb, with pinnately-trifoliate leaves, and with the flowers either aggregate in the axils of the leaves on short pedicels, or disposed in short pedunculate racemes.

1 *S. HISPIDA* (Mœnch. l. c.)  $\odot$ . H. Native of Japan, East Indies, and the Moluccas. *Dolichos Soja*, Lin. spec. 1621. Jacq. icon. rar. t. 145. *Soja Japonica*, Savi, diss. l. c. Kœmpf. amœn. 837 and 838, with a figure. Corolla violaceous, hardly longer than the calyx. The seeds, which are usually called

*Miso* in Japan, are put into soups, and are the most common dish there, insomuch that the Japanese frequently eat them three times a day. The *Soja* of the Japanese, which is preferred to the *Kitjap* of the Chinese, is prepared from the seeds, and is used in almost all their dishes instead of common salt. The Chinese also have a favourite dish made of these seeds, called *ten-hu* or *tau-hu*, which looks like curd, and though insipid in itself, yet with proper seasoning is agreeable and wholesome.

*Var. β, pallida* (D. C. prod. 2. p. 396.) flowers yellow; seeds white. Roxb. hort. beng. p. 55.

*Hispid Soja*. Fl. July, Aug. Clt. 1790. Pl. 1½ foot.

*Cult.* The seeds of this plant only require to be sown in a warm sheltered situation in the month of May.

**CXCI. DO'LICHOS** (from *δολιχος*, *dolichos*, long; in reference to the length of the twining stems, which in some species extend to the tops of the loftiest trees). Lin. gen. no. 867. exclusive of many of the species. Adans. fam. 2. p. 325. Savi, diss. 1824. p. 15. D. C. legum. mem. ix. prod. 2. p. 396.

**LIN. SYST.** *Diadelphia, Decandria*. Calyx bibracteolate at the base, campanulate, 5-toothed, with 2 of the teeth approximate or joined at the base. Corolla papilionaceous, with a roundish vexillum, which is furrowed at the base, and furnished with 2 or 4 diverging callosities. Wings oblong, obtuse. Carina obtuse, incurved, forming almost a straight angle, never spirally twisted. Stamens diadelphous. Anthers roundish. Style compressed, bearded from the middle to the apex. Legume compressed, linear, 2-valved, having the valves neither winged nor nerved; the seeds intercepted by a kind of cellular substance. Seeds ovate, more or less compressed, with a small oval hylum.—Herbs or subshrubs, usually with twining stems, acute stipulas, pinnately-trifoliate leaves, stipellate leaflets, and axillary racemes ~~or~~ *racemes*. The species of this genus are not well defined, and are therefore worthy of a monograph, the only mode by which genera containing a great number of species can be well distinguished.

**SECT. I. EUDOLICHOS** (from *eu*, well, and *dolichos*; this section contains the genuine species). D. C. prod. 2. p. 397. Legume compressed, apiculated by the short permanent style.

1 *D. lignosus* (Lin. spec. 1022.) stems woody; branches twining, rather villous; leaflets ovate, acute, smooth, glaucous beneath; peduncles longer than the leaves; flowers umbellate; legumes linear, straight, smoothish. *h. C. G.* Native of the East Indies. Lin. hort. cliff. t. 20. Smith, spic. t. 21.—Rumph. amb. 5. t. 136. Flowers rose-coloured, with a purplish keel. Legume white inside. Seeds black, with a white hylum.

*Woody Dolichos*. Fl. July, Aug. Clt. 1776. Shrub tw.

2 *D. Curtisii*; stem woody; branches twining, rather villous; leaflets rhomboid, acute, glaucous beneath, smooth; peduncles long; flowers umbellate; legume linear, falcate. *h. C. G.* Native of the East Indies. *Dolichos lignosus*, Curt. bot. mag. 382. Flowers rose-coloured, with a purplish keel. Perhaps this is the edible variety of *D. lignosus* mentioned in Roxb. cat. hort. beng. p. 7.

*Curtis's Dolichos*. Fl. July, Aug. Clt. 1776. Shrub tw.

3 *D. Jacquini* (D. C. prod. 2. p. 397.) stem woody; branches twining, hispid; leaflets ovate, acute; peduncles shorter than the leaves; flowers umbellate; legumes linear, straight, very pilose. *h. C. S.* Native of the West Indies, in woods. *D. lignosus*, Jacq. amer. 205. pict. 100. exclusive of the synonymes. Flowers white. Seeds 18, black, with a white hylum.

*Jacquini's Dolichos*. Fl. July, Aug. Clt. 1800. Shrub tw.

4 *D. Galeatus* (Gaud. in Freycenet, et voy. part. bot. p. 486. t. 15.) plant procumbent or twining; branchlets and petioles

puberulous; leaflets ovate-elliptic, acuminate, rounded at the base, reticulately-veined, membranous, smooth; peduncles axillary, 3-flowered; the 2 superior lobes of the calyx large and roundish, lower ones lanceolate, acute; legumes 3-keeled. *h. C. G.* Native of the Sandwich Islands. Perhaps a species of *Canavalia*.

*Helmetted Dolichos*. Pl. tw.

5 *D. ? spurius* (Mey. prim. esseq. 242.) stem shrubby, climbing; branches tomentose; leaflets ovate, obtuse at both ends, tomentose beneath; peduncles 2-flowered, length of the petioles; legumes linear, ending in a long acumens, tomentose. *h. C. S.* Native of Guiana, in the island of Arowabish. Flowers large, purplish-violet. Vexillum without any callosity, having the unguis thickened with the calyx. Seeds imbedded in dry pulp.

*Spurious Dolichos*. Shrub tw.

6 *D. ? subracemosus* (Jacq. amer. 205.) stems permanent, twining, and arc, as well as the leaves, glabrous; leaflets ovate-lanceolate; peduncles racemose, 3-4-flowered; legumes linear, acuminate, rather torose, glabrous. *h. C. S.* Native of the West Indies, among bushes. Flowers bluish-purple. Style spatulate at the apex. Stigma ciliate bearded.

*Somewhat-racemose-flowered Dolichos*. Shrub tw.

7 *D. undulatus* (Sesse et Moc. in herb. Lamb.) plant pubescent; leaflets elliptic, acuminate, mucronate; calyx and vexillum clothed with rusty down; vexillum a little shorter than the keel; lateral leaflets oblique; peduncles shorter than the leaves; flowers large, racemose. *h. C. S.* Native of Mexico.

*Waved-leaved Dolichos*. Pl. tw.

8 *D. tuberosus* (Lam. dict. 2. p. 296.) stem shrubby, twining; root tuberous; leaflets roundish, acuminate; racemes pedunculate, elongated; legumes straight, pendulous, compressed, torulose, clothed with rufous villi. *h. C. S.* Native of Martinique.—Plum. ed. Burm. t. 220. Both the root and the seeds are eaten when dressed by the inhabitants of Martinico.

*Tuberous-rooted Dolichos*. Shrub tw.

9 *D. hirsutus* (Thunb. in Lin. trans. 2. p. 339.) stems twining, tomentose; leaflets broad, ovate, acute, villous on both surfaces, lateral ones somewhat 2-lobed; racemes very long; legume hairy, ending in a hooked mucrone. *h. C. G.* Native of Japan. Banks, icon. Kämpf. t. 41. Root thick, creeping. Flowers purple.

*Hairy Dolichos*. Fl. June, July. Clt. 1802. Pl. tw.

10 *D. pubescens* (Lin. spec. 1021.) stems twining, and are, as well as the leaves, clothed with soft hairs; flowers axillary, 1-3-together, almost sessile; legumes compressed, linear-lanceolate, pubescent, erect, but at length drooping. *h. C. S.* Native of South America. *Glycine tomentosa β*, Willd. spec. 3. p. 1061. ex enum. 2. p. 754. Flowers cream-coloured.

*Pubescent Dolichos*. Pl. tw.

11 *D. Sesset*; plant clothed with soft, woolly, canescent pubescence; leaflets ovate, acuminate, entire; calycine segments lanceolate; vexillum villous, shorter than the keel; flowers disposed in elongated racemes, which are 5 or 6 times longer than the leaves. *h. C. S.* Native of Mexico. Flowers red, secund. (v. s. in herb. Lamb.)

*Sesse's Dolichos*. Pl. tw.

12 *D. pilosus* (Klein, in Willd. spec. 3. p. 1043.) stem twining, with a few adpressed hairs; leaflets ovate-lanceolate, scabrous above, and pubescent beneath; racemes 3-6-flowered; legumes linear, clothed with rusty pili, hooked at the apex. *h. C. S.* Native of the East Indies. Racemes an inch or 1½ inch long. Flowers purple.

*Pilose Dolichos*. Fl. July. Clt. 1790. Pl. tw.

13 *D. tetraspermus* (Willd. spec. 3. p. 1044.) stem twining; leaflets rhomboid, mucronate, glabrous; racemes longer than the

leaves; legumes acinaciform, oblong, cuspidate, 4-seeded.  $\mathcal{U}$ .  $\odot$ . S. Native of the East Indies. Flowers usually twin, almost sessile, small, pale yellow?

*Four-seeded Dolichos*. Fl. May, June. Clt. 1816. Pl. tw.

14 *D. PAVONI*; plant smooth, herbaceous; leaflets ovate, acuminate, obtuse, mucronate; peduncles long, few-flowered at the top; legumes flat, puberulous, villous; calyx smooth, green, with ovate ciliated segments, uppermost one broad; vexillum very broad, covering the rest of the petals.  $\mathcal{U}$ .  $\odot$ . S. Native of Peru. *D. pubescens*, Ruiz et Pav. in herb. Lamb.

*Pavon's Dolichos*. Pl. tw.

15 *D. OLYCINOIDES* (H. B. et Kunth, nov. gen. amer. 6. p. 410.) stems twining; branches and petioles beset with retrograde pili; leaflets ovate-oblong, obtuse, mucronate, rounded at the base, 3-nerved, strigose; peduncles very long, few-flowered; lobes of calyx acutish, with the upper lip very broad, and somewhat emarginate.  $\mathcal{U}$ .  $\odot$ . S. Native of Peru, in sandy places near Truxillo. Legume compressed.

*Glycine-like Dolichos*. Pl. tw.

16 *D. CAPE'NSIS* (Lin. amcn. 6. afr. 22.) stems twining, herbaceous, and are, as well as the leaves, glabrous; leaflets ovate, lateral ones a little lobed; peduncles usually 2-flowered.  $\mathcal{U}$ .  $\odot$ . G. Native of the Cape of Good Hope. Flowers yellow, ex. Herm. afr. 17. solitary, ex Thunb. fl. cap. 590. Legume elliptic, compressed, ex Lin. short, depressed, ex Herm. acinaciform, attenuated at both ends, an inch long, and glabrous, ex Thunb. Perhaps many species are confused under the name of *D. Capensis*, and they are probably all species of *Rhynchosia*.

*Cape Dolichos*. Fl. July, Aug. Clt. 1823. Pl. tw.

17 *D. ARBORESCENS*; pubescent; leaflets ovate, acuminate, entire, many-nerved; racemes many-flowered, longer than the leaves, spicate; calycine segments lanceolate, lower one inflexed, and longer.  $\mathcal{U}$ . S. Native of Mexico. A strong shrub, with yellow flowers. (v. s. in herb. Lamb.)

*Arborescent Dolichos*. Shrub 10 to 12 feet.

18 *D. FALCATUS* (Klein, in Willd. spec. 3. p. 1047.) stems twining, pilose; leaflets roundish-ovate, acuminate, glabrous, terminal one 3-lobed, lateral ones with a lobe on the outer side; peduncles 2-flowered, shorter than the leaves; legumes falcate. —Native of the East Indies. Rottl. et Willd. nov. act. eur. ber. 4. 1803. p. 211. Flowers probably purple.

*Falcate-podded Dolichos*. Pl. tw.

19 *D. ARISTATUS* (Lin. spec. 1021.) stems twining, herbaceous; leaflets ovate-oblong, acuminate, smooth; peduncles 2-flowered; legumes linear, straight, ending in a long awn.  $\odot$ .  $\odot$ . S. Native of South America. Awn of pod nearly an inch long.

*Awned-podded Dolichos*. Pl. tw.

20 *D. GEMINIFLORUS*; plant herbaceous, quite smooth, middle leaflet sagittate, lateral ones oblique, and only bulged out on one side, all mucronate; stipulas spatulate; bracteas ovate, acuminate, membranous, drawn out at the base; peduncles very long, usually 2-flowered; legumes very long, narrow, compressed, on short pedicels.  $\mathcal{U}$ .  $\odot$ . S. Native of Mexico. (v. s. in herb. Lamb.)

*Twin-flowered Dolichos*. Pl. tw.

21 *D. FILIFORMIS* (Lin. amcn. 5. p. 402.) stems twining, herbaceous; leaflets linear, obtuse, mucronate, glabrous, pubescent beneath; stigma almost naked.  $\mathcal{U}$ .  $\odot$ . S. Native of Jamaica, among bushes about Old Harbour. P. Browne, jam. 206. where it is called *cat's-claws*. It is used as a purgative ingredient in diet drinks, and is said to answer in cases of dropsy.

*Filiform Dolichos*. Pl. tw.

22 *D. CILIARIS* (Klein, in Willd. spec. 3. p. 1049.) stems twining, filiform; leaflets oblong, obtuse, mucronate, glabrous, but ciliated on the margins; peduncles shorter than the petioles,

usually 4-flowered; legumes acinaciform, glabrous.—Native of the East Indies.

*Ciliated-leaved Dolichos*. Pl. tw.

23 *D. HETEROPHYLLUS* (Horn. hort. hafn. suppl. p. 80.) stems twining; lateral leaflets broad, cordate, terminal one lanceolate and elongated; legumes racemose, acinaciform, with the back entire.  $\odot$ .  $\odot$ . H. Cultivated in the Canary Islands. Perhaps a species of *Láblab*.

*Variable-leaved Dolichos*. Fl. July, Aug. Clt. 1810. Pl. cl.

24 *D. LUTEUS* (Swartz, fl. ind. occ. 3. p. 1246.) stems twining, herbaceous, glabrous; leaflets roundish or ovate-rhomboid, glabrous; racemes spicate, longer than the leaves; legumes somewhat cylindrical, glabrous.  $\mathcal{U}$ .  $\odot$ . S. Native of the south of Jamaica, among grass in wet places by the sea-side. Flowers yellow.

*Yellow-flowered Dolichos*. Fl. July, Aug. Clt. 1812. Pl. tw.

25 *D. OBTUSIFOLIUS*; plant pubescent; leaflets broad, roundish, obtuse, middle one bulged out on both sides, and attenuated at both ends; racemes long; flowers in fascicles; teeth of calyx narrow, lower ones subulate.  $\mathcal{U}$ .  $\odot$ . S. Native of Mexico. Flowers apparently purple. (v. s. in herb. Lamb.)

*Blunt-leafletted Dolichos*. Pl. tw.

26 *D. HASTATUS* (Lour. coch. 442.) stems procumbent, herbaceous; leaflets glabrous, somewhat hastate; peduncles erect, many-flowered; legumes linear, rather terete, straight.  $\mathcal{U}$ .  $\odot$ . S. Native of the east coast of Africa, where it is also cultivated for the sake of the seeds, which are eaten by the natives. Flowers yellow. Perhaps this and the preceding species are referrible to section II. *Catiang*.

*Hastate-leafletted Dolichos*. Pl. tw.

27 *D. ANGULARIS* (Willd. spec. 3. p. 1051.) stem erect, hairy; leaflets rhomboid-ovate, acuminate, lateral ones rather angular; peduncles 2-flowered, shorter than the leaves; legumes linear, nearly terete, torose, acute, pendulous.—Native of ~~Japan~~. Banks, icon. Kœmpf. t. 40.

*Angular-leaved Dolichos*. Pl. 1 to 2 feet.

28 *D. BIFLORUS* (Lin. spec. 1023.) stem erect, perennial, smooth; leaflets oval-lanceolate, acute, glabrous; peduncles very short, 2-flowered; legumes erectish, hairy.  $\mathcal{U}$ . S. Native of the East Indies.—Pluk. alm. t. 213. f. 1. Flowers yellow. *D. biflorus*, Burm. ind. 161. which was collected in Persia by Garcin, is a distinct plant, but the specimen of it which is preserved in the herbarium of Delessert is so incomplete as to preclude giving a description of it.

*Two-flowered Dolichos*. Fl. July, Aug. Clt. 1776. Pl. 1½ ft.

29 *D. UNIFLORUS* (Lam. dict. 2. p. 299.) stem erect, woody at the base; branches villous, twining; leaflets oval, acute, clothed with soft villi; flowers solitary, almost sessile in the axils of the leaves; legumes nearly erect, falcate, 5-seeded, pubescent.  $\mathcal{U}$ .  $\odot$ . S. Native of the East Indies. Flowers yellow.

*One-flowered Dolichos*. Shrub tw.

SECT. II. *CATJANG* (*Cat-jang* is the name of some species in Malabar). *D. C.* prod. 2. p. 398. Legumes cylindrical.

\* *Leaflets entire*.

30 *D. CATJANG* (Lin. mant. 259.) stem erect, herbaceous; leaflets broad-lanceolate, glabrous; peduncles very long, 2-3-flowered; legumes linear, terete, glabrous, straight.  $\odot$ . S. Native of the East Indies, where it is called *cat-jang*.—Rumph. amb. 5. t. 139. f. 1.—Rheed. mal. 3. t. 41.—Lour. coch. 442. Seeds small, brown, black, or pale. There are several varieties of this plant differing in the colour of the flowers and seed, all of which are much cultivated in the places of their natural growth for food.

*Cat-jang Dolichos*. Fl. July, Aug. Clt. 1793. Pl. 1½ foot.

31 *D. MONACHA'LIS* (Brot. fl. lus. 2. p. 125.) stem herbaceous, erect, twining a little; leaflets ovate, acute, glabrous; peduncles 4-6-flowered, longer than the leaves after flowering; legumes almost terete, a little arched, glabrous, at length pendulous. ☉. ☉. H. Native of Portugal, and cultivated in moist valleys for the sake of its seeds, which are dressed and eaten by the inhabitants. Flowers pale yellow striped with purple. Stigma ending in a callous spur. Seeds white, girded by a black ring around the hylum. Said to be a hybrid between *D. Catiáng* and *D. Sinénsis*.

*Monk's Dolichos.* Fl. July, Aug. Clt. 1816. Pl.  $\frac{3}{4}$  foot.

32 *D. SINÉNSIS* (Lin. amœn. 4. p. 326. but not of Forsk.) stems twining, herbaceous, glabrous; leaflets ovate, acuminate; peduncles 2-flowered, shorter than the leaves; legumes terete, torulose, pendulous. ☉. ☉. H. Native of the East Indies and China. Jacq. hort. vind. t. 71. Lour. coch. 436. Sims, bot. mag. 2232. Rumph. amb. 5. p. 134. *Dolichos cylindricus*, Mœnch. Flowers pale violet or flesh-coloured. Seeds white or red. Legume 1-2 feet long, eatable when young.

*China Dolichos.* Fl. July, Aug. Clt. 1776. Pl. tw.

33 *D. NILÓTICUS* (Delil. fl. aegypt. 109. t. 38. f. 1.) stems twining, herbaceous, pubescent; hairs adpressed, reflexed; leaflets ovate, acuminate; peduncles naked at the base; flowers spicate; legumes almost cylindrical, villous, pendulous. ☉. ☉. H. Native of Egypt. *D. Sinénsis*, Forsk. deser. 132. but not of Lin. Flowers yellow, with the vexillum painted with lines.

*Nile Dolichos.* Pl. tw.

34 *D. LUBIA* (Forsk. deser. 133.) stems diffuse, glabrous; leaflets ovate; peduncles very long; flowers disposed in spicate racemes; legumes straight, terete, compressed, scabrous, 10-seeded. ☉. H. Native of Egypt, and where it is cultivated for the sake of the legumes, which are dressed and eaten by the inhabitants. Flowers yellow. *Lubia* is the Arabic name of the plant.

*Lubia Dolichos.* Fl. July, Aug. Clt. 1818. Pl. diffuse.

35 *D. VEXILLA'TUS* (H. B. et Kunth, nov. gen. amer. 6. p. 440.) stems twining, and are, as well as the petioles, clothed with retrograde hairs; leaflets oblong-lanceolate, mucronate, strigose, somewhat 3-nerved; peduncles longer than the leaves; lobes of calyx subulately-acuminate; legumes terete, hairy. ☉. ☉. S. Native of South America. Flowers greenish.

*Var. a*; leaflets acuminate; peduncles 3-4-flowered. ☉. ☉. S. Native of Cuba, about the Havannah. *Phaseolus vexillatus*, Lin. spec. 1017.—Dill. hort. elth. 2. f. 302.

*Var. β*; leaflets obtuse; peduncles 2-flowered. H. B. et Kunth, l. c. Native of Caraccas.

*Large-bannered Dolichos.* Fl. July, Aug. Clt. 1732. Pl. tw.

36 *D. CYLINDRICUS* (Hamilt. prod. fl. ind. occid. p. 61.) stems woody, twining, hairy; leaflets oblong, acute, beset with a few rusty pili beneath; pedicels elongated; flowers sub-umbellate; legume cylindrical, elongated, hairy; seed dark, numerous, 15-20, minute. ☉. ☉. S. Native of Guiana.

*Cylindrical-podded Dolichos.* Shrub tw.

37 *D. REPENS* (Lin. amœn. 5. p. 402.) stems creeping; leaflets pubescent, ovate; flowers twin, disposed in racemes; legumes linear, terete. ☉. S. Native of Jamaica, by the sea-side. The root is a strong purgative.

*Creeping-stemmed Dolichos.* Pl. cr.

• • *Leaflets lobed.*

38 *D. LOBA'TUS* (Willd. spec. 3. p. 1047.) stem twining; lateral leaflets 2-lobed, terminal one 3-lobed, with the middle lobe mucronate; flowers racemose.—Native of the Cape of Good Hope. *D. trilobus*, Houtt. pfl. syst. 8. p. 860. t. 64. f. 1. Thunb. prod. 130? Flowers yellow or purple.

*Lobed-leafletted Dolichos.* Fl. July, Aug. Clt. 1800. Pl. tw.

39 *D. ARGÉNTÆUS* (Willd. spec. 3. p. 1047.) stems twining, clothed with rusty villi; leaflets rather angular, clothed with silky villi beneath, terminal one 3-lobed; peduncles 2-flowered, shorter than the petioles. ☉. ☉. S. Native of Guinea. Flowers yellow?

*Silvery Dolichos.* Pl. tw.

40 *D. ? TRILOBATUS* (Lin. mant. 1. p. 101.) stems prostrate; leaflets lobed; peduncles 3-flowered, longer than the leaves. ☉. S. Native of the East Indies. *Glycine triloba*, Lin. mant. 510.—Pluk. alm. t. 120. Flowers small, yellow. Perhaps a species of *Glycine*.

*Three-lobed-leafletted Dolichos.* Pl. pros.

41 *D. ? ANGULOSUS* (D. C. prod. 2. p. 399.) stems decumbent; lateral leaflets 2-lobed, terminal one parabolic; peduncles longer than the leaves; flowers capitate.—Native of Pennsylvania. *Phaseolus vexillatus*, Walt. fl. car. but not of Lin. ex Pursh. *Glycine angulosa*, Muhl. in Willd. spec. 3. p. 1056. Flowers rose-coloured.

*Angular-leafletted Dolichos.* Fl. Ju. Aug. Clt. 1820. Pl. dec.

42 *D. PALMATIFIDUS* (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 399.) stem twining, glabrous; leaflets 3-nerved, 3-lobed, rarely 5-lobed; lobes ovate, mucronate; peduncles longer than the leaves; flowers racemose. ☉. ☉. S. Native of Mexico. Cœn or Coentle Hern. mex. 252. f. 2. Flowers bluish. Legume teretely-compressed, straight.

*Palmatifid-leaved Dolichos.* Shrub tw.

SECT. III. UNGUICULÁRIA (from *unguicularis*, of a claw or unguis; in reference to the legumes being terminated by an unguiculate callous beak). Legumes almost cylindrical, obtuse at the apex, and ending in a depressed, callous, somewhat unguiculate beak, which is rather concave beneath. Leaflets entire.

43 *D. UNGUICULATUS* (Jacq. hort. vind. 1. t. 23.) stem twining, and is, as well as the leaves, glabrous; peduncles length of the leaves, bearing at the apex 2-3 flowers in a kind of umbel; legume ending in a recurved beak. ☉. ☉. S. Native of Barbados. Flowers whitish. Seeds ovate, white, or pale brown, with a snow white hylum.

*Unguiculated-podded Dolichos.* Fl. Ju. Jul. Clt. 1780. Pl. tw.

44 *D. TRANQUEBARICUS* (Jacq. hort. vind. 3. t. 70.) stem twining, and is, as well as the leaves, glabrous; peduncles length of the leaves, bearing 3-4 flowers at the apex in a kind of umbel; legumes ending in a straight beak. ☉. ☉. S. Native of Tranquebar. Flowers bluish violet, with a white keel. Legumes more slender than those of the preceding species. Seeds pale brown, but rather blackish around the white hylum.

*Tranquebar Dolichos.* Fl. June, July. Clt. 1801. Pl. tw.

45 *D. MELANOPHTHALMUS* (D. C. prod. 2. p. 100.) stem twining, and is, as well as the leaves, glabrous; peduncles length of the leaves, bearing 2-3 flowers at the apex in a kind of umbel; legumes ending in a straight or somewhat recurved beak. ☉. ☉. H. Cultivated in Vascony, where it is called *Habine*, and in Italy, where it is called *Fascola à l'occhio nero*. *D. unguiculatus*, Thor. chl. land. 306. Seeds white, but marked with a black circle around the snow white hylum.

*Black-eyed-seeded Dolichos.* Fl. Jul. Aug. Clt. 1800. Pl. tw.

46 *D. SESQUIPEDALIS* (Lin. spec. 1019.) stem twining, glabrous; leaflets broad, ovate; legumes almost cylindrical, smooth, very long, torulose, and ending in a hooked mucrone. ☉. ☉. S. Native of South America. Jacq. hort. vind. 1. t. 67. Flowers of a purplish blue colour. Legumes a foot and a half in length.

*Foot-and-a-half-long-podded Dolichos.* Fl. Aug. Clt. 1781. Pl. tw.

47 *D. UMBELLATUS* (Thunb. in Lin. trans. 2. p. 339.) stems twining, and are villous, as well as the leaves; peduncles flexuous, longer than the leaves; flowers disposed in a kind of um-

bellate raceme; legumes straight, glabrous.  $\mathcal{U}$ .  $\odot$ . G. Native of Japan. *D. unguiculatus*, Thunb. fl. jap. 279. Lour. coch. p. 436. Flowers variegated with white, yellow, and violet.

*Umbellate-flowered Dolichos.* Pl. tw.

48 *D. SPHÆROSPERMUS* (D. C. prod. 2. p. 400.) stem erect, branched, glabrous; leaflets ovate, acutish; peduncles elongated, bearing few flowers at the apex; legumes straight; seeds spherical.  $\odot$ . S. Native of Jamaica, where it is called *Calarana* or *Black-eyed-pea*. Sloane, hist. jam. 181. t. 117. *Phascolus sphaerospermus*, Lin. spec. 1018. Flowers white. Legumes terete according to P. Browne, but compressed according to Sloane. Seeds white, with a black hylum, and are sweet, and as good for food as any of the kidney-beans.

*Round-seeded Dolichos* or *Black-eyed-pea*. Fl. July, Aug. Clt. 1816. Pl. 1 foot.

49 *D. BRUNELLI* (Zucc. obs. 1. no. 82.) stems erect, much branched, and arc, as well as the leaves, glabrous; lateral leaflets lobed on the outside; peduncles 4-6-flowered, longer than the leaves; legumes erect, ending in a spoon-shaped beak.  $\odot$ . ? S. Native country unknown. Flowers blue, but with the keel white. Seeds dark blue, with a white hylum.

*Brunelli's Dolichos.* Pl. 1 to 2 feet.

† *Species not sufficiently known.*

50 *D. RETICULATUS* (Ait. hort. kew. 3. p. 33.) stems twining; leaflets ovate, rugose, reticulated, villous; racemes few-flowered.  $\mathcal{U}$ .  $\odot$ . G. Native of New Holland. Flowers purple?

*Reticulated-leaved Dolichos.* Fl. Ju. Jul. Clt. 1781. Sh. tw.

51 *D. SCABER* (Rich. in act. soc. h. n. paris. p. 111.) twigs rough and woody; leaflets ovate, coriaceous, quite smooth; spike many-flowered; receptacle of flower hooked.  $\mathcal{U}$ .  $\odot$ . S. Native of Cayenne.

*Scabrous-stemmed Dolichos.* Shrub tw.

52 *D. VIRGATUS* (Rich. l. c.) woody; leaves and spikes of flowers hairy; leaflets obovate, abruptly acuminate; spikes of flowers very long and slender.  $\mathcal{U}$ .  $\odot$ . S. Native of Cayenne. Perhaps a species of *Mucuna*.

*Twiggy Dolichos.* Shrub tw.

53 *D. FUNARIUS* (Mol. chil. ed. gall. 335.) stems twining, perennial; legumes pendulous and 5-seeded; leaflets oval, glabrous on both surfaces.  $\mathcal{U}$ .  $\odot$ . G. Native of Chili, where the inhabitants make ropes of the stems.

*Rope Dolichos.* Shrub tw.

54 *D. GIBBOSUS* (Thunb. fl. cap. 590.) stems herbaceous, twining, and arc as well as the leaves glabrous; leaflets acuminate, lateral ones very short, terminal one ovate and gibbous at the base; peduncles longer than the leaves; racemes oblong.  $\odot$ . ?  $\odot$ . G. Native of the Cape of Good Hope, on the mountains.

*Bulged-leafletted Dolichos.* Pl. tw.

55 *D. DECUMBENS* (Thunb. l. c.) stems herbaceous, decumbent, hardly pubescent; leaflets ovate, obtuse, glabrous; peduncles length of leaves, bearing an umbel of flowers at the apex.  $\odot$ . G. Native of the Cape of Good Hope. Legume unknown.

*Decumbent Dolichos.* Pl. decumbent.

56 *D. TOMENTOSUS* (Roth, nov. spec. 345.) plant clothed with grey tomentum; stem erect; leaflets ovate-roundish, acuminate; racemes axillary, usually solitary, many-flowered; flowers distich; vexillum pubescent. Native of the East Indies. Legume unknown.

*Tomentose Dolichos.* Pl. 1 to 2 feet.

57 *D. FRUTESCENS* (Hamilt. in D. Don, prod. fl. nep. 240.) stem shrubby, erect; leaflets rhomboid-ovate, mucronate, glabrous; racemes axillary, compound, longer than the leaves; calycine teeth roundish, and are as well as the pedicels covered

with silky pubescence; carina equal in length to the vexillum.  $\mathcal{U}$ . G. Native of Nipaul. Leaflets large. Flowers cream-coloured.

*Shrubby Dolichos.* Shrub.

*Cult.* None of the species are worth cultivating for ornament except the *D. lignosus*, *D. Jacquini*, and *D. Curtisii*. A light rich soil answers all the species, and they are either increased by seeds or cuttings; cuttings planted in a pot of sand root freely, those of the stove species require heat.

CXCH. TÆNIOCARPUM (*ταenia*, *tænia*, a riband, and *καρπος*, *karpōs*, a fruit; shape of pods). Desv. obs. legum. in Schlecht. Linnaea. 2. p. 512.

LIN. SYST. *Diadelphia*, *Decandria*. Calyx bractless, bilabiate, 4-cleft; upper lip bidentate, lower one 3-parted. Vexillum ovate. Wings spurred. Keel obtuse, concave, compressed. Stamens diadelphous. Style elongated, filiform. Legume hispid, compressed, many-celled, somewhat articulated or torulose. Seeds kidney-shaped, shining.

1 *T. ARTICULATUM* (Desv. l. c.).  $\mathcal{U}$ .  $\odot$ . S. Native of St. Domingo. — Plum. ed. Burm. t. 222. *Dolichos articulatus*, Lam. dict. 2. p. 296. A frutescent twining plant, clothed with rufous villi, with angularly-toothed leaflets; pedunculate racemes of violaceous-purple flowers, and straight legumes. Racemes of flowers a foot and a half long.

*Jointed-legged Tæniocarpum.* Shrub tw.

*Cult.* A light rich soil will suit this plant, and cuttings will root freely if planted in a pot of sand placed under a hand-glass, in heat.

CXCH. VIGNA (in memory of Dominic Vigna, a commentator on Theophrastus). Savi, diss. phas. 1824. p. 16. D. C. prod. 2. p. 401.

LIN. SYST. *Diadelphia*, *Decandria*. Calyx 4-cleft, upper lip entire, or of two divisions, which are joined to the apex. Corolla with a broad reflexed vexillum, furnished with converging callosities above the base. Wings rhomboid. Stamens diadelphous. Stipe of ovary sheathed. Legume terete, incurved. Seeds nearly globose, without any caruncle, but having the umbilicus on the side. — Twining herbs, like *Dolichos*. Perhaps sufficiently distinct from that genus in the terete legumes.

1 *V. GLABRA* (Savi, mem. phas. 3. p. 8.) plant twining, smooth; upper lip of calyx obtuse.  $\odot$ .  $\odot$ . S. Native of South America (ex Jacq.) and of North America, in the rice-fields of Georgia (ex Pursh). *Dolichos luteolus*, Jacq. hort. vind. 1. p. 39. t. 90. Leaves pinnately trifoliate; leaflets ovate, acute. Peduncles longer than the leaves. Flowers yellow, disposed in heads at the top of the peduncles. Seeds black, with a white hylum. Stigma much bearded.

*Glabrous Vigna.* Fl. July, Aug. Clt. 1805. Pl. tw.

2 *V. VILLOSA* (Savi, l. c.) plant twining, villous; upper lip of calyx acuminate.  $\odot$ .  $\odot$ . H. Native of Chili. Flowers golden yellow. Legume 2 inches long. Seeds black.

*Villous Vigna.* Pl. tw.

*Cult.* The seeds of the species of this genus should be sown in May, in a warm sheltered situation in the open ground.

CXCIV. LABLAB (*Lablab* is the Arabic name of *Convolvulus*, with which the present genus has no other affinity, unless in the twining habit). Adans. fam. 2. p. 325. Mæench. meth. 153. Savi, diss. 1821. p. 15 and 19. D. C. prod. 2. p. 401. — *Dolichos*, Gaert. fruct. 2. p. 322. t. 150.

LIN. SYST. *Diadelphia*, *Decandria*. Calyx campanulately-tubular, 4-cleft; the segments erect, 3 lower ones acute, superior one broader, entire, composed of 2 joined segments. Corolla with a spreading vexillum, which is channelled, and furnished with 4 parallel callosities at the base. Keel so much curved as

to form a right angle. Stamens diadelphous, the tenth one free, and received between the callosities of the vexillum. Stipe of ovary sheathed at the base. Style compressed, bearded beneath. Stigma terminal. Legume flat, acinaciform, muricated from tubercles at the sutures; the seeds separated by transverse cellular dissepiments. Seeds 4 or fewer from abortion, ovate, a little compressed, with a linear callosity rising from the umbilicus, as well as being marginate at both extremities.—Twining herbs, with spreading stipulas, pinnately-trifoliate leaves, stipellate entire leaflets, pedunculate racemes of flowers, each peduncle bearing a single leaf. Pedicels somewhat verticillate. Seeds black or brown, with the hylum and callosity white.

1 *L. VULGARIS* (Savi, l. c. p. 19. f. 8. a. b. c.) legumes oblong, ventricose, acinaciform; pericarp easily separated? seeds ovate, somewhat compressed; gland basilar, hemispherical, furrowed.  $\alpha$ .  $\gamma$ . S. Native of the East Indies, and Egypt; and now cultivated in several of the West India islands. *Dolichos Lablab*, Lin. spec. 1019. Sims, bot. mag. 896. Lam. dict. 2. p. 293. *L. niger*, Mœnch.—Riv. tetr. irr. t. 29. f. 4.—Alp. ægypt. t. 71. Leaflets roundish-ovate, ending in a point furnished with a bristle. Stipulas lanceolate. This plant is cultivated for the sake of the legumes, which are cooked and eaten.

*Var.  $\alpha$ , niger* (D. C. prod. 2. p. 401.) flowers violaceous; seeds black. P. Alp. ægypt. 74. t. 75.

*Var.  $\beta$ , purpureus* (D. C. l. c.) flowers purple; seeds blackish purple. Lin. spec. 1021. Smith, exot. bot. t. 74. Lindl. bot. reg. 830. *Dolichos purpureus*, Jacq. fragm. 45. t. 55. Stems purplish. Bracteoles equal in length to the tube of the calyx. Wings spreading. The legumes when fresh and young are sapid and salubrious, and are cooked and eaten in the manner of kidney-beans.

*Var.  $\gamma$ , albiflorus* (D. C. l. c.) flowers white; seeds of a pale rust colour. *Dolichos Bengalensis*, Jacq. hort. vind. 2. t. 124. Willd. spec. 3. p. 1038. Stems pale. Bracteoles shorter than the tube of the calyx. Wings of flower rather adpressed. The legumes are dressed and eaten like those of the last variety.

*Common Lablab*. Fl. July, Aug. Clt. 1790. Pl. tw.

2 *L. NANKINENSIS* (Savi, l. c. p. 22. f. 8. d. g.) legumes oblong, ventricose, acinaciform; pericarp easily separated; seeds ovate, turgid; gland basilar, hemispherical, furrowed, acuminate downwards.  $\alpha$ .  $\gamma$ . G. Native of China, and cultivated in the West Indies for the sake of its legumes, which are dressed and eaten when young in the manner of kidney-beans. Flowers white. Legume  $2\frac{1}{2}$  inches long, and 10 lines broad. Seeds milk-coloured. This and the former species are called *Tul-Trangi* or European-bean by the Egyptians. The inhabitants make pleasant arbours of them. Alpinus says they grow wild in Egypt. Hasselquist is, however, certain that they do not grow wild in Lower Egypt, but are only cultivated there in gardens.

*Nankin Lablab*. Fl. July, Aug. Clt. 1714. Pl. tw.

3 *L. LEUCOCARPUS* (Savi, l. c. f. 9. a. d.) legumes somewhat lanceolate, compressed, torose; pericarp undulately curled, and separated with difficulty; seeds nearly globose; gland basilar, hemispherical, blunt.  $\alpha$ .  $\gamma$ . S. Native of the East Indies. *Dolichos Lablab*, Gærtn. fruct. 150. Flowers white, very like those of the preceding species. Legume white,  $2\frac{1}{2}$  inches long, and 8 lines broad. Seeds black or blackish red.

*White-fruited Lablab*. Fl. July, Aug. Clt. 1816. Pl. tw.

† *Species not sufficiently known.*

4 *L. CULTRATUS* (D. C. prod. 2. p. 402.) legumes hooked at the apex.  $\alpha$ .  $\gamma$ . G. Native of Japan. *Dolichos cultratus*, Thunb. in Lin. trans. 2. p. 340. Willd. spec. 3. p. 1029. *Dolichos ensiformis*, Thunb. jap. 279.—Banks, icon. Kœmpf. t. 25. Lateral leaflets 2-lobed. Flowers purple.

*Cultrate-podded Lablab*. Fl. July, Aug. Clt. 1816. Pl. tw. 5 *L. MICROCARPUS* (D. C. l. c.) legumes short, hardly twice the length of the breadth.  $\alpha$ .  $\gamma$ . S. Native of the Moluccas, on the sea-shore. *Dolichos spicatus*, Kœn. mss. in Roxb. hort. beng. p. 55.—Rumph. amb. 5. t. 141. f. 1. Flowers purple, disposed in spikes. Seeds black. Perhaps only a variety of *L. vulgaris*.

*Small-podded Lablab*. Fl. July, Aug. Clt. 1818. Pl. tw.

6 *L. PERENNANS* (D. C. l. c.) leaves pubescent; seeds nearly spherical.  $\alpha$ .  $\gamma$ . G. Native of Cochin-china and the Moluccas. *Dolichos albus*, Lour. coch. p. 439.—Rumph. amb. 5. t. 137. Flowers as well as seeds white. This is only a variety of *L. vulgaris* according to Roxburgh.

*Lasting Lablab*. Fl. June, July. Clt. 1820. Pl. tw.

*Cult.* The seeds of all the species may be sown in pots, and placed in a hot-bed; and in the course of May, when the plants will be several inches high, they may be planted out into the open ground in a warm sheltered situation, in the manner of scarlet-runners, and supported in the same way.

CXCV. PACHYRHIZUS (from  $\pi\alpha\chi\upsilon\varsigma$ , *pachys*, thick, and  $\rho\iota\zeta\alpha$ , *rhiza*, a root; in reference to the thick tuberous roots of the plants). Rich. herb. D. C. legum. mem. ix. prod. 2. p. 402. —Cacàra, Pet. Th. diet. sc. nat. 5. p. 55.

Lin. syst. *Diadelphina*, *Decandria*. Calyx urceolate, 4-lobed, upper lobe broad, and somewhat emarginate. Petals connected at the base? Vexillum roundish, spreading, without any callosity, biplicate at the base; the plaits involving the stipes of the wings. Stamens diadelphous, with the tube or sheath tumid at the base, and gaping widely. Ovary girded by a little sheath, which rises from the torus. Style beardless, incurved, tumid at the apex. Legume compressed, elongated. Seeds 7-8, reniform.—Twining suffruticose plants, with tuberous eatable roots, pinnately-trifoliate leaves, and axillary racemes of bluish violet flowers.

1 *P. ANGULATUS* (Rich. herb. D. C. prod. 2. p. 402.) leaflets angular, toothed, glabrous; stems suffruticose.  $\beta$ .  $\gamma$ . S. Native of the Moluccas, and elsewhere in the East Indies, and of the Mauritius, where it is cultivated for the sake of its roots. *Dolichos bulbosus*, Lin. spec. 1020. —Rumph. amb. 5. t. 132. —Pluk. alm. t. 52. f. 1. Root a single turnip-formed tuber, usually ending in a single tail, but sometimes divided; when young it is eaten both raw and boiled by the inhabitants of India and the Mauritius.

*Angular-leaved Pachyrhizus*. Fl. June, July. Clt. 1781. Shrub tw.

2 *P. TRILOBUS* (D. C. prod. 2. p. 402.) leaflets 3-lobed, pubescent; stems suffruticose, hairy.  $\beta$ .  $\gamma$ . G. Native of China and Cochin-china. *Dolichos trilobus*, Lour. coch. 439, exclusive of the synonymes. Flowers bright purple, with a yellow spot in the centre of the vexillum. Tubers of root few, about 2 feet long, nearly terete, for which the plant is cultivated in China and Cochin-china, where they are boiled and eaten by the inhabitants.

*Three-lobed-leafletted Pachyrhizus*. Shrub tw.

3 *P. MONTANUS* (D. C. l. c.) leaflets rhomboid-ovate, entire, tomentose; stems suffruticose.  $\beta$ .  $\gamma$ . G. Native of Cochin-china. *Dolichos montanus*, Lour. coch. 440. Flowers purple, disposed in spikes. Anthers 5 oblong, and 5 roundish. Roots with bundles of hard tubers.

*Mountain Pachyrhizus*. Shrub tw.

*Cult.* A light rich soil will suit these plants, and cuttings will root in sand under a hand-glass, or the plants may be increased by the tubers of the roots, or by seeds.

CXCVI. PAROCHETUS (from  $\pi\alpha\rho\alpha$ , *para*, nigh, and  $\alpha\chi\tau\omicron\varsigma$ , *ochetos*, a brook; in reference to the habitat of the

plants). Hamilt. in D. Don, prod. fl. nep. 240. D. C. prod. 2. p. 402.

LIN. SYST. *Diadélphia, Decándria*. Calyx 4-cleft, naked. Corolla papilionaceous, with an incumbent 2-lobed vexillum, and an obtuse keel, which is covered by the wings. Stamens diadelphous. Style smooth. Stigma obtuse. Legume gibbous, many-seeded. Seeds roundish.—Perennial creeping herbs, with trifoliate leaves, which stand on long petioles, membranous stipulas, and axillary, shewy, purple, solitary flowers, on long pedicels.

1 *P. COMMUNIS* (Hamilt. l. c.) leaflets truncate, dentately-serated. *U. G.* Native of Nipaul, at Narainhetty.

*Common Parochetus*. Fl. July. Clt. 1820. Fl. creeping.

2 *P. MAJOR* (D. Don, l. c.) leaflets obovate, retuse, crenated. *U. G.* Native of Nipaul, at Narainhetty. Larger than the preceding species, and with the habit of a species of *Oxalis*.

*Larger Parochetus*. Pl. creeping.

*Cult.* A light rich soil will answer the species of this genus, and as they are creeping plants, they are easily increased by dividing.

CXCVII. *DIOCLEA* (in memory of Diocles Carystinus, an ancient Greek botanist). H. B. et Kunth, nov. gen. amer. 6. p. 437. but not of Spreng.

LIN. SYST. *Diadélphia, Decándria*. Calyx half-4-cleft, bracteolate at the base; the segments acuminate, 2 lateral ones narrowest. Corolla with an obovate-oblong reflexed vexillum, destitute of callosities. Stamens diadelphous, the tenth one sometimes adhering to the others a little. Stigma somewhat clavate. Disk somewhat urceolate. Legume linear, compressed, many-seeded, furnished with a membranous margin on both sides towards the seminiferous suture. Seeds with a linear hylum.—Twining shrubs, with pinnately-trifoliate leaves, stipellate leaflets, axillary elongated pedicels, and red flowers.

1 *D. JACQUINIANA* (D. C. prod. 2. p. 403) leaflets ovate, acute; stems and legumes glabrous. *h. C. S.* Native of Martinique, in woods and among bushes. *Dolichos ruber*, Jacq. amer. p. 204. t. 123. Flowers red.

*Jacquin's Dioclea*. Shrub tw.

2 *D. SERICEA* (H. B. et Kunth, l. c. t. 576.) leaflets elliptic, cordate at the base, acute at the apex, pubescent above, but clothed with silky-silvery pubescence beneath; legumes clothed with yellowish silky down. *h. C. S.* Native of New Granada, near Honda. Flowers blue.

*Silky Dioclea*. Shrub tw.

3 *D. APURENSIS* (H. B. et Kunth, l. c.) leaflets elliptic-oblong, rounded at the base, glabrous, acuminate-mucronate at the apex, strigose on the nerves and veins beneath. *h. C. S.* Native on the banks of the Orinoco, at the confluence of the Apures. Flowers red.

*Apures Dioclea*. Shrub tw.

4 *D. ? MOLLIS* (D. C. prod. 2. p. 103.) leaflets rhomboid-ovate, acuminate, and are, as well as the branches, clothed with very soft down; peduncles shorter than the leaves, 3-6-flowered. *h. C. S.* Native country unknown. *Dolichos mollis*, Jacq. fragm. 6. t. 88. Flowers pale yellow. Legume unknown. This plant differs from *Dolichos* in the calyx being 4-cleft, and from *Vigna* in the vexillum being without callosities.

*Soft Dioclea*. Fl. July. Clt. 1824. Shrub tw.

*Cult.* The species of this genus will grow well in light rich soil, and they are easily increased by cuttings planted in sand, with a hand-glass placed over them, in heat.

CXCVIII. *PSOPHOCARPUS* (from *ψοφος*, *psophos*, a sound, and *καρπος*, *carpos*, a fruit; in reference to the seeds rattling in the pods when ripe on being shaken). Neck. elem. no.

1362. D. C. prod. 2. p. 403.—Bôtor, Adans. fam. p. 326. exclusive of the synonymes of Plum. Pet. Th. dict. sc. nat. 5. p. 241.

LIN. SYST. *Diadélphia, Decándria*. Calyx urceolate, unequally bilabiate. Corolla with a roundish reflexed vexillum, bearing 2 cylindrical callosities at the base. Wings stipitate, the stipes received within the margins of the vexillum. Keel oblong, 2-edged. Stamens diadelphous. Legume oblong, furnished with 4 longitudinal wings, 7-8-seeded. Seeds roundish.—A climbing herb, with tuberous roots, pinnately-trifoliate leaves, axillary twin racemes, and bluish flowers.

1 *P. TETRAGONOLOBUS* (D. C. l. c.) *U. C. S.* Native of the Mauritius, where it is cultivated under the name of *Pois-carré*. *Dolichos tetragonolobus*, Lin. spec. 1021.—Rumph. amb. 5. t. 133. There is a smaller kind which was gathered along the banks of rivulets in Madagascar by M. Aubert Du Petit Thours. The plant is cultivated in the Mauritius for the sake of its seeds, which are used in the same way as we do peas.

*Four-angled-podded Psophocarpus*. Fl. Sept. Nov. Clt. 1816. Pl. cl.

*Cult.* See *Lablab*, p. 361, for culture and propagation.

CXCIX. *CANAVALIA* (*Canavali* is the name of one of the species in Malabar). D. C. legum. mem. ix. prod. 2. p. 403.—*Canavali*, Adans. fam. 2. p. 326.—*Malòchia*, Savi, diss. 1824. p. 15. and 1825. p. 1.—*Dolichos* species of Lin.

LIN. SYST. *Monadélphia, Decándria*. Calyx tubular, bilabiate (f. 49. b.), lower lip with 3 small acute teeth, upper lip with 2 large rounded lobes. Corolla with a large vexillum (f. 49. d.), bearing 2 parallel callosities at the base; wings stipitate, oblong, auricled. Keel of 2 petals (f. 49. c.). Stamens monadelphous (f. 49. a.), or the tenth one adhering but slightly to the others. Legume compressed (f. 49. e.), with 3 prominent nerves, especially with a prominent nerve on each side of the seminiferous suture, and terminating in an inflexed mucrone (f. 49. e.); the seeds separated by cellular membranes. Seeds oval-oblong (f. 49. e.), with the hylum linear.—Herbs or subshrubs, with twining branches, pinnately-trifoliate leaves, axillary many-flowered racemes, tern pedicels, and large purple flowers.

1 *C. OBTUSIFOLIA* (D. C. prod. 2. p. 404.) leaflets ovate, obtuse; legumes straight, twice the length of the breadth. *h. C. S.* Native of Malabar. *Dolichos obtusifolius*, Lam. dict. 2. p. 295. *Dolichos rotundifolius*, Vahl. symb. 2. p. 81.—Rheed. mal. 8. t. 42.—Pluk. alm. t. 51. f. 2. Flowers purple.

*Obtuse-leaved Canavalia*. Fl. July, Aug. Clt. 1820. Sh. tw.

2 *C. EMARGINATA*; leaflets ovate, obtuse, emarginate; legumes straight, twice the length of the breadth. *h. C. S.* Native of Malabar. *Dolichos emarginatus*, Jacq. hort. schœnbr. 2. t. 221.

*Emarginate-leafletted Canavalia*. Fl. July, Aug. Clt. 1800. Shrub tw.

3 *C. MINIATA* (D. C. prod. 2. p. 404.) leaflets ovately-orbicular, rounded at both ends, reticulately veined; coriaceous, and are smooth, as well as the petioles; peduncles very long, and many-flowered; legumes generally 3-seeded, on short stipes. *U. C. S.* Native of Cuba. *Dolichos miniatus*, H. B. et Kunth, nov. gen. amer. 6. p. 441. Flowers vermilion-coloured.

*Vermilion-flowered Canavalia*. Pl. tw.

4 *C. GLADIATA* (D. C. prod. 2. p. 404.) leaflets ovate, acute; legumes 8 times longer than broad; racemes longer than the leaves; vexillum oblong. *h. C. S.* Native of the East Indies. *Dolichos gladiatus*, Jacq. icon. rar. t. 560. *Malòchia gladiata*, Savi, mem. 1825. p. 4. Nattamàmè, Banks, icon. Kœmpf. t. 39. Flowers white, pendulous, suffused with red. Legume nearly a foot long. Seeds brown.

*Var. β, mucheroides* (D. C. prod. 2. p. 404.) racemes length of the leaves; legumes 3 times longer than broad, ascending,

and incurved at the apex; flowers erect.  $\hbar$ .  $\circ$ . S. Native of the East Indies. *Lobus machæroides*, Rumph. amb. 5. p. 135. f. 1.—Rheed. mal. 8. t. 45. Perhaps a proper species.

*Sword-podded Canavalia*. Fl. June, July. Clt. 1790. Sh. tw.

FIG. 49.

5 *C. ENSIFORMIS* (D. C. prod. 2. p. 404.) leaflets ovate, acute; legumes 10 times or more longer than they are broad.  $\circ$ . ?  $\circ$ . S. Native of Malabar and the West Indies. *Dolichos ensiformis*, Lin. spec. 1022. Lam. dict. 2. p. 295. *Dolichos acinaciformis*, Jacq. coll. 1. p. 114. icon. rar. t. 559.—Rheed. mal. 8. t. 44.—Sloan. hist. jam. 1. t. 114. f. 1, 2, 3. *Malòchia ensiformis*, Savi, mem. 1825. p. 1. Flowers pale purple. Seeds white, but having the hylum girded with brick-colour.

*Var.  $\beta$ , albida* (D. C. l. c.) flowers and seeds white. *Mucuna albida*, Moc. et Sesse, fl. mex. icon. ined.

*Ensiform-podded Canavalia*. Fl. July, Aug. Clt. 1778. Pl. tw.

6 *C. LOUREIRII*; leaflets ovate, acute, wrinkled, glabrous; legumes large, broad, thickest on the back; stamens diadelphous.  $\hbar$ .  $\circ$ . S. Native of China and Cochinchina, where it is cultivated for adorning arbours. *Dolichos ensiformis*, Lour. coch. 437. Flowers purplish violet.

*Loureiro's Canavalia*. Shrub tw.

7 *C. RUTILANS* (D. C. l. c.) leaflets oval-oblong, obtuse; legumes straight, 4 times longer than broad.  $\hbar$ .  $\circ$ . S. Native of Mexico. *Mucuna rutilans*, Moc. et Sesse, fl. mex. ined. Flowers and seed of a reddish scarlet colour.

*Glittering Canavalia*. Shrub tw.

8 *C. INCURVA* (D. C. l. c.) leaflets oblong, acute; flowers axillary, solitary; legumes ensiform, incurved, acuminate.  $\mathfrak{L}$ .  $\circ$ . G. Native of Japan, about Nagasaki. *Dolichos incurvus*, Thunb. fl. jap. 280. Herb glabrous. Legumes a span long. Flowers purple. Perhaps sufficiently distinct from *C. gladiata*.

*Incurved-podded Canavalia*. Pl. tw.

9 *C. LINEATA* (D. C. l. c.) leaflets ovate, obtuse, ending in a lined acumen; flowers racemose; legumes oblong, acute, with a straight back, but rounded in front.  $\hbar$ .  $\circ$ . G. Native of Japan, about Nagasaki. *Dolichos lineatus*, Thunb. fl. jap. 280. Flowers purple. Legumes 2 inches long.

*Lined-leaved Canavalia*. Pl. tw.

10 *C. ROSEA* (D. C. l. c.) stems creeping, and ascending; leaflets roundish, shining; racemes longer than the leaves; legumes oblong, ending in a short acumen.  $\hbar$ . S. Native of Jamaica, in sand by the sea-side. *Dolichos roseus*, Swartz, fl. ind. occ. 3. p. 1243. Flowers of a reddish blue-colour, rather coriaceous.

*Rose-coloured-flowered Canavalia*. Fl. July, Aug. Clt. 1812. Pl. creeping.

11 *C. BONARIENSIS* (Lindl. bot. reg. 1199.) leaflets ovate, obtuse, coriaceous, glabrous, acuminate; racemes drooping, longer than the leaves; lower lip of calyx furnished with one tooth-like process; ovary falcate, pubescent, 6-ovulate, on a long villous stipe.  $\hbar$ .  $\circ$ . G. Native of Buenos Ayres. Flowers purple, large.

*Buenos Ayrcan Canavalia*. Fl. Ju. Aug. Clt. 1824. Sh. tw.

*Cult.* Elegant twining or climbing plants, well adapted for training up the rafters in a stove or greenhouse; their culture and propagation are the same as those for *Dioclea*, p. 362.

*οδονς*, *odous*, a tooth; in reference to the vexillum being furnished with a tooth on each side at the base). Lindl. bot. reg. 1101.

*LIN. SYST. Diadelphia, Decandria*. Calyx bractless, thrust in at the base, bilabiate; upper lip bidentate, lower one trifid, with subulate segments. Corolla with a reflexed vexillum, which is furnished with an inflexed tooth on each side at the base; wings and keel linear. Stamens diadelphous. Style filiform, glabrous, crowned by a capitellate stigma. Legume linear-oblong, compressed, wingless, torulose, many-seeded. Seeds oblong, compressed, greenish brown, with a small linear hylum, and girded by a thick white arillus. Cotyledons oblong. Radicle obtuse, inflexed.—A twining shrub, with pinnately-trifoliate leaves, stipellate ovate leaflets, ending in a spine-like mucrone, and short axillary racemes of large purple flowers.

1 *A. OVATUS* (Lindl. l. c.)  $\hbar$ .  $\circ$ . S. Native of Trinidad. Plant hairy in every part except the upper surface of the leaves. *Ovate-leaved Amphodus*. Fl. July, Aug. Clt. 1820. Sh. tw. *Cult.* See *Mucuna* for culture and propagation, p. 364.

*CCI. MUCUNA* (*Mucuna guaca* is the Brazil name of *M. urens*). Adans. fam. 2. p. 325. Juss. ann. mus. 11. p. 76. D. C. prod. 2. p. 404.—Hornera, Neck.—*Stizolobium*, Pers. ench. 2. p. 299.—*Negrètia*, Ruiz et Pav. prod. t. 21. Citta, Lour. Labradia, Swed. mat. med.—*Carpopogon*, Roxb. hort. beng.—*Macroceratides*, Raddi.

*LIN. SYST. Diadelphia, Decandria*. Calyx campanulate, bilabiate; lower lip trifid, with acute segments, the middle segment drawn out most, upper lip broad, entire, and obtuse. Corolla with assurgent vexillum, shorter than the wings and keel; wings oblong, length of the keel, which is oblong, straight, and acute. Stamens diadelphous, with 5 of the anthers oblong-linear, and the other 5 ovate and hairy. Legume oblong, torose, 2-valved; the seeds separated by cellular dissepiments. Seeds round, with a linear hylum girded by a circular mark.—Climbing herbs or shrubs, with pinnately-trifoliate leaves, and axillary racemes, which are usually pendulous when bearing the fruit. Legumes hispid from innumerable brittle, stiff, stinging caducous bristles, which easily penetrate the cuticle.

*SECT. I. ZOOPHTHALMUM* (from *ζωον*, *zoon*, an animal, and *οφθαλμος*, *ophthalmos*, an eye; in reference to the form of the seeds, which resemble the eye of an animal). P. Browne, jam. D. C. prod. 2. p. 405. Legumes with the furrows transversely lamellose.

1 *M. URENS* (D. C. prod. 2. p. 405.) flowers racemose; legumes covered with stinging bristles; leaflets clothed with shining tomentum beneath.  $\hbar$ .  $\circ$ . S. Native of the West Indies and South America. *Mucuna*, Maregr. bras. 19. Plum. amer. t. 107. Pluk. phyt. t. 213. f. 2. *Dolichos urens*, Lin. spec. 1020. Jacq. amer. 2. t. 182. f. 84. *Stizolobium urens*, Pers. ench. 2. p. 299. Flowers large, white or yellow, with the lower edge of the wings red. The seeds from their resemblance to an eye are called by the French *Yeur-bourrique*, or ass's eye, and for the same reason they have the name *ox-eye-bean* in our colonies in the West Indies.

*Burning Cow-itch* or *Ox-eye-bean*. Fl. June, July. Clt. 1691. Shrub cl.

2 *M. MOLLIS* (D. C. l. c.) flowers disposed in globose heads on the tops of the peduncles; bractæas ovate, acutish; legumes clothed with dense silky tomentum, oblong, acinaciform, 6-celled; leaflets ovate, acuminate, hairy above, but clothed with silky rufescent tomentum beneath.  $\hbar$ .  $\circ$ . S. Native of New Granada, on mount Quindiu, in temperate places. *Negrètia mollis*, H. B. et Kunth, nov. gen. amer. 6. p. 444.

*Soft Cow-itch*. Shrub cl.

SECT. II. STIZOLÖBIUM (from *στίζω*, *stizo*, to sting, and *λοιβος*, *lobos*, a pod; in allusion to the stinging hairs with which the pods are clothed). P. Browne, *jam.* D. C. prod. 2. p. 405. Legumes destitute of the transverse lamellæ.

3 M. ALTISSIMA (D. C. prod. 2. p. 405.) flowers racemose; legumes beset with stinging hairs; leaflets glabrous on both surfaces. *h. ∘. S.* Native of Martinique, in mountain woods. *Dolichos altissimus*, Jacq. *amer.* 203. t. 182. f. 85. exclusive of the synonyme of Rheed. Flowers with a bluish violet vexillum, and a rather yellowish carina.

*Tallest Cow-itch.* Fl. summer. Clt. 1779. Shrub cl.

4 M. PRURIENS (D. C. prod. 2. p. 405.) flowers racemose; legumes stinging, with the valves somewhat keeled; leaflets hairy beneath, acuminate, middle one rhomboid, lateral ones dilated on the outside. *h. ∘. S.* Native of Malabar, Rheed. *mal.* 8. t. 85.; of the Moluccas, Rumph. *amb.* 5. p. 112.; of the West Indies, P. Browne, *jam.* 290. t. 31. f. 4.; and of Guinea. *Dolichos pruriens*, Lin. *spec.* 1020. *Lam. dict.* 2. p. 290. *Stizolobium pruriens*, Pers. *Carpopogon pruriens*, Roxb. Flowers violaceous, becoming black when dried. Perhaps the American, Asiatic, and African plants are the same. A decoction of the roots is said to be a powerful diuretic. The pods are about 4 inches long, thickly beset on the outside with stiff brown hairs, which, when applied to the skin, occasion a most intolerable itching. In the choice of *Cow-itch*, all those pods which are brown or shrivelled, rusty, or of a bad colour or diminutive size, ought to be rejected. In medicine, the ripe pods are dipped in syrup, which is again scraped off with a knife. When the syrup is rendered as thick as honey by the hairs, it is fit for use. It acts mechanically as an anthelmintic, occasions no uneasiness, and may be safely taken from a tea-spoonfull to a table-spoonfull in the morning, fasting. The worms are said to appear with the second or third dose. A vinous infusion of the pods (12 to a quart) is said to be a certain remedy for the dropsy. A strong infusion of the roots sweetened with honey is used in India by the native practitioners in cases of cholera morbus.

Common or *Stinging Cow-itch.* Fl. summ. Clt. 1681. Sh. cl.

5 M. GIGANTEA (D. C. prod. 2. p. 405.) flowers umbellate; legumes covered with stinging hairs, 3-4-seeded; leaflets glabrous, acuminate, lateral ones dilated on the outside, middle one ovate. *h. ∘. S.* Native of Malabar and of Chittagong. —Rheed. *mal.* 8. t. 36. *Carpopogon giganteum*, Roxb. *hort. beng.* p. 54. *Dolichos giganteus*, Willd. *spec.* 3. p. 1041. Flowers of a pale greenish colour.

*Var. β, nigricans* (D. C. prod. 2. p. 405.) corolla black marked with a white spot. *h. ∘. G.* Native of Cochin-china, in hedges. *Citta nigricans*, Lour. *coch.* 456. Rumph. *amb.* 5. t. 6. ex Lour. but Rumphius's plant has greenish white flowers, and is therefore referrible to the species.

*Giant Cow-itch.* Fl. July, Aug. Clt. 1815. Shrub cl.

6 M. MACROCARPA (Wall. *pl. asiat. rar.* 1. p. 41. t. 47.) leaves sparingly pilose; flowers large, racemose; keel longer than the wings, of a different colour; legumes very long, ensiform, torulose, tomentose, many-seeded. *h. ∘. G.* Native of Nipaul, on the mountains. Flowers party-coloured; vexillum green; wings purple and keel brown.

*Long-fruited Mucuna.* Shrub tw.

7 M. INFLEXA (D. C. l. c.) flowers umbellate; pedicels inflexed; legumes covered with stinging hairs; seeds globose; lateral leaflets cordate. *h. ∘. S.* Native of the Andes, in woods. *Negrètia inflexa*, Ruiz. et Pav. *syst.* 176. Peduncles pendulous, 2 or 4 yards long. Flowers dark purple, becoming black when dry.

*Inflexed-pedicelled Cow-itch.* Shrub cl.

8 M. ELLIPTICA (D. C. l. c.) flowers umbellate; legumes covered with very stinging hairs, 2-seeded; seeds convex on both ends; lateral leaflets ovate. *h. ∘. S.* Native of Peru,

on mountains. *Negrètia elliptica*, Ruiz. et Pav. *syst.* 176. Flowers dark purple, drying black.

*Elliptic-leafletted Cow-itch.* Shrub cl.

9 M. MITIS (D. C. l. c.) racemes very long; legumes unarmed; seeds compressed; leaflets obliquely ovate. *h. ∘. S.* Native of Peru, in groves. *Negrètia mitis*, Ruiz. et Pav. *syst.* 177. Flowers dark purple, becoming black on drying.

*Mild Cow-itch.* Fl. summer. Clt. 1820. Shrub cl.

10 M. COMOSA (D. C. l. c.) racemes erect, dense-flowered; legumes oblong, unarmed; seeds compressed, with the hylum girded; leaflets elliptic, mucronate, glabrous. *h. ∘. S.* Native of Guiana, near Essequibo, in groves. *Dolichos comosus*, Mey. *prim. esseq.* 241. Corolla white, tipped with purple.

*Tufted Cow-itch.* Shrub cl.

11 M. PLATYCARPA (D. C. l. c.) legumes compressed; seeds flat; leaflets ovate, cordate, intermediate one oblong-linear, acute. *h. ∘. S.* Native of Peru, in groves. *Negrètia platycarpa*, Ruiz. et Pav. *syst.* 177.

*Broad-podded Cow-itch.* Shrub cl.

12 M. MACROCRATIDES (D. C. prod. 2. p. 406.) flowers spicate; legumes compressed, torulose, pilose on the back, and furnished with 2 margins; seeds reniform; leaflets ovate, glabrous above, villous beneath. *h. ∘. S.* Native of Brazil, on the Mandioca mountains, near Rio Janeiro. *Macrocratides pseudo-stizolobium*, Radd. *mem. add. bras.* 13. f. 5. Flowers rather small, of a violaceous colour. Peduncles and calyxes black. Seeds black, except the concave part.

*Long-horned Cow-itch.* Clt. 1824. Shrub cl.

13 M. MUTISIANA (D. C. l. c.) racemes pedunculate, somewhat capitate; bractæas ovate, rounded at the apex, clothed with rusty tomentum; leaflets smoothish, membranous, elliptic-oblong, acuminate, lateral ones with very unequal sides. *h. ∘. S.* Native of South America, near Santa Fe de Bogota. *Negrètia Mutisiana*, H. B. et Kunth, *nov. gen. amer.* 6. p. 442. Legume unknown.

*Mutis's Cow-itch.* Shrub cl.

† *Species indicated in Roxburgh's Hortus Bengalensis, but not described.*

14 M. MONOSPERMA (D. C. l. c.), *h. ∘. S.* Native of the East Indies. *Carpopogon monospermum*, Roxb. *hort. beng.* p. 54.

*One-seeded Cow-itch.* Clt. 1816. Shrub tw.

15 M. ATROPURPUREA (D. C. l. c.). *h. ∘. S.* Native of the East Indies, in Travancore. *Carpopogon atropurpureum*, Roxb. l. c. Flowers dark purple, almost black.

*Dark-purple-flowered Cow-itch.* Clt. 1820. Shrub tw.

16 M. NIVEA (D. C. l. c.). *h. ∘. S.* Native of Bengal. *Carpopogon niveum*, Roxb. l. c. Flowers white.

*Snowy-flowered Cow-itch.* Clt. 1816. Shrub tw.

17 M. IMBRICATA (D. C. l. c.). *h. ∘. S.* Native of Silhet. *Carpopogon imbricatum*, Roxb. l. c.

*Imbricated Cow-itch.* Clt. 1815. Shrub tw.

18 M. BRACTEATA (D. C. l. c.). *h. ∘. S.* Native of Chittagong. *Carpopogon bracteatum*, Roxb. l. c.

*Bracted Cow-itch.* Clt. 1826. Shrub tw.

19 M. ANGUEA (Roxb. *hort. beng.*, under *Carpopogon*). *h. ∘. S.* Native of the East Indies.

*Snake Cow-itch.* Shrub tw.

*Cult.* A rich soil suits the species of *Cow-itch*, and they are easily increased from cuttings. None of them are worth growing, unless in botanical gardens.

CCH. CALOPOGONUM (from *καλος*, *kalos*, beauty, and *πωγων*, *pogon*, a beard; in reference to hairs on the calycine segments). Desv. *obs. legum. in Schlecht. Linnæa* 2. p. 513.

LIN. SYST. *Diadelphia, Decandria*. Calyx bractless, deeply 5-cleft, closed, smooth; segments elongated, awl-shaped, nearly

equal, pinnately bearded, longer than the corolla. Legume straight, depressed, or rather hooked, pilose, 8-seeded.—An herbaceous twining plant, with trifoliate leaves.

1 *C. mucunoides* (Desv. l. c.). 2. *C. S.* Native of Guinea. *Mucuna-like Calopogonum*. Pl. tw.

*Cult.* See *Mucuna* for culture and propagation, p. 364.

CCHII. CAJANUS (*Catjang* is the Amboyna name for *C. flavus*). D. C. cat. hort. monsp. 85. no. 43. H. B. et Kunth, nov. gen. amer. 6. p. 395. D. C. prod. 2. p. 406. Cajan. Adan. fam. 2. p. 326. Pet. Th. dict. sci. nat. 6. p. 166.

LIN. SYST. *Diadelphia*, *Decándria*. Calyx campanulate, 5-cleft; segments subulate, incurved at the apex, 2 superior ones joined together higher up than the rest. Corolla with ample vexillum, which is bicallous at the base, and an obtuse straight keel. Stamens diadelphous. Legume oblong, compressed, oblique, torulose, 2-valved. Seeds numerous, nearly spherical, separated by membranous partitions. Erect shrubs, clothed with velvety pubescence, with pinnately trifoliate leaves, stipellate leaflets, and axillary racemes of yellow flowers, with 2 pedicels rising from each bractea. Cotyledons conferruminate in germination.

1 *C. bicolor* (D. C. l. c.) vexillum discoloured on the outside; legumes 4-5-seeded, spotted; stipels of the lateral leaflets about equal in length to the petiolules. *C. S.* Native of the East Indies. *Cytisus* Cajan, var. *β*. Lam. dict. 2. p. 249. *Cytisus pseudo-cajan*, Jacq. hort. vind. 2. t. 119.—Rheed. mal. 6. t. 13. Flowers yellow, except the outside of the vexillum, which is purplish. The seeds are eatable, and very delicate when young.

*Two-coloured-flowered Pigeon-pea*. Fl. Jul. Aug. Clt. 1800. Shrub 3 to 6 feet.

2 *C. flavus* (D. C. l. c.) vexillum the same colour on both sides; legumes 4-5-seeded, and are as well as the calyxes spotless; stipels of lateral leaflets one half shorter than the petiolules. *C. S.* Native of the East Indies, but now cultivated in South America and Africa. *Cytisus* Cajan, Lin. spec. 1044. Jacq. obs. 1. t. 1. Plum. ed. Burm. 114. f. 2. Burm. zeyl. p. 86. t. 37. Hughes, barb. 199. t. 19. This shrub is cultivated in both Indies, South America, and Africa. In the West Indies it is chiefly planted in rows, as a fence to the sugar plantations. The seed is much eaten by the poorer inhabitants and negroes, and is esteemed a wholesome pulse; in Martinico even the better sort of people hold the seeds in high estimation, and prefer them to common peas. The chief use they are put to in Jamaica is for feeding pigeons, whence the English name. The branches, with the ripe seeds and leaves, are given to feed hogs, horses and other cattle, which grow very fat on them.

*Yellow-flowered or Common Pigeon-pea*. Fl. July, Aug. Clt. 1687. Shrub 4 to 10 feet.

*Cult.* A light rich soil will suit the species of *Cajanus*; and young cuttings will root in sand, with a hand-glass placed over them, in heat, but the plants are annually raised from seeds brought or sent from the West and East Indies.

CCIV. LUPINUS (of Pliny and other Latin writers, said to be from *lupus*, a wolf, on account of its being supposed to destroy the fertility of the soil; or rather *απο της λυπης*, *apotes lupes*, whence Virgil calls lupines *tristes lupini*, the bitterness of this pulse contracting the muscles and giving a sorrowful appearance to the countenance, *Fossius*). Tourn. inst. 392. t. 213. Lin. gen. 1176. Gærtn. fruct. 2. p. 150. D. C. prod. 2. p. 406.

LIN. SYST. *Monadelphiu*, *Decándria*. Calyx profoundly bilabiate. Corolla papilionaceous, the vexillum with reflexed sides, and the keel acuminate. Stamens monadelphous, with the tube or sheath entire, 5 of the anthers are smaller, rounder,

and earlier, and the other 5 oblong and later. Style filiform. Stigma terminal, roundish, bearded. Legume coriaceous, oblong, compressed, obliquely torulose. Cotyledons thick, but converted into leaves at the time of germination. Herbs or subshrubs, with digitate leaves, constantly composed of from 5-15 leaflets, very rarely simple. Leaflets complicated before expansion, and while asleep or through the night. Stipulas adnate to the petioles. Peduncles opposite the leaves or terminal. Flowers alternate or verticillate, sessile, or pedicellate, disposed in racemes, and spikes, with one bractea under each pedicel, and with 2 bracteoles adhering laterally to the calyx, which are caducous, or wanting.

#### § 1. *Leaves digitate.*

##### \* *Annual herbs.*

1 *L. albus* (Lin. spec. 1015.) flowers alternate, pedicellate, destitute of bracteoles; upper lip of calyx entire, lower one tridentate; leaflets obovate-oblong, usually 7 or 8, villous beneath. *C. H.* Native of the Levant, and now cultivated in the south of Europe. Ludw. ect. t. 191. Blackw. icon. t. 282. *L. sativus*, Gater. montaub. 126.—Chus. hist. 2. p. 228. f. 1. Flowers white, almost sessile. This plant is cultivated in some parts of Italy and other parts of the south of Europe, as other pulse, for food; also in the south of France, on poor, dry, extensive plains, as an ameliorating crop, to be ploughed in where no manure is to be had, and the ground is too bad for clover or other better plants. In Tuscany, it is not only cultivated for food, but also for improving the land by ploughing it in, a practice continued from the time of the ancient Romans, as may be seen by consulting Pliny and Columella. With us it is used only among other annuals in the flower-border.

*Var. β*; keel of flower tipped with violet. *L. albus*, *Ægyptiacus*, March. meth. 152.

*White Lupine*. Fl. June, Aug. Clt. 1596. Sh. 1 to 2 feet.

2 *L. termis* (Forsk. descrip. 131.) flowers alternate, pedicellate, bracteolate; upper lip of calyx entire, lower one somewhat tridentate; leaflets 5-6, obovate-oblong, villous beneath. *C. H.* Native of Egypt. *L. prolifer*, Desrous. in Lam. dict. 3. p. 622. Flowers white but with the vexillum tipped with blue. Like *L. albus* and *L. varius*. *Termis* is the Arabic name of the plant. The peduncles, after being peeled, are eaten raw, and the seeds are boiled as other pulse by the Arabians.

*Termis* or Egyptian white Lupine. Fl. Ju. Aug. Clt. 1802. Pl. 1 to 2 feet.

3 *L. varius* (Lin. spec. 1015.) flowers somewhat verticillate or alternate, pedicellate, bracteolate; upper lip of calyx bidentate, lower one slightly tridentate; leaflets oblong-lanceolate, villous beneath, usually 5-6 in number. *C. H.* Native of Spain, South of France, Corsica, Egypt, and in the islands of the Archipelago of Europe, &c. *L. semi-verticillatus*, Desrous. in Lam. dict. 3. p. 623. *L. sylvestris a*, Lam. fl. fr. Flowers large, blue or purplish.

*Variable Lupine*. Fl. Jul. Aug. Clt. 1596. Pl. 2 to 3 feet.

4 *L. micrctus* (Lin. spec. 1015.) flowers alternate, bracteolate; upper lip of calyx bipartite, lower one trifid; leaflets 5, oblong-spatulate, hairy on both surfaces; legumes very hairy. *C. H.* Native of Spain, South of France, Egypt, Corsica, and the islands of the Archipelago of Europe. *L. digitatus*, Forsk. descrip. 131.—J. Baul. hist. 289. with a figure.—Park. parad. 335. t. 337. f. 1.—Gerard. emac. 1217. f. 4. Flowers smaller than those of *L. varius*, lower ones sometimes axillary. Plant clothed with ferruginous hairs.

*Hairy Lupine*. Fl. June, July. Clt. 1629. Pl. 1 foot.

5 *L. pilosus* (Lin. spec. 1015.) flowers verticillate, pedicellate, bracteolate; upper lip of calyx bipartite, lower one entire; leaflets 9-11, oblong-lanceolate, villous on both surfaces, as well

as the stems and calyxes. ☉. H. Native of the south of Europe. Flowers rose-coloured, with the middle of the vexillum red.

*Var. β, cæruleus*; flowers bluish-purple. The Great Blue Lupine.

*Pilose or Rose Lupine.* Fl. Jul. Aug. Clt. 1710. Pl. 2 to 4 ft.

6 *L. BRACTEOLARIS* (Desrous. in Lam. dict. 3. p. 622.) flowers alternate, pedicellate, bracteolate; upper lip of calyx bipartite, lower one trifid; stipulas ovate-lanceolate; leaflets 5-6, obovate-oblong, villous on both surfaces. ☉. H. Native of Monte Video. Said to be allied to *L. hirsutus*, according to Desrousseaux. Perhaps the same as *L. rupëstris* of Kunth. Flowers probably purplish.

*Bracteolate Lupine.* Fl. June, July. Clt. 1820. Pl. 1 foot.

7 *L. ANGUSTIFOLIUS* (Lin. spec. 1016.) flowers alternate, on short pedicels, without bracteoles; upper lip of calyx bifid, lower one entire; leaflets 7-8, linear, clothed with adpressed pubescence; legumes villous, usually 6-seeded. ☉. H. Native of Spain, south of France, Italy, Sicily, and Corsica, in corn-fields. Knor. del. 2. t. L. f. 7. Riv. tetr. irr. t. 28.—J. Bauh. hist. 2. p. 291. with a figure, exclusive of the description. *L. varius*, Savi, fl. pis. 2. p. 178. Flowers blue. Seed variegated.

*Narrow-leafletted Lupine.* Fl. July, Aug. Clt. 1696. Pl. 2 to 3 feet.

8 *L. LINIFOLIUS* (Roth. abhand. 14. t. 5.) flowers alternate; upper lip of calyx bifid; lower one rather trifid; leaflets linear, very narrow, channelled. ☉. H. Native country unknown. Willd. spec. 3. p. 1025. Flowers blue, smaller than those of the preceding species.

*Flax-leaved Lupine.* Fl. Jul. Aug. Clt. 1791. Pl. 1 to 2 ft.

9 *L. LINEARIS* (Desrous. in Lam. dict. 3. p. 625.) flowers alternate, on short pedicels, bracteolate; upper lip of calyx bifid, lower one tridentate; leaflets 8-11, linear, very narrow. ☉. H. Native of Monte Video. Flowers small, blue, but with the outside of the vexillum yellowish. The stems are said to be herbaceous, but perhaps the root is perennial.

*Linear-leafletted Lupine.* Pl. 1 to 2 feet.

10 *L. LUTEUS* (Lin. spec. 1015.) flowers verticillate, sessile, bracteolate; upper lip of calyx bipartite, lower one tridentate; leaflets 7-9, oblong, lower ones obovate. ☉. H. Native of Spain, south of France, and Sicily. Curt. bot. mag. 140.—Riv. tetr. irr. t. 26.—J. Bauh. hist. 2. p. 290. with a figure. *L. odoratus*, Hortul. Flowers yellow, sweet-scented. Bractæas ovate, erect.

*Yellow Lupine.* Fl. June, Aug. Clt. 1596. Pl. 1 to 1½ ft.

11 *L. HUMIFUSUS* (Sesse et Moc. in herb. Lamb.) plant clothed with hairs in every part, except the leaves; leaflets 7-9, linear-lanceolate, pubescent, mucronate; flowers alternate; calyx villous, with the upper lip entire and shorter than the lower one, which is tridentate. ☉. H. Native of Mexico. Flowers purplish blue.

*Trailing Lupine.* Pl. ½ foot.

12 *L. MICROCARPUS* (Sims, bot. mag. t. 2413.) flowers verticillate, sessile, bracteolate; upper lip of calyx very short, emarginate, superior one tridentate; bractæas reflexed; leaflets oblong-linear; legumes rhomboid, 2-seeded, hairy. ☉. H. Native of Chili. Flowers blue, with a purplish apex. Keel ciliated on the inside at the base.

*Small-podded Lupine.* Fl. May, June. Clt. 1821. Pl. ½ ft.

13 *L. FUSILLUS* (Pursh, fl. amer. sept. 2. p. 468.) flowers alternate, without bracteoles; upper lip of calyx bipartite, lower one entire; leaflets 5-7, linear-elliptic, glabrous above, but hairy beneath, as well as the stems and petioles; legumes very hairy, 2-seeded. ☉. H. Native of North America, on the plains between the Missouri and the White River. Nutt. gen. amer. 2. p. 93. Flowers small, blue mixed with red.

*Small Lupine.* Fl. June, Aug. Clt. 1817. Pl. ¾ foot.

14 *L. BICOLOR* (Lindl. bot. reg. 1109.) stems branched, co-

rymbous, and are as well as the leaves clothed with silky pili; leaflets 5-7, linear spatulate; flowers few, verticillate; calyx clothed with silky wool, inappendiculate, having the upper lip bifid, and the lower one elongated and entire; wings longer than the vexillum; legumes many-seeded. ☉. H. Native of North America, in the interior of the country, about the Columbia River, from Fort Vancouver to the branches of Lewis and Clarke's river. Flowers with a white vexillum, which becomes reddish purple, and the keel and wings bluish purple.

*Two-coloured-flowered Lupine.* Clt. 1826. Pl. 1 foot.

15 *L. MICRANTHUS* (Doug. in bot. reg. 1251.) flowers somewhat verticillate, bracteolate, sessile; upper lip of calyx bifid, lower one entire; leaflets 5-7, linear, spatulate, ciliated; legumes 6-seeded, furrowed transversely; stem branched; roots granular. ☉. H. Native of North America, upon the gravelly banks of the southern tributaries of the Columbia, and of the interior of California, in barren ground. Flowers pale bluish purple, the vexillum white in the centre, with 2 or 4 parallel black dots.

*Small-flowered Lupine.* Fl. May, Jul. Clt. 1826. Pl. ½ to 1 ft.

#### \* \* Perennial herbs.

16 *L. MEXICANUS* (Cerv. in Lag. nov. spec. 22. no. 288.) herbaceous; flowers alternate, pedicellate, bracteolate; upper lip of calyx emarginate, lower one obscurely tridentate; leaflets oblong-linear, pilose beneath. ♂? G. Native of Mexico. Ker. bot. reg. 457. Flowers blue, about the size of those of *L. perennis*.

*Mexican Lupine.* Fl. Feb. May. Clt. 1819. Pl. 1 to 2 ft.

17 *L. PERENNIS* (Lin. spec. 1015.) herbaceous; flowers alternate, pedicellate, bracteolate; upper lip of calyx somewhat emarginate, lower one entire; leaflets 8-9, lanceolate, mucronulate, rather villous beneath; root creeping. ♀. H. Native of North America, in sandy places, and on sandy hills from Canada to Florida. This is a very common plant in the State of New York, in Long Island, and about Philadelphia, where we have seen it growing in great plenty on sandy banks and in woods. Mill. fig. t. 170. f. 1. Lam. ill. 616. f. 1. Curt. bot. mag. 202. Flowers of a pale bluish purple colour.

*Perennial Lupine.* Fl. June, July. Clt. 1658. Pl. 1 to 2 ft.

18 *L. NOOTKATENSIS* (Sims, bot. mag. t. 1311. and 2137.) herbaceous; flowers rather verticillate, pedicellate, without bracteoles; both lips of calyx entire; leaflets 7-8, obovate-lanceolate, hairy as well as the stems. ♀. H. Native of North America, on the western coast at Nootka Sound, and of the Island of Unalashka. Pursh, fl. amer. sept. 2. p. 462. Flowers elegant, blue, mixed with purple, white, or yellow, and streaked with more intense veins.

*Nootka Sound Lupine.* Fl. May, Jul. Clt. 1794. Pl. 1 to 1½ ft.

19 *L. POLYPHYLLUS* (Doug. in bot. reg. 1096.) herbaceous; flowers rather verticillate, without bracteoles, pedicellate; leaflets 11-15, lanceolate, hairy beneath; both lips of calyx quite entire; stems pilose. ♀. H. Native of North America, on the north-west coast. Corolla purple; the vexillum of a deep bluish purple, and with the keel paler.

*Var. β, albiflorus* (Lindl. bot. reg. 1377.) flowers white.

*Many-leafletted Lupine.* Fl. Ju. Sept. Clt. 1826. Pl. 2 to 4 ft.

20 *L. ALBUCAULIS* (Doug. mss.) herbaceous; flowers alternate, pedicellate, bractless; disposed in long racemes; both lips of calyx entire; leaflets 8-9, obovate-lanceolate, mucronate, hairy beneath; stem pubescent. ♀. H. Native of North America, on the north-west coast. Flowers purplish?

*White-stemmed Lupine.* Pl. 1 to 1½ foot.

21 *L. LAXIFLORUS* (Doug. in bot. reg. 1140.) plant herbaceous, pilose; flowers alternate, without bracteoles; upper lip of calyx entire, saecate at the base, lower one longer, ovate, and acu-

minated; keel beardless; vexillum obcordate; leaflets 7-9, linear-lanceolate; stipulas small, subulate. *U. H.* Native of North America, about the great rapids of the Columbia River. Racemes loose. Flowers with the vexillum and tips of the wings blue, but the keel and base of the wings are reddish.

*Loose-flowered Lupine.* Fl. Aug. Sept. Clt. 1826. Pl. 1 to  $1\frac{1}{2}$  foot.

22 *L. TENELLUS* (Dougl. mss.) herbaceous; flowers somewhat verticillate, pedicellate, bractless; both lips of calyx entire, lower one linear, elongated; leaflets usually 7, very narrow-linear, clothed with villi as well as the petioles; stem slender; stipulas subulate. *U. H.* Native of North America, on the western coast. Flowers apparently bluish purple.

*Slender Lupine.* Pl. 1 to 2 feet.

23 *L. LEVIDUS* (Dougl. in bot. reg. 1249.) plant herbaceous; flowers alternate, pedicellate, without bracteoles; calyx villous, the upper lip bipartite, the lower one acuminate and elongated; leaflets 5-7, lanceolate, silky on both surfaces; flower bearing stems erect, furnished with 1 or 2 leaves; petioles long. *U. H.* Native of North America, from Fort Vancouver to the great falls of the Columbia river, on the dry elevated banks of streams. Flowers with the vexillum purplish blue inside, with a white spot at the base, and pale outside. Wings purplish blue. Keel dark purple at the apex. Seeds white.

*Pretty Lupine.* Fl. Aug. Sept. Clt. 1826. Pl.  $\frac{1}{2}$  foot.

24 *L. ORNATUS* (Dougl. in bot. reg. 1261.) herbaceous; flowers verticillate, appendiculate; upper lip of calyx bifid, lower one entire and elongated; leaflets 7-12, linear-lanceolate, clothed with silvery silky down on both surfaces; legumes 1-5-seeded. *U. H.* Native of North America, in mountain valleys on the banks of the Spokane river, near the Kettle Falls on the Columbia river. Flowers rather large, with a pale vexillum, blue wings, and a ciliated paler keel.

*Ornamented Lupine.* Fl. May, Nov. Clt. 1826. Pl. 1 to 2 ft.

25 *L. MINIMUS* (Dougl. mss.) herbaceous, dwarf, hairy; stems 1-2-leaved; leaves on long petioles, mostly radical; leaflets 7-8, obovate-lanceolate, clothed with silky villi; flowers somewhat verticillate, bracteolate, almost sessile; bracteas longer than the calyx; upper lip of calyx bipartite, lower one entire, elongated, acuminate. *U. H.* Native of North America, on the western coast. Flowers apparently purple.

*Least Lupine.* Pl.  $\frac{1}{2}$  foot.

26 *L. LITTORALIS* (Dougl. in bot. reg. 1198.) herbaceous; flowers verticillate, pedicellate, without bracteoles; both lips of calyx entire; leaflets 5-7, linear-spatulate, silky on both surfaces; legumes 10-12-seeded, furrowed transversely; root granular. *U. H.* Native of North America, on the west coast from Cape Mendocino to Paget's Sound, where it binds together the loose sand by its roots. Flowers with a purple vexillum, blue wings, and a pale keel. The roots are used by the natives about the Columbia river as winter food.

*Shore Lupine.* Fl. June, Oct. Clt. 1826. Pl. 1 foot.

27 *L. ARIDUS* (Dougl. in bot. reg. 1242.) plant herbaceous, very hairy; flowers verticillate, pedicellate, bracteolate; upper lip of calyx bifid, lower one entire; leaflets 5-9, linear-lanceolate, villous; stipulas subulate. *U. H.* Native of North America, growing along with *L. leucophyllus*, where it forms dense tufts. Flowers purplish blue; the vexillum purple, but the wings are darker.

*Arid lupine.* Fl. Aug. Sept. Clt. 1827. Pl. 1 foot.

28 *L. SULPHUREUS* (Dougl. mss.) herbaceous, and clothed with silky villi; flowers somewhat verticillate, pedicellate, without bracteoles; both lips of calyx entire, lower one elongated; leaflets linear-lanceolate, usually 13, silky; stipulas subulate. *U. H.* Native of North America, on the western coast. Flowers sulphur-coloured.

*Sulphur-coloured-flowered Lupine.* Pl. 1 to  $1\frac{1}{2}$  foot.

29 *L. PLUMOSUS* (Dougl. in bot. reg. 1217.) plant herbaceous, very villous; flowers alternate, on short pedicels, bracteolate; upper lip of calyx bifid, lower one entire; leaflets 5-7, lanceolate, silky; legumes glabrous, 3-5-seeded; bracteas longer than the flowers, villous, deciduous. *U. H.* Native of Northern California, growing in gravelly soils; it is also found at the sources of the Walla-Wallah river, near the Blue Mountains, on the north-western coast of America. Flowers blue, with the keel and wings pallid.

*Feathery Lupine.* Fl. June, July. Clt. 1826. Pl. 2 to 3 ft.

30 *L. DECUMBENS* (Torrey, in ann. lye. 2. p. 181.) plant suffrutescent, rather decumbent; flowers pedicellate, somewhat verticillate, bracteolate; calyx clothed with silky hairs, having both lips entire; leaflets oblong-lanceolate, acute, and obtuse, silky beneath. *U. H.* Native of North America, on the southern branches of the Arkansa. Flowers small, purple, about half the size of those of *L. perennis*.

*Decumbent Lupine.* Pl. procumbent.

31 *L. LEUCOPHYLLUS* (Dougl. in bot. reg. 1124.) plant herbaceous, very villous; flowers alternate, pedicellate, bracteolate; upper lip of calyx bifid, lower one entire; leaflets 7-9, oblong-lanceolate; stipulas subulate, woolly. *U. H.* Native of North America. Flowers disposed in long racemes, and are either white or tinged with light pink.

*White-leaved Lupine.* Fl. June, Nov. Clt. 1826. Pl. 2 to 3 ft.

32 *L. SABINIAEUS* (Dougl. bot. reg. 1435.) herbaceous; flowers somewhat verticillate, without bracteoles; racemes many-flowered; calyx villous, with the upper lip ovate and acute, lower one boat-shaped, revolute; wings roundish, size of vexillum; keel acute; leaflets 7-12, lanceolate, acuminate, silky. *U. H.* Native of North America, at the junction of Lewis and Clarke's river with the Columbia. Flowers yellow.

*Sabine's Lupine.* Fl. May, June. Clt. 1827. Pl. 2 to 3 ft.

33 *L. CHAMISSONIS* (Eschscholtz, in mem. acad. imp. sc. petersb. vol. 10. p. 281. ex Schlecht. Linnæa. vol. 3. p. 147.) stems herbaceous, clothed with cinereous tomentum; leaves on long petioles; leaflets obovate-lanceolate, bluntish, clothed with grey tomentum, but when young with rusty, silky tomentum; flowers verticillate, 3-4 in a whorl; pedicels quadrangular; stipulas linear, villous; upper lip of calyx trifid, lower one lanceolate, entire. *U. H.* Native of California, in sandy places. Flowers purple. Legumes 3-4-seeded, clothed with rusty villi. Bracteas longer than the pedicels.

*Chamisso's Lupine.* Pl. 3 feet.

34 *L. SERICEUS* (Pursh, fl. amer. sept. 2. p. 468.) herbaceous; flowers rather verticillate, without bracteoles; upper lip of calyx cut, lower one entire; leaflets 7-8, lanceolate, acute, silky on both surfaces; stems clothed with silky tomentum. *U. H.* Native of North America, on the banks of the Kooksosky river, and of North California, in the sea sand at Port St. Francisco. Flowers pale purple or rose-coloured, according to Pursh, but Chamisso says they are yellow, and fade to a purplish colour in drying.

*Silky Lupine.* Fl. May, June. Clt. 1826. Pl. 2 to 3 feet.

35 *L. ARGENTEUS* (Pursh, fl. amer. sept. 2. p. 468.) herbaceous; flowers alternate, without bracteoles; upper lip of calyx obtuse, lower one entire; leaflets 5-7, linear-lanceolate, acute, glabrous above, but clothed with silky-silvery down beneath. *U. H.* Native of North America, on the banks of the Kooksosky river. Flowers cream-coloured.

*Silvery Lupine.* Fl. May, June. Clt. 1826. Pl. 1 to 2 ft.

36 *L. ARGYREUS* (D. C. prod. 2. p. 408.) herbaceous; flowers verticillate, pedicellate, bracteolate; upper lip of calyx nearly entire, lower one somewhat tridentate; leaflets oblong, clothed with silky hairs on both surfaces; legumes very hairy, 2-3-seeded. *U. ? G.* Native country unknown, but cultivated in

gardens in Teneriffe, where it was gathered by Courant. Flowers blue. It is not known whether this plant is an annual or a perennial.

*Silvered Lupine.* Pl. 2 to 3 feet?

37 *L. ELEGANS* (H. B. et Kunth, nov. gen. amer. 6, p. 477.) plant herbaceous, erect, covered with soft pili; racemes elongated, pedunculate; flowers somewhat verticillate; calyx clothed with silky pili, having the lower lip acute and entire; leaflets lanceolate, acute, clothed with adpressed pili beneath; stipulas setaceous. 2. ? G. Native of Mexico, between Real del Morán and Totolnico-el-Grande. Flowers violaceous? Legume hairy, 3-6-seeded.

*Elegant Lupine.* Pl. 1 to 2 feet.

38 *L. MONTANUS* (H. B. et Kunth, nov. gen. amer. l. c.) herbaceous; racemes elongated, pedunculate; flowers somewhat verticillate; calyx clothed with soft pili, having the upper lip acuminate and entire; leaflets 12-13, linear-lanceolate, acute, clothed with adpressed pili beneath. 2. G. Native of New Spain, at Nevado de Toluceo. Flowers violaceous? Legume hairy, usually 8-seeded.

*Mountain Lupine.* Pl. 1 foot?

39 *L. NUBIGENS* (Kunth, mim. p. 174. t. 50.) plant herbaceous, dwarf; flowers without bracteoles, on very short pedicels, disposed in very dense spikes; upper lip of calyx bipartite, lower one entire; bracteas longer than the corolla; leaflets oblong, acute, hairy on both surfaces. 2. G. Native of the Andes, about Quito, at Mount Antisana. Flowers blue.

*Cloud-born Lupine.* Pl.  $\frac{1}{4}$  foot.

40 *L. ALOPECUROIDES* (Desrous. in Lam. dict. 3, p. 626.) plant herbaceous, caulescent, clothed with rusty woolly down; racemes sessile; flowers disposed in very dense spikes, bracteolate; upper lip of calyx bipartite, lower one entire; bracteas longer than the corolla; leaflets oval-lanceolate. 2. G. Native of the Andes, about Quito. Flowers violaceous.

*Fox-tail-like-spiked Lupine.* Pl. 2 to 3 feet.

41 *L. VAGINATUS* (Schlecht et Cham. in Linnæa. 5, p. 590.) herbaceous, and clothed with silky villi; stipulas large, adnate to the petioles almost their whole length, 5-nerved, pubescent, drawn out on each side into a tooth, sheathing the axillary branches; the free part of the petiole shorter than the sheath; leaflets 11-13, lanceolate-linear, clothed with silky pili beneath, but glabrous above; stem obtuse-angled, pubescent, fistular; flowers somewhat verticillate; upper lip of calyx deeply bipartite, lower one longer, acuminate, and entire. 2. F. Native of Mexico, on mount Orizaba. Bracteas oblong, long-acuminate, membranous, deciduous. Corolla blue. Legume in a young state very hairy, 5-6-seeded.

*Sheathing-stipuled Lupine.* Pl. 1 foot?

42 *L. ARBUSTUS* (Dougl. in bot. reg. 1230.) suffrutescent; flowers alternate, pedicellate, bracteolate; upper lip of calyx bifid, lower one entire, acute; leaflets 7-13, obovate-oblong, silky on both surfaces; legumes 3-4-seeded; seeds small, white. 2. F. Native of North California; it is also common near Fort Vancouver. Flowers with a blue vexillum, purple in the centre; wings and carina rose-coloured.

*Shrub Lupine.* Fl. May, June. Clt. 1826. Shrub 1 to 2 ft.

\*\*\* *Shrubby species.*

43 *L. ARBOREUS* (Sims, bot. mag. 628.) shrubby; flowers somewhat verticillate, pedicellate, without bracteoles; both lips of calyx entire; keel ciliated on the inside; leaflets lanceolate-linear, acute, pubescent beneath. 2. F. Native country unknown. Flowers yellowish.

*Tree Lupine.* Fl. July, Aug. Clt. 1793. Shrub 6 feet.

44 *L. MULTIFLORUS* (Desrous. in Lam. dict. 3, p. 624.) shrubby; flowers alternate, almost sessile, bracteolate; upper

lip of calyx bifid, lower one tridentate; leaflets lanceolate, covered with silky villi. 2. F. Native of Monte Video. Flowers azure blue, but the vexillum and carina are yellowish on the outside. Spikes very long.

*Many-flowered Lupine.* Fl. Jul. Sept. Clt. 1810. Sh. 5 to 6 ft.

45 *L. MUTABILIS* (Sweet, fl. gard. 2. t. 130.) shrubby, erect, branched; branches spreading, glaucous, glabrous; leaflets 7-9, glaucescent and rather pubescent beneath, lanceolate, bluntish; flowers somewhat verticillate; calyx without bracteoles, upper lip bifid, lower one keeled, acute, entire. 2. F. Native of South America. Flowers large, the vexillum white mixed with blue, changing to blue, with a large yellow mark in the centre; wings white, faintly striated; keel white. *L. Cruikshanksii*, Hook. bot. mag. t. 3056., a native of Peru, is nothing but a slight variety of *L. mutabilis*, differing a little in the colour of the flowers.

*Changeable-flowered Lupine.* Fl. June, Aug. Clt. 1819. Shrub 3 to 6 feet.

46 *L. CANALICULATUS* (Sweet, fl. gard. 3, p. 283.) shrubby, clothed in every part with silky tomentum; flowers alternate, pedicellate, bracteolate; calyx appendiculate, with the upper lip bifid, and lower one entire and acuminate; leaflets 8-9, linear, canaliculate, obtuse, clothed with silky pubescence beneath; ovary very hairy. 2. F. Native of Buenos Ayres. Flowers bright blue.

*Channelled-leafletted Lupine.* Fl. June, Aug. Clt. 1828. Sh. 3 to 6 feet.

47 *L. VERSICOLOR* (Sweet, fl. gard. 2d series, t. 12.) shrubby, erect, branched; branches and leaves pubescent; leaflets 7-9, lanceolate-spatulate, bluntish, and somewhat mucronate, smoothish above, and pubescent beneath; stipulas linear-subulate; racemes elongated, on short peduncles; flowers somewhat verticillate; bracteas caducous, spreading, silky, ciliated, longer than the calyx, which is also silky; upper lip of calyx bifid, lower one entire. 2. F. Native of Mexico. Flowers small, with the vexillum of a purplish lilac colour above about half-way down, then becoming blue on each side; wings of a fine dark blue, tinged with purple; keel ash-coloured, dark purple towards the point.

*Party-coloured-flowered Lupine.* Fl. July, Sept. Clt. 1825. Shrub 2 to 4 feet.

48 *L. PULCHELLUS* (Sweet, fl. gard. 2d ser. t. 67.) shrubby, erect, branched; branches erect, clothed with silky pubescence; leaflets 5-7, oblong-lanceolate, acute, mucronate, tapering to the base, pubescent beneath, and with adpressed pili; stipulas setaceous; racemes middle-sized, pedunculate; flowers verticillate; bracteas caducous and setaceous, longer than the pedicels; both lips of calyx entire. 2. F. Native of Mexico. Flowers disposed in a longish raceme, the vexillum with various shades of purple and blue mixed; wings pale blue, slightly edged with purple. Keel white, tipped with bluish purple.

*Nat Lupine.* Fl. June, Oct. Clt. 1827. Shrub 3 to 4 feet.

49 *L. CAMPESTRIS* (Schlecht et Cham. in Linnæa. 5, p. 589.) shrubby, densely clothed with canescent pubescence; branches angular; leaflets 7, oblong-lanceolate, bluntish, mucronate, green above; stipulas subulate, short; racemes panicle; flowers somewhat verticillate; calyx bibacteolate, with both lips entire, the lowest one longest; legumes hairy. 2. F. Native of Mexico, between Perote and Plachichuca. Bracteas linear, acuminate, caducous. Flowers violaceous, about the size of those of *L. angustifolius*.

*Field Lupine.* Shrub 2 to 4 feet.

50 *L. LEPTOPHYLLUS* (Schlecht. et Cham. in Linnæa. 5, p. 589.) shrubby; branches angular, clothed with adpressed pubescence; leaflets 9, linear, acute, with a few silky hairs on both surfaces; stipulas foliaceous, linear; flowers disposed in loose pedunculate racemes, somewhat verticillate; calyx pubes-

cent, with both lips entire, and about equal in length, the upper one broadest; legumes hairy in a young state. *h. F.* Native of Mexico, between Tlachichuca and Tepetitla. Flowers violaceous, about the size of those of *L. luteus*.

*Slender-leaved Lupine.* Shrub 1 to 3 feet.

51 *L. RUPESTRIS* (H. B. et Kunth, nov. gen. amer. 6. p. 474.) plant shrubby, branched, procumbent or ascendent; flowers somewhat verticillate; calyx clothed with silky pili, with the upper lip bifid, and the lower one tridentate; leaflets lanceolate, acute, clothed with silky pili beneath. *h. F.* Native of South America, on the burning mount Rucu-Pichincha near Quito. Corolla violaceous. Racemes of flowers pedunculate. Legumes clothed with adpressed pili.

*Rock Lupine.* Shrub proc.

52 *L. MICROPHYLLUS* (Desrous. in Lam. dict. 3. p. 624.) shrubby, procumbent, much branched; flowers without bracteoles, disposed in a kind of spicate head; upper lip of calyx bipartite, lower one entire; leaflets 6-9, linear, clothed with silky villi beneath. *h. F.* Native of Peru, on mount Antisana. H. B. et Kunth, nov. gen. amer. 6. p. 473. Flowers blue. Legume oval, acuminate, 6-8 lines long.

*Small-leaved Lupine.* Shrub proc.

53 *L. SMITHIANUS* (Kunth, mim. p. 177. t. 51.) plant suffruticose, branched, clothed with silky hairs; flowers somewhat verticillate, on very short pedicels, bracteolate; upper lip of calyx bifid, lower one entire; leaflets lanceolate-linear, obtuse, rather villous. *h. F.* Native of South America, on the burning mount Rucu-Pichincha, and in frigid places near Popayan. Stem much branched. Leaflets 3 lines long. Legume oblong, 3-4-seeded, nearly an inch long, clothed with silky hairs. Flowers blue.

*Smith's Lupine.* Shrub 2 to 3 feet.

54 *L. PANICULATUS* (Desrous. in Lam. dict. 3. p. 625.) plant suffruticose? erect; flowers somewhat alternate, pedicellate, bracteolate; calyx clothed with silky hairs, having the upper lip bifid, and the lower one entire; leaflets 6-7, lanceolate, glabrous above, but rather villous beneath. *h. F.* Native of Peru, and near Santa-Fe-de-Bogota. H. B. et Kunth, nov. gen. amer. 6. p. 476. Flowers blue according to Desrousseux, but according to Kunth they are violaceous, and disposed in loose spikes. Stipulas subulate. Racemes pedunculate.

*Panicled-flowered Lupine.* Shrub erect.

55 *L. SARMENTOSUS* (Desrous. in Lam. dict. 3. p. 626.) plant shrubby, climbing; flowers verticillate, on short pedicels, without bracteoles; upper lip of calyx bifid, lower one entire; leaflets lanceolate, glabrous above, but rather villous beneath. *h. F.* Native of Peru, on mount Antisana. *L. gracilis*, Kunth, mim. 182. t. 52. ex H. B. et Kunth, nov. gen. amer. 6. p. 472. Flowers blue. Spikes short, oval, on long peduncles. Legume 8-10 lines long.

*Sarmentose Lupine.* Shrub 3 feet.

56 *L. BIMACULATUS* (Lam. dict. 3. p. 626.) plant shrubby, sarmentose, and hoary; flowers somewhat verticillate, tern, pedicellate, bracteolate; vexillum bicallous at the base. *h. F.* Native of Peru. Flowers a little smaller than those of *L. varius*, bluish violet; the vexillum with 2 yellow marks at the base.

*Two-spotted-flowered Lupine.* Shrub sarmentose.

57 *L. TOMENTOSUS* (D. C. prod. 2. p. 409.) shrub clothed in every part with silky tomentum; flowers verticillate, pedicellate, bracteolate; both lips of calyx entire; leaflets 8-10, oblong, bluntish, mucronulate, tapering to the base; ovary very hairy. *h. F.* Native of Peru. Sweet, fl. gard. 3. t. 261. Flowers large, with the vexillum channelled above, and spotted on each side of the channel with several small blue specks, and a large blue spot on each side near the base; wings about equal in length to the vexillum, striped more or less with blue branched

lines; keel with a dark purple point, fringed longitudinally with long white hairs. The vexillum at length changes to a purple, and the wings to pale red, striped with blue at the base.

*Tomentose Lupine.* Fl. June, Aug. Clt. 1825. Sh. 4 to 5 ft.

58 *L. ? AFRICANUS* (Tour. coch. 429.) stem shrubby, diffuse; peduncles many-flowered, terminal; leaflets 3, lanceolate. *h. S.* Native of the Eastern coast of Africa. Flowers yellow.

*African Lupine.* Shrub 3 feet.

## § 2. *Leaves simple, entire.*

59 *L. VILLOsus* (Willd. spec. 3. p. 1029.) plant herbaceous, decumbent, clothed with wool-like villi; leaves simple, oblong-lanceolate; stipulas filiform; flowers somewhat verticillate or alternate, on short pedicels, bracteolate, upper lip of calyx bidentate, lower one entire; legumes very hairy. *g. H.* Native of South Carolina, Florida, and Georgia, in sandy pine woods. Pursh, fl. amer. sept. 2. t. 21. Nutt. gen. amer. 2. p. 93. *L. pilosus*, Walt. car. 180. *L. integrifolius*, Desrous. in Lam. dict. 3. p. 627. but not of Lin. Flowers reddish.

*Villous Lupine.* Fl. July, Aug. Clt. 1787. Pl. proc.

60 *L. DIFFUSUS* (Nutt. gen. amer. 2. p. 93.) plant herbaceous, diffusely procumbent, densely clothed with silky villi; leaves simple, oblong-obovate, lower ones alternate; stipulas and petioles short and naked. *u. F.* Native about Wilmington, and elsewhere in both Carolinas, in oak woods.

*Diffuse Lupine.* Pl. proc.

61 *L. INTEGRIFOLIUS* (Lin. amœn. 6. afr. p. 43.) plant herbaceous, villous; leaves simple, oblong, petiolate, acute; flowers alternately pedicellate, bracteolate; upper lip of calyx bifid; lower one entire. *o. G.* Native of the Cape of Good Hope. Flowers blue.

*Entire-leaved Lupine.* Pl. 1 foot?

62 *L. COCHINCHINENSIS* (Tour. coch. 429.) plant herbaceous, erect; leaves simple, emarginate, glabrous; flowers bracteolate, disposed in a spike; upper lip of calyx bifid, lower one tridentate; legume glabrous, many-seeded. *o. H.* Native of Cochinchina and Bengal. Flowers yellow.

*Cochin-china Lupine.* Pl. 1 to 2 feet.

*Cult.* Every species of *Lupine* are worth cultivating for the purpose of decorating flower-borders, as they are very ornamental when in flower; they thrive best in light soil, and are most easily increased by seeds. The shrubby kinds require to be protected in severe weather in winter by a glass covering, or by matting. If they are grown against a wall, they can be easily sheltered in winter. Cuttings of them root readily.

CCV. CYLISTA (from κυλίσ, *kylix*, a calyx; in reference to the calyx being very large). Ait. hort. kew. 3. p. 512. D. C. prod. 2. p. 410.

*Lin. syst. Diadelpbia, Decandria.* Calyx larger than the corolla, 4-cleft; upper segment emarginate or bifid, lower one the largest, and sometimes very large. Corolla papilionaceous, permanent. Keel 2-edged. Stamens diadelphous. Legume usually 2-seeded. Seeds in *C. pychnostachya* ovate-globose, shining, with a small oval hylum. Embryo with thick cotyledons, and a small incurved radicle. — Twining shrubs, with pinnately-trifoliate leaves, rhomboid or ovate, acute, stipellate leaflets, and axillary simple racemes of yellow flowers. Bractæas large, caducous.

1 *C. SCARIOsa* (Ait. l. c. Roxb. cor. 1. t. 92.) calyx very large, scarious, with the upper segment emarginate, lower one very large; legumes 1-celled, 1-2-seeded; bractæas lanceolate, acuminate. *h. S.* Native of the East Indies, among the Circars. Flowers pale yellow, mixed with red. Style inflexed at the base, slender, but at length becoming thick and dilated.

*Scarious-calyxed Cylista.* Pl. tw.

2 *C. TOMENTOSA* (Roxb. cor. t. 221) calyx villous; the seg-

ments cuneated, upper one bifid, lower and lateral ones equal; legumg divided transversely into 2 1-seeded cells, somewhat constricted in the middle; bracteas broad, ovate, mucronulately acuminate.  $\mathcal{U}$ .  $\mathcal{O}$ . S. Native of Mysore. Flowers yellow. Seeds spherical, bluish violet, polished, lower one usually abortive.

*Tomentose Cylista.* Clt. 1820. Pl. tw.

3 *C. ? ALBIFLORA* (Sims, bot. mag. 1859.) calyx half-5-cleft, with nearly equal segments, shorter than the corolla; bracteas ovate, acuminate.  $\mathcal{h}$ .  $\mathcal{O}$ . S. Native of the Mauritius. The plant is clothed in every part with ferruginous pubescence. Perhaps a species of *Rynchosia*. Flowers white.

*White-flowered Cylista.* Fl. April, May. Shrub tw.

4 *C. VILLOSA* (Ait. hort. kew. ed. 2. vol. 4. p. 300.) calyx membranous; upper segment bifid.  $\mathcal{h}$ .  $\mathcal{O}$ . G. Native of the Cape of Good Hope. *Dolichos hirtus*, Andr. bot. rep. t. 446. Flowers yellow.

*Villous Cylista.* Fl. April, May. Clt. 1776. Shrub tw.

5 *C. PYCNOSTACHYA* (D. C. prod. 2. p. 410.) calyx with one of the lips bipartite, and with the other bluntly tridentate.  $\mathcal{h}$ .  $\mathcal{O}$ . S. Native of Sierra Leone. Leaves unknown. Pedicels twin, densely racemose. Calyx and legume permanent, clothed with velvety down. Petals and stamens permanent. Corolla probably resupinate. The tridentate lip is usually under the vexillum. Perhaps a proper genus.

*Slender-spiked Cylista.* Shrub tw.

*Cult.* See *Eriosëma*, for culture and propagation, p. 348.

CCVI. ERYTHRINA (from *ερυθρος*, *erythros*, red; in reference to the colour of the flowers). Lin. gen. 855. Lam. ill. t. 608. D. C. prod. 2. p. 410. Corallodendron, Tourn. inst. t. 446. Mouricou, Adams.

LIN. SYST. *Diadelphia, Decandria*. Calyx tubular (f. 50. a.), with a truncate, somewhat dentate border (f. 50. a.), or spathaceous. Corolla with a very long oblong vexillum (f. 50. b.); wings as well as the dipetalous keel much shorter than the vexillum. Stamens diadelphous (f. 50. c.), straight, the tenth one adhering more or less to the rest, but sometimes free, much shorter than the wings, rarely deficient. Legume long (f. 50. d.), torulose, many-seeded, 2-valved. Seeds ovate, having a lateral hilum. Trees or shrubs, rarely herbs, with small stipulas, which are distinct from the petiole, pinnately-trifoliate leaves, having the leaflets furnished with glands at the base instead of stipels. Stems and petioles usually furnished with prickles. Racemes of flowers elongated, with the pedicels usually approximating by threes. Flowers red, scarlet, or crimson. Seeds shining, usually black and red mixed, or pure black or red.

§ 1. *Acaules* (from *a*, without, and *caulis*, a stem; in reference to the species contained in this division having nothing but annual stems, rising from a subterraneous trunk). Both the floriferous and leaf bearing branches dying down yearly, and rising again from an underground stump or trunk.

1 *E. HERBACEA* (Lin. spec. 992.) branches herbaceous, annual, and arc, as well as the leaves, unarmed and glabrous; leaflets rhomboid; racemes elongated; flowers distant, tern; calyx truncate; vexillum lanceolate.  $\mathcal{U}$ . F. Native of Carolina, Florida, and about the Mississippi, in sandy fields and woods. Trew. chr. t. 58. Sims, bot. mag. 877. Lodd. bot. cab. 851. Floriferous branches sometimes furnished with one or two leaves. Corolla deep scarlet. The tenth or loose stamen free and short.

*Herbaceous Coral-tree.* Fl. June, Sept. Clt. 1724. Pl. 2 to 3 feet.

2 *E. HEDEREFOLIA* (Spreng. syst. 3. p. 244.) leaflets somewhat 3-lobed, acuminate; pedicels rising in the racemes by

threes; calyx 5-toothed; stem prickly; root tuberous.  $\mathcal{U}$ . F. Native of Louisiana. *Xyphanthus hederæfolius*, Rafin. Flowers scarlet.

*Ivy-leaved Coral-tree.* Pl. 1 to 2 feet.

3 *E. RESUPINATA* (Roxb. cor. 3. t. 220.) branches herbaceous, annual, and arc, as well as the petioles, rather prickly; leaflets roundish; racemes crowded with flowers, short; calyx bilabiate; vexillum oval-oblong.  $\mathcal{U}$ . S. Native of the East Indies. Vexillum of a lurid scarlet colour. Racemes 2 or 3 inches long, rising before the leaves.

*Resupinate-flowered Coral-tree.* Clt. 1823. Pl. 1 foot.

§ 2. *Species the stems of which are only herbaceous in the gardens, or when not protected in winter by a stove, but in their native countries become small trees.*

4 *E. HORRIDA* (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 413.) stems almost herbaceous, angular, and arc, as well as the petioles and ribs of leaves, very prickly; leaflets ovate, cordate, acute; calyx 5-toothed; legume stipitate, pendulous, prickly.  $\mathcal{U}$ . F. Native of Mexico, on mount Ayahualtempo. Flowers unknown, but probably crimson.

*Horrid Coral-tree.* Clt. 1824. Pl. 2 to 3 feet.

5 *E. LONGIPES* (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 413.) stems nearly herbaceous, prickly; petioles unarmed; leaflets ovate; racemes lateral, on long peduncles; calyx obliquely truncate, somewhat bilabiate; vexillum oblong; stamens 9 connected, the tenth free.  $\mathcal{U}$ . F. Native of Mexico. Flowers of a coppery scarlet colour. Root fibrous.

*Long-peduncled Coral-tree.* Pl. 2 to 3 feet.

6 *E. LEPTORHIZA* (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 413.) stems herbaceous, and arc, as well as the petioles, unarmed; leaflets ovate, rather cordate; calyx spathaceous; vexillum oblong, bidentate at the apex; legume rather villous.  $\mathcal{U}$ . F. Native of Mexico. Racemes terminal. Flowers of a pale scarlet colour. Stamens 9 connected, and one free. Legume stipitate, cuspidate at the apex.

*Slender-rooted Coral-tree.* Pl. 2 to 3 feet.

7 *E. CRISTA-GALLI* (Lin. mant. 99.) stems woody; petioles prickly, glandular; leaflets oval or ovate, glaucescent, coriaceous, bluntish; calyx truncate, somewhat bidentate; stamens 9 connected, but with the tenth free; keel 3 times the length of the calyx.  $\mathcal{h}$ . F. Native of Brazil. Smith, exot. bot. 2. p. 95. Sweet, fl. gard. 214. A stout shrub. Flowers of a bright deep scarlet colour.

*Cock's-comb Coral-tree.* Fl. May, July. Clt. 1771. Shrub 6 to 8 feet, or tree 20 feet.

8 *E. LAURIFOLIA* (Jacq. obs. 3. p. 1. t. 51.) stems suffrutescent, branched; branches glabrous, rather prickly; leaflets petiolate, oblong, acuminate; petioles rather prickly, glandular; calyx truncate, unidentate; keel monopetalous; stamens monadelphous.  $\mathcal{h}$ . F. Native of South America. Sweet, fl. gard. 2. t. 142. *E. crista-galli*, Ker. bot. reg. 313. exclusive of the synonyms. Flowers of a rich dull crimson.

*Laurel-leaved Coral-tree.* Fl. July, Sept. Clt. 1800. Pl. 6 feet, or tree 20 feet.

§ 3. *Arboreous or shrubby species, with the branches bearing the racemes as well as the leaves.*

9 *E. CARNEA* (Ait. hort. kew. 3. p. 8.) stem shrubby, prickly; petioles unarmed; leaflets rhomboid-ovate, acute, glabrous; vexillum linear, elongated; calyx campanulate, truncate.  $\mathcal{h}$ . S. Native of South America, in Vera Cruz and St. Martha. Lindl. bot. reg. 1327. Trew. chr. 2. t. 3. *E. Americana*, Mill. dict. no. 2. Flowers pale red, not large, about 2 inches long.

*Var.  $\beta$* ; leaves puberulous beneath. Ker. bot. reg. 389.

*Flesh-coloured-flowered Coral-tree.* Fl. May, July. Clt. 1733. Shrub 4 to 10 feet.

10 *E. CORALLODENDRON* (Lin. spec. 992. exclusive of var. *a.*) stem arboreous, prickly; petioles unarmed; leaflets broad, rhomboid-ovate, acute, glabrous; calyx truncate, 5-toothed; vexillum oblong; the tenth stamen free, and about equal in length to the rest. *h. S.* Native of the West Indies. *Comm. hort. amst.* 1. t. 108. *E. spinosa*, Mill. diet. no. 1. Flowers deep scarlet, about 2 inches long. The flowers do not appear until the leaves have fallen.

*Common Coral-tree.* Fl. May, June. Clt. 1690. Shrub 6 to 12 feet.

11 *E. ENNEANDRA* (D. C. cat. hort. monsp. 109.) stem arboreous, and is, as well as the petioles, prickly; leaflets rhomboid, pubescent beneath; calyx truncate; vexillum linear-oblong; stamens 9 joined together, the tenth absent. *h. S.* Native of South America. *E. velutina*, Jacq. hort. schœnbr. 4. t. 466. Flowers of a deep scarlet colour. The leaves push forth when the flowers begin to decay, and fall before they rise. In Jacquin's *E. velutina* the calyx is somewhat bluntly toothed, while in this plant it is truncate.

*Eucandrous Coral-tree.* Fl. May, July. Clt. 1800. Shrub 6 to 12 feet.

12 *E. MACROPHYLLA* (D. C. prod. 2. p. 411.) stem shrubby; petioles rather prickly; leaflets broadly ovate, acuminate, glabrous above, pubescent beneath; calyx tubular, bluntly somewhat bilabiate at the apex; vexillum linear-oblong, straight; wings and keel shorter than the calyx; stamens 10, monadelphous. *h. G.* Native country unknown, but is cultivated in the gardens of Teneriffe. Leaflets 9-12 inches long, and 7-9 inches broad. Racemes clothed with velvety villi. Flowers scarlet. This species comes very near *E. corallodendron*, but differs from it in the tenth stamen being connected to the rest; it is also nearly allied to *E. mollis*.

*Long-leafletted Coral-tree.* Clt. 1822. Tree 10 to 12 feet.

13 *E. MITIS* (Jacq. hort. schœnbr. t. 216.) stem arboreous, and is, as well as the petioles, unarmed; leaflets rhomboid-ovate, acute, glabrous; calyx tubular, bilabiate at the apex; vexillum elongated, linear-lanceolate; stamens 9 connected, the tenth one almost free, and about equal in length to the others. *h. S.* Native of Caraccas. *E. inermis*, Mill. diet. no. 6. ? Flowers either pale or dark scarlet. The leaves rising when the flowers begin to fade.

*Mild Coral-tree.* Clt. 1790. Tree 10 to 12 feet.

14 *E. SUBEROSA* (Roxb. hort. beng. p. 53.) stem prickly; petioles unarmed; leaflets roundish-rhomboid, tomentose beneath; calyx spathaceous, bilabiate; stamens diadelphous, length of the vexillum. *h. S.* Native of the East Indies. Flowers scarlet.

*Corky Coral-tree.* Tree.

15 *E. FOIANTHUS* (Brot. in Lin. trans. 14. p. 342. t. 11.) stem arboreous, prickly; petioles also prickly; lateral leaflets ovate, middle one rhomboid-ovate, all pubescent beneath; calyx obliquely truncate, with the upper side cleft or entire; stamens diadelphous, hardly shorter than the vexillum. *h. S.* Native of South America. *Lindl. bot. reg.* 1246. Flowers scarlet.

*Grass-flowered Coral-tree.* Fl. June, Sept. Clt. 1823. Tree 10 to 15 feet.

16 *E. SECUNDIFLORA* (Brot. in Lin. trans. 14. p. 340. t. 12.) stem arboreous, prickly; petioles unarmed; leaflets ovate, somewhat acuminate, glabrous on both surfaces; calyx unopen, obsoletely denticulated, toothless, truncate, and variously cut behind; stamens diadelphous, length of the vexillum; keel equal in length to the wings, but longer than the calyx, and almost 3 times shorter than the vexillum. *h. S.* Native of Brazil. Flowers deep scarlet, secund (f. 50.)

*Secund-flowered Coral-tree.* Clt. 1820. Tree 10 to 14 feet.

17 *E. SPECIOSA* (Andr. bot. rep. t. 443.) stems shrubby, prickly; petioles and ribs of leaves prickly; leaflets broad, slightly 3-lobed, acuminate, glabrous; calyx tubular, somewhat bidentate; vexillum linear-lanceolate, elongated. *h. S.* Native of the West Indies. *Ker. bot. reg.* 750. A. and B. where the petioles are said to be unarmed in the description, but the plant is figured with them. Flowers deep crimson. Stamens undescribed. Racemes and calyces velvety.

*Sheny Coral-tree.* Fl. Aug. Oct. Clt. 1805. Shrub 6 to 10 feet.

18 *E. GUINEENSIS*; stem much branched, prickly; petioles and ribs of leaves prickly; leaflets oval-lanceolate, entire; calyx spathaceous; legume torulose. *h. S.* Native of Sierra Leone, in the low lands. An elegant species, with long spike-formed racemes of scarlet flowers. The leaves pushing forth when the flowers begin to fade, or as the wet season advances (*v. s. herb. Lamb.*)

*Guinea Coral-tree.* Fl. Feb. March. Shrub 6 to 8 feet.

19 *E. RUBRINERVA* (H. B. et Kunth, nov. gen. amer. 6. p. 454.) stem arboreous, prickly; leaflets roundish-ovate, acuminate, rather cuneate and rounded at the base, 5-nerved, glaucous beneath; calyx tubular, spathaceous, glabrous; vexillum linear, straight; stamens nearly monadelphous. *h. S.* Native of South America, on the western declivities of mountains about Santa-Fé-de-Bogotá, where it is called *Chocho*. Flowers flesh-coloured.

*Red-nerred-leaved Coral-tree.* Clt. 1823. Tree 10 to 20 ft.

20 *E. UMBROSA* (H. B. et Kunth, l. c.) stem arboreous, prickly; leaflets somewhat acuminate, 3-nerved, glabrous, rounded and truncate at the base, the middle one rather deltoid; calyx campanulate, spathaceous; vexillum linear-cuneate, straight, very long; stamens diadelphous. *h. S.* Native of South America, between La Guayra and Caraccas, where it is called *Bucare*, and where it is planted in rows to shade the plantations of *Theobroma Cacao* or chocolate-nut. It is also used in Trinidad for the same purpose. Flowers scarlet.

*Shady Coral-tree.* Clt. 1817. Tree 40 to 60 feet.

21 *E. CAFFERA* (Thunb. prod. 121. fl. cap. 559.) stem arboreous, and is, as well as the petioles and primary ribs of leaves, prickly; leaflets broad-ovate, glabrous, bluntly acuminate; calyx 5-toothed; vexillum oval-oblong, obtuse; stamens 9 connected together, the tenth free. *h. S.* Native of Caffre Land. *Ker. bot. reg.* 736. A. and B. Sims, bot. mag. 2431. Flowers of a dirty scarlet-colour.

*Caffrarian Coral-tree.* Fl. June, July. Clt. 1816. Shrub 6 feet.

22 *E. HUMEANA* (Spreng. syst. 3. p. 243.) stem arboreous, prickly; leaflets acute, smooth; petioles prickly, and nerves of leaves beneath; racemes aggregate, straight, terminal; calyx truncate, toothed; stamens diadelphous, shorter than the vexillum. *h. S.* Native country unknown. *E. Caffra*, Brot. vag. Flowers scarlet.

*Hume's Coral tree.* Tree.

23 *E. ARBORESCENS* (Roxb. cor. 3. t. 219.) stem arboreous, prickly; petioles unarmed; leaflets broadly ovate, acutish, pubescent beneath; calyx campanulate, entire; vexillum oval, concave; stamens 10, monadelphous at the base. *h. S.* Native of Nipaul. Flowers of a carmine colour, about an inch and a

FIG. 50.

half long. Legumes pendulous, pedicellate, villous, cuspidate at the apex.

*Arborescent Coral-tree.* Clt. 1818. Tree 12 to 15 feet.

24 *E. INDICA* (Lam. dict. 2. p. 391. var. *a.*) stem arboreous, prickly; petioles unarmed; leaflets broad-ovate, acute, glabrous; calyx spathaceous; vexillum spreading, ovate, concave; stamens monadelphous at the base. *h.* S. Native of the East Indies. *E. corallodendron* *β*, Lin. spec. 992. *E. orientalis*, Murr. comm. gætt. 8. p. 35. t. 1.—Rheed. mal. 6. t. 7.—Rumph. amb. 2. t. 76. Flowers of a splendid scarlet-colour. In Rheed's figure the calyx is acute and much elongated, but in the figure of Rumphius it is short and obtuse; they are therefore probably distinct species.

*Indian Coral-tree.* Clt. 1814. Tree 20 to 30 feet.

25 *E. LOUREIRI*; stem arboreous, prickly; petioles unarmed; leaflets rather cordate, deltoid, acute, glaucous; calyx spathaceous; vexillum very long, acute; stamens monadelphous at the base, equal in length to the vexillum. *h.* G. Native of China and Cochin-china. *E. corallodendron*, Lour. coch. 427. Flowers scarlet. A decoction of the bark is used against intercurrent fevers, and the leaves are used to cleanse ulcers.

*Loureiro's Coral-tree.* Tree 20 to 30 feet.

26 *E. VICTA* (Lin. spec. 993.) stem arboreous, prickly; petioles and ribs of leaves rather prickly; leaflets broadly ovate, painted with white in the centre; calyx spathaceous; vexillum oval, concave; stamens monadelphous at the base. *h.* S. Native of the Moluccas. *E. Indica* *β*, Lam. l. c.—Rumph. amb. 2. t. 77. Flowers of a carmine colour. Seeds dark purple.

*Painted-leaved Coral-tree.* Clt. 1696. Shrub 6 to 10 feet.

27 *E. SPATHACEA* (D. C. prod. 2. p. 412.) stem arboreous, and is as well as the petioles unarmed; leaflets broad-ovate, acute, glabrous; calyx velvety, spathaceous, acutely 5-toothed at the apex. *h.* S. Native of St. Domingo. Wings and keel scarlet; vexillum not seen.

*Spathaceous-calyxed Coral-tree.* Clt. 1824. Sh. 6 to 10 ft.

28 *E. VELUTINA* (Willd. nov. act. scrut. berol. 3. p. 426. spec. 3. p. 914.) stem arboreous, prickly; leaflets rounded at both ends, 3-nerved, rather pilose above, but clothed with soft canescent tomentum beneath, unarmed, terminal one transversely elliptic; calyx spathaceous, slightly 5-toothed, tomentose; vexillum elliptic, reflexed. *h.* S. Native of South America, near Caraccas. H. B. et Kunth, nov. gen. amer. 6. p. 435. Flowers with a reddish yellow vexillum, and with the wings and keel greenish yellow.

*Velvety Coral-tree.* Clt. 1810. Tree 60 feet.

29 *E. FUSCA* (Lour. coch. 427.) stem shrubby, prickly; petioles unarmed; leaflets lanceolate, glabrous; calyx bilabiate; vexillum elongated, convolute; stamens monadelphous at the base. *h.* G. Native of Cochin-china, on the banks of rivers. *Gelula aquatica*, Rumph. amb. 2. t. 78. ex Lour. but neither the figure nor description agrees with the present plant. Flowers of a brownish-red colour.

*Brownish-flowered Coral-tree.* Shrub 8 feet.

30 *E. NERVOSA* (D. C. prod. 2. p. 413.) stem arboreous, and is as well as the petioles unarmed; leaflets oval, acuminate, glabrous above, feather-nerved beneath and clothed with velvety down as well as the petioles; racemes axillary, short; calyx ample, irregularly 5-toothed. *h.* S. Native of Brazil. Flowers 2 inches long. Leaflets 4-6 inches long, with the nerves elevated beneath. Legumes unknown.

*Nerved-leaved Coral-tree.* Tree.

31 *E. GLAUCA* (Willd. nov. act. nat. scrut. berol. 3. p. 428. spec. 4. p. 915.) stem arboreous, prickly; petioles almost unarmed; leaflets ovate, glaucous beneath; calyx bilabiate; vexillum cuneiform, spreading; keel longer than the wings; stamens 10, monadelphous at the base. *h.* S. Native of South Ame-

rica, at Caraccas and near Cumana. Legume glabrous. Seeds grey. Flowers copper-coloured.

*Glaucous-leaved Coral-tree.* Clt. 1819. Tree 20 feet?

32 *E. ? ISOPE'TALA* (Lam. dict. 2. p. 392.) stems sarmentose, and are as well as the petioles unarmed; leaflets ovate-lanceolate, glabrous; calyx campanulate, 5-lobed; petals unguiculate, about equal in length; stamens 10, monadelphous at the base. *h.* S. Native of Brazil, at Rio Janeiro. Flowers an inch and a half long. Legume unknown.

*Equal-petalled Coral-tree.* Shrub cl.

33 *E. SENEGALENSIS* (D. C. prod. 2. p. 413.) stem shrubby, and is as well as the petioles and ribs of leaves prickly; leaflets ovate-oblong, obtuse, coriaceous, glabrous; calyx obliquely truncate, somewhat bilabiate; vexillum oblong-cuneiform, straight, obtuse. *h.* S. Native of Senegal. Flowers an inch long, deep crimson. Leaflets 3 inches long and 12 or 15 lines broad. The leaves push forth when the flowers begin to fade.

*Senegal Coral-tree.* Fl. Feb. Mar. Shrub 6 to 8 feet.

34 *E. ABYSSINICA* (Lam. dict. 2. p. 392.) stem arboreous, prickly; petioles unarmed; leaflets glabrous, obtuse, lateral ones broadly and obliquely ovate, terminal one roundish. *h.* S. Native of Abyssinia (Bruce). Flowers and fruit unknown. According to Bruce, the seeds of this species of *Coral-tree* are called *Carats* in Abyssinia, and are used in weighing gold and precious stones.

*Abyssinian Coral-tree.* Tree.

35 *E. BREVIFLORA* (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 413.) stem shrubby, and is as well as the petioles prickly; leaflets ovate, acute; racemes axillary, shorter than the leaves; calyx bilabiate; vexillum oval; legumes pendulous, few-seeded, glabrous, unarmed, mucronate. *h.* G. Native of Mexico, at the river Ayacapixtla. Flowers scarlet.

*Short-flowered Coral-tree.* Tree.

36 *E. CORALLOIDES* (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 413.) stem arboreous, bearing a solitary prickle under each leaf; petioles unarmed; leaflets ovate; calyx truncate; vexillum linear-oblong; legumes glabrous, few-seeded, stipitate at the base, cuspidate at the apex. *h.* G. Native of Mexico. Flowers scarlet. Seeds red; the hylum girded by a white line; they are commonly called *Colorines*.

*Coral-like-seeded Coral-tree.* Tree.

37 *E. PATENS* (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 414.) stem shrubby, and is as well as the petioles unarmed; leaflets ovate, obtuse; racemes terminal, rather velvety; mouth of calyx dilated and obliquely truncate; vexillum spreading, stipitate, roundish; legume villous. *h.* S. Native of Mexico. Flowers scarlet.

*Spreading Coral-tree.* Tree.

38 *E. DIVARICATA* (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 414.) stem shrubby, prickly; petioles unarmed; leaflets cordate, acute; calyx velvety, spathaceous, 5-toothed at the apex; vexillum spreading, oval; stamens diadelphous. *h.* S. Native of Mexico. Flowers scarlet, large, and very beautiful. Racemes lateral, many-flowered. Perhaps the same as *E. spathacea*, but differs in the trunk being prickly.

*Divaricate Coral-tree.* Tree.

39 *E. MONOSPERMA* (Gaud. in Freycenet, voy. bot. p. 486. t. 114.) arboreous, unarmed; leaflets broadly ovate, reniform, obtuse, clothed with brownish tomentum beneath; legume 1-seeded. *h.* S. Native of the Sandwich Islands. Flowers scarlet.

*One-seeded Coral-tree.* Tree.

+ *Species, the names of which are given in garden catalogues, but without any description.*

1 *E. aculeatissima*, Desf. 2 *E. triacantha*, Willd. 3 *E. incana*, Willd. 4 *E. piscidioides*, Hortul. 5 *E. fulgens*, Hortul. 6 *E. stricta*, Roxb. 7 *E. coralifolia*, Roxb. 8 *E. sublobata*, Roxb.

**Cult.** The species of *Coral-tree* have fine large leaves and splendid flowers, and are therefore worth cultivating in every collection of stove plants; they all thrive well in light loamy soil. In order to bring them into flower they should be placed on shelves in the stove, when they have lost their leaves giving them hardly any water, and when they begin to shew flowers they may be watered more freely. Cuttings of all, if taken off at a joint without depriving them of their leaves, strike root readily in sand, under a hand-glass, in moist heat. *E. laurifolia* and *E. crista-galli* will thrive and flower freely if planted in the open ground, in a warm sheltered situation; in such a situation, however, they are always killed to the stump in winter.

**CCVII. RUDOLPHIA** (in honour of Charles Asmund Rudolph, a botanist of Jena). Willd. nov. act. scrut. berol. 3. p. 151. spec. 3. p. 918.—*Erythrina*, spec. of Lin. and Juss.—*Butea*, spec. of Pers.

**LIN. SYST.** *Diadelphia, Decandria*. Calyx tubular, bilabiate, 4-cleft; upper lobe largest and obtuse, lower one acute, 2 lateral ones very short. Corolla with an oblong-linear, straight, very long vexillum. Wings very narrow, shorter than the calyx, as well as parts of the carina. Stamens diadelphous. Legume compressed, flat, sessile, many-seeded, mucronate by the style. Seeds flat.—Climbing shrubs with simple leaves, which are furnished with 2 stipels each at the top of the petiole.

1 *R. VOLUBILIS* (Willd. l. c. Vahl. ecl. 3. p. 41. t. 30.) branches dotted from tubercles; leaves glabrous, cordate, ovate, acuminate; racemes bearing flowers from the base.  $\frac{h}{2}$ .  $\odot$ . S. Native of Porto-Rico, on the highest mountains, and of Mexico. Flowers scarlet, an inch and a half long.

*Var.  $\beta$ , pilosiuscula* (D. C. prod. 2. p. 414.) branches and petioles pilose. *Erythrina cordifolia*, Juss. inel. *Erythrina Portoricensis*, Desf.

*Twining Rudolphia*. Shrub tw.

2 *R. ROSEA* (Tussac, fl. ant. t. 22.) branches smooth, glabrous; leaves ovate-oblong, glabrous, acuminate; racemes pedunculate.  $\frac{h}{2}$ .  $\odot$ . S. Native of St. Domingo. Flowers scarlet, hardly an inch long. Legume pubescent. Perhaps the figure in Plum. icon. t. 102. f. 1. is referrible to this species, and all the synonymes to the following, but the leaves in our plant are not peltate as in it, the flowers are smaller and the legume is not glabrous nor torose at the seeds, as represented in the figure of Plumier.

*Rose-flowered Rudolphia*. Clt. 1826. Shrub tw.

3 *R. Pelta'ta* (Willd. l. c.) leaves rather cordate, oblong-lanceolate, peltate; raceme on a long peduncle.  $\frac{h}{2}$ .  $\odot$ . S. Native of St. Domingo. Plum. ed. Burm. t. 102. f. 1. *Erythrina planisiliqua*, Lin. spec. 993. Lam. dict. 2. p. 392. Perhaps the same as the last species. Flowers probably scarlet.

*Peltate-leaved Rudolphia*. Shrub tw.

4 *R. RUBRA* (H. B. et Kunth, nov. gen. amer. 6. p. 432. t. 591.) branches angular, sulcated, glabrous; petioles winged; leaves somewhat deltoid-ovate, and somewhat hastately cordate at the base, and acuminate at the apex, glabrous; peduncles axillary; legume beaked by the style.  $\frac{h}{2}$ .  $\odot$ . S. Native of New Granada, in shady places near Turbaco, ex Kunth, and in Cuba, about the Havannah, Willd. *Glycine sagittata*, Humb. in Willd. enum. 757. Flowers scarlet or rose-coloured.

*Doubtful Rudolphia*. Clt. 1815. Shrub tw.

**Cult.** The species are elegant climbers, bearing large scarlet flowers, and are well adapted for covering the rafters in stoves or stove conservatories. Their culture and propagation are the same as for the species *Erythrina*, which see.

**CCVIII. BUTEA** (in honour of John Earl of Bute, once a munificent patron of Botany). Roxb. cor. 1. p. 22. D. C. prod. 2. p. 414.—Pläso, Rheed. and Adans.

**LIN. SYST.** *Diadelphia, Decandria*. Calyx campanulate, 5-toothed, the 2 superior teeth approximate and almost connected. Corolla with a lanceolate spreading vexillum; keel incurved, about equal in length to the wings and vexillum. Stamens diadelphous. Legume stipitate, compressed, flat, membranous, indehiscent, 1-seeded at the apex. Seed large, compressed. Asiatic, unarmed trees, with pinnately trifoliate leaves, and large ovate, roundish, stipellate leaflets. Racemes many-flowered. Flowers 3 together, on short pedicels, and furnished with 2 bracteoles each, under the calyx. Corolla of a deep scarlet colour. Down on the calyxes usually black and velvety. This genus probably agrees better with the tribe *Dalbergiæ* than with the present.

1 *B. FRONDOSA* (Roxb. cor. 1. p. 22. t. 21. asiat. res. 3. p. 469.) branches pubescent; leaflets roundish, obtuse, or emarginate, rather velvety beneath; corolla 4-times the length of the calyx; calycine teeth acutish.  $\frac{h}{2}$ . S. Native of the East Indies, on the mountains.—Rheed. mal. 6. t. 16 and 17. *B. frondosa*, Kern. icon. sel. 1. t. 4. *Erythrina monosperma*, Lam. dict. 1. p. 391. Stipes and sutures of the legumes clothed with white tomentum, but the valves are hardly pubescent. Flowers 2 inches long. The red juice which flows from the tree evaporates to the consistence of gum, which is astringent, and is called gum-lac or East India kino, but is not so good as the African kino. The expressed juice of the fresh flowers, and infusions of the dried flowers yield a water colour brighter than gamboge; they also yield a fine durable yellow lake in a large proportion. The lac insects are frequently found upon the smaller branches and petioles of the tree; but whether the natural juices of its bark contribute to improve their red colouring matter has not been determined.

*Frondose Butea*. Clt. 1796. Tree 40 feet.

2 *B. SUPERBA* (Roxb. cor. 1. t. 22.) branches glabrous; leaflets roundish, obtuse, velvety beneath; corolla 4-times the length of the calyx; calycine teeth acute.  $\frac{h}{2}$ .  $\odot$ . S. Native of Coromandel, on the mountains. This is a very shewy tree, approaching the preceding species, but is larger in all its parts. It yields similar juice.

*Superb Butea*. Clt. 1798. Shrub tw.

3 *B. PARVIFLORA* (Roxb. hort. beng. p. 53.) branchlets pubescent; leaflets roundish, obtuse, clothed with silky tomentum beneath; racemes panicled; corolla hardly twice the length of the calyx; calycine teeth acute.  $\frac{h}{2}$ .  $\odot$ . S. Native of Coromandel. Flowers 4 lines long.

*Small-flowered Butea*. Shrub tw.

4 *B. BRAAMIANA* (D. C. prod. 2. p. 415.).  $\frac{h}{2}$ .  $\odot$ . G. Native of China. Braam. icon. chin. t. 23. This tree comes very near to *B. frondosa*, but differs in the leaflets being edged with white, probably with white tomentum, in the calyx being greenish, in the flowers being fewer on the racemes, in the genitals being more exserted, and in the petals diverging more.

*Braam's Butea*. Tree tw.

**Cult.** The species of this genus bear large fine leaves, and large shewy scarlet flowers. Their culture and propagation are the same as for the species of *Erythrina*, which see.

#### Tribe VI.

**DALBERGIEÆ** (plants agreeing in some important characters with *Dalbergia*. Bronn. diss. p. 134. exclusive of some genera. D. C. mem. legum. x. Corolla papilionaceous (f. 51. b.), perigynous. Stamens variously connected. Embryo with the radicle bent back upon the edge of the cotyledons (f. 21. c. f.), which are thick (f. 21. c.). Legumes 1-2-seeded, indehiscent. —Usually climbing shrubs, with impari-pinnate leaves, rarely, but sometimes pinnately trifoliate or simple. This tribe is pro-

bably very distinct from *Phascolidæ*, but the germination of the seeds is not sufficiently known.

**CCIX. DERRIS** (δερρις, *derris*, a skin; in reference to the consistence of the legumes). Lour. coch. p. 432. D. C. prod. 2. p. 415.

**LIN. SYST.** *Monadelphina, Decandria*. Calyx tubular, with 5 blunt teeth. Corolla papilionaceous. Keel lunate, of 2 concrete petals. Stamens 10, monadelphous. Legume oblong, obtuse, much compressed, 1-seeded, membranous. Seed oblong, flat.—Unarmed, climbing, glabrous shrubs, with impari-pinnate leaves, having from 1 to many pairs of exstipellate leaflets. Racemes axillary and lateral. Flowers white. Roots fleshy.

1 *D. TRIFOLIATA* (Lour. l. c.) leaves pinnately trifoliate; leaflets ovate-lanceolate; racemes axillary, length of leaves. *h. S.* Native of China, in the province of Canton, in woods.

*Trifoliate Derris.* Shrub cl.

2 *D. PINNATA* (Lour. l. c.) leaves impari-pinnate, with many pairs of alternate, ovate-oblong leaflets; peduncles lateral, many-flowered. *h. S.* Native of Cochinchina, in woods.

*Pinnate-leaved Derris.* Shrub cl.

**Cult.** These shrubs are well adapted for the climbers in greenhouses, or greenhouse conservatories. Ripened cuttings will root readily in sand, under a hand-glass.

**CCX. ENDESPERMUM** (from ἐνδεσ, *endees*, indigent, and σπέρμα, *sperma*, a seed; in reference to the want of seeds, there being only one in each legume). Blum. ex flora, 1825. p. 132. D. C. prod. 2. p. 415.

**LIN. SYST.** *Monadelphina, Enneandria*. Calyx bilabiate, bilobed at the base; upper lip bluntly 2-lobed, lower one tridentate. Wings and carina on long claws. Stamens 9, monadelphous, the tenth one absent or deficient. Legume on a very long pedicel, membranous and foliaceous, lanceolate, 1-seeded, indehiscent. Seed linear, compressed. This genus is said to be allied to *Dalbergia*.

1 *E. SCANDENS* (Blum. l. c.). *h. S.* Native of Java. Leaves abruptly pinnate; leaflets alternate, oblong, elongated, obtuse at the base, ending in a very short acumen at the apex, villous on both surfaces, but more so beneath. Racemes when bearing the flowers shorter than the leaves, but becoming longer as the pods advance. Flowers small, probably white.

*Climbing Endespermum.* Shrub cl.

**Cult.** See *Dalbergia* for culture and propagation, p. 375.

**CCXI. PONGAMIA** (*Pongam* is the Malabar name of the first species). Lam. ill. t. 603. Vent. malm. no. 28. D. C. prod. 2. p. 416.—*Galedupa*, Lam. dict. 2. p. 594. exclusive of the synonyms of Rumphius, and therefore the name.

**LIN. SYST.** *Monadelphina, Decandria*. Calyx cup-shaped, 5-toothed, obliquely truncate. Petals 5, all unguiculate and disposed into a papilionaceous corolla. Stamens 10, monadelphous, having the sheath or tube cleft above, or the tenth stamen loosened from the rest. Legume somewhat stipitate, compressed, flat, indehiscent, beaked, 1-celled, 1-2-seeded.—East Indian trees, with impari-pinnate leaves, opposite leaflets, axillary racemes of usually white or yellow flowers.

1 *P. GLABRA* (Vent. malm. t. 28.) leaves with 2-3 pairs of ovate, acuminate, glabrous leaflets. *h. S.* Native of the East Indies. *Robinia mitis*, Lin. spec. 1044. *Dalbergia arborea*, Willd. spec. 3. p. 901. *Galedupa Indica*, Lam. dict. 2. p. 594. *Burm. fl. ind.* 163.—*Rheed. mal.* 6. t. 3. Calyx red. Corolla white.

*Glabrous Pongamia.* Clt. 1699. Shrub 5 to 10 feet.

2 *P. CHINENSIS* (D. C. prod. 2. p. 416.) leaves with 2 or 3 pairs of ovate-lanceolate, glabrous leaflets; m shrubby. *h. G.* Native of China. *Robinia mitis*, Lour. coch. 455. Flowers yellow, tern in the raceme.

*China Pongamia.* Shrub 3 feet.

3 *P. ULIGINOSA* (D. C. l. c.) leaves with 1-2 pairs of oval-oblong, acuminate, glabrous leaflets. *h. S.* Native of Bengal. *Galedupa uliginosa*, Roxb. hort. beng. 53. *Robinia uliginosa*, Willd. spec. 3. p. 1133. Flowers white.

*Bog Pongamia.* Clt. 1824. Shrub tw.

4 *P. GRANDIFLORA* (Vent. malm. no. 28.) leaves with 3-4 pairs of elliptic, obtuse leaflets, which are pubescent beneath. *h. S.* Native of the East Indies. *Galedupa grandiflora*, Vahl. in herb. Juss. Legume compressed, flat, oval, pubescent. Racemes shorter than the leaves.

*Great-flowered Pongamia.* Clt. 1818. Shrub.

5 *P. SERICEA* (Vent. l. c.) leaves with 3-4 pairs, or only with 1 pair from abortion, of oblong leaflets, which are silky beneath; racemes elongated, approximating into a panicle. *h. S.* Native of Java. Flowers probably white.

*Silky-leaved Pongamia.* Shrub.

6 *P. ATROPURPUREA* (Wall. pl. rar. asiat. 1. p. 70. t. 78.) leaves with 3-4 pairs of oblong, attenuated, coriaceous, smooth leaflets; flowers disposed in dense racemes, numerous, forming a terminal panicle; legumes broad, ovate-lanceolate, 1-seeded, smooth. *h. S.* Native of the Burman empire, in woods on the shores of Martaban, at Amherst, and Moalmyne, and elsewhere. Flowers deep purple. The wood is much esteemed by the Burmese and Taleyne people, who employ it for beams and rafters in their houses. Dr. Wallich was told that they eat the tender leaves.

*Dark-purple-flowered Pongamia.* Tree 70 feet.

**Cult.** See *Dalbergia* for culture and propagation, p. 375.

**CCXII. DALBERGIA** (in honour of Nicholas Dalberg, a Swedish botanist). Roxb. hort. beng. p. 52. and cor. 2. vol. 2. D. C. prod. 2. p. 416. *Dalbergia*, spec. Lin. fil. suppl. 52. Lam. ill. 601. f. 2.—Solöri, Adans. fam. 327.

**LIN. SYST.** *Monadelphina, Octandria*, and *Decandria*, or *Dialophia, Decandria*. Calyx campanulate, 5-toothed (f. 51. a.). Corolla papilionaceous (f. 51. c.); petals of keel connected to the apex (f. 51. b.). Stamens 8-10, sometimes all monadelphous, with the tube or sheath cleft in front, sometimes divided into 2 equal opposite bundles. Legume stipitate, membranous, compressed, flat, oblong, tapering to both ends, 1-3-seeded (f. 51. d.). Seeds compressed, remote. Radicle inflexed.—Sometimes trees, but usually climbing shrubs, with impari-pinnate leaves.

1 *D. OUGEINENSIS* (Roxb. hort. beng. p. 53.) leaves pinnately trifoliate; leaflets ovate-roundish, rather villous, with undulately curled margins; pedicels 1-flowered, rising in fascicles, and are as well as the calyxes villous. *h. S.* Native of the East Indies. Flowers small. Terminal leaflets obovate.

*Ougein Dalbergia.* Clt. 1820. Tree 30 feet.

2 *D. Sissoo* (Roxb. hort. beng. p. 52.) leaflets 5, alternate, petiolulate, obovate, abruptly acuminate, glabrous above, but pubescent beneath; panicles axillary, puberulous, shorter than the leaves. *h. S.* Native of Bengal. Stamens 8, monadelphous, with a dorsal fissure. Legume linear-lanceolate, tapering to the base, stipitate, glabrous, 1-seeded. Flowers white.

*Sissoo Dalbergia.* Clt. 1820. Tree 30 feet.

3 *D. LATIFOLIA* (Roxb. cor. 2. p. 7. t. 113.) leaflets 3-5, alternate, roundish, emarginate, glabrous above and pubescent beneath; panicles axillary, few-flowered, much shorter than the leaves. *h. S.* Native of Coromandel, on the mountains. Stamens monadelphous, with a dorsal fissure. Flowers white. Legume oblong-lanceolate. The wood is used in making household furniture in India.

*Broad-leaved Dalbergia.* Clt. 1811. Tree 40 feet.

4 *D. RUBIGINOSA* (Roxb. cor. 2. p. 9. t. 115.) leaflets 7, nearly opposite, oblong, obtuse, glabrous; branches and petioles tomentose; panicles axillary, much shorter than the leaves. *h.*

✓ *S.* Native of Coromandel, on the mountains. Flowers white. Stamens monadelphous, with a dorsal fissure. Legumes unknown. *Rusty Dalbergia*. Clt. 1811. Shrub cl.

5 *D. ROBUSTA* (Roxb. hort. beng. p. 53.) leaflets 7-9, oval, or obovate, obtuse, somewhat mucronulate, minutely pubescent; racemes spike-formed, twice the length of the leaves; pedicels aggregate. *h. S.* Native of the East Indies, in Silhet. Flowers small, white, numerous. Stamens monadelphous, with a dorsal fissure. Legumes unknown.

*Robust Dalbergia*. Clt. 1816. Tree 30 feet.

6 *D. SCANDENS* (Roxb. cor. 2. t. 192.) leaflets 9-11, elliptic-oblong, acutish, glabrous; racemes axillary, spike-formed, longer than the leaves; pedicels in fascicles. *h. S.* Native of Coromandel. Flowers rose-coloured. Legumes linear-lanceolate, 2-3-seeded, glabrous, tapering to both ends.

*Climbing Dalbergia*. Clt. 1812. Shrub cl.

7 *D. VOLUBILIS* (Roxb. cor. 2. t. 191.) leaflets 11, alternate, oval, mucronate, glabrous; panicles terminal and axillary, divaricate. *h. S.* Native of Coromandel, on the mountains. Flowers blue. Stamens divided into 2 equal bundles. Legumes linear-oblong, obtuse, 1-2-seeded, glabrous.

*Twining Dalbergia*. Clt. 1818. Shrub tw.

8 *D. FRONDOSA* (Roxb. hort. beng. 53.) leaflets 9-11, alternate, obovate, obtuse, emarginate, glabrous; panicles axillary, usually nearly terminal, length of leaves; pedicels and calyxes hardly pubescent. *h. S.* Native of Coromandel. Flowers white. Stamens divided into two equal bundles. Legume broad, linear, tapering to both ends, 1-3-seeded, glabrous, wingless on both sutures.

*Frondose Dalbergia*. Tree 30 feet.

9 *D. PANICULATA* (Roxb. cor. 2. p. 8. t. 114.) leaflets 9-11, alternate, elliptic-obovate, obtuse or emarginate, glabrous; panicle terminal; peduncles, pedicels, and calyxes villous. *h. S.* Native of Coromandel, on the mountains. Flowers white. Stamens divided into 2 equal bundles. Legume oval-lanceolate, 1-2-seeded.

*Panicked Dalbergia*. Clt. 1811. Tree 30 feet.

10 *D. TIMORENSIS* (D. C. prod. 2. p. 417.) leaflets 9-11, alternate, glabrous on both surfaces; racemes axillary, length of leaves. *h. S.* Native of the Island of Timor. Flowers unknown. *D. lanceolaria*  $\beta$ , Lam. dict. 3. p. 256. ex herb. mus. Paris. Legume linear-lanceolate, attenuated at both ends, glabrous, 1-2-seeded; the seminiferous suture bearing a narrow wing. The figure in Rheed. mal. 6. t. 22. is referrible to this species.

*Timor Dalbergia*. Clt. 1826. Tree 15 feet.

11 *D. LANCEOLARIA* (Lin. fil. suppl. 316.) leaflets 11-15, alternate, oblong, obtuse, pilose and veinless beneath; racemes axillary, elongated, and are as well as the calyxes pilose. *h. S.* Native of the East Indies. Flowers rusty. Stamens divided into 2 equal bundles. Legume linear-lanceolate, 1-2-seeded, on a long stipe.

*Spear-shaped-podded Dalbergia*. Tree 30 feet.

12 *D. ARBorea* (Roth nov. spec. 330.) leaflets 17-25, alternate, oval, obtuse, somewhat emarginate, pubescent on both surfaces, when young they are clothed with tomentum; racemes paniced, sub-second. *h. S.* Native of the East Indies. Stamens equally diadelphous. Legume unknown.

*Tree Dalbergia*. Tree 30 to 40 feet.

13 *D. BARCLAYII* (Telfair, mss. Hook, exot. bot. 188.) leaflets opposite, linear-lanceolate, with revolute margins, silky beneath; racemes terminal, elongated; calyx with subulate teeth; vexillum silky on the back. *h. S.* Native of the Mauritius. Stamens 10, monadelphous. Flowers purple; the pedicels rising 2-3-together from the raceme.

*Barclay's Dalbergia*. Clt. 1823. Shrub.

14 *D. RUFA*; leaflets alternate, elliptic, rather oblique at the base, emarginate at the apex, clothed with rufous pubescence beneath as well as the petioles and branches; racemes or panicles of flowers axillary, short. *h. S.* Native of Sierra Leone. Habit of *Tamarindus* (v. s. herb. Lamb.).

*Rufous Dalbergia*. Tree 20 feet.

15 *D. AFZELIANA*; glabrous, smooth; branches warted; leaflets small, alternate, obtuse at both ends, deeply emarginate at the apex; panicles axillary, shorter than the leaves; legumes flat, stipitate, membranous. *h. S.* Native of Sierra Leone. Flowers unknown (v. s. herb. Lamb.).

*Afzelius's Dalbergia*. Shrub 8 to 10 feet.

16 *D. OBLONGIFOLIA*; branches, panicles, and under side of leaves clothed with rufous pubescence; leaflets alternate, elliptic-oblong, glabrous above, obtuse at both ends, and slightly mucronate at the apex; panicles twin, axillary. *h. S.* Native of Sierra Leone. Flowers unknown (v. s. herb. Lamb.).

*Oblong-leaved Dalbergia*. Tree.

17 *D. SERICEA*; branches and panicles clothed with rufescent pubescence; leaflets alternate, when young clothed with silky down, elliptic, tapering to the base, obtuse and mucronate at the apex; panicles sub-corymbose, axillary, much shorter than the leaves. *h. G.* Native of Nipaul. Flowers small (v. s. herb. Lamb.).

*Silky Dalbergia*. Shrub.

18 *D. MARGINATA* (Roxb. hort. beng. 53.) glabrous; leaflets alternate, broad, obovate, coriaceous, margined, rather glaucous beneath; panicles 2-3-together, diffuse, shorter than the leaves. *h. S.* Native of the East Indies.

*Margined-leafletted Dalbergia*. Shrub cl.

19 *D. CAUDATA*; leaflets numerous, alternate, oblong-lanceolate, emarginate, mucronate, pale beneath; racemes axillary, paniced, pubescent, shorter than the leaves; legumes pubescent, 1-seeded at the base, and hooked, ending in a long coriaceous, obtuse wing. *h. S.* Native of Guiana. (v. s. herb. Lamb.).

*Tailed-podded Dalbergia*. Tree.

20 *D. JAPONICA*; leaflets opposite, elliptic, tapering to both ends, acuminate, mucronate, glaucous beneath; racemes axillary; flowers secund. *h. G.* Native of Japan. (v. s. herb. Lamb.).

*Japan Dalbergia*. Tree.

21 *D. ? LATISILIQUA* (Desf. cat. hort. par. 198.) leaflets ovate, abruptly acuminate, pubescent beneath; pedicels pubescent; legumes broad. *h. S.* Native of South America. The rest of the plant unknown.

*Broad-silique Dalbergia*. Tree.

22 *D. ? HETEROPHYLLA* (Willd. spec. 3. p. 901.) leaflets 3-5, ovate, glabrous, obtuse; racemes axillary, longer than the leaves. *h. S.* Native of the East Indies. Stamens 10, monadelphous. Legume reniform-oval, reticulately veined.

*Variable-leaved Dalbergia*. Tree.

† *Species, the names of which are only known from Roxburgh's Hortus Bengalensis, p. 53. and p. 98. without any description.*

1 *D. emarginata*. 2 *D. Zeylanica*. 3 *D. tamarindifolia*. 4 *D. stipulacea*. 5 *D. rimosa*. 6 *D. reniformis*. 7 *D. alata*. 8 *D. parviflora*. 9 *D. Crowei*. 10 *D. spinosa*.

*Cult.* The species will all grow freely in a mixture of sand,

FIG. 51.

loam, and peat, and young cuttings of them will strike root freely if planted in a pot of sand, with a hand-glass placed over them, in a little bottom heat. The climbing kinds are well adapted for covering the rafters in stoves or stove conservatories.

**CCXIII. PTEROCARPUS** (from *πτερον*, *pteron*, a wing, and *καρπος*, *carpos*, a fruit; in reference to the pods being girded by a broad wing). Lin. gen. no. 854. Lam. ill. t. 602. exclusive of some species. D. C. prod. 2. p. 418.

**LIN. SYST.** *Monadelphica Decandria*, or *Diadelphica Decandria*. Calyx 5-toothed. Petals 5, disposed into a papilionaceous corolla. Stamens 10, monadelphous or diadelphous. Legume indehiscent, irregular, nearly orbicular, usually varicose, 1-seeded, girded by a wing. Cotyledons thick, incurved. Radicle somewhat inflexed at the base. — Unarmed trees or shrubs, with impari-pinnate leaves, and axillary racemes of flowers. This is a very polymorphous genus, and ought to be divided into several genera, but at present the flowers and fruit of the species are too little known to render this practicable.

**SECT. I. MOUTOU'CHIA** (*Moutouchi* is the Caribbean name of *P. suberosa*). Aubl. guian. 2. p. 748. t. 299. D. C. prod. 2. p. 418. — *Griselinea*, Neck. elem. no. 1358. but not of Forst. Stamens monadelphous, with the sheath or tube entire, not cleft above. Legume roundish, suberose, 1-seeded, having the superior suture straight, but not winged.

1 *P. DRACO* (Lin. spec. 438.) leaflets 5-7, alternate, ovate, acuminate, glabrous, shining; fruit smoothish. *h. S.* Native of Guadaloupe and others of the West India islands. *P. officinalis*, Jacq. amer. 283. t. 183. f. 92. *P. Draco*, Willd. exclusive of the synonymies of Aublet and Commerson. *P. hemiptera*, Gærtn. fruct. 2. p. 351. t. 156. f. 2. The wood of this tree is white and heavy, the bark thick, of a rusty grey colour, being cut transversely it betrays no marks of redness at first, but in a short time it is variegated with many blood red dots, that collect into little globules or tears. The tree itself when cut in different parts in a short time is full of blood-coloured drops, shining and very clear, in the space of 10 minutes they harden, especially if the sun shines hot, and then are collected under the name of *sanguis draconis* or dragon's-blood. The bark, wood, and leaves have an astringent taste. The resin of *P. Draco* was formerly sent in abundance from Carthage to Spain; it no longer occurs in commerce on account of the decreased demand for dragon's-blood, and all the dragon's-blood now in commerce is obtained chiefly from the fruit of *Calamus Draco verus*, and *ruidentum*, the uses of which we shall give under that head.

*Dragon's-blood Pterocarpus*. Clt. 1820. Tree 30 to 40 ft.

2 *P. SUBEROSUS* (Pers. ench. 2. p. 277.) leaflets 5-9, alternate, ovate, acuminate, glabrous, shining; fruit reticulately-rugose from elevated nerves. *h. S.* Native of Guiana, in humid woods. *Moutouchia suberosa*, Aubl. guian. 2. p. 748. t. 299. *P. Moutouchia*, Lam. ill. t. 602. f. 1. Racemes panicle. Flowers yellow.

*Cerky-fruited Pterocarpus*. Tree 40 feet.

3 *P. CRISATUS* (Moc. et Sesse, fl. mex. icon. ined.) leaflets 5-9, alternate, ovate, acutish; fruit smoothish; petals curled. *h. S.* Native of Mexico. Racemes panicle. Flowers of a dirty yellow peach colour.

*Curled petalled Pterocarpus*. Tree 40 feet.

**SECT. II. AMPHYMENIUM** (from *αμφι*, *amphi*, around, and *ὑμην*, *hymen*, a membrane; in reference to the pods being girded round by a membrane). Stamens monadelphous, with the sheath or tube cleft longitudinally on the upper side, sometimes the whole length. Fruit almost orbicular, containing 1 or 2 seeds inside, girded all round by a broad membrane.

4 *P. ROHRII* (Vahl. symb. 2. p. 79.) leaflets 7-9, alternate,

ovate-oblong, abruptly acuminate, and arc, as well as the branches and fruit, glabrous. *h. S.* Native of French Guiana, in woods. *P. Apalatda*, Rich. in act. soc. nat. par. 1. p. 111. *P. Rohrii*, Willd. spec. 3. p. 905. exclusive of the synonymies of Aublet, according to König in ann. bot. 1. p. 358. Aubl. guian. 2. t. 145. f. 56. fruit, exclusive of the rest of the plate.

*Rohr's Pterocarpus*. Clt. 1816. Tree 40 feet.

5 *P. ORBICULATUS* (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 418.) leaflets 5, opposite, ovate, acute, glabrous; fruit orbicular, emarginate at the base, but mucronate at the apex. *h. S.* Native of Mexico. Flowers yellow.

*Orbicular-fruited Pterocarpus*. Tree 30 feet.

6 *P. AMPHYMENIUM* (D. C. prod. 2. p. 418.) leaflets 7, ovate-elliptic, acute, rounded at the base, glabrous above, and pubescent beneath; branches, petioles, calyxes, and fruit clothed with soft tomentum. *h. S.* Native of Mexico, on the western declivities of mountains. *Amphymentium pubescens*, H. B. et Kunth, nov. gen. amer. 6. p. 380. Flowers yellow?

*Around-membraned Pterocarpus*. Tree 50 feet.

7 *P. MARSUPIUM* (Roxb. cor. 2. p. 9. t. 116.) leaflets 5-7, alternate, elliptic, somewhat emarginate, coriaceous, glabrous; branches and calyxes glabrous; panicle terminal; legume rather truncate, glabrous. *h. S.* Native of Coromandel, on the mountains. Flowers pale yellow. Stamens disposed in 2 pentandrous bundles, which are rather concrete on the lower side.

*Pouch-podded Pterocarpus*. Clt. 1811. Tree 40 feet.

8 *P. DALBERGIFOLIES* (Roxb. hort. beng. p. 53.) leaflets 5-7, alternate, elliptic, bluntish, coriaceous, and arc, as well as the branches and calyxes, glabrous; panicles of flowers axillary. *h. S.* Native of the East Indies. Stamens divided into 2 pentandrous bundles. Flowers yellow.

*Dalbergia-like Pterocarpus*. Tree 40 feet.

9 *P. BILOBUS* (Roxb. in herb. Lamb.) leaflets broad, glabrous, alternate, ovate-roundish, deeply 2-lobed at the apex; racemes short, axillary; fruit 1-seeded. *h. S.* Native of the East Indies.

*Two-lobed-leaved Pterocarpus*. Tree 20 feet.

**SECT. III. ECHINODISCUS** (from *εχινος*, *echinos*, a hedge-hog, and *δισκος*, *diskos*, a disk; in allusion to the legumes being beset with stiff bristles in the centre). Fruit almost orbicular, and somewhat falcate, mucronate from the base of the style, which is either lateral or oblique, girded all round by a membrane, and beset with long stiff bristles in the centre. Flowers unknown. The species of this section are not well known, or it would have probably constituted a distinct genus.

10 *P. ADANSONII* (D. C. prod. 2. p. 419.) leaflets 13-15, alternate, petiolulate, oval or rather oblong, acutish or mucronate, adult ones glabrous above, but clothed with adpressed, silky velvety, canescent down beneath, as well as the branches, petioles, peduncles, and legumes; point of legume lateral, somewhat falcate, not reflexed. *h. S.* Native of Senegal. *P. Senegalensis*, Vahl. ex herb. Juss.

*Adanson's Pterocarpus*. Tree 20 to 30 feet.

11 *P. ECHINATUS* (Pers. ench. 2. p. 277.) leaflets ovate, somewhat cordate, glabrous; legume smoothish, falcate, with the point directed towards the pedicel. *h. S.* Native at Capo de Solar.

*Echinatell-fruited Pterocarpus*. Tree.

12 *P. ERINACEUS* (Lam. dict. 5. p. 728. ill. 602. t. 4.) leaflets alternate, elliptic, obtuse, glabrous above, but clothed with rusty pubescence beneath; fruit having a short, straight, lateral point. *h. S.* Native of Senegal and other parts of Guinea. The true African kino has been discovered by Mr. Mungo Park to be the produce of this tree. It is known up the rivers Gambia and Senegal by the name of *Pan du Sangué*. Kino is a gum resin

which is a powerful remedy in obstinate chronic diarrhœas and dysenteries, and in all diseases arising from laxity of the solids. Externally it is applied as a styptic to check hæmorrhages from wounds or ulcers, and to diminish the discharge of ichorous matter from ill-conditioned ulcers.

*Hedge-hog-fruited Pterocarpus.* Tree 20 feet.

13 *P. ANGOLÆNSIS* (D. C. prod. 2. p. 419.) leaflets 11, petiolulate, ovate, ending in a short taper point, glabrous above, but pubescent along the nerves beneath; fruit large, rather villous. *h. S.* Native of the western coast of Africa, in the kingdom of Angola.

*Angola Pterocarpus.* Tree 30 feet.

SECT. IV. *SANTALARIA* (from *santalum*, the Latin name for Saunder's-wood). D. C. prod. 2. p. 419. Stamens unequally diadelphous, that is, 9 connected, and 1 free. Fruit almost orbicular, containing 2 or 3 seeds inside.

14 *P. INDICUS* (Willd. spec. 3. p. 904.) leaflets 5-9, alternate, ovate, acute, glabrous; racemes axillary, simple or branched; fruit acutely mucronate. *h. S.* Native of the East Indies.—Rumph. amb. 2. t. 70. *P. Indicus*, Roxb. hort. beng. p. 53. *P. Draco*, Lam. ill. t. 602. f. 2.—Comm. hort. amst. 1. t. 109. Flowers white.

*Indian Pterocarpus.* Tree 30 feet.

15 *P. SANTALINUS* (Lin. fil. suppl. 318.) leaflets 3-5, alternate, roundish, retuse, glabrous; racemes axillary, simple or branched; petals crenated. *h. S.* Native of India, on mountains. Flowers yellow, streaked with red. This is the true *Santalum rubrum* of König. The wood is dark red with black veins, heavy, close, capable of a good polish, and sinking in water. The wood is known in commerce by the name of *Saunder's-wood*; it yields a deep red colouring matter, which appears to be of a resinous nature, to ether and alcohol, but not to water. Its colouring matter forms beautifully coloured precipitates with many metallic solutions. It also yields one kind of dragon's-blood.

*Saunder's-wood.* Clt. 1800. Tree 66 feet.

16 *P. SANTALINOIDES* (Lher. herb. D. C. prod. 2. p. 419.) leaflets 7-9, alternate, oval, acuminate, glabrous; racemes axillary, simple, shorter than the leaves; peduncles clothed with velvety pubescence; bracteoles 2, linear, subulate, longer than the calyx. *h. S.* Native of Sierra Leone. Flowers dirty yellow.

*African Saunder's-wood* or *Santalum-like Pterocarpus.* Clt. 1793. Tree 60 feet.

17 *P. FLAVUS* (Lour. coch. p. 431.) leaflets 5-7, opposite, ovate, acute; racemes lateral, spiked; vexillum toothed. *h. G.* Native of China and the Moluccas. *P. luteus*, Poir. suppl. 4. p. 610.—Rumph. amb. 3. t. 117. Bark yellow, bitter, and is used for dyeing yellow. Flowers yellow.

*Yellow-barked Saunder's-wood.* Tree 40 feet.

18 *P. ROXBURGHII*; leaflets alternate, ovate, obtuse, pubescent beneath; fruit 1-seeded. *h. S.* Native of the East Indies. *P. flavus*, Roxb. hort. beng. p. 153. but not of Lour.

*Roxburgh's Pterocarpus.* Tree 30 feet.

19 *P. ULIGINOSUS* (Roxb. hort. beng. p. 533.) leaflets opposite, ovate, acuminate, glabrous; racemes long, paniced. *h. S.* Native of the East Indies. Flowers white.

*Bog Pterocarpus.* Tree.

20 *P. SAPINDOIDES* (D. C. prod. 2. p. 419.) leaflets 11-13, opposite, oval, acuminate, glabrous; panicles axillary, much shorter than the leaves, rather velvety. *h. S.* Native of South America. Stamens diadelphous. Fruit unknown. Perhaps referrible to *Amerimum*.

*Sapindus-like Pterocarpus.* Tree 20 feet.

21 *P. SCANDENS* (Poir. dkt. 5. p. 730.) leaflets 7-11, opposite, oblong, acuminate, glabrous; racemes axillary, longer than the leaves; stems climbing. *h. S.* Native of Caraccas.

*Amerimum scandens*, Willd. spec. 3. p. 909. Points of leaflets emarginate. Flowers violaceous. Calyx truncate. Legume 2-seeded.

*Climbing Pterocarpus.* Clt. 1817. Shrub cl.

SECT. V. *ATELEIA* (from *ατελες*, *ateles*, imperfect; in reference to *P. Atelia*, which is without the wings and keel to the flowers). Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 419. Legume membranous, samaroid, stipitate, compressed, with the upper suture straight, and furnished with a narrow wing, but the lower suture is convex. Racemes simple. Perhaps proper genus.

22 *P. ATELEIA* (D. C. prod. 2. p. 419.) leaflets 13, alternate, ovate, lower ones smallest. *h. S.* Native of Mexico. *Atelia pterocarpa*, Moc. et Sesse, fl. mex. icon. ined. Flowers white, disposed in racemose spikes. Corolla with an oblong vexillum, but the wings and keel are wanting. Stamens 10, monadelphous at the base.

*Imperfect-flowered Pterocarpus.* Tree 20 feet.

23 *P. MICROCARPUS* (Pers. ench. 2. p. 277.) leaflets 7, opposite, elliptic, obtuse at both ends, but emarginate at the apex, coriaceous, glabrous; peduncles and petioles pubescent. *h. S.* Native of South America. Flowers unknown. Legume pale, 1-seeded, reticulately veined.

*Small-fruited Pterocarpus.* Tree.

24 *P. GUUMIFER* (Bert. in herb. Balb. D. C. prod. 2. p. 419.) leaflets 5-7, opposite, oblong, attenuated at both ends, bluish, glaucescent; petioles and pedicels glabrous. *h. S.* Native of St. Domingo. D. C. legum. mem. 10. t. 57. f. 1. Flowers unknown. Pods like those of the two preceding species.

*Gum-bearing Pterocarpus.* Tree.

25 *P. PELTARIA* (D. C. prod. 2. p. 419.) leaflets 3, oblong-linear, glabrous; legumes stipitate, oval, winged on one side, 1-seeded. *h. G.* Native of the Cape of Good Hope. *Clypeola* and *Peltaria Capensis*, Burm. herb.—D. C. legum. mem. 10. t. 57. f. 2. Racemes terminal, almost simple. Flowers pendulous. Calyx acutely 5-toothed, small, permanent. Petals deciduous. Stamens monadelphous, with the sheath or tube permanent, and cleft above.

*Buckler-podded Pterocarpus.* Tree.

*Cult.* The species of *Pterocarpus* thrive best in a loamy soil, and young cuttings not deprived of their leaves root readily in sand under a hand-glass, in heat.

CCXIV. *DREPANOCARPUS* (from *δρεπανος*, *drepanon*, a sickle, and *καρπος*, *carpos*, a fruit; in reference to the form of the pods, which are falcate). Meyer, prim. esseq. 238. D. C. prod. 2. p. 420.—*Nephrosis*, Rich. ined.—*Orucaria*, Juss. ined.

*LIN. SYST. Monadelphia Decandria*, or *Diadelphia Decandria*. Calyx 5-toothed, with 2 bracteas at the base, lower tooth diverging at the apex. Petals 5, disposed into a papilionaceous corolla. Stamens 10, monadelphous, with the sheath or tube cleft in front, or equally diadelphous, that is, disposed in 2 pentandrous bundles. Legume compressed, indehiscent, wingless, falcate, 1-celled, 1-seeded. Seeds fixed to the ventral suture.—Shrubs, with impari-pinnate leaves with usually from 5-9 nearly opposite oval-oblong leaflets. Panicles of flowers terminal.

1 *D. LUNATUS* (Meyer, l. c.) spines stipular, hooked; leaflets 5-9, alternate, glabrous, oblong, obtuse; panicle ferruginous. *h. S.* Native of South America by the sea-side. *Pterocarpus lunatus*, Lin. fil. suppl. 317. *P. apterus*, Gart. fruct. t. 156. *Nephrosis aculeata*, Rich. herb. *Orucaria lunata*, Juss. herb.—Plum. ed. Burm. t. 201. f. 2. *Orucaria*, Clus. exot. 47 and 48. with a figure.—Bauh. hist. 1. p. 445. with a figure. Flowers white. Legumes crescent-shaped.

*Lunate-podded Drepanocarpus.* Clt. 1792. Sh. 6 to 10 feet.

2 *D. AFRICANUS*; spines stipular; leaflets alternate, oblong, obtuse, white beneath; racemes terminal. *h. S.* Native of Guinea, on the sea shore. Legume flat, crescent-shaped, as well as the seed. (v. s. herb., Lamb.)

*African Drepanocarpus.* Fl. Feb. Shrub 6 to 10 feet.

3 *D. DUBIUS* (H. B. et Kunth, nov. gen. amer. 6. p. 390.) spines none; leaflets 5-7, puberulous beneath. *h. S.* Native of Caraccas, in the plains. Leaflets elliptic, rounded at both ends, membranous. Legume reniformly semi-lunate, wrinkled reticulately. Flowers unknown.

*Doubtful Drepanocarpus.* Tree 30 feet.

4 *D. ? CYATHIFORMIS* (D. C. prod. 2. p. 420.) spines none; shrub climbing; leaflets alternate, ovate, acuminate, glabrous; panicles somewhat corymbose; fruit orbicular, rather cup-shaped. *h. S.* Native of Mexico. *Pterocarpus cyathiformis*, Moc. et Sesse, fl. mex. icon. ined.

*Cup-shaped-podded Drepanocarpus.* Shrub cl.

5 *D. MICROPHYLLUS* (Meyer, in act. soc. nat. cur. bonn. 12. p. 807.) spines stipular, recurved; leaves with many pairs of leaflets; stamens monadelphous. *h. S.* Native of Panama. Very like the following species.

*Small-leafletted Drepanocarpus.* Shrub 6 to 10 feet.

6 *D. ISADELPHUS* (Meyer, l. c.) spines stipular, recurved; leaflets 12-16 pairs; stamens equally diadelphous. *h. S.* Native of Surinam. Ovary hairy, falcate. Fruit unknown.

*Isadelphous-stamened Drepanocarpus.* Shrub 6 to 10 feet.

7 *D. PANICULATUS*; leaves with 4 pairs of leaflets; leaflets elliptic, coriaceous, pubescent beneath; panicles equal in length to the leaves; fruit lunate. *h. S.* Native of St. Domingo. *Pterocarpus paniculatus*, Spreng. syst. 3. p. 192.

*Panicled Drepanocarpus.* Tree.

*Cult.* See *Pterocarpus* for culture and propagation, p. 377. The species require to be watered occasionally with salted water to make them thrive.

CCXV. ECASTAPHYLLUM (from *εκαστός*, *hecastos*, each, and *φυλλον*, *phyllon*, a leaf; in reference to the leaves of the two first species being each composed of only one leaflet). P. Browne, jam. 299. Rich. in Pers. ench. no. 1670. D. C. prod. 2. p. 420. —*Hecastophyllum*, H. B. et Kunth, nov. gen. amer. 6. p. 387.

LIN. SYST. *Diadélphia*, *Octo-Decándria*. Calyx campanulate, somewhat bilabiate, upper lip emarginate, lower one trifid. Corolla papilionaceous. Stamens 8-10, equally diadelphous or 9, and 8 of them equally diadelphous and 1 loose. Legume nearly orbicular, membranous, valveless, biovulate, but only 1-seeded. Seed reniform. Radicle uncinately-inflexed.—Shrubs, with simple, trifoliate, or impari-pinnate leaves, and axillary sub-corymbose panicles of flowers.

1 *E. BROUWNEI* (Pers. ench. 2. p. 277.) petiole bearing only one leaflet; the leaflet broad, ovate, rounded and cordate at the base, acuminate at the apex, and pubescent beneath. *h. S.* Native of the West Indies and South America, as well as of Senegal and Gambia, in swampy places. *E. frutescens*, Browne, jam. p. 299. t. 52. f. 1. *Pterocarpus Ecastaphyllum*, Lin. spec. 1052. exclusive of the synonyme of Plumier. Berg. act. stockh. 1769. p. 116. t. 4. *Amerimnum Sieberi*, Reichb. in Sieb. pl. exsicc. seneg. no. 36. Leaves spreading in a double row, pubescent when young, but glabrous in the adult state. Calyx ferruginous.

*Var. β, glabrum*; leaves glabrous beneath.

*Browne's Ecastaphyllum.* Clt. 1733. Shrub 6 to 8 feet.

2 *E. DUBIUM* (H. B. et Kunth, nov. gen. amer. 6. p. 388.) petiole with only one leaflet; leaflet elliptic-oblong, ending in a short blunt acumen, rather cordate at the base, and marked with pellucid lines, and pilose on the nerve beneath; legumes

reniform, wrinkled. *h. S.* Native of the province of Caraccas, near Caicara at the Orinoco.

*Doubtful Ecastaphyllum.* Shrub 6 to 8 feet.

3 *E. PLUMIERI* (Pers. ench. 2. p. 227.) leaves impari-pinnate, with 3-5 broadly ovate, bluntish, glabrous leaflets. *h. S.* Native of South America.—*Plum.* ed. Burm. t. 246. f. 2. *Pterocarpus Plumieri*, Poir. suppl.

*Plumier's Ecastaphyllum.* Clt. 1820. Shrub 6 to 10 feet.

4 *E. PUBESCENS* (D. C. prod. 2. p. 421.) leaves impari-pinnate, with 5-7 alternate, ovate, acuminate leaflets, which are pubescent, as well as the branches and legumes. *h. S.* Native of Cayenne or French Guiana. Panicles axillary, branched, pedunculate. Stamens equally diadelphous. Legume nearly orbicular, almost an inch in diameter.

*Pubescent Ecastaphyllum.* Shrub.

5 *E. MONETARIA* (D. C. prod. 2. p. 421.) leaflets 3, alternate, ovate, acuminate, glabrous; peduncles axillary, numerous, spiked. *h. S.* Native of Surinam in humid places. *Dalbergia Monetaria*, Lin. fil. suppl. 317. *Pterocarpus ternata*, Poir. dict. 5. p. 727. ex Kunth and Richard, Pers. ench. 2. p. 277. Stamens 9, 8 of which are disposed in two equal bundles, but the ninth one is loose, or hardly connected to the others at the base. Legume oval, roundish. Flowers minute, white. The root when cut yields a purple juice. The wood is red, and yields a resin resembling dragon's-blood.

*Money-like-podded Ecastaphyllum.* Shrub 6 to 10 feet.

6 *E. BERTERII* (D. C. prod. 2. p. 421.) leaflets 3, alternate, obovate-orbicular; racemes spike-formed, simple, axillary, solitary; legume coriaceous, glabrous, nearly orbicular. *h. S.* Native of St. Domingo. *Pterocarpus Berterii*, Spreng. syst.

*Bertero's Ecastaphyllum.* Shrub.

† *A doubtful species.*

7 *E. ? MICROPHYLLUM* (H. B. et Kunth, nov. gen. amer. 7. p. 268.) leaflets 25-45, small, oblong, acute, and somewhat mucronate, rounded at the base, clothed with adpressed pili on both surfaces; legumes falcate, oblong, rather rugulose. *h. S.* Native of Venezuela, near Santa Barbara.

*Small-leafletted Ecastaphyllum.* Shrub.

*Cult.* See *Pterocarpus*, p. 377. for the culture and propagation of the species.

CCXVI. AMERIMNUM (from *a*, priv. and *μεριμνα*, *merimna*, care; void of care or in a state of security; but what induced Dr. P. Browne to give this name to the present genus is unknown to us, unless it was the careless flow of the branches, or some medical virtue which the plant is supposed to possess). P. Browne, jam. 288. Adans. fam. 2. p. 320. D. C. prod. 2. p. 421.—*Amerimnum* species of Swartz, fl. ind. occ. 3. p. 1233. t. 25.

LIN. SYST. *Monadélphia*, *Decándria*. Calyx somewhat bilabiate, 5-toothed. Petals 5, disposed into a papilionaceous corolla. Stamens 10, monadelphous, with the sheath or tube cleft in front. Legume compressed, 2-valved, 1-celled, 1-seeded; the superior suture straight, and a little winged; the lower one very convex. — Small trees or shrubs, with alternate, stalked, ovate, somewhat cordate, simple leaves.

1 *A. BROUWNEI* (Swartz, fl. ind. occ. 3. p. 1234.) leaves ovate, somewhat cordate, acute, glabrous; peduncles axillary, 10-flowered, glabrous or puberulous. *h. S.* Native of Jamaica, St. Domingo, and Carthage, in dry places among bushes. P. Browne, jam. 288. t. 32. f. 3. Jacq. amer. 199. t. 180. f. 58. *Pterocarpus Amerimnum*, Poir. dict. 5. p. 729. Flowers white, sweet-scented. The shrub being weak supports itself upon its neighbours.

*Browne's Amerimnum.* Clt. 1793. Shrub 6 to 10 feet.

2 *A. strigulosum* (H. B. et Kunth, nov. gen. amer. 6. p. 389.) leaves ovate, rather cordate, obtuse, clothed with adpressed pili on both surfaces.  $\frac{1}{2}$ . S. Native on the banks of the Orinoco. Branches and petioles clothed with ferruginous tomentum. Racemes axillary, solitary, 3 times longer than the petioles.

*Strigulose Amerimnum.* Shrub 6 to 10 feet.

*Cult.* See *Pterocarpus*, p. 377, for culture and propagation.

CCXVII. BRYA (from  $\beta\rho\upsilon\omega$ , *bryo*, to sprout; the seeds germinate before falling from the tree). P. Browne, jam. 299. Bronn. legum. 135. D. C. prod. 2. p. 421.—*Aldina*, Adans. fam. 328.

LIN. SYST. *Monadelphica*, *Decandria*. Flowers the same as those of *Amerimnum*, but the stamens are all monadelphous, the tenth one concrete with the others to the middle. Legume bi-articulate; joints 1-seeded, dehiscent, compressed, with the superior suture straight, and the lower one convex, but the upper joint is sometimes wanting.—American trees, furnished with stipular spines, simple crowded leaves, or perhaps trifoliate leaves, with the leaflets sessile.

1 *B. Ebenus* (D. C. prod. 2. p. 421.) spines distinct; leaflets aggregate, obovate; peduncles 2-3-together, axillary, 1-2-flowered, shorter than the leaves.  $\frac{1}{2}$ . S. Native of the West Indies. P. Browne, jam. 299. t. 31. f. 2. Plum. ed. Burm. t. 246. f. 1. *Aspalathus Ebenus*, Lin. spec. 1001. *Amerimnum Ebenus*, Swartz, prod. 104. *Pterocarpus buxifolius*, Murr. syst. 642. *Pterocarpus glabrus*, Reichb. Flowers bright yellow. Fruit lunate, hairy. The wood of this tree is cut in the West Indies, and sent to England under the name of ebony, though it is not the true ebony, which is a plant of a very different genus. The wood of this American ebony being of a fine greenish brown colour, and polishing very well, and of a very hard durable nature, is much coveted by musical instrument makers. Dr. Browne says that the small dimensions of this shrubby tree renders it fit only for few purposes, the trunk seldom exceeding 3 or 4 inches in diameter, but that the slender branches being very tough and flexible are frequently used for riding switches, and generally kept at all the wharfs about Kingston to scourge the refractory slaves.

*American Ebony.* Fl. July, Aug. Clt. 1713. Tree 12 to 14 ft.

2 *B. ? parviflora* (D. C. prod. 2. p. 421.) spines connate; leaflets oblong-lanceolate, tapering to the base; racemes bracteate, few-flowered.  $\frac{1}{2}$ . S. Native of Brazil. *Amerimnum parviflorum*, Spreng. neue entd. 2. p. 159.

*Small-flowered Brya.* Shrub 12 feet.

*Cult.* See *Pterocarpus* for culture and propagation, p. 377.

CCXVIII. DEGUELIA (abridged from *assa-ha pagara undeguele*, the Caribbean name of the plant). Aubl. guian. 2. p. 750. t. 300. Lam. ill. t. 603. D. C. prod. 2. p. 422.—*Cylizoma*, Neck. clem. no. 1343.

LIN. SYST. *Diadelphica*, *Decandria*. Calyx bilabiate, upper lip entire, lower one trifid. Petals 5, disposed into a papilionaceous corolla; wings and carina equal in length, but the vexillum is larger. Stamens 10, diadelphous. Ovary (ex Richard) declinate, narrow, oblong, hispid, straightish. Style stretched out, capillary, hispid on the inner side even to the apex. Stigma terminal, capitate, glandular. Legume (ex Aubl.) globose, small, 2-valved, 1-seeded. Seed spherical, covered with farina.—A sarmentose shrub, with impari-pinnate leaves, furnished with 2 pairs of oval acute leaflets, spike-formed axillary racemes of flowers. This genus, according to its habit, is allied to *Nissolia* and *Pterocarpus*, but the legume, as it is described by Aublet, belongs probably to a different plant (according to Richard).

1 *D. scandens* (Aubl. l. c.)  $\frac{1}{2}$ . S. Native of Guiana,

on the banks of rivers. Branches and leaves glabrous. Peduncles clothed with brown velvety down. Bractees small, acute. Flowers white.

*Climbing Deguelia.* Shrub cl.

*Cult.* See *Pterocarpus* for culture and propagation, p. 377.

## Suborder II. or Tribe VII.

SWARTZIEÆ (plants agreeing with *Swartzia* in important characters). D. C. legum. mem. xi. prod. 2. p. 422. Sepals closely joined into an ovate-globose alabastrum before expansion (f. 52. b.), which at last bursts valvately, as the flowers expand (f. 52. g.). Petals few, irregular or wanting, and arc, as well as the stamens, hypogynous (f. 52. d.). Radicle incurved (f. 21. e. f.). Cotyledons thick. Germination unknown. Leaves simple or simply pinnate. This is a very distinct suborder or tribe, agreeing with *Detariæ* in the valveless calyx, with tribe *Mimoseæ* in the hypogynous stamens, and in the irregular petals as well as in the habit of the plants with *Dalbergiæ*.

CCXIX. SWARTZIA (in honour of Olof Swartz, M.D. a long time resident in the West Indies, and author of *Flora Indica Occidentalis*, &c.) Schreb. gen. 1227. Willd. spec. 2. p. 1219. D. C. prod. 2. p. 422.

LIN. SYST. *Deca-Polyandria*, *Monogynia*. Sepals closely connected into an ovate-globose alabastrum, but bursting afterwards somewhat irregularly and almost valvately almost to the base. Petal one, hypogynous, flat, lateral or wanting. Stamens 10-15-25, variable in number, hypogynous, sometimes with 2 or 4 of them larger than the others, and sterile, and appearing like petals, the rest usually connected a little way at the base. Legume usually stipitate, 2-valved, 1-celled, few-seeded. Seeds arillate, exalbuminous. Embryo with thick cotyledons, and an uncinate, inflexed, short, exserted radicle.—Trees, with simple or impari-pinnate leaves, and with the flowers rising in racemes from the axils of the leaves.

SECT. I. POSSIRA (the name of *S. arborescens* in Guiana). Aubl. guian. 2. p. 934.—*Rittera*, Schreb. gen. no. 1919.—*Hoelzelia*, Neck. clem. no. 1383. Flowers usually with one petal, rarely with 3; when the last is the case, one of them is much larger than the rest.

\* *Leaves simple, having the petiole bidentate at the apex. The teeth in place of stipels.*

1 *S. simplicifolia* (Willd. spec. 2. p. 1219.) leaves simple, ovate-oblong, obtuse, emarginate; peduncles usually 5-flowered; petal one, roundish, ovate, larger than the calyx; stamens 20-25.  $\frac{1}{2}$ . S. Native of the West Indies. *Rittera simplex*, Vahl. *Possira simplex*, Swartz, prod. 82. Flowers pale yellow.

*Simple-leaved Swartzia.* Clt. 1818. Shrub 6 to 10 feet.

2 *S. grandiflora* (Willd. l. c.) leaves simple, oblong-ovate, acuminate; peduncles 3-flowered; petal roundish-reniform, large; stamens 20-25.  $\frac{1}{2}$ . S. Native of Trinidad and St. Vincent. *Rittera grandiflora*, Vahl. ecl. 2. p. 37. pl. amer. dec. 1. t. 9. Flowers yellow. Ovary stipitate, arched.

*Great-flowered Swartzia.* Clt. 1821. Shrub 6 to 8 feet.

3 *S. dodecandra* (Willd. l. c.) leaves simple, ovate, drawn out at the apex into an emarginate acumen; peduncles usually 5-flowered; petal oblong, length of calyx; stamens 10-20.  $\frac{1}{2}$ . S. Native of South America. *Rittera dodecandra*, Vahl. symb. 2. p. 60. t. 34. Ovary stipitate. Flowers yellow.

*Dodecandrous Swartzia.* Shrub 6 feet.

4 *S. parviflora* (D. C. legum. mem. xi. t. 60.) leaves simple, on very short petioles, ovate, drawn out into an emarginate

acumen; peduncles usually 3-flowered; petal unguiculate, roundish, a little fringed, length of calyx; stamens 20-25. *h. S.* Native of Cayenne. Legume on a short stipe, ovate, 2-seeded. Seeds ovate-conical, truncate at the central extremity.

*Small-flowered Swartzia.* Shrub 6 feet.

5 *S. OCHNACEA* (D. C. legum. mem. xi. t. 58.) leaves simple, ovate-elliptic, acutish; peduncles 1-flowered. *h. S.* Native of South America, about Buenos Ayres. Flowers unknown. Legume standing on a stipe half an inch long, obovate, tapering to the base, apiculated by the style. Seed 1, large, reniform.

*Ochna-like Swartzia.* Shrub 6 feet.

\* \* *Leaves impari-pinnate, with 3-7 leaflets.*

6 *S. TRIPHYLLA* (Willd. l. c.) leaves trifoliate, but the lower ones are simple; leaflets oval-lanceolate, acuminate; peduncles 2-5-flowered. *h. S.* Native of Guiana and Cayenne. *Possira arborëscens*, Aubl. guian. 2. p. 934. t. 353. *Possira triphylla*, Swartz, prod. 82. Flowers yellow.

*Var. β, grandiflora* (Raddi, mem. pl. bras. add. p. 16.) leaflets undulate; petal large. Native near Rio Janeiro.

*Three-leafletted Swartzia.* Shrub 8 feet.

7 *S. APTERA* (D. C. legum. mem. xi. prod. 2. p. 423.) leaves trifoliate; petioles terete, wingless; leaflets ovate-elliptic, drawn out into a blunt, narrow, somewhat emarginate acumen; peduncles 2-5-flowered. *h. S.* Native of Cayenne and Guiana.

*Wingless-petioled Swartzia.* Shrub 6 feet.

8 *S. MYRTIFOLIA* (Smith, in Rees' cycl. no. 5.) leaves with 3-5 leaflets; petioles margined; leaflets lanceolate-oblong; petal orbicular, length of calyx; stamens very numerous, polyadelphous. *h. S.* Native of the Caraccas. Petal yellowish.

*Mistle-leaved Swartzia.* Shrub 6 feet.

9 *S. PINNATA* (Willd. l. c.) leaves with 5 leaflets; petioles terete; leaflets elliptic, acuminate; peduncles rather velvety; racemes twin; petal orbicular, unguiculate, longer than the calyx; stamens numerous. *h. S.* Native of Trinidad. *Ritiera pinnata*, Vahl. eccl. 2. p. 38. Corr. ann. mus. 9. p. 289. t. 24. f. 2. *Possira pinnata*, Poir. suppl. 4. p. 533. Legume elongated, many-seeded. Leaflets 7 inches long. Flowers yellowish.

*Pinnate-leaved Swartzia.* Clt. 1817. Shrub 6 feet.

10 *S. LONGIFOLIA* (D. C. legum. mem. xi. prod. 2. p. 423.) leaves with 5 leaflets; petioles terete; leaflets elliptic-oblong, acuminate, shining; racemes panicle, rather velvety, a little longer than the petioles; petal orbicular; stamens 10. *h. S.* Native of Cayenne. Calyx bipartite, with the lobes reflexed. Petals 3, particularly with a roundish vexillum and 2 wings. Ovary clothed with hoary, adpressed down. Leaflets 7-8 inches long. Perhaps a true species of *Swartzia*.

*Long-leaved Swartzia.* Shrub 6 to 12 feet.

11 *S. BRACHYSTACHYA* (D. C. legum. mem. xi.) leaves with 5-7 leaflets, and are as well as the branchlets glabrous; petioles terete; leaflets elliptic, acuminate; peduncles smoothish, 5-9-flowered; petal ovate-orbicular, longer than the calyx. *h. S.* Native of Cayenne. Flowers polyandrous. Stamens about 40, nearly equal in length. Leaflets 3 inches long.

*Short-spiked Swartzia.* Shrub 6 to 10 feet.

12 *S. TOMENTOSA* (D. C. legum. mem. xi. t. 59.) leaves with 5-7 leaflets; petioles terete, and are as well as the branchlets velvety; leaflets oval-oblong, acuminate, velvety beneath; stipulas nearly orbicular. *h. S.* Native of Cayenne, on the banks of rivers, where it is called *Bois pagaie blanc*. *Robinia Panacæo*, Aubl. guian. 2. p. 769. t. 307. *Robinia tomentosa*, Willd. spec. 3. p. 1134. Racemes rising beneath the leaves along the branches. Flowers red. The wood is white, and very useful. *Anacoco* is the Guiana name of the tree.

*Tomentose Swartzia.* Tree 60 feet.

13 *S. FLEMINGII* (Raddi, mem. pl. bras. add. p. 18.) leaves

pinnate; petioles terete; leaflets oblong, hairy beneath; flowers spicate; petal pilose beneath. *h. S.* Native of Brazil. Flowers white, rising in branches, furnished with orbicular leaves. Ovary covered with silky tomentum.

*Flemingia-like Swartzia.* Tree 60 feet.

14 *S. LANGSDORFII* (Raddi, l. c. p. 17.) leaves pinnate; petioles margined; leaflets ovate, acute, glabrous, reticulated with veins; racemes 5-6-flowered. *h. S.* Native of Brazil. Flowers white, rising like those of the preceding.

*Langsdorf's Swartzia.* Tree 60 feet.

15 *S. POLYPHYLLA* (D. C. legum. mem. xi. prod. 2. p. 424.) leaves with 9-11 leaflets; petioles terete, wingless; leaflets ovate, acuminate, glabrous; racemes usually 3-together, slender, somewhat spike-formed; petal roundish. *h. S.* Native of Cayenne. Ovary glabrous, stipitate. From the petal falling off very soon the plant is easily confounded with the next section.

*Many-leafletted Swartzia.* Tree 20 feet.

SECT. II. *TOUNATEA* (*Tounou* is the Guiana name of *S. alata*). Aubl. guian. 1. p. 550. t. 218. D. C. prod. 2. p. 424.—*Swartzia*, Schreb. gen. no. 1227.—*Gynanthistrophe*, Poit. in herb. Deless. Flowers apetalous. Legume hooked at the apex.

16 *S. ALATA* (Willd. spec. 2. p. 1220.) leaves pinnate, with 5 leaflets; petioles margined; leaflets oval-oblong, acute, rather velvety beneath; racemes many-flowered, spike-formed. *h. S.* Native of Guiana, in woods. *Tounatea Guianensis*, Aubl. l. c. Ovary hairy, attenuated at the base, containing 4 or 5 ovula, crowned by a short, hooked stigma. Flowers small, green.

*Winged-petioled Swartzia.* Tree 20 feet.

17 *S. APETALA* (Raddi, l. c. p. 19.) leaves pinnate; leaflets ovate-lanceolate, acuminate, glabrous; spikes 20-30-flowered; flowers apetalous. *h. S.* Native of Brazil.

*Apetalous Swartzia.* Tree 25 feet.

*Cult.* Sandy loam and peat is the best mixture for the species of this genus; and cuttings, not deprived of any of their leaves, will root if planted in a pot of sand, with a hand-glass placed over them, in heat.

CCXX. *BAPHIA* (from βαφή, *baphe*, a dye; the tree produces the cam-wood of commerce). Afz. ex Lodd. bot. cab. 4. p. 367. D. C. prod. 2. p. 424.

LIN. SYST. *Decandria, Monogynia*. Calyx calyptriform, inclosing the corolla, bursting under the carina, and erect under the vexillum, at length falling off altogether. Corolla with a roundish spreading vexillum, linear wings, which are about the length of the vexillum, and an acute carina. Stamens 10, distinct. Legume falciform. Seeds 6, lenticular.—A tree with impari-pinnate leaves. Leaflets 5, oval-oblong, acuminate, shining. Pedicels 2-3-together, 1-flowered, axillary. Flowers white or yellow.

1 *B. NITIDA* (Lodd. l. c.). *h. S.* Native of Sierra Leone. The wood is used for dyeing under the name of cam-wood. It is brought from Sierra Leone to this country.

*Shining-leaved Cam-wood.* Fl. Ju. Nov. Clt. 1793. Tr. 50 ft.

*Cult.* See *Swartzia* for culture and propagation.

CCXXI. *ZOLLERNIA* (dedicated to Frederick William III. King of Prussia, as we presume from his being descended from the princes of Hohen Zollern). Max. et Nees. in nov. act. bon. 13. p. 1. t. 2 and 3.

LIN. SYST. *Enneandria, Monogynia*. Calyx entire, cleft laterally (f. 52. a.), reflexed. Petals 5, nearly equal (f. 52. c.). Stamens 9-13 (f. 52. d.), hypogynous; anthers erect, linear (f. 52. d.), acuminate, all complete, or 2 a little smaller than the others. Legume (f. 52. h.), stipitate, 1-celled, 2-valved, few-seeded. Seeds exalburginous. Embryo with the radicle unci-

nately inflexed.—Unarmed trees or shrubs, with simple stipulate leaves, and axillary or terminal, many-flowered racemes, bibracteolate pedicels and yellow flowers.

1 *Z. SPLENDENS* (Max. et Nees. l. c. p. 15. t. C.) stipulas nearly orbicular; leaves ovate-oblong, glabrous. *h. S.* Native of Brazil. Flowers large, yellow.

*Splendid Zollernia.* Shrub 10 to 15 feet.

2 *Z. FALCATA* (Max. et Nees. l. c. p. 16. t. D.) stipulas falcate; leaves oblong, acute at the base, attenuated at the apex and bluntish, glabrous. *h. S.* Native of Brazil, on the banks of the river Paraíba. *Kraméria glabra*, Spreng. *neue entd.* 2. p. 157. Flowers yellow, smaller than those of the first species. (f. 52.)

*Falcate-stipuled Zollernia.* Tree 20 feet.

*Cult.* See *Swartzia* for culture and propagation, p. 380.

FIG. 52.

DIVISION II. RECTEMERIE (from *rectus*, straight, and *embryo*, an embryo; in reference to the radicle and cotyledons being straight). Radicle and cotyledons straight. (f. 21. i. k. l m.)

### Suborder III. or Tribe VIII.

MIMOSEÆ (plants agreeing with *Mimosa* in important characters). Embryo straight (f. 21. m.), sometimes with the radicle bending a little to the cotyledons. Flowers regular (f. 53. a.), usually polygamous (f. 53. b.), rarely all hermaphrodite (f. 54. b.). Sepals 4-5, valvate in aestivation, usually connected together at the base, the calyx is therefore 4-5-toothed (f. 54. a.). Petals 4-5, equal (f. 53. a.), also valvate in aestivation, usually hypogynous, rarely inserted in the bottom of the calyx, sometimes more or less connected together into a monopetalous corolla. Stamens inserted with the petals, free (f. 53. b. f. 54. b.), or monadelphous, equal in number to the petals or multiple that number (f. 53. b.). Embryo straight (f. 21. m.), with a hardly evident plumule. Umbilical funicle usually twisted. Leaves abruptly pinnate or abruptly bipinnate. Cotyledons in all, except *Entada*, and perhaps some species of *Inga*, foliaceous and exserted.

CCXXII. ENTADA (the Malabar name of one of the species). Adans. fam. 2. p. 319. Rich. herb. D. C. mem. legum. xii. prod. 2. p. 424.—*Gigalobium*, P. Browne, jam. 362.

LIN. SYST. *Polygamia, Monœcia*. Flowers polygamous. Petals 5, distinct. Stamens 10-25. Anthers glandular at the apex. Legume compressed, evidently articulated; the valves usually separating into 2 membranes at maturity. Joints of legume 1-seeded, with the ribs permanent. Seeds thick. Cotyledons fleshy, remaining unchanged and inclosed within the spermatem in germination.—Shrubs with climbing, unarmed stems, bipinnate or conjugately bipinnate leaves, usually with the rachis terminating in a tendril. Flowers white, innumerable, with many abortions, disposed in dense spikes. Legume glabrous, unarmed, very large.

1 *E. GIGALOBIMUM* (D. C. legum. mem. xii. prod. 2. p. 424.) leaves bipinnate, ending in a tendril, with 1-2 pairs of pinnae, and 2-4 pairs of oblong, emarginate, glabrous leaflets; spikes of flowers axillary; stamens 20-25. *h. S.* Native of the West Indies, climbing over trees and forming arbores. *Mimosa scandens*, Swartz, obs. 389. Lun. hort. jam. 1. p. 137. *M. scandens Americana*, Lin. and most other authors. Legume

6-8 feet long, coriaceous, with the sutures very thick. Seeds nearly orbicular, 2 inches in diameter. The shrub is called *Cacoon* in the West Indies.

*Giant-podded Entada.* Clt. 1819. Shrub cl.

2 *E. PURSATHA* (D. C. legum. mem. xii. prod. 2. p. 425.) leaves bipinnate, ending in a tendril, with 1-2 pairs of pinnae and 2-4 pairs of ovate, emarginate, glabrous leaflets on each pinna; spikes of flowers axillary; stamens 10. *h. S.* Native of the Moluccas on the sea-shore, Malabar, and the Mauritius.—Rheed. mal. 8. t. 32, 33, 34.—Rumph. amb. 5. t. 4. Pursætha, Lin. fl. zeyl. 614. Burm. ind. 222. *Mimosa scandens*, Roxb. hort. beng. p. 40. *M. scandens Indica* of authors. Legume like that of *E. gigalobium*. This species is classed among the emetics in Java.

*Pursætha Entada.* Clt. 1780. Shrub cl.

3 *E. MONOSTACHYA* (D. C. legum. mem. xii. prod. 2. p. 425.) leaves bipinnate, terminated by a tendril, having 1 or 2 pairs of pinnae, and with 4 or 5 pairs of oblong-obovate, emarginate, glabrous leaflets on each pinna; spikes of flowers solitary. *h. S.* Native of Malabar. *E. Rheedii*, Spreng. syst. 2. p. 325. Spikes elongated, simple, and axillary, according to Rheedé's figure. Flowers decandrous. *Entada*, Rheed. mal. 9. t. 77. *Mimosa Entada*, Willd. spec. 4. p. 1041. Legume unknown.

*One-spiked Entada.* Clt. 1800. Shrub cl.

4 *E. POLYSTACHYA* (D. C. legum. mem. xii. t. 61 and 62. prod. 2. p. 425.) leaves bipinnate, at length ending in a tendril, with 2-3 pairs of pinnae, and with 7 pairs of oval, emarginate, glabrous leaflets on each pinna; spikes of flowers numerous, in fascicles. *h. S.* Native of Guiana, Martinico, and Guadaloupe. *Mimosa polystachya*, Lin. spec. 520. Jacq. amer. p. 265. t. 183. f. 93. *M. bipinnata*, Aubl. guian. 2. p. 946. *E. Parrana*, Spreng. syst. 2. p. 325. Legume a foot long, compressed, membranous. Seeds oval, 6 lines long. Flowers apetalous, ex Jacq. but 5-petalled in the specimen. The plant climbs up trees, and often destroys them.

*Many-spiked Entada.* Clt. 1816. Shrub cl.

5 *E. CHILIANTHA* (D. C. l. c.) leaves bipinnate, with 3-4 pairs of pinnae, and 7-8 pairs of linear, oblong leaflets on each pinna, which are pubescent beneath; spikes twin, terminal on the branches. *h. S.* Native of Guiana, in humid places. *Mimosa chiliantha*, Meyer, prim. esseq. 163.—Plum. ed. Burm. t. 12. Flowers decandrous.

*Lip-flowered Entada.* Shrub cl.

6 *E. ADENANTHERA* (D. C. l. c.) leaves with 2 pairs of pinnae: leaflets ovate, oblique, glabrous; tendrils terminal. *h. S.* Native of the Island of Mallicocco. *Adenanthera scandens*, Forst. prod. no. 117. This plant, from its habit, is related to the present genus.

*Adenanthera-like Entada.* Shrub cl.

*Cult.* See shrubby species of *Mimosa* for culture and propagation, p. 387.

CCXXIII. MIMOSA (from *μυμιος*, *mimos*, a mimic; the leaves of many of the species, particularly in sensitive plants, mimic animal sensibility). Adans. fam. 2. p. 319. Gartin. fruct. 2. p. 344. Willd. spec. 4. p. 1028. D. C. prod. 2. p. 425.—*Mimosa* species of Lin.

LIN. SYST. *Polygamia, Monœcia*. Flowers polygamous. Petals 4-5, connected together into a 4-5-cleft, funnel-shaped corolla. Stamens inserted in the base of the corolla, or in the stipe of the ovary, equal in number to the lobes of the corolla, or double or triple that number, particularly from 4 to 15 in number. Legume compressed, flat, 1 or many-jointed; joints 1-seeded; ribs permanent. Stipulas petiolar. Leaves bipinnate, with 1 or more pairs of pinnae, each pinna bearing 2 or many pairs of leaflets. Flowers rose-coloured or white, disposed in

heads. Leaves usually sensible to the touch, as in the common sensitive plant.

SECT. I. *EUMIMOSA* (from *eu*, well, and *Mimosa*; genuine species). D. C. legum. mem. xii. prod. 2. p. 425. Legumes compressed, moniliform, particularly with the ribs contracted at the articulations. Flowers rose-coloured.

§ 1. *Sensitiveæ*. Leaves with 1 pair of pinnæ, and with 2 pairs of leaflets on each pinna, the inner pair smaller than the outer pair. Stamens 4, rarely 5. Leaves in most of the species sensible to the touch.

1 *M. DE'BILIS* (Humb. et Bonpl. in Willd. spec. 4. p. 1029.) stem herbaceous, simple, rather prickly, glabrous, unarmed at the base of the petioles, but hairy; leaflets obovate, mucronate, clothed on both surfaces with adpressed pubescence; heads of flowers elliptic, solitary. ☉. S. Native of South America, near Caripe. H. B. et Kunth, nov. gen. amer. 6. p. 248. Flowers rose-coloured. Pods unknown.

*Weak Sensitive-plant*. Pl. 1 to 2 feet.

2 *M. ALBIDA* (Humb. et Bonpl. in Willd. spec. 4. p. 1030.) branches clothed with canescent pubescence, prickly; leaflets dimidiately-oblong, acute, pubescent; petioles unarmed; heads of flowers twin. ♀. S. Native of Peru, near Moche, in sand by the sea-side. A creeping shrub, very nearly allied to *M. sensitiva*. Legume hispid, 4-celled, hardly constricted between the seeds. Flowers rose-coloured. Kunth, min. p. 2. t. 1.

*Whitish Sensitive-plant*. Shrub creeping.

3 *M. SENSITIVA* (Lin. spec. 1501.) stem and petioles prickly; leaflets ovate, acute, clothed with adpressed pili beneath, but glabrous above. ♀. S. Native of Brazil. Flowers rose-coloured and tetrandrous, as in the preceding species, however, Linnaeus's plant is said to have pentandrous flowers. Trew. chr. t. 95. Ker. bot. reg. 25. Lindl. bot. reg. Flowers purple. Leaflets broad, but not so sensible to the touch as those of *M. pudica*.

*Sensitive-plant*. Fl. April, Sept. Clt. 1618. Sh. 3 to 6 ft.

4 *M. OBTUSIFOLIA* (Willd. enum. p. 1047.) stem and petioles prickly; leaflets dimidiately cordate, ovate, obtuse, glabrous. ♀. S. Native of Brazil. Flowers red. Very like *M. sensitiva*, but more prickly and glabrous.

*Blunt-leafletted Sensitive-plant*. Fl. June, July. Clt. 1816. Shrub 2 to 4 feet.

5 *M. STRIGOSA* (Willd. spec. 4. p. 1030.) branchlets and petioles beset with stiff hairs and prickles; leaflets rather dimidiate, ovate-oblong, acute, strigose on both surfaces; heads of flowers usually solitary. ♀. S. Native of South America, at the Orinoco and of Mexico. H. B. et Kunth, nov. gen. amer. 6. p. 248. Flowers purple. Perhaps the same as *M. strigosa* of Pers. ench. 2. p. 263.

*Strigose Sensitive-plant*. Fl. June, Jul. Clt. 1818. Sh. 1 ft.

6 *M. ADHÆRENS* (H. B. et Kunth, nov. gen. amer. 6. p. 249.) branches hairy and prickly; petioles villous, unarmed; leaflets dimidiately-obovate, mucronate, clothed above with adpressed pili, and with silky and somewhat strigose hairs beneath; heads of flowers solitary. ♀. S. Native of South America, at the Orinoco. Flowers red. Legume unknown.

*Adhering Sensitive-plant*. Shrub 3 to 4 feet.

7 *M. FLORIBUNDA* (H. B. et Kunth, nov. gen. amer. 6. p. 250.) branches and petioles pubescently-pilose and very prickly; leaflets 2-pairs, somewhat dimidiately ovate, acute, clothed with strigose hairs beneath, but glabrous above; heads of flowers twin or tern. ♀. S. Native of South America, near Cumana, and of Mexico, near Jalapa. Flowers red.

*Var. β, Willdenowii* (D. C. prod. 2. p. 426.) heads of flowers disposed in a terminal panicle. *M. floribunda*, Willd. spec. 4. p. 1031. *M. Willdenowii*, Poir. suppl. 1. p. 50.

*Bundle-flowered Sensitive-plant*. Fl. June, July. Clt. 1824. Shrub 1 to 1½ foot.

§ 2. *Pudicæ* (*pudicus*, chaste; in reference to the sensitive qualities of the leaves). Leaves with 1 or more pairs of pinnæ; when the last is the case, they are disposed in a digitate manner at the top of the common petiole, each pinna bearing many pairs of leaflets, which are about equal in size and shape. Stamens 4, rarely 5. Leaves usually sensible to the touch.

8 *M. PISTACIÆFOLIA* (Willd. spec. 4. p. 1028.) unarmed; leaves with 1 pair of pinnæ, each pinna bearing 3 pairs of elliptic, obtuse leaflets, with a gland between the terminal pair. ♀. S. Native of Caraccas. Flowers red. Legume linear, sinuated, 6-7 inches long. Perhaps belonging to a different division of the genus.

*Pistachio-leaved Humble-plant*. Tree 10 to 15 feet.

9 *M. VIVA* (Lin. spec. 1500.) plant unarmed, herbaceous; leaves with 1 pair of pinnæ, each pinna bearing 4 pairs of roundish leaflets; legume with only one joint. ♀. S. Native of Jamaica, in meadows. Sloan. hist. 2. t. 182. f. 7. Flowers purple.

*Lively Humble-plant*. Fl. July, Aug. Clt. 1739. Pl. 1 ft.

10 *M. PECTINATA* (Kunth, min. p. 5. t. 2. nov. gen. amer. 6. p. 25.) branches prickly, and beset with stiff villi; leaves conjugately pinnate; common petiole rather shorter than the prickles; leaflets many pairs, approximate, linear, acute, with strigosely ciliated margins. ♀. S. Native of the Andes of Quito, in hot places. Flowers red. Fruit unknown.

*Pectinate-leaved Humble-plant*. Shrub.

11 *M. POLYCARPA* (Kunth, min. p. 8. t. 3. nov. gen. amer. 6. p. 25.) branches prickly, striated, pilose; leaves conjugately pinnate; petioles much longer than the prickles; leaflets many pairs, oblong-linear, acute, glabrous above, but clothed with adpressed pili beneath as well as on the margins. ♀. S. Native of Peru, in sandy places. Heads of flowers solitary. Flowers red. Legumes pilose, with very hispid margins.

*Many-fruited Humble-plant*. Shrub 1 to 2 feet.

12 *M. PUDICA* (Lin. spec. 1501.) stem herbaceous, prickly, with the petioles and peduncles more or less beset with stiff hairs or bristles; leaves somewhat digitately pinnate, with 4 pinnæ, each pinna bearing many pairs of linear leaflets. ☉. S. Native of Brazil. Andr. bot. rep. t. 544. Flowers red. Legumes glabrous in the middle, but with the margins beset with stiff bristles. Superior leaves sometimes the same as the inferior ones. This plant is commonly grown in gardens, under the name of the sensitive plant, the leaves falling on the slightest touch. Sensitive plants were not unknown to the ancients. Theophrastus speaks of the *Αισχυροπύρην*, as growing about Memphis in Egypt, and Pliny of the *Æschynomene*, so called from its contracting the leaves at the approach of the hand. It is thus characterized in the flowery poetry of Darwin:

"Weak with nice sense the chaste *Mimosa* stands,  
From each rude touch withdraws her timid hands;  
Oft as light clouds o'erpass the summer glade,  
Alarm'd she trembles at the moving shade,  
And feels alive through all her tender form  
The whisper'd murmurs of the gathering storm;  
Shuts her sweet eye-lids to approaching night,  
And hails with freshen'd charms the rising light."

The cause of the well-known motion of the leaves of the sensitive and humble plants has been the subject of many ingenious explanations; but it has not been treated by any botanist with so much ingenuity as by Dr. Dutrochet, whose theory we give as explained in the Botanical Register.

M. Dutrochet states, that having ascertained hot nitric acid to possess the power of separating and reducing to its simplest

form the whole mass of vegetable tissue, and that the same acid produced other effects equally advantageous for the examination of the most obscure parts of vegetable structure, he was induced to give his attention to that of *Mimosa pudica*, in the hope of gaining some evidence respecting the cause to which its sensibility is to be ascribed. Beginning with the pith he observed a considerable number of minute globules, of a greenish colour, intermingled among the cells, and adhering to them in an irregular manner. After attempting to show the probability of these globules having deceived Mirble in various points of his analysis of vegetation, and especially in regard to the pores, which that botanist supposes to exist in the cellular tissue of plants, Dr. Dutrochet proceeds to remark, that the application of hot nitric acid to these globules renders them perfectly opaque, whence he concludes that they are in fact minute cells, filled with a particular fluid which is subject to become concrete by the application of acids. Now it is known that such fluids as are thus altered by acids are usually dissolved and liquefied again by the application of alkalis. A few drops, therefore, of a solution of hydrate of potass were suffered to fall upon a portion of the pith on which nitric acid had been acting, and the mixture was exposed to the heat of a lamp. Being examined after a few minutes, the globules were found to have resumed their natural appearance. This curious fact indicated, in the opinion of Dutrochet, a strong and unexpected point of analogy between plants and animals. According to the microscopical researches of some modern observers, it has been ascertained that all the organs of animals are composed of a conglomeration of minute corpuscles, similar to those just described; the corpuscles which constitute the muscles are soluble in acids, but those which compose the nervous system are insoluble in the same acids, and only soluble in alkalis. Now, as the chemical properties and external appearance of the particles scattered among the cellular tissue of plants, and constituting the nervous system of animals, are the same, the author is induced to infer, that the spherical particles of plants are in fact the scattered elements of their nervous system. This hypothesis receives additional strength from the great similarity which exists between the medullary substance of the brain of *Mollusca gasteropoda* and the cellular medullary tissue of plants. In pursuit of this idea, Dr. Dutrochet made a variety of experiments upon the sensitive plant, the results of which seem to be these:—The principal point of locomotion or of mobility exists in the little swelling which is situated at the base of the common and partial petioles of the leaves; this swelling is composed of a very delicate cellular tissue, in which is found an immense number of nervous corpuscles; the axis of the swelling is formed of a little fascicle of tubular vessels. It was ascertained by some delicate experiments, that the power of movement, or of contraction and expansion, exists in the parenchyma and cellular tissue of the swelling, and that the central fibres have no specific action connected with the motion. It also appeared that the energy of the nervous powers of the leaf depended wholly upon an abundance of sap, and that a diminution of that fluid occasioned an extreme diminution of the sensibility of the leaves. Prosecuting his remarks still further, the author ascertained that in the motion of the sensitive plant two distinct motions take place, the one of locomotion, which is the consequence of direct violence offered to the leaves, and which occurs in the swellings already spoken of; the other is nervimotion, which depends upon some stimulus applied to the surface of the leaflets, unaccompanied by actual violence, such as the solar rays concentrated in the focus of a lens. As in all cases the bending or folding of the leaves evidently takes place from one leaf to another with perfect continuity, it may safely be inferred, that the invisible nervous action takes place in a direct line from the point

of original irritation, and that the cause by which this action of nervimotion is produced must be some internal uninterrupted agency. This was, after much curious investigation, determined by the author to exist neither in the pith nor in the bark, nor even in the cellular tissue filled with nervous corpuscles, and on which he supposes the locomotion of the swelling at the base of the petioles to depend. It is in the ligneous part of the central system in certain tubes supplied with nervous corpuscles, and serving for the transmission of sap, that Dr. Dutrochet believes he has found the true seat of nervimotion, which he attributes to the agency of the sap alone, while he considers the power of locomotion to depend upon the nervous corpuscles alone.

*Var. β, glabrata* (D. C. prod. 2. p. 426.) stem glabrous. Native of St. Domingo and St. Thomas. Plum. ed. Burm. t. 202.

*Var. γ, tetrandra* (Willd. spec. 4. p. 1032.) leaflets clothed with adpressed pili beneath. *M. pudica*, H. B. et Kunth, nov. gen. amer. 6. p. 252.

*Chaste or Common Humble-plant.* Fl. April, Sept. Clt. 1638. Pl. 1 foot.

13 *M. hispida* (H. B. et Kunth, nov. gen. amer. 6. p. 252.) stems prickly, and densely beset with stiff hairs; leaves somewhat digitately pinnate, with 4 pinnae; leaflets linear, acute, ciliated, glabrous; heads of flowers usually twin; legumes very hispid. *h. S.* Native of South America, near Santa Barbara. Very nearly allied to *M. pudica*. Flowers red.

*Hispid Humble-plant.* Fl. May, Sept. Clt. 1820. Sh. 1 to 2 ft.

14 *M. pedunculata* (Willd. spec. 4. p. 1032.) stem shrubby, prickly, glabrous; leaves somewhat digitately pinnate, with 4 pinnae, each pinna bearing many pairs of linear leaflets; heads of flowers elliptic. *h. S.* Native of Brazil, about Bahia. Flowers red.

*Blushing Humble-plant.* Fl. Ju. Aug. Clt. 1818. Sh. 1 to 2 ft.

15 *M. tomentosa* (Humb. et Bonpl. in Willd. spec. 4. p. 1033.) branches unarmed, clothed with silky hairs; leaves somewhat digitately pinnate, with 4 pinnae, each pinna bearing many pairs of oblong-linear leaflets, which are clothed with hoary silky villi beneath. *h. S.* Native of South America, on the banks of the river Orinoco. Kunth, min. p. 11. t. 4. H. B. et Kunth, nov. gen. amer. 6. p. 253. Flowers red. Legumes unknown. The specific name is fallacious.

*Tomentose Humble-plant.* Shrub.

16 *M. hirsuta* (Moe. et Sesse, in herb. Lamb.) prickles stipular, recurved; leaves with only 1 pair of pinnae, each pinna bearing numerous linear, mucronate leaflets; stem hispid as well as the pedicels, petioles, and rachis of leaves; peduncles solitary or twin, axillary, about the length of the petioles; calyx hispid; legumes prickly on the margins, 3-4-jointed. *h. S.* Native of Mexico. Heads of flowers nearly globular, red.

*Hairy Sensitive-plant.* Pl. 1 to 2 feet.

17 *M. tricephala* (Schlecht. et Cham. in Linnæa. 5. p. 591.) leaves with 1 pair of pinnae, each pinna bearing 12 pairs of oblique, ovate-elliptic, mucronate leaflets, which are adpressedly ciliated on the margins, shining and glabrous above, but strigose beneath; petiole short; stipulas small, filiform; branches, rachis of leaves, and peduncles scabrous from stiff hairs; heads tern, on long peduncles, axillary, and forming a loose terminal raceme, which is leafy at the base. *h. S.* Native of Mexico, between Laguna, Verde, and Actopan. Flowers pale red. Legumes unknown.

*Three-headed Mimosa.* Shrub.

18 *M. polydactyla* (Humb. et Bonpl. in Willd. spec. 4. p. 1033.) stems prickly, glabrous, pilose above; leaves somewhat digitately pinnate, with 8 pinnae, each pinna bearing many pairs of linear leaflets. *h. S.* Native of Guiana, and about Demerara, as well as in Maranham. Flowers purple. Heads of flowers twin, ovate, pedunculate.

*Many-fingered Humble-plant.* Fl. June, July. Clt. 1822. Shrub 1 to 2 feet.

§ 3. *Bipinnatæ* (from *bipinnatus*, bipinnate leaves). Leaves bipinnate, with the pinnae distant, not approximate at the top of the common petiole, as in the last division.

\* *Plants prickly.*

19. *M. GEMINATA* (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 427.) stems diffuse, and are as well as the petioles prickly; leaves bipinnate, with 2-3 pairs of pinnae, each pinna bearing 15-20 pairs of leaflets; heads of flowers axillary, twin. 2. S. Native of North America, on the western coast. Heads of flowers almost like those of *M. pulchra*. Flowers red. Legumes unknown.

*Twin-headed Mimosa.* Pl. diffuse.

20. *M. MONTANA* (Kunth, mim. p. 31. t. 10. nov. gen. amer. 6. p. 259.) branches prickly, puberulous; leaves bipinnate, short, unarmed, with 2-3 pairs of pinnae, each pinna bearing 4-6 pairs of elliptic-oblong, puberulous leaflets. 2. S. Native of Peru, on the Andes, near Caxamarca, at the height of 4310 feet above the level of the sea. Heads of flowers solitary or twin, of a very pale rose colour or white. Legume linear, many-jointed, glabrous.

*Mountain Mimosa.* Shrub 1 to 2 feet.

21. *M. HUMILIS* (Humb. et Bonpl. in Willd. spec. 4. p. 1037.) branches prickly, hispid; leaves bipinnate, with 3-4 pairs of pinnae, each pinna bearing 6-13 pairs of linear, acutish leaflets, which are puberulous beneath as well as on the margins; prickles straight, subulate, those on the petioles opposite; heads of flowers solitary. 2. S. Native of Peru. H. B. et Kunth, nov. gen. amer. 6. p. 254. Flowers red. Legume ovate, 2-jointed, beset with bristles.

*Humble Mimosa.* Shrub 1/2 foot.

22. *M. HAMATA* (Willd. spec. 4. p. 1033.) branches, petioles, and peduncles pubescent and prickly; leaves bipinnate, with 4 pairs of pinnae, each pinna bearing 7-8 pairs of leaflets; peduncles longer than the leaves. 2. S. Native of the East Indies. Legume 5-jointed, sinuated, pubescent.

*Hooked Mimosa.* Shrub 2 to 4 feet.

23. *M. SOMNIANS* (Humb. et Bonpl. in Willd. spec. 4. p. 1036.) branches prickly, rather hispid; leaves bipinnate, with 4-5 pairs of pinnae, each pinna bearing many pairs of linear, glabrous leaflets; rachis rather prickly; heads of flowers solitary. 2. S. Native of New Granada, on the Andes. H. B. et Kunth, nov. gen. amer. 6. p. 256. Kunth, mim. p. 20. t. 7. Flowers red. Legume linear, many-jointed, hispid.

*Sleeping Mimosa.* Shrub 2 to 6 feet.

24. *M. PALPITANS* (Humb. et Bonpl. in Willd. spec. 4. p. 1036.) branches prickly, glabrous; leaves bipinnate, with 5-6 pairs of pinnae, each pinna bearing many pairs of linear, glabrous leaflets; rachis setose, and rather prickly; heads of flowers usually twin. 2. S. Native of South America. Flowers red. Legumes linear, 8-12-jointed, rather setose. Perhaps distinct from *M. somnians*.

*Beating Mimosa.* Shrub 2 to 4 feet.

25. *M. INTERMEDIA* (Kunth, mim. p. 16. t. 6. H. B. et Kunth, nov. gen. amer. 6. p. 255.) branches hispid, and are as well as the rachis prickly; leaves bipinnate, with 4-7 pairs of pinnae, each pinna bearing 9-15 pairs of linear, obtuse, glabrous leaflets; heads of flowers usually twin. 2. S. Native of the plains of Caraccas. Flowers red. Legume short, 2-4-jointed, oblique, hispid, with the upper joint broader than the rest.

*Intermediate Mimosa.* Shrub procumbent.

26. *M. SOMNICULOSA* (H. B. et Kunth, nov. gen. amer. 6. p. 257.) branches pilose, and are as well as the rachis prickly; leaves bipinnate, with 10-12 pairs of pinnae, each pinna bearing

many pairs of linear, acutish, glabrous leaflets; heads of flowers solitary. 2. S. Native of South America, within the tropics. Flowers red.

*Sleepy Mimosa.* Shrub.

\* \* *Plants unarmed.*

27. *M. VISCIDA* (Willd. enum. p. 1048.) branches and petioles unarmed; but clothed with clammy glands; leaves bipinnate, with 4 pairs of pinnae, each pinna bearing many pairs of linear, obtuse, glabrous leaflets; heads of flowers globose, solitary. 2. S. Native of Brazil. Flowers red. Legume unknown. Perhaps belonging to a different section.

*Clammy Mimosa.* Clt. 1825. Shrub 2 feet.

28. *M. MICROCEPHALA* (Humb. et Bonpl. in Willd. spec. 4. p. 1039.) branches and petioles unarmed, but clothed with adpressed pili; leaves bipinnate, with 12-14 pairs of pinnae, each pinna bearing many pairs of oblong-linear, obtuse, ciliated leaflets; heads of flowers ovate, twin or tern. 2. S. Native of the banks of the river Orinoco. Kunth, mim. p. 23. t. 8. nov. gen. amer. 6. p. 257. Flowers red. Legume linear, many-jointed, strigose.

*Small-headed Mimosa.* Fl. June, July. Clt. 1820. Shrub 2 to 4 feet.

SECT. II. *HABBA'SIA* (*Hubbas* is the Egyptian name of *M. polyacantha*). D. C. legum. mem. xii. prod. 2. p. 428. Legume compressed, very hispid, with straight parallel margins, never contracted at the articulations; joints few, shorter than broad. In all the species the branches and petioles are prickly; the prickles on the petioles usually opposite. Leaves bipinnate. Flowers white.

29. *M. DORMIENS* (Humb. et Bonpl. in Willd. spec. 4. p. 1035.) branches prickly, and densely clothed with white hairs; leaves bipinnate, with 5-7 pairs of pinnae, each pinna bearing 9-12 pairs of linear, rather falcate, acute leaflets, which are pubescent on both surfaces; prickles opposite, subulate, straight, placed between each pinna, and at their base; heads of flowers solitary. 2. S. Native of South America, in sand on the banks of the river Apures. Flowers white. Legume unknown, but is allied to *M. asperata*.

*Sleeping Mimosa.* Fl. June, July. Clt. 1818. Sh. procumb.

30. *M. CANESCENS* (Willd. spec. 4. p. 1038.) leaves bipinnate, with 8-10 pairs of pinnae, each pinna bearing many pairs of leaflets, which are covered with hoary strigæ; cauline prickles hooked, those on the petioles remote. 2. S. Native of Guinea. Flowers white. Branches, petioles, and peduncles beset with stiff pubescence.

*Canescent Mimosa.* Fl. June, July. Clt. 1822. Shrub 1 foot.

31. *M. NERVIDA* (Willd. spec. 4. p. 1037.) leaves bipinnate, with 10 pairs of pinnae, each pinna bearing many pairs of 3-nerved leaflets; cauline prickles hooked, petiolar ones wanting. 2. S. Native of Caraccas. Branches, petioles, and peduncles setose. Legume attenuated at both ends, flat, setose, of about 15 joints. Flowers white.

*Hispid Mimosa.* Tree 10 to 20 feet.

32. *M. CILIATA* (Willd. enum. p. 1048.) leaves bipinnate, with 10 pairs of pinnae, each pinna bearing many pairs of ciliated leaflets; prickles straight, opposite, a pair between each pair of pinnae, but solitary at the base of the pinnae. 2. S. Native of Brazil. Branches and petioles hairy. Flowers white. Legumes unknown. Allied to *M. asperata*.

*Ciliated-leafletted Mimosa.* Shrub.

33. *M. PELLITA* (Humb. et Bonpl. in Willd. spec. 4. p. 1037.) leaves bipinnate, with 8-12 pairs of pinnae, each pinna bearing many pairs of leaflets, which are hispid on the margins, as well as on the under surface; cauline prickles straight, as well as those at the base of the pinnae; peduncles twin, 4 times longer than the

heads of the flowers.  $\frac{1}{2}$ . S. Native of South America, near Cumana, and on the banks of the river Magdalena near Nares. Branches and petioles hispid. Legumes rather incurved, and hispid, composed of 21-23 joints. Stamens 10-12 in the specimens collected about Cumana, but only 8 in those collected near Nares, ex Kunth, mim. 27. t. 9. H. B. et Kunth, nov. gen. 6. p. 258.

*Clad Mimosa.* Shrub 3 to 4 feet.

34 *M. POLYACANTHA* (Willd. spec. 4. p. 1034.) leaves bipinnate, with 8-11 pairs of pinnae, and each pinna bearing many pairs of leaflets; prickles on the stem, as well as those between the pinnae, hooked, those at the base of the pinnae straight, and subulate; peduncles 4 times the length of the heads of flowers.

$\frac{1}{2}$ . S. Native of Guinea, Abyssinia, and Upper Egypt. Bruce, trav. 5. t. 7. *M. Habbas*, Delile, ill. fl. ægypt. p. 31. but not of Link. Peduncles and petioles beset with stiff adpressed villi. Perhaps sufficiently distinct from *A. asperata*.

*Many-spined Mimosa.* Shrub 2 to 3 feet.

35 *M. ASPERATA* (Willd. spec. 4. p. 1035.) leaves bipinnate, with 8-12 pairs of pinnae, each pinna bearing many pairs of leaflets, which are clothed with adpressed bristles beneath, as well as on the margins; prickles on the stem, and between the pinnae rather hooked, but those at the base of the pinnae are straight; peduncles usually twin, length of the heads of flowers.  $\frac{1}{2}$ . S. Native of Jamaica, Vera Cruz, and about Demerara. D. C. legum. mem. xii. t. 63. Calyx unequally many-toothed. Leaves falling on the slightest touch.

*Var. a, hirsutior* (D. C. l. c.) *M. asperata*, Lin. spec. 1507. Mill. fig. t. 182. f. 3. Breyn. cent. t. 19.

*Var. b, levior* (D. C. l. c.) *M. pigra*, Lin. amæn. 4. p. 274. —Breyn. cent. t. 20.

*Roughened Mimosa.* Fl. June, July. Clt. 1733. Shrub 3 to 6 feet.

36 *M. SICARIA* (Hoffm. verz. pfl. 1824. p. 221.) leaves bipinnate, with usually 5 pairs of pinnae, each pinna bearing many pairs of linear, rather ciliated leaflets; prickles straight, subulate, those on the stems scattered, between the pinnae opposite, and solitary between the pairs.  $\frac{1}{2}$ . S. Native of Brazil. Perhaps sufficiently distinct from *M. asperata*.

*Sicaria Mimosa.* Shrub 4 to 6 feet.

SECT. III. BATAUCALON (from *batoc*, *batos*, a bramble, and *kav- $\lambda$ oc*, *kaulos*, a stem; stems prickly). D. C. prod. 2. p. 429. Legumes compressed, flat, quite glabrous or hardly pubescent, with parallel ribs, never contracted at the articulations, unarmed or bearing a single row of spines. The leaves of all are bipinnate, and the flowers either white or pale yellow.

37 *M. RUBRICAVILIS* (Lam. diet. 1. p. 20.) branch and petiolar prickles scattered and hooked; leaves bipinnate, and are, as well as the branchlets, clothed with adpressed pubescence, having 4-5 pairs of pinnae, and each pinna bearing 10-12 pairs of oblong-linear leaflets; glands oblong, one situated between each pair of pinnae when young.  $\frac{1}{2}$ . S. Native of the East Indies. *M. octandra*, Roxb. cor. 2. t. 200. *M. Rottleri*, Spreng. syst. 2. p. 206. Heads of flowers yellowish, 3 or 4 rising together from the axils of the upper leaves, which are abortive. Legume compressed, curved, glabrous, obscurely articulated, and furnished with hooked prickles on both sutures, very rarely unarmed.

*Red-stemmed Mimosa.* Fl. June, July. Clt. 1799. Shrub rambling.

38 *M. ? CERATONIA* (Lin. spec. 1508.) branch and petiolar prickles scattered and hooked; leaves bipinnate, and are, as well as the branches, glabrous, with usually 5 pairs of pinnae, each pinna bearing many pairs of obovate leaflets; legumes quite smooth, obscurely articulated, and bearing hooked prickles on the ribs on both sides.  $\frac{1}{2}$ . S. Native of St. Domingo and

Porto-Rico. Plum. ed Burm. 17. t. 8. *Acacia Ceratonia*, Willd. spec. 4. p. 1091. A rambling shrub.

*Ceratonia-like Mimosa.* Shrub 1 to 2 feet.

39 *M. OLIGACANTHA* (D. C. prod. 2. p. 429.) cauline prickles hooked, one under each leaf; leaves bipinnate, unarmed, and are, as well as the branches, glabrous; pinnae 3-4 pairs, and each pinna bearing 3-4 pairs of obovate leaflets; legumes evidently articulated, and hardly aculeated on the ribs.  $\frac{1}{2}$ . S. Native of St. Martha. Prickles of legume straight, subulate, and very few.

*Few-spined Mimosa.* Shrub 3 to 6 feet.

40 *M. CASTA* (Lin. spec. 1500.) branch and petiolar prickles scattered and hooked; leaves bipinnate, with only one pair of pinnae, situated at the top of the petiole, each pinna bearing 4 pairs of obliquely-ovate acute leaflets, which are rough from adpressed strigæ, and ciliated; legumes oval-oblong, with the disks glabrous, but with the sutures very spiny.  $\frac{1}{2}$ . S. Native of South America. Comm. hort. 1. t. 28. The lower flowers of the spikes are barren, but the upper ones are fertile.

*Chaste Mimosa.* Fl. July. Clt. 1741. Shrub.

41 *M. LEOCARPA* (D. C. legum. mem. xii.) prickles on the branches very few and straightish; leaves unarmed, bipinnate, and are, as well as the branches, glabrous, with 12 pairs of pinnae, each pinna bearing many pairs of linear leaflets; legumes unarmed, glabrous, evidently articulated, disposed in racemes.  $\frac{1}{2}$ . S. Native of St. Martha. *Acacia nitans*, Spreng. in herb. Balb. Perhaps belonging to a different division of the genus.

*Smooth-fruited Mimosa.* Shrub.

† *Species uncertain to which genus they belong, or to what section of the genus; they are therefore disposed according to the form of the leaves.*

\* *Leaves simple.*

42 *M. BAUHINIFOLIA* (Salish. prod. p. 324.) leaves simple, 2-lobed, pubescent. —Native country, flowers, and fruit unknown. Perhaps a species of *Bauhinia* or *Hymenæa*.

*Bauhinia-leaved Mimosa.* Shrub.

\* \* *Leaves simply pinnate.*

43 *M. ? PILOSA* (Lour. coch. 650.) unarmed; leaves pinnate, with many pairs of very pilose leaflets; leaflets ovate, obtuse; heads of flowers terminal; legume straight, slender.  $\frac{1}{2}$ . G. Native of Cochinchina, in woods. *M. crinita*, Pers. ench. 2. p. 261. Flowers white, disposed in large heads, polyandrous. Perhaps a species of *Unga*.

*Pilose Mimosa.* Shrub 4 feet.

44 *M. FERA* (Lour. coch. p. 652.) prickles scattered, branched; leaves impari-pinnate; leaflets 5 pairs, oblong-ovate, emarginate; spikes of flowers lateral; corolla 5-cleft, decandrous; legumes curved, flat, many-seeded.  $\frac{1}{2}$ . S. Native of Cochinchina and China, where it is planted for hedges, which are impenetrable to animals. From the branched spines we should judge this tree to be a species of *Gleditschia*.

*Fierce Mimosa.* Tree 50 feet.

\* \* \* *Leaves with one pair of pinnae.*

45 *M. STAMINEA* (Billb. pl. bras. in flora. 1821. p. 332.) unarmed; leaves with one pair of pinnae, each pinna bearing about 25 pairs of leaflets; heads of flowers globose, axillary, pedunculate; stamens very long.  $\frac{1}{2}$ . S. Native of Brazil.

*Long-stamened Mimosa.* Shrub or tree.

46 *M. CASCABELLO* (Coll. hort. ripul. 91.) unarmed; leaves with one pair of pinnae, each pinna bearing 2-3 pairs of elliptic, acutish, glabrous leaflets, with an adpressed gland between the outer pair of leaflets.  $\frac{1}{2}$ . S. Native country unknown, as well as the flowers and fruit. Said to be allied to *M. pistaciæfolia*.

*Cascabelillo Mimosa.* Shrub 3 to 4 feet.

47 *M. HIRSU'TA* (Spreng. syst. 2. p. 204.) unarmed; stipules linear; leaves with one pair of pinnae, each pinna bearing 12 pairs of oval, marginated, ciliated leaflets; common petiole hairy.  $\frac{1}{2}$  S. Native of Monte Video.

*Hairy Mimosa.* Shrub or tree.

48 *M. SPRENGERII* (D. C. prod. 2. p. 430.) prickles scattered, horizontal; branches strigose, adpressed downwards; leaves with 1 pair of pinnae, each pinna bearing 6 pairs of obliquely ovate-oblong, nerved leaflets, ciliated at the base; flowers axillary, sessile, pentandrous.  $\frac{1}{2}$  S. Native of Monte Video. *M. ciliata*, Spreng. syst. 2. p. 204. but not of Willd.

*Sprengel's Mimosa.* Shrub or tree.

\*\*\*\* *Leaves pinnate and bipinnate.*

49 *M. COCHILIOCARPA* (Gomes. obs. pl. bras. p. 30. t. 4. f. 3.) unarmed; leaves doubly and abruptly-pinnate, with 3 pairs of pinnae, and 3 pairs of leaflets; heads of flowers solitary; legumes compressed, spiral.  $\frac{1}{2}$  S. Native of Brazil, near Rio Janeiro. Abaremotema, Pis. bras. 77. Leaflets ovate-lanceolate, 3 or 4 pairs on each pinna, and 3 pairs of pinnae. Stamens 20, monadelphous. Bark chinky, and very astringent.

*Twisted-fruited Mimosa.* Shrub 3 to 6 feet.

\*\*\*\*\* *Leaves bipinnate.*

† *Unarmed shrubs or trees.*

50 *M. ? CORNICULATA* (Lour. coch. 651.) unarmed; leaves bipinnate; leaflets usually 8 pairs; petiole prickly at the base, and propped by a recurved callous horn; panicle terminal, subcorymbose.  $\frac{1}{2}$  G. Native of China, in the suburbs of Canton. Flowers white, 4-cleft, polyandrous and monadelphous. Perhaps a species of *Acacia*. Loureiro did not see any hermaphrodite flowers.

*Horned-petioled Mimosa.* Tree 20 feet.

51 *M. BALSAMICA* (Mol. chil. ed. gall. 338.) unarmed; leaves bipinnate; pinnae 6 pairs; leaflets somewhat denticulated; flowers octandrous.  $\frac{1}{2}$  S. Native of Chili.

*Balsam Mimosa.* Shrub or tree.

52 *M. TERMINALIS* (Salisb. prod. 325.) leaves bipinnate; petioles acutely angled above; leaflets unequal-sided, ovate-lanceolate, mucronulate, coriaceous.  $\frac{1}{2}$  G. Native about Port Jackson, in New South Wales.

*Terminal Mimosa.* Tree.

53 *M. AGGREGATA* (Pers. ench. 2. p. 263.) leaves bipinnate; leaflets distant, pilose beneath, as well as the petioles; peduncles numerous, aggregate in the axils of the leaves.  $\frac{1}{2}$  S. Native of the East Indies. Perhaps a species of *Acacia*.

*Aggregate-peduncled Mimosa.* Tree.

54 *M. RHOMBIFOLIA* (Pers. ench. 2. p. 263.) leaves bipinnate; leaflets large, rhomboid; flowers disposed in spikes.  $\frac{1}{2}$  S. Native of Trinidad. Perhaps a species of *Acacia*.

*Rhomb-leafletted Mimosa.* Tree.

55 *M. ? TORTILIS* (Forsk. descrip. p. 176.) leaves bipinnate, with 5 pairs of pinnae, the outer pair furnished with a scale between, each pinna bearing 7-9 pairs of oblong, very short leaflets; legumes twisted, glomerated.  $\frac{1}{2}$  G. Native of Arabia, near Hares. Flowers white, disposed in heads. Perhaps a species of *Acacia*.

*Twisted-podded Mimosa.* Tree.

56 *M. ? GLOMERATA* (Forsk. descrip. 177.) leaves bipinnate; legumes black, twisted, glomerated.  $\frac{1}{2}$  S. Native of Arabia.

*Glomerate-podded Mimosa.* Shrub.

57 *M. ? FLAVA* (Forsk. descrip. 176.) leaves bipinnate, with 3-5 pairs of pinnae, each pinna bearing 7-10 pairs of linear ob-

tuse leaflets, destitute of any glands.  $\frac{1}{2}$  G. Native of Arabia. Flowers pale yellow.

*Yellow-flowered Mimosa.* Shrub.

†† *Armed shrubs or trees.*

58 *M. LUTEA* (Mill. dict. no. 17.) prickles very long; leaves bipinnate, glabrous; flowers globose, pedunculate.  $\frac{1}{2}$  S. Native of South America. Flowers yellow.

*Yellow Mimosa.* Tree.

59 *M. TRINE'RVIS* (Desf. cat. hort. par. 180. Pers. ench. 2. p. 266.) glabrous; rameal and petiolar prickles scattered, and rather hooked; leaves bipinnate, with 3-4 pairs of pinnae, each pinna bearing 8-10 pairs of oval-rhomboid, mucronulate, veiny leaflets, which are 3-nerved at the base; there is a gland at the base of the petiole, and one between each of the two extreme pairs of pinnae.  $\frac{1}{2}$  S. Native country unknown, as well as the legumes and flowers. *Acacia trine'rvis*, Desv. journ. bot. 1814. 1. p. 70. Perhaps the figure in Breyn. cent. 1. t. 17. appertains to this plant, and therefore it is the same as *M. longisiliqua* of Lam. dict. 1. p. 21. The species appears to be intermediate between the sections *Habbasia* and *Balancaulon* of the present genus.

*Three-nerved-leafletted Mimosa.* Tree?

60 *M. ? ANGULATA* (Spreng. neue entd. 2. p. 158.) prickles on the angles of the branches scattered, and bent backwards; leaves bipinnate, with 12 pairs of pinnae, each pinna bearing many pairs of linear ciliated leaflets; petioles unarmed, and are, as well as the branches, very villous, and bearing glands between the pairs of pinnae; panicle branched.  $\frac{1}{2}$  S. Native of Brazil. Legume unknown. Said to be allied to *M. rubicaulis*.

*Angular-branched Mimosa.* Shrub or tree.

61 *M. RUGATA* (Lam. dict. 1. p. 20.) prickles scattered, short, hooked; leaves bipinnate, with 7-8 pairs of pinnae, each pinna bearing 13-15 pairs of linear leaflets; there is a sessile gland at the base of the petiole; legumes complanate, sinuated, plicate, wrinkled, mucronate.  $\frac{1}{2}$  S. Native of the East Indies. Legumes 5 inches long, and one inch broad. Flowers unknown.

*Wrinkled Mimosa.* Tree.

62 *M. LATISPINO'SA* (Lam. dict. 1. p. 22.) spines petiolar, scattered, very broad, compressed, straight; leaves bipinnate, at length becoming glabrous, glandless, with 12-20 pairs of unarmed pinnae, each pinna bearing 10-15 pairs of elliptic-oblong leaflets.  $\frac{1}{2}$  S. Native of Madagascar. Petioles, branches, and under side of leaves pubescent. Flowers and fruit unknown.

*Broad-spined Mimosa.* Clt. 1823. Shrub.

63 *M. ? SINUATA* (Lour. coch. 653.) shrub climbing and prickly; leaves bipinnate, with many pairs of pinnae, as well as leaflets; leaflets small, linear; heads of flowers axillary, solitary, small, on long peduncles; legumes compressed, sinuated.  $\frac{1}{2}$  G. Native of Cochinchina, in woods. Perhaps a species of *Entada*. Corolla wanting.

*Sinuated-podded Mimosa.* Shrub cl.

64 *M. ? SEMISPINO'SA* (Lin. spec. 1508.) prickles crowded at the tops of the internodes; leaves bipinnate.  $\frac{1}{2}$  S. Native of South America. The rest unknown.

*Half-spiny Mimosa.* Shrub.

65 *M. ? CAMPECHIANA* (Mill. dict. no. 20.) spinose; leaves bipinnate; leaflets narrow; spines split their whole length.  $\frac{1}{2}$  S. Native about Campeachy. The rest unknown.

*Campeachy Mimosa.* Tree.

66 *M. KANTU'FFA* (Bruce, trav. ed. gall. 8vo. vol. 13. p. 88. t. 36.) rameal, stipular, and petiolar prickles hooked; leaves bipinnate, with 7-8 pairs of pinnae, each pinna bearing about 9 or 10 pairs of oblong obtuse leaflets; spikes of flowers cylindrical; stamens 10, free.  $\frac{1}{2}$  S. Native of Abyssinia. A very prickly bush, with sweet-scented flowers. *Pterolobium*, R. Brown, abyss.

whence the legume is probably winged. Perhaps a species of *Acácia* or *Gagnebina*.

*Kantuffa* Mimosa. Shrub 6 feet.

67 *M. ? AGRESTIS* (Sieb. in Spreng. syst. 2. p. 206.) prickles on the branches horizontal and straight; branches hoary; leaves bipinnate, with 6 pairs of pinnae, each pinna bearing about 16 pairs of pubescent leaflets; racemes spicate, exceeding the leaves.  $\frac{1}{2}$ . G. Native of Palestine. Perhaps the same as *M. arvensis*, Sieb. ex Steud. nom.

*Field* Mimosa. Shrub.

68 *M. ÆMULA* (Spreng. syst. 2. p. 206.) prickles much crowded, straight, and rather flexuous; leaves bipinnate, with 8 pairs of pinnae, each pinna bearing about 12 pairs of roundish leaflets, which are clothed with stellate pubescence, but tomentose beneath; heads of flowers tomentose, hairy.  $\frac{1}{2}$ . S. Native of Brazil.

*Rival* Mimosa. Shrub or tree.

69 *M. ? ARBUSTRENSIS* (Roxb. ex Spreng. syst. 2. p. 206.) prickles on the branches crowded, and a little recurved; branches dotted; branchlets villous; leaves bipinnate, with 8 pairs of pinnae, each pinna bearing many pairs of linear ciliated leaflets; petioles unarmed, pubescent, glandular at the base; heads of flowers panicle.  $\frac{1}{2}$ . S. Native of the East Indies.

*Cleansing* Mimosa. Clt. 1820. Shrub.

70 *M. ? MADAGASCARIENSIS* (Spreng. l. c.) prickles on the branches scattered, and a little reflexed; leaves bipinnate, with 10 pairs of pinnae, each pinna bearing many pairs of minute linear leaflets, which are villous, as well as the branchlets; peduncles lateral, usually twin.  $\frac{1}{2}$ . G. Native of Madagascar.

*Madagascar* Mimosa. Shrub or tree.

71 *M. ? BRASILIENSIS* (Spreng. l. c.) prickles stipular, opposite, erect; petioles hairy, almost unarmed; leaves bipinnate, with many pairs of pinnae, as well as leaflets; leaflets linear, imbricated; heads of flowers shorter than the leaves.  $\frac{1}{2}$ . S. Native of Brazil.

*Brazil* Mimosa. Shrub or tree.

72 *M. FERRUGINEA* (Rottl. in Spreng. l. c.) prickles both of the branches and petioles recurved; petioles and branchlets pubescent; leaves bipinnate, with many pairs of pinnae, as well as leaflets; leaflets linear, dimidiate, imbricated, glabrous; gland oblong, situated at the base of the petiole; heads of flowers panicle, terminal.  $\frac{1}{2}$ . S. Native of the East Indies.

*Rusty* Mimosa. Clt. 1818. Shrub.

73 *M. BARCLAYANA* (Hort.) There is nothing further known of this plant than that it is a native of Madagascar.

*Barclay's* Mimosa. Shrub or tree.

*Cult.* The leaves of most of the species of this genus are sensitive to the touch, and are therefore all worth cultivating for curiosity. They thrive well in a mixture of loam and peat, and young cuttings will root if planted in a pot of sand, with a bell-glass placed over them in heat. Some of the kinds ripen seeds in abundance, by which they are easily increased. The seeds of the annual kinds require to be sown in pots, and the pots placed in a hot-bed, and when the plants rise to the height of 2 or 3 inches they should be potted off separately into small pots, and shifted from size to size of pots as they grow, giving the plants plenty of heat and moisture.

CCXXIV. GAGNEBINA (meaning unknown). Neck. elem. no. 1296. D. C. legum. mem. xii. no. 3. prod. 2. p. 431.

LIN. SYST. *Decándria, Monogýnia*. Flowers hermaphrodite. Calyx 5-toothed. Petals 5, oblong-linear, distinct. Stamens 10. Style long, filiform, deciduous. Legume complanate, dry, indehiscent, with a marginal wing rising from both sutures, transversely many-celled inside; cells 1-seeded.—Elegant, unarmed, glabrous shrubs, natives of the Mauritius and Madagascar. Leaves bi-

pinnate, with many pairs of linear leaflets, which are equal in size and shape, and having a gland at the base of the petiole, and one between each pair of pinnae. Spikes of flowers axillary, cylindrical, yellow. Legumes clothed with white villi when young, but glabrous in the adult state.

1 *G. TAMARISCINA* (D. C. prod. 2. p. 432.) leaves with about 20 pairs of pinnae, each pinna bearing about 30 pairs of leaflets; spikes of flowers crowded at the tops of the branches, disposed in a kind of racemose corymb.  $\frac{1}{2}$ . S. Native of the Mauritius and Madagascar. D. C. legum. mem. xii. t. 64. f. B. *Mimosa tamariscina*, Lam. diet. 1. p. 13. *Acácia tamariscina*, Willd. spec. 4. p. 1062.—Pluk. alm. t. 329. f. 3.

*Tamarix-like* Gagnebina. Clt. 1824. Shrub 6 feet.

2 *G. AXILLARIS* (D. C. prod. 2. p. 432.) leaves with 24 pairs of pinnae, each pinna bearing about 50 pairs of leaflets; spikes of flowers axillary, lower ones solitary, upper ones rising by twos or threes.  $\frac{1}{2}$ . S. Native along with the preceding species. D. C. legum. mem. xii. t. 64. f. A. *M. pterocarpa*, Lam. diet. 1. p. 13. Vahl. symb. 3. p. 103.

*Axillary-spiked* Gagnebina. Clt. 1824. Shrub 6 feet.

*Cult.* See *Mimosa* for culture and propagation.

CCXXV. INGA (the South American name of *I. vera*, adopted by Marcgraff). Plum. gen. 13. t. 25. Willd. spec. 4. p. 104. Kunth, min. p. 35. D. C. legum. mem. xii. —Amòsa, Neck. elem. no. 1298.

LIN. SYST. *Polygámia, Monœcia*. Flowers polygamous. Calyx 5-toothed. Petals 5, connected together into a 5-cleft corolla. Stamens numerous, exerted, sometimes joined together a short way at the base, and sometimes a great way up. Legume broad, linear, compressed, 1-celled. Seeds sometimes imbedded in pulp, sometimes in farina, and sometimes, though rarely, enveloped in a pellicle.—Usually unarmed trees or shrubs, with spikes or heads of red or white flowers. This genus will require to be still further divided into separate genera, when the characters of the species are better known. The legumes being in some thickened at the margins, in others flat, straight, or twisted. The seeds in some are imbedded in pulp, in others enveloped in a dry pellicle at maturity. The stamens in some are monadelphous only at the base, while in others they are connected into a long exerted column, and the pollen in the anthers in some is powdery, but in others it is in a few granular masses, as in *Aschpiadææ*.

§ 1. *Inga vera* (true species of *Inga*). Leaves simply pinnate. Leaflets large, from 2 to 9 pairs, the extreme ones always the largest. The species contained in this division are all natives of South America; they are unarmed trees, bearing spikes of flowers, with a few exceptions, and furnished with glands on the petioles between the pairs of leaflets.

\* *Pterópode* (from *πτερον*, *pteron*, a wing, and *πους*, *podos*, a foot; in reference to the footstalks of the leaves being winged). Common petiole evidently winged.

1 *I. SAÏDA* (H. B. et Kunth, nov. gen. amer. 6. p. 286.) leaves with 2 pairs of oblong acuminate leaflets, which are membranous, quite smooth, shining above, and attenuated at the base.  $\frac{1}{2}$ . S. Native of the banks of the river Magdalena. Legumes 5-6 inches long, and a little arched, containing pulp which is sweet and sapid. Fl. w. unknown.

*Sapid* Inga. Tree 50 feet.

2 *I. QUASSIÆFOLIA* (Willd. spec. 4. p. 1013.) leaves with 2 pairs of ovate-oblong acuminate leaflets, which are shining on both surfaces; spikes of flowers ovate, pedunculate; corolla villous.  $\frac{1}{2}$ . S. Native of Para, in Brazil. Superior leaflets 3 inches long. Branches glabrous. Legume unknown.

*Quassia-leaved* Inga. Clt. 1820. Tree 40 feet.

3 *I. NI'TIDA* (Willd. spec. 4. p. 1013.) leaves with 2 pairs of oblong-lanceolate leaflets, which are shining on both surfaces, and pilose on the veins beneath; spikes of flowers pedunculate, oblong; corolla villous. *h. S.* Native of Para, in Brazil. Branches hairy. Superior leaflets 4-5 inches long. Legume unknown.

*Shining-leaved Inga.* Tree 30 to 40 feet.

4 *I. PILOSIUSCULA* (Desv. journ. bot. 1814. p. 71.) leaves with 2 pairs of oval-oblong, acuminate, shining leaflets, which are rather pilose, as well as the branches; glands large, one between each pair of leaflets; spikes of flowers oblong-capitate, pedunculate; corolla villous. *h. S.* Native of Cayenne. *Mimosa pilosiuscula*, Rich. in act. soc. hist. nat. par. 1. p. 113. *Mimosa lucida*, Vahl. ecl. amer. 3. p. 31. t. 24. Petioles cuneately winged beneath the upper pair of pinnae, and somewhat orbicularly winged beneath the lower pair. Branches terete. Superior leaflets 5-6 inches long. Legume unknown.

*Pilose Inga.* Tree 40 feet.

5 *I. SETIFERA* (D. C. prod. 2. p. 432.) leaves with 2 pairs of oval abruptly-acuminate leaflets, which are rather cuneate at the base, paler beneath, and rather villous on both surfaces; petiole broadly winged, and drawn out at the apex into a long bristle, which is longer than the superior internode of the leaves; spikes of flowers ovate, pedunculate; corolla villous. *h. S.* Native of French Guiana. Superior leaflets 6-8 inches long, and the lower ones 3 inches long, having the nerves clothed with adpressed villi, and the intervals between the nerves rather pilose. Legume unknown.

*Bristle-bearing Inga.* Clt. 1824. Tree 20 to 30 feet.

6 *I. LUCIDA* (H. B. et Kunth, nov. gen. amer. 6. p. 287.) leaves with 2 pairs of nearly elliptic, rather acuminate, coriaceous, quite smooth leaflets, which are shining above, and rounded at the base; spikes of flowers panicle, elliptic-oblong; corolla clothed with silky wool. *h. S.* Native on the banks of the river Magdalena, near Badilles. Seeds black.

*Lucid-leaved Inga.* Tree 20 to 30 feet.

7 *I. UMBELLIFERA* (Stend. nom. p. 431.) leaves with 2 pairs of lanceolate leaflets, which are glabrous, as well as the corollas and branches, with a gland between one of the pairs of leaflets; umbels of flowers axillary, pedunculate. *h. S.* Native of South America. *Mimosa umbellifera*, Vahl. ecl. amer. 3. p. 30. Legumes spiral. Flowers white.

*Umbelliferous Inga.* Tree.

8 *I. FULGENS* (Kunth, min. p. 31. t. 11. nov. gen. amer. 6. p. 287.) leaves with 2-3 pairs of obovate-elliptic, quite smooth leaflets, which are rounded at both ends, and undulate on the margins; spikes of flowers elliptic-oblong, somewhat panicle; corolla clothed with silky hairs. *h. S.* Native of New Granada, near Honda. Flowers red. Legumes unknown.

*Fulgent Inga.* Tree.

9 *I. MACROPHYLLA* (Humb. et Bonpl. in Willd. spec. 4. p. 1015.) leaves with 2 or 3 pairs of ovate, cordate, rather acuminate, membranous, glabrous leaflets, which are shining above; spikes of flowers pedunculate; corolla villous. *h. S.* Native of South America, on the banks of the Orinoco near St. Fernando de Atabapo. H. B. et Kunth, nov. gen. amer. 6. p. 286. Branches tetragonal. Superior leaflets half a foot long. Legumes unknown.

*Long-leafletted Inga.* Tree.

10 *I. ALBA* (Willd. spec. 4. p. 1013.) leaves with 3-4 pairs of oblong, acuminate, nearly equal leaflets, which are glabrous above and scabrous beneath; spikes of flowers ovate, twin, pedunculate. *h. S.* Native of Cayenne. *Mimosa alba*, Swartz. fl. ind. occ. 2. p. 976. Vahl. ecl. 3. p. 31. Petioles a little margined, wingless at the base, but winged at the apex. Corolla green. Filaments white, monadelphous. Legume unknown.

*White-stamened Inga.* Clt. 1804. Tree 10 to 20 feet.

11 *I. FEUILLEI* (D. C. prod. 2. p. 433.) leaves with 3-4 pairs of oval-oblong, glabrous leaflets, which are acute at both ends; spikes of flowers usually twin, ovate, pedunculate; legumes very long, linear, flat, glabrous. *h. S.* Native of Peru, also cultivated in the gardens about Lima. Pacai, Feuill. obs. 3. p. 2. p. 27. t. 19. but not of Frezier. Flowers white. Legume 1-2 feet long, containing a sweet white pulp which is eaten by the natives of Peru.

*Feuille's Inga.* Clt. 1824. Tree 20 to 30 feet.

12 *I. SINEMARIENSIS*; leaves with 2 pairs of ovate, shining, glabrous leaflets, which taper to both ends; spikes axillary, solitary, shorter than the leaves, pedunculate. *h. S.* Native of Guiana, and the island of St. Christopher. *Mimosa Sinemariensis*, Aubl. guian. 2. p. 945. Swartz, fl. ind. occ. 2. p. 979. Flowers white.

*Sinemari Inga.* Tree 20 feet.

13 *I. MOCINIANA*; leaves with 5 pairs of elliptic, acuminate leaflets, which are pubescent above, but clothed with silky down beneath; petioles winged; peduncles, rachis, and young branches clothed with rusty down; peduncles solitary, axillary; corolla clothed with yellowish down. *h. S.* Native of Mexico. Flowers red. (v. s. in herb. Lamb.)

*Mocino's Inga.* Tree.

14 *I. SETOSA*; clothed with bristles in every part, but more so on the petioles, branches, and peduncles; leaves with 6 pairs of sessile, broad, elliptic, acuminate leaflets; petioles broadly winged; stipulas roundish, acuminate; peduncles long, axillary, solitary, bearing spikes of loose flowers at the apex. *h. S.* Native of Peru. (v. s. in herb. R. et P. in herb. Lamb.)

*Bristly Inga.* Tree.

15 *I. PISANA*; clothed with rusty pubescence, especially on the under side of the leaves, peduncles, and young branches; leaves with 3-4 pairs of oblong, acuminate leaflets; petioles winged; spikes of flowers forming a terminal panicle. *h. S.* Native of Peru. *Mimosa Pisana*, Ruiz et Pav. in herb. Lamb.

*Pisan Inga.* Tree.

16 *I. ODORATA*; young stems and peduncles pubescent; leaves with 2 pairs of oblique, elliptic, long-acuminate leaflets; spikes twin or tern, axillary. *h. S.* Native of Peru. *Mimosa odorata*, Ruiz et Pav. in herb. Lamb. Petioles only sometimes winged at the very apex.

*Sweet-scented Inga.* Tree.

17 *I. PAVONIANA*; clothed with rusty down; petioles winged; leaflets alternate, elliptic-oblong, broad, acuminate, and rather cordate at the base, glabrous above, except on the nerves; spikes of flowers axillary, solitary; bractees linear, length of calyx. *h. S.* Native of Peru. Calyx tubular, ribbed. Corolla villous. (v. s. in herb. Lamb.)

*Pavon's Inga.* Tree.

18 *I. FASTUOSA* (Willd. spec. 4. p. 1014.) leaves with 4-5 pairs of ovate-oblong, acuminate leaflets, which are glabrous above, but clothed with rusty hairs beneath; glands pedicellate; spikes few-flowered; peduncles and corollas villous. *h. S.* Native of Caraccas. *Mimosa fastuosa*, Jacq. fragm. t. 10. Corolla tubular, rufous, 2 inches long. Stamens red, twice the length of the corolla. Legume broad-linear, twisted in a spiral manner, with thickened margins.

*Proud Inga.* Clt. 1820. Tree 50 feet.

19 *I. SAPINDOIDES* (Willd. spec. 4. p. 1012.) leaves with usually 4 pairs of oblong, acuminate leaflets, which are glabrous and shining above, and rather scabrous beneath; spikes of flowers oblong, solitary; corollas glabrous; branchlets hairy. *h. S.* Native of Caraccas. Flowers white. Legumes linear, glabrous, a foot long.

*Sapindus-like Inga.* Tree 50 feet.

20 *I. VELUTINA* (Willd. spec. 4. p. 1014.) leaves with 4 pairs of ovate, acute leaflets, which are clothed with soft pubescence on both surfaces, but shining above; spikes of flowers solitary; corolla villous; branches and peduncles hairy. *h. S.* Native of Para, in Brazil. Legumes unknown. There is a solitary gland between each of the lower pairs of leaflets, and 3 between the superior pair.

*Velvety Inga.* Clt. 1820. Tree.

21 *I. AFFINIS* (D. C. prod. 2. p. 433.) leaves with 4 pairs of oval, acuminate leaflets, which are pubescent above and rather shining, but villous beneath and opaque; petioles, branches, peduncles, and flowers clothed with velvety tomentum; spikes of flowers solitary or twin; corolla villous. *h. S.* Native of Brazil. This species is very nearly allied to *I. velutina*, but the leaflets are not above half the size, with a solitary gland between each pair of leaflets.

*Allied Inga.* Clt. 1800. Tree.

22 *I. INGOIDES* (Willd. spec. 4. p. 1012.) leaves with 4 pairs of oval-oblong, acuminate leaflets, which are clothed with velvety tomentum beneath, with a gland between each pair; racemes terminal, tomentose. *h. S.* Native of Cayenne. *Mimosa ingoides*, Rich. act. soc. hist. par. 1. p. 113. Allied to the following species.

*Inga-like Inga.* Tree 20 feet.

23 *I. SPURIA* (Humb. et Bonpl. in Willd. spec. 4. p. 1014.) leaves with 5-6 pairs of oblong, acuminate leaflets, which are shining and glabrous above, but clothed with fine pubescence beneath; spikes of flowers axillary, usually twin; corollas villous; legumes sulcate, pubescent. *h. S.* Native of South America, in humid places near Cumana and Santa Fe de Bogota. Kunth, min. 39. t. 12. *H. B. et Kunth*, nov. gen. amer. 6. p. 289. Allied to *I. vera*, but the leaves are pubescent beneath, and the legume is longer and mucronate. Corolla green.

*Spurious Inga.* Clt. 1820. Tree 40 to 60 feet.

24 *I. VERA* (Willd. spec. 4. p. 1010.) leaves with 4-5 pairs of obovate-oblong, acuminate, glabrous, membranous leaflets; spikes axillary, few-flowered, usually solitary; corolla clothed with silky wool; legume furrowed, pubescent. *h. S.* Native of Brazil, Mexico, West Indies, and near Maypures, on the Orinoco, &c. *Mimosa Inga*, Lin. spec. 1498.—Sloan. hist. t. 183. f. 1. —Plum. gen. t. 25. Flowers white. Legume sweet and edible.

*True Inga.* Fl. July, Aug. Clt. 1739. Tree 20 to 30 feet.

25 *I. BONPLANDIA'NA* (*H. B. et Kunth*, nov. gen. amer. 6. p. 288.) leaves with 5 pairs of elliptic-oblong, acute, rather cordate, somewhat coriaceous, glabrous leaflets, which are shining above; flowers in spikes; corollas silky; legumes glabrous. *h. S.* Native of South America, in the province of Jaen de Bracamoros, on the banks of the Camaya.

*Bonpland's Inga.* Tree 40 to 50 feet.

26 *I. INSIGNIS* (Kunth, min. p. 43. t. 13. *H. B. et Kunth*, nov. gen. amer. 6. p. 290.) leaves with 5 pairs of elliptic, acuminate, glabrous leaflets, which are rounded at the base, the nerves rather hairy, shining above; spikes of flowers oblong, axillary, twin; corollas clothed with silky hairs. *h. S.* Native of South America, between Quito and Pucambo. Flowers white. The legume, according to Bonpland, is quadrangular, woody, tomentose, and pulpy inside.

*Shiny Inga.* Tree 40 to 50 feet.

27 *I. ORNIFOLIA* (*H. B. et Kunth*, nov. gen. amer. 6. p. 291.) leaves with 5 pairs of oblong-lanceolate, acuminate, coriaceous, pilose leaflets, which are cordate at the base and shining above; spikes of flowers solitary, axillary, and terminal. *h. S.* Native near Quito. Flowers unknown. Legume linear, with thickened margins, rather falcate, densely tomentose.

*Ash-leaved Inga.* Tree 20 feet.

28 *I. ORNATA* (Kunth, min. p. 46. t. 14. *H. B. et Kunth*, nov.

gen. amer. 6. p. 292.) leaves with 5 pairs of oblong, acute leaflets, which are rounded at the base, and pubescent above; branches and peduncles clothed with hairy pubescence; spikes of flowers oblong, twin, panicle; corolla clothed with silky hairs. *h. S.* Native in the province of Popayan, on the bank of the river Cauca. Corolla rufous, 10 lines long. Stamens red, 3 inches long. Legumes 3-4 feet long, furrowed, pulpy inside.

*Adorned Inga.* Tree.

29 *I. RHIOFOLIA* (Willd. enum. p. 1016.) leaves with 5 pairs of oblong, acuminate leaflets which are shining and hairy above, but villous beneath; branches clothed with ferruginous tomentum. *h. S.* Native of Brazil. Flowers and fruit unknown.

*Red-leaved Inga.* Tree.

30 *I. BERTERIA'NA* (D. C. legum. mem. xii. prod. 2. p. 131.) leaves with 6 pairs of oblong, acuminate leaflets, which are rather puberulous above, but clothed with soft velvety down beneath, with a gland situated between each pair; branches, peduncles, petioles, calyxes, and nerves of leaves clothed with short velvety down; spikes of flowers ovate, axillary, solitary; corolla clothed with silky hairs. *h. S.* Native of St. Martha. Corolla white. Stamens red.

*Bertero's Inga.* Tree.

31 *I. ANGUSTIFOLIA* (Willd. spec. 4. p. 1012.) leaves with 4-9 pairs of lanceolate, acuminate leaflets, which are shining on both surfaces; legumes linear, flat, glabrous. *h. S.* Native of Caraccas. Glands small, between the pairs of leaflets. Flowers unknown.

*Narrow-leafletted Inga.* Tree.

\* \* *Apteropodæ* (from *a*, priv. *πτερον*, *pteron*, a wing, and *πους ποδος*, *pous podos*, a foot; in allusion to the footstalks of the leaves being without wings, so conspicuous in the last division). *Common petiole hardly winged or altogether naked.*

32 *I. ? BOURGONI* (D. C. prod. 2. p. 431.) leaves with 2-3 pairs of ovate, shining, glabrous leaflets; petioles a little winged at the apex of the articulations, and also each furnished with a gland; spikes of flowers axillary, short, usually 4 together. *h. S.* Native of Guiana, Cayenne, Caraccas, and of Barbados, in humid woods. *Mimosa Bourgoni*, Aubl. guian. 2. t. 358. *Mimosa fagifolia*, Lin. spec. 1498. *I. marginata*, Willd. spec. 4. p. 1015. The legume, according to Aublet, is dry and divided internally into many cells by transverse dissepiments. The column of stamens exerted beyond the corolla, which is glabrous. *Bourgoni* is the French name of the tree in Guiana.

*Bourgoni Inga.* Clt. 1752. Tree 30 to 40 feet.

33 *I. MARGINATA* (*H. B. et Kunth*, nov. gen. amer. 6. p. 285.) leaves with 2 pairs of oblong, much-acuminate, membranous, glabrous leaflets, which are opaque above, and shining beneath, and cuneate at the base; petiole rather pilose, furnished with a narrow wing at the apex. *h. S.* Native of South America, in the valleys of Arazuem. Perhaps sufficiently distinct from *I. Bourgoni*. Flowers white.

*Marginate-petioled Inga.* Clt. 1820. Tree 20 to 30 feet.

34 *I. THYRSODEA* (Desv. journ. bot. 1814. 1. p. 71.) leaves with 3 pairs of ovate, glabrous leaflets, which are veiny beneath; petioles almost naked, except at the tops of the articulations, where they are a little winged; branches angular, cinereous; flowers thyrsoid. *h. S.* Native of Guiana. Legume unknown. Flowers not sufficiently known.

*Thyrsoid Inga.* Tree.

35 *I. RUBIGINOSA* (D. C. prod. 2. p. 431.) leaves with 4-5 pairs of oblong-ovate, acuminate leaflets, which are glabrous and shining above, except on the nerves, but clothed with rusty-velvety down beneath, as well as the branches, petioles, peduncles, and calyxes; spikes of flowers oblong, usually twin; corolla clothed with silky hairs. *h. S.* Native of Cayenne.

*Mimosa rubiginosa*, Rich. act. soc. hist. nat. par. 1. p. 113. Pers. ench. no. 18. Corolla rufous, 9 lines long. Legume unknown.

*Rusty Inga*. Tree.

36 *I. THIBAUDIANA* (D. C. legum. mem. xii. prod. 2. p. 434.) leaves with 4-5 pairs of ovate-oblong, acuminate leaflets, which are glabrous above, except the nerves, but pubescent beneath as well as the petioles, peduncles, and calyxes; spikes of flowers usually twin, oblong, but panicle at the tops of the branches; corollas clothed with silky pubescence.  $\frac{1}{2}$ . S. Native of Cayenne. Petioles winged at the apex, but naked at the base. Corolla slender, 7 lines long. Stamens red, exserted. Legume unknown.

*Thibaud's Inga*. Tree.

37 *I. FRAXINEA* (Willd. spec. 4. p. 1019.) leaves with 5 pairs of oblong, acuminate, shining leaflets; petiole semi-terete, pubescent; spikes of flowers pedunculate, pubescent, and panicle at the tops of the branches; corollas glabrous.  $\frac{1}{2}$ . S. Native of Para, in Brazil. Legume unknown.

*Ash-like Inga*. Tree 20 to 30 feet.

38 *I. INEQUA'LIS* (Humb. et Bonpl. in Willd. spec. 4. p. 1019.) leaves with 4 pairs of oblong-lanceolate, membranous leaflets, which are unequal at the base, shining above, and glabrous on both surfaces as well as the petioles, peduncles, and flowers; spikes of flowers oblong, on short peduncles.  $\frac{1}{2}$ . S. Native on the banks of the Orinoco.

*Unequal-leafletted Inga*. Tree.

39 *I. HUMBOLDTIANA* (H. B. et Kunth, nov. gen. amer. 6. p. 285.) leaves with 4 pairs of oblong, acute, membranous, glabrous leaflets, which are acutish at the base and shining above; spikes of flowers nearly globose, terminal, panicle; corolla clothed with silky hairs.  $\frac{1}{2}$ . S. Native of New Granada, on the banks of the river Magdalena. Legumes unknown.

*Humboldt's Inga*. Tree.

40 *I. NOBILIS* (Willd. enum. 1047.) leaves with 3-4 pairs of oblong, acute, glabrous leaflets; spikes panicle; peduncles pubescent; corolla silky.  $\frac{1}{2}$ . S. Native of Brazil. Legumes unknown.

*Noble Inga*. Tree.

41 *I. JUGLANDIFOLIA* (Willd. spec. 4. p. 1018.) leaves with 3-4 pairs of oblong, acuminate, glabrous leaflets, which are attenuated at the base; petioles glandless, and are as well as the branches clothed with ferruginous pubescence; spikes of flowers 2-3-together, axillary, pedunculate; corolla villous.  $\frac{1}{2}$ . S. Native of Caraccas. Legume linear, flat, 7 inches long. This is very distinct, from the absence of the glands on the petiole.

*Walnut-leaved Inga*. Tree 20 to 30 feet.

42 *I. CORUSCANS* (Humb. et Bonpl. in Willd. spec. 4. p. 1017.) leaves with 3 pairs of oblong leaflets, which are attenuated at both ends, coriaceous, glabrous, and shining; petioles, branches, peduncles, and flowers glabrous; spikes of flowers 2-3-together, crowded, axillary.  $\frac{1}{2}$ . S. Native of New Granada, on the banks of the river Magdalena, near Viejo. Spikes of flowers 2 inches long. Legume unknown. Kunth, nov. gen. amer. 6. p. 285.

*Glittering Inga*. Tree.

43 *I. STIPULARIS* (D. C. legum. mem. xii. prod. 2. p. 435.) leaves with 2-3 pairs of oval, acutish leaflets, which are shining above, but glabrous on both surfaces, as well as the branches and flowers; stipulas large, orbicular, permanent, foliaceous; spikes of flowers ovate, axillary, solitary, pedunculate.  $\frac{1}{2}$ . S. Native of Cayenne. Calyx tubular, 2-3 lines long. Corolla hardly twice the length of the calyx. Legume unknown.

*Stipular Inga*. Tree.

44 *I. CAPITATA* (Desv. journ. bot. 1814. vol. 1. p. 71.) leaves with 2 pairs of ovate, acuminate, shining leaflets, which are

quite glabrous on both surfaces, as well as petioles, branches, peduncles, and flowers; spikes of flowers ovate-oblong, axillary, 2-3-together, pedunculate.  $\frac{1}{2}$ . S. Native of Cayenne. Branches warted, terete. Calyx tubular, 2 lines long. Legume unknown.

*Capitate-flowered Inga*. Tree.

45 *I. LAURINA* (Willd. spec. 4. p. 1018.) leaves with 2 pairs of obovate-oblong, acuminate, shining leaflets, which are glabrous on both surfaces, as well as the petioles, peduncles, and flowers; spikes of flowers solitary or twin, elongated, almost sessile, axillary.  $\frac{1}{2}$ . S. Native of St. Christopher, Martinico, St. Domingo, Brazil, Guadeloupe, and Porto-Rico. *Mimosa laurina*, Swartz, fl. ind. occ. 2. p. 978. *Mimosa fagifolia*, Jacq. amer. 264. t. 164. Calyx 1 line long. Corolla white, 3-times the length of the calyx. The pulp contained in the legumes is purgative.

*Laurel-like Inga*. Clt. 1818. Tree 30 feet.

46 *I. PUNCTATA* (Willd. spec. 4. p. 1016.) leaves with 2-3 pairs of oblong, acuminate, shining leaflets, which are glabrous as well as the branches; petioles terete, pubescent; spikes of flowers ovate, pedunculate, and panicle at the tops of the branches; corolla clothed with silky villi.  $\frac{1}{2}$ . H. Native of Caraccas. Branches beset with white dots. Legume unknown.

*Dotted-branched Inga*. Clt. 1818. Tree.

47 *I. SPLENDENS* (Willd. spec. 4. p. 1017.) leaves with 2 pairs of oblong, acuminate, shining leaflets, which are glabrous on both surfaces, as well as petioles and branches; spikes of flowers axillary, twin, pedunculate; corolla clothed with silky villi.  $\frac{1}{2}$ . S. Native of Para, in Brazil. Branches warted. Legumes unknown. The species is said to be allied to *I. punctata*, but it is larger in all its parts.

*Splendent Inga*. Tree.

48 *I. SPECTABILIS* (Willd. spec. 4. p. 1017.) leaves with 2 pairs of ovate, acute, shining leaflets, which are unequal at the base and glabrous on both surfaces, as well as the petioles and branches; spikes terminal; corollas villous.  $\frac{1}{2}$ . S. Native of South America, and cultivated in St. Martha. *Mimosa spectabilis*, Vahl, act. soc. hafn. 2. p. 219. t. 10. Leaflets thickly beset with feather nerves, the superior ones 6 or 7 inches long and 4 broad, but the lower ones are one-half smaller than the superior ones.

*Sherry Inga*. Tree.

49 *I. SERTULIFERA* (D. C. prod. 2. p. 436.) leaves with 2 pairs of ovate, shining leaflets, which are glabrous on both surfaces as well as the calyxes and corollas; flowers pedunculate, umbellate; umbels simple.  $\frac{1}{2}$ . S. Native of Cayenne. *Mimosa coriacea*, Pers. ench. 2. p. 262. *Inga coriacea*, Desv. journ. bot. 1814. vol. 1. p. 71. but not of Willd. Branches warted. Leaflets large. Legumes unknown.

*Little-garland-bearing Inga*. Tree.

50 *I. NODOSA* (Willd. spec. 4. p. 1016.) leaves with 2 pairs of ovate-oblong, unequal-sided, glabrous leaflets, furnished with a small gland between the lower pair.  $\frac{1}{2}$ . S. Native of Ceylon, *Mimosa nodosa*, Lin. spec. 1496.—Pluk. alm. 211. f. 5.

*Knotted Inga*. Tree.

51 *I. CORIACEA*; leaves with 3-4 pairs of leaflets, lower ones the smallest; petioles wingless; leaflets lanceolate, acuminate, oblique at the base, undulated on the margins, hairy as well as the petioles and young branches; peduncles short, few-flowered, lateral, terminal, and axillary.  $\frac{1}{2}$ . S. Native of Mexico. *Mimosa coriacea*, Sesse et Moc. in herb. Lamb.

*Coriaceous-leaved Inga*. Tree.

52 *I. COCCINEA*; petioles wingless; leaves with 3 pairs of broad-elliptic, acuminate, smooth leaflets, which are oblique at the base, sometimes with a smaller leaflet on one side at the base; spikes long.  $\frac{1}{2}$ . S. Native of Peru. *Mimosa coccinea*, Ruiz, et Pav. in herb. Lamb. Flowers scarlet.

*Scarlet-flowered Inga.* Tree.

53 *I. CARNOSA*; petioles wingless; leaves with 3 pairs of broad, elliptic, mucronate, smooth leaflets; peduncles axillary, twin, clothed with rusty down as well as the young branches; legumes lanceolate, flat. *h. S.* Native of Peru. *Mimosa carnosa*, Ruiz et Pav. in herb. Lamb.

*Fleshy Inga.* Tree.

54 *I. RUIZIANA*; petioles wingless; leaves with 4 pairs of elliptic-oblong, very long, and very broad, smoothish leaflets; panicles axillary, clothed with rusty down; spikes capitate, many-flowered. *h. S.* Native of Peru. (v. s. in herb. Lamb.)

*Ruiz's Inga.* Tree.

55 *I. AGGREGATA*; petioles wingless; leaves with 3-4 pairs of smooth, membranous, ovate-oblong, acuminate leaflets; spikes aggregate, axillary. *h. S.* Native of Peru. (v. s. in herb. Lamb.)

*Aggregate-spiked Inga.* Tree.

56 *I. STIPULACEA*; petioles hispid, wingless; leaves with 2 pairs of broad, elliptic, acuminate, sessile leaflets, which are attenuated at the base; tube of stamens much exserted; stipulas large, rounded at the apex, nerved. *h. S.* Native of Peru. *Mimosa stipulacea*, Ruiz et Pav. in herb. Lamb.

*Large-stipuled Inga.* Tree.

57 *I. GUAYAQUILENSIS*; petioles naked; leaves with 2 pairs of elliptic-oblong, glabrous leaflets, which are attenuated at both ends, and acuminate at the apex; spikes sessile, solitary, or twin. *h. S.* Native of Guayaquil. (v. s. in herb. Ruiz et Pav.)

*Guayaquil Inga.* Tree.

58 *I. FAGIFOLIA*; petioles wingless; leaves with 3 pairs of long, oblong-lanceolate, glabrous leaflets, furnished with 1 gland between each pair; panicles terminal and axillary, twin or solitary; peduncles clothed with rusty down. *h. S.* Native of Peru. *Mimosa fagifolia*, Ruiz et Pav. in herb. Lamb. Flowers red.

*Beach-leaved Inga.* Tree.

59 *I. UMBELLATA*; petiole wingless, bearing only one pair of leaflets at the apex, which are ovate-elliptic, acuminate, and glabrous; peduncles axillary; flowers umbellate, pedicellate. *h. S.* Native of Peru. *Mimosa axillaris*, Ruiz et Pav. in herb. Lamb. Flowers apparently white.

*Umbellate-flowered Inga.* Tree.

60 *I. HETEROPHYLLA* (Willd. spec. 4. p. 1020.) leaves with 1-2 pairs of oblong, acuminate leaflets, which are shining on both surfaces; petioles, branches, and flowers glabrous; glands of the petiole somewhat pedicellate; peduncles terete at the base; flowers disposed in umbellate racemes. *h. S.* Native of Para, in Brazil. *Mimosa Para*, Poir. suppl. 1. p. 44. Branches warted from dots. Leaflets  $1\frac{1}{2}$  inch long. Legumes unknown.

*Various-leaved Inga.* Tree.

61 *I. HYMENÆOIDES* (Desv. journ. bot. 1814. 1. p. 70.) leaves with 1-2 pairs of ovate, oblique, obtuse, shining leaflets; petioles glandless; branches, peduncles, and flowers glabrous; heads of flowers axillary, pedunculate; legumes oblong, obtuse, straight, tapering at the base, with thickened margins. *h. S.* Native of Cayenne. Leaflets rather coriaceous,  $1\frac{1}{2}$  inch long and 1 inch broad. Legumes 2 inches long.

*Hymenæa-like Inga.* Clt. 1823. Tree.

62 *I. INICUIL* (Schlecht. et Cham. in Linnaea. 5. p. 592.). This species comes very near *I. coriacea*, with the glands on the petioles usually obsolete, the legume 1 foot long and an inch broad, 6-10-seeded, glabrous, curved, or straight, with the valves thick, and containing eatable pulp. There is another tree found in Mexico, near Colipa, very similar to *I. Inicuil*, but differs in the glands, in the petioles being always present, and in the inflorescence being in few-flowered heads, on short peduncles, which are disposed in crowded fascicles in the axils of the leaves.

*h. S.* Native of Mexico, where it is called *Inicuil*. Bracteoles minute, ciliated. Flowers white.

*Inicuil Inga.* Tree.

§ 2. *Hymenæoides* (containing plants which have the habit of *Hymenæa*). Leaves with 1 pair of pinnae, and each pinna bearing 2-3 or many leaflets.

\* *Bigemina* (from *bis*, twice, and *geminus*, a twin; in reference to the leaves, which are divided twice by twos). Leaves with one pair of pinnae, and each pinna bearing only one pair of leaflets.

63 *I. MICROPHYLLA* (Humb. et Bonpl. in Willd. spec. 4. p. 1004.) spines stipular, straight; leaflets dimidiately-elliptic, obtuse, and retuse, glabrous, rather coriaceous; petiole smooth, furnished with a gland in the fork; spikes of flowers globose-elliptic, solitary, axillary; corolla 4-cleft, glabrous. *h. S.* Native of South America, near Cumana. H. B. et Kunth, nov. gen. amer. 6. p. 293. Spines thick. Legumes unknown.

*Small-leaved Inga.* Clt. 1817. Shrub 3 feet.

64 *I. PUNGENS* (Humb. et Bonpl. in Willd. spec. 4. p. 1004.) spines stipular, very short, straight; leaflets dimidiately-oblong, obtuse and retuse, membranous, glabrous; petioles hairy, furnished with a gland in the fork; heads of flowers globose, racemose; corolla 5-cleft, pubescent; legumes torulose, circinate. *h. S.* Native of Mexico. H. B. et Kunth, nov. gen. amer. 6. p. 294. Flowers white.

*Pungent Inga.* Tree 50 feet.

65 *I. DULCIS* (Willd. spec. 4. p. 1005.) spines stipular, very short, straight; leaflets somewhat dimidiately-oblong, obtuse, and somewhat retuse and mucronate; petioles hairy, shorter than the leaflets, with a gland in the fork, as well as one between the leaflets; heads of flowers globose, racemose. *h. S.* Native of Coromandel and the Philippine islands. *Mimosa dulcis*, Roxb. cor. 1. t. 99. Flowers white, in terminal racemes. Legume twisted, red, and glabrous, containing a fleshy sweet pulp, which is reckoned wholesome.

*Sweet Inga.* Clt. 1800. Tree 30 feet.

66 *I. JAVAÏNA* (D. C. prod. 2. p. 136.) spines stipular, very short, and straight, or wanting; leaflets somewhat dimidiately-oblong, obtuse, glabrous; petiole smooth, and longer than the leaflets, with a gland in the fork; heads of flowers globose, racemose. *h. S.* Native of Java. Legume flat, incurved, glabrous, coarctate between the seeds.

*Java Inga.* Tree 20 feet.

67 *I. UNGUIS-CATI* (Willd. spec. 4. p. 1006.) spines stipular, straight; leaflets roundish-elliptic, rather dimidiate, emarginate, membranous, glabrous; petiole glabrous, furnished with a gland in the fork, and between the leaflets; heads of flowers globose, disposed in terminal racemes; legume twisted. *h. S.* Native of the Caribbee Islands, and near Cumana. *Mimosa unguis-cati*, Lin. spec. 499. Jacq. hort. schœnbr. 3. t. 392. Descourt, fl. ant. 1. t. 11. Quémochilt, Hern. mex. 94.—Pham. ed. Burm. t. 4. Flowers whitish. In Jamaica it is called *Black-bean shrub*. The seeds, according to Sloane, are eaten by goats, and sometimes by the negroes; they are frequently brought to England, and strung as beads. The bark is astringent, and is used in lotions and fomentations in America.

*Cat's-claw Inga.* Clt. 1670. Tree 10 feet.

68 *I. GUADALUPENSIS* (Desv. journ. bot. 1814. 1. p. 70.) plant unarmed; leaflets obovate-rhomboid, obtuse, veiny, quite smooth; petiole glabrous, furnished with a gland in the fork, and one between the leaflets; heads of flowers globose, pedunculate, racemose; legumes twisted, glabrous. *h. S.* Native of Guadaloupe. *Mimosa Guadalupensis*, Pers. ench. 2. p. 262. Perhaps only an unarmed variety of *I. unguis-cati*. Flowers white.

*Guadaloupe Inga.* Tree.

69 *I. MELLIFERA* (Willd. spec. 4. p. 1006.) spines stipular, recurved; leaflets somewhat dimidiately-obovate, with a gland at the base of the petiole; legume ensiform, straight. *h. S.* Native of Arabia Felix. *Mimosa linguicati*, Forsk. desc. 176. *M. mellifera*, Vahl. symb. 2. p. 103. Flowers white, from which bees collect a great deal of honey.

*Honey-bearing Inga.* Tree 10 feet.

70 *I. LANCEOLATA* (Humb. et Bonpl. in Willd. spec. 4. p. 1005.) spines stipular, straight; leaflets somewhat dimidiately-lanceolate, obtuse; petiole rather puberulous, furnished with a gland in the fork, and between the leaflets; spikes of flowers cylindrical, axillary, solitary; legumes curved. *h. S.* Native of New Andalusia, near Cumana. Kunth, min. 49. t. 15. nov. gen. amer. 6. p. 293. Flowers white, as in the rest of the present division of the genus. Legume linear, glabrous. Spikes longer than the leaves.

*Lanceolate-leafletted Inga.* Tree 50 to 60 feet.

71 *I. LIGUSTRINA* (Willd. spec. 4. p. 1007.) spines stipular, short, straight; leaflets dimidiately-oblong, obtuse at both ends; petiole pubescent, with a gland in the fork, as well as one between the leaflets; spikes of flowers cylindrical, axillary, solitary; legume straight. *h. S.* Native of Caraccas, in sandy places. *Mimosa ligustrina*, Jacq. fragm. t. 32. f. 5. Spikes of flowers white, about equal in length to the leaves.

*Prick-like Inga.* Tree 15 feet.

72 *I. ? FECTIDA* (Willd. spec. 4. p. 1008.) unarmed; leaves bipinnate, with 1 or 2 pairs of bifoliate pinnae; leaflets somewhat dimidiately-oblong, acutish, glaucous and rather puberulous beneath; spikes of flowers twin, cylindrical. *h. S.* Native of the West Indies. *Mimosa fectida*, Jacq. hort. schœnbr. 3. t. 390. *Acacia fectida*, H. B. et Kunth, nov. gen. amer. 6. p. 265. Corolla greenish. Stamens 10, white. Spikes of flowers almost extrafoliaceous. Legume unknown. Seeds naked, ex Bonpl.

*Fetid Inga.* Clt. 1816. Tree 10 to 20 feet.

73 *I. HYMENEFOLIA* (Humb. et Bonpl. in Willd. spec. 4. p. 1008.) spines stipular, very minute, straight; leaflets somewhat dimidiately-oblong, acuminate, obtuse, somewhat coriaceous, glabrous; petioles glabrous, furnished with a gland in the fork, and between the leaflets; spikes of flowers elliptic-oblong, racemose; corolla 5-cleft, pubescent. *h. S.* Native of Cumana, in shady woods near Caripe, and on the banks of the river Magdalena. H. B. et Kunth, nov. gen. amer. 6. p. 296. Flowers large. Legume unknown.

*Hymenea-leaved Inga.* Tree 20 feet.

74 *I. SPRENGELII*; spines stipular, twin, straight; leaves with one pair of pinnae, each pinna bearing 2 obliquely-oblong, obtuse, coriaceous, glabrous leaflets; flowers racemose; legumes glabrous, smoothish. *h. S.* Native of South America. *I. Berteri*, Spreng. syst. 3. p. 127. but not of D. C.

*Sprengel's Inga.* Tree.

75 *I. PUBESCENS* (Bert. ined. D. C. prod. 2. p. 437.) spines stipular, very small, straight; leaflets oblong-lanceolate, rather oblique at the base, obtuse, pubescent beneath; petiole rather pubescent, with a gland in the fork and between the leaflets; heads of flowers globose, racemose. *h. S.* Native of St. Martha. Corolla greenish, puberulous. Stamens red. Legume unknown. Very like *I. forfic.*

*Pubescent Inga.* Tree.

76 *I. FORFEX* (Kunth, min. p. 52. t. 16. nov. gen. amer. 6. p. 295.) leaflets obliquely-oblong, or lanceolate-oblong, acute, and rather mucronate; petiole glabrous, with a gland in the fork and between the leaflets; heads of flowers globose, racemose. *h. S.* Native of New Granada, near Carthagena. Corolla greenish, puberulous. Stamens red.

*Forcep Inga.* Tree 20 feet.

77 *I. ROSEA* (Steud. nom. p. 431.) spines stipular, straight; leaflets lanceolate, and are, as well as the branches, glabrous; heads few-flowered, disposed in loose axillary racemes; pedicels twin. *h. S.* Native of Cayenne. *Mimosa rosea*, Vahl. ecl. amer. 3. p. 33. t. 25. Flowers red. Legume unknown.

*Var. β, subinermis* (D. C. prod. 2. p. 437.) leaflets oblong, pubescent beneath; spines very short.

*Rose-coloured-flowered Inga.* Shrub 6 to 10 feet.

78 *I. MACROSTACHYA* (Steud. nom. p. 431.) spines stipular, straight; leaflets lanceolate-oblong, and are, as well as the branches, glabrous, with a gland at the top of the common petiole, as well as one at the tops of partial ones; spikes of flowers axillary, elongated, solitary; corolla clothed with fine tomentum on the outside. *h. S.* Native of Cayenne. *Mimosa brachystachys*, Vahl. ecl. amer. 3. p. 34. t. 24. Legumes unknown.

*Long-spiked Inga.* Tree.

79 *I. PANICULATA* (Spreng. in herb. Balb. D. C. prod. 2. p. 437.) unarmed; leaflets elliptic-oblong, obtuse at both ends, rather velvety above, but clothed with velvety tomentum beneath; petioles clothed with soft pubescence, nearly glandless; heads of flowers nearly globose, pedunculate, panicle. *h. S.* Native of South America. Corolla velvety. Stamens red. Legume unknown.

*Panicle Inga.* Tree.

80 *I. TETRAPHYLLA*; leaves with 1 pair of pinnae, and each pinna bearing 1 pair of leaflets; leaflets oblong, oblique, clothed with white pili beneath; peduncles twin, axillary; heads of flowers globose. *h. S.* Native of Mexico. *Mimosa tetraphylla*, Sesse et Moc. in herb. Lamb.

*Four-leafletted Inga.* Shrub.

\* \* *Tergemine* (from *ter*, thrice, and *geminus*, a twin; in reference to the divisions of the leaves). *Leaves with 1 pair of pinnae, each pinna bearing 3 or 5 leaflets.*

81 *I. RAMIFLORA*; smooth; leaves with 1 pair of pinnae, and each pinna furnished with 3 leaflets, which are elliptic and acuminate; spikes sessile, rising in clusters from the branches. *h. S.* Native of Guayaquil. *Mimosa ramiflora*, Ruiz et Pav. in herb. Lamb. Flowers apparently white.

*Branch-flowered Inga.* Tree 20 feet.

82 *I. TERGEMINA* (Willd. spec. 4. p. 1008.) unarmed; pinnae trifoliate; leaflets obliquely-oblong, obtuse, glaucous beneath; petioles glandless; fascicles of flowers axillary, solitary, pedunculate; legumes straight, with thickened margins. *h. S.* Native of Martinico. *Mimosa tergemina*, Lin. spec. 1499. Jacq. amer. t. 177. f. 81.—Plum. ed. Burm. t. 10. f. 1.—*I. Caripensis*, Willd. spec. 4. p. 1009. which is not different, according to Kunth, nov. gen. amer. 6. p. 298. Flowers purplish.

*Three-paired-leafletted Inga.* Clt. 1820. Tree 20 feet.

83 *I. VAHLIA* (D. C. prod. 2. p. 438.) unarmed; pinnae trifoliate; leaflets obliquely-lanceolate, attenuated, bluntish, and are as well as the branches glabrous, with a gland on the top of the common petiole, as well as on the tops of the partial ones; spikes of flowers somewhat opposite, elongated, rising from the leafless branches. *h. S.* Native of St. Martha. *Mimosa ligustrina*, Vahl. ecl. amer. 3. p. 34. t. 27. but not of Jacquin.

*Vahl's Inga.* Tree.

84 *I. EMARGINATA* (Humb. et Bonpl. in Willd. spec. 4. p. 1009.) unarmed; pinnae trifoliate; leaflets somewhat dimidiately obovate, obtuse, sometimes somewhat emarginate, and rather cordate at the base; petioles glandless; fascicles of flowers pedunculate, disposed in a somewhat panicle raceme. *h. S.* Native of Mexico, near Acapulco, on the sea-shore. Kunth,

mim. 54. t. 17. nov. gen. amer. 6. p. 296. Flowers of a rose-purple colour. Stamens 14-20. Legume unknown.

*Emarginate-leafletted Inga.* Fl. Feb. June. Clt. 1825. Sh. 4 to 6 feet.

85 *I. CORIACEA* (Humb. et Bonpl. in Willd. spec. 4. p. 1009. but not of Desv.) unarmed; pinnae trifoliate; leaflets somewhat dimidiately oblong-lanceolate, acutish, intermediate one the largest; petioles glandless; fascicles of flowers usually twin, axillary, pedunculate. *h. S.* Native of South America. Legume linear, straight, flat, 3 inches long.

*Coriaceous-leafletted Inga.* Shrub.

86 *I. CATARACTÆ* (H. B. et Kunth, nov. gen. amer. 6. p. 297.) shrub climbing, unarmed; pinnae bifoliate; leaflets obliquely lanceolate-oblong, acuminate, dimidiately rounded at the base, membranous, glabrous; peduncles axillary, twin; legumes circinnate. *h. S.* Native on the banks of the Orinoco, near Atures, at the cataracts of Javarivono. Flowers unknown. Legumes linear, compressed, smooth, each containing 4-9 lenticular seeds.

*Cataract Inga.* Shrub cl.

87 *I. LONGIFOLIA* (Humb. et Bonpl. in Willd. spec. 4. p. 1009.) shrub climbing, unarmed; pinnae trifoliate; leaflets oblong-lanceolate, equal-sided, acuminate, attenuated at the base, membranous, glabrous, with a gland between the terminal leaflets; flowers in spikes; legumes puberulous. *h. S.* Native of South America, near Cavico, on the banks of the Chanaya. H. B. et Kunth, nov. gen. amer. 6. p. 298.

*Long-leafletted Inga.* Shrub cl.

88 *I. FALCIFORMIS* (D. C. prod. 2. p. 438.) unarmed; pinnae trifoliate; leaflets oblong-lanceolate, acuminate, attenuated at the base, narrowest on the inner side, with a gland between the pinnae and one between the terminal leaflets; legume very flat, linear, falcate, obtuse. *h. S.* Native of St. Martha. Plant quite glabrous. Leaflets 4-6 inches long, and 1 inch broad. Legumes longer than the leaflets, containing about 14 seeds.

*Falciform-podded Inga.* Tree.

89 *I. GLOMERATA* (D. C. prod. 2. p. 438.) unarmed; pinnae trifoliate; leaflets dimidiately oblong-lanceolate, attenuated at the base, acuminate at the apex, with a gland between the pinnae, and one also between the terminal leaflets; flowers disposed in glomerate fascicles, which are axillary, lateral, and sessile. *h. S.* Native of Cayenne. Stamens monadelphous beyond the corolla. Flowers apparently white. Leaves glabrous.

*Glomerate-flowered Inga.* Tree.

90 *I. LATIFOLIA* (Willd. spec. 4. p. 1020.) unarmed; pinnae trifoliate, but usually bearing 5 leaflets; leaflets dimidiate at the base, ovate-oblong, acuminate, lower ones alternate, upper ones opposite, with a gland between the pinnae and between the opposite leaflets; flowers disposed in pedunculate, lateral, and axillary fascicles. *h. S.* Native of the Caribbee islands, and the warmer parts of Mexico. *Mimosa latifolia*, Lin. spec. 1499.—Plum. ed. Burm. t. 9. Flowers rose-coloured. Legume unknown.

*Broad-leaved Inga.* Fl. Mar. April. Clt. 1768. Tree.

91 *I. UMBROSA* (Wall. pl. rar. asiat. 2. p. 23. t. 124.) spines stipular, straight; leaves with 1 pair of pinnae, each pinna bearing 3 broad leaflets, the lower one the smallest; leaflets oblong, obtuse, oblique at the base, acute; petioles wingless, bearing a small, flat gland at the apex; heads of flowers pedunculate, axillary, solitary, glabrous, globose. *h. S.* Native of Silhet. Flowers white, fragrant.

*Shady Inga.* Tree 40 to 60 feet.

\*\*\* *Conjugato-pinnatæ* (from *conjugatus* and *pinnatus*; in reference to the disposition of the leaflets). *Leaves with one pair of pinnae, each pinna bearing from 2 to many pairs of opposite leaflets.*

VOL. II.

92 *I. CIRCINNALIS* (Willd. spec. 4. p. 1023.) spines stipular, straight; pinnae bearing 2-3 pairs of ovate, mucronate leaflets, with a gland in the fork of the petiole; heads of flowers pedunculate, axillary, and disposed in a kind of raceme at the tops of the branches. *h. S.* Native of St. Domingo and of the Bahama Islands. Catesb. car. 2. t. 97. *Mimosa circinnalis*, Lin. spec. 1490. Plum. ed. Burm. t. 5. Leaflets usually ending in a spine-like mucrone. Legume long, cochleate, filled with pulp inside. Seeds flat, red and black mixed.

*Circinnate-podded Inga.* Clt. 1726. Tree 10 to 15 feet.

93 *I. CA'NDIDA* (H. B. et Kunth, nov. gen. amer. 6. p. 299.) prickles conically-subulate, straight; pinnae bearing 2-3 pairs of obliquely obovate leaflets, which are rounded at both ends, rather coriaceous, and somewhat mucronate, glabrous; heads of flowers axillary, solitary, globose; legumes circinnate. *h. S.* Native near Guayaquil. Flowers white.

*White-flowered Inga.* Shrub 6 to 12 feet.

94 *I. EXCELSA* (Kunth, mim. 57. t. 18. nov. gen. amer. 6. p. 299.) spines stipular, straight; leaves conjugately or doubly pinnate, the outer pinnae bearing 4 leaflets, and the lower ones only 2 leaflets; leaflets obovate, oblique at the base, with a gland between the pinnae and one between each pair of leaflets; heads of flowers axillary, pedunculate. *h. S.* Native of New Granada, on the banks of the river Magdalena, near Tomependa. Flowers white. Legume circinnate.

*Tall Inga.* Tree 60 to 70 feet.

95 *I. UMBELLATA* (Willd. spec. 4. p. 1027.) spines stipular, straight; leaves conjugately or doubly pinnate, each pinna bearing 8-10 pairs of leaflets, with glands between the pairs of leaflets; heads of flowers axillary, umbellate. *h. S.* Native of the East Indies. *Mimosa umbellata*, Vahl symb. 2. p. 103. Legume spiral, when young pubescent.

*Umbellate-flowered Inga.* Tree.

96 *I. PURPUREA* (Willd. spec. 4. p. 1021.) unarmed; pinnae bearing from 3-7 pairs of oblong, obtuse leaflets, which are unequal at the base; petioles glandless; heads of flowers pedunculate, axillary. *h. S.* Native of Martinique and of Cumaná. *Mimosa purpurea*, Lin. spec. 1500. Andr. bot. rep. 372. Ker. bot. reg. 129.—Plum. ed. Burm. t. 10. f. 2. Flowers purple. Legume linear, obtuse, tapering at the base, straight, with thickened margins. *I. obtusifolia* of Willd. spec. 4. p. 1022. is not distinct according to Kunth, nov. gen. amer. 6. p. 301.

*Purple Inga.* Fl. Mar. April. Clt. 1733. Shrub 3 to 6 ft.

97 *I. TAXIFOLIA* (Kunth, mim. p. 64. t. 20. nov. gen. amer. 6. p. 301.) unarmed; pinnae bearing 13-20 pairs of oblong, obliquely cordate, glabrous leaflets; petioles glandless, pubescent; heads axillary, solitary, few-flowered, on short peduncles. *h. S.* Native on the Andes of Quito. Flowers red. Legumes unknown.

*Few-leaved Inga.* Shrub 6 feet.

98 *I. COCHLEATA* (Willd. spec. 4. p. 1020.) unarmed; pinnae 2, each bearing 3 pairs of elliptic, acuminate, shining leaflets, with an obscure gland between each pair; umbels of flowers pedunculate, solitary, or twin. *h. S.* Native of Para, in Brazil. Legume cochleate, with the outer margin repand.

*Cochleate-podded Inga.* Shrub 6 to 10 feet.

99 *I. XYLOCARPA* (D. C. prod. 2. p. 439.) unarmed; pinnae 2, each bearing 3-4 pairs of ovate-elliptic, acutish leaflets, with a gland between the pinnae and between each pair of leaflets; heads of flowers usually twin, pedunculate, globose; legume woody, falcate, mealy inside. *h. S.* Native of Coromandel. Flowers white. Corolla smooth, 5-toothed. Stamens 10. *Mimosa xylocarpa*, Roxb. cor. 1. p. 68. t. 100. *Acacia xylocarpa*, Willd. spec. 4. p. 1055. Leaflets broad.

*Woody-fruited Inga.* Clt. 1816. Tree 60 feet.

100 *I. CAULIFLORA* (Willd. spec. 4. p. 1021.) unarmed; pinnae 2, each bearing 3 pairs of oblong, unequal leaflets, with a gland

between each pair; flowers lateral, in umbels. *h. S.* Native of Para, in Brazil. Allied to *I. latifolia*.

*Stem-flowered Inga.* Tree 40 feet.

101 *I. BIGEMINA* (Willd. spec. 4. p. 1807.) unarmed; pinnæ 2, each bearing 2-3 pairs of oblong-lanceolate, acuminate leaflets; petiole glabrous, with a gland in the fork and one between each pair of leaflets; racemes panicle, terminal; legume twisted. *h. S.* Native of the East Indies. *Mimosa bigemina*, Lin. spec. 1409. Vahl. symb. 2. p. 103. — Rheed. mal. 6. t. 12.

*Two-paired-leafletted Inga.* Tree 40 feet.

102 *I. JIRINGA* (Jacq. mal. misc. 1. no. 1. p. 14. under *Mimosa*) unarmed; pinnæ 2, each bearing 3 pairs of quite smooth leaflets; panicles fascicled, axillary; heads few-flowered; legumes large, articulately twisted, black. *h. S.* Native of the East Indies, Pulo-Pinang, Malacca, &c. *Mimosa Djiringa*, Roxb. hort. beng. p. 93. Flowers white. *Jiringa* is the Malay name of the tree.

*Jiringa Inga.* Tree.

103 *I. MOLLISSIMA* (Humb. et Bonpl. in Willd. spec. 4. p. 1007.) unarmed; pinnæ 2, each bearing 4 pairs of obliquely obovate leaflets, which are clothed on both surfaces with very soft silky villi; petioles glandless, and are as well as the branches clothed with pubescence; heads of flowers pedunculate, axillary, solitary. *h. S.* Native of South America. Kunth, mim. p. 61. t. 19. H. B. et Kunth, nov. gen. amer. 6. p. 300. Legume straight, linear, obtuse, beset with hairy tomentum, with thickened margins. Stamens white.

*Very soft Inga.* Tree 20 feet.

104 *I. FASCICULATA* (Willd. spec. 4. p. 1022.) unarmed; pinnæ 2, each bearing 8-10 pairs of cultrate, 2-nerved leaflets; heads of flowers pedunculate, axillary, solitary. *h. S.* Native of Para, in Brazil. Legume linear, flat, acute, attenuated at the base, with a thickened glabrous margin.

*Fascicled-flowered Inga.* Tree 20 feet.

105 *I. CANESCENS* (Schlecht. et Cham. in Linnaea. 5. p. 593.) shrubby, unarmed, and clothed on every part with soft canescent hairs; leaves with 1 pair of pinnæ, each pinna bearing 2 pairs of leaflets, lower pair the smallest, all obliquely elliptic, obtuse, and mucronulate; heads of flowers axillary, on long peduncles. *h. S.* Native of Mexico, between Marantial and Puente del Rey. A much-branched shrub. Terminal leaflets 9 lines long. Tube of stamens exerted beyond the corolla.

*Canescent Inga.* Shrub 6 feet.

106 *I. TRIFLORA*; unarmed; pinnæ 2, each bearing 3-4 pairs of obovate, roundish, nerved, coriaceous, glabrous, shining, box-like leaflets, which are rusty beneath and oblique at the base; panicles of flowers axillary; the heads few-flowered. *h. S.* Native of Guayaquil. *Mimosa triflora*, Ruiz. et Pav. in herb. Lamb.

*Three-flowered Inga.* Shrub 6 feet.

107 *I. ADIANTIFOLIA* (Kunth, mim. p. 66. t. 21. nov. gen. amer. 6. p. 501.) unarmed; upper leaves conjugately pinnate, lower ones bipinnate, each pinna bearing from 11-13 pairs of obliquely-linear, oblong, glabrous leaflets, which are cuneate at the base; heads of flowers axillary, pedunculate, solitary, or twin. *h. S.* Native of South America, on the shady banks of the river Atabapo, in the province of Guiana. *I. discolor*, Willd. 4. p. 1023. Corolla greenish. Stamens white. Legumes unknown.

*Adiantum-leaved Inga.* Tree 20 to 30 feet.

§ 3. *Samaneæ* (*Saman* is the South American name of *A. Saman*). Leaves doubly pinnate, that is, bipinnate.

• *Paucifoliolæ* (from *paucus*, few, and *foliolum*, a leaflet). Spines none. Leaves with from 2-9 pairs of pinnæ, each pinna bearing from 2-20 pairs of leaflets.

108 *I. FILIPES* (Vent. choix. t. 38.) leaves with 2 pairs of pinnæ, each pinna bearing from 3-4 pairs of obovate, glabrous leaflets, with a gland between each pair of pinnæ; heads of flowers axillary, on very long peduncles, rather pendulous. *h. S.* Native of St. Domingo. Flowers red. Legume linear, pendulous, acute, torulose at the seeds.

*Thread-petioled Inga.* Shrub 6 feet.

109 *I. NANDINÆFOLIA* (D. C. prod. 2. p. 440.) leaves with 2 or 3 pairs of pinnæ, each bearing 2-3 pairs of oval leaflets, which are attenuated at both ends, with an obscure gland between each pair of pinnæ; heads of flowers usually twin, on long peduncles. *h. S.* Native of Brazil. The leaves are black when dried. Legume linear and incurved.

*Nandina-leaved Inga.* Shrub.

110 *I. MONILIFORMIS* (D. C. prod. 2. p. 440.) leaves with 2 pairs of pinnæ, each bearing 6-7 pairs of oval, obtuse, glabrous leaflets, with a depressed gland between each pair of pinnæ; petioles and peduncles rather pubescent; umbels of flowers axillary, on long peduncles; flowers on long pedicels; legume moniliform. *h. S.* Native of the island of Timor. Corolla tubular, and is as well as calyx glabrous. Stamens numerous.

*Moniliform-podded Inga.* Tree or shrub.

111 *I. SAPONARIA* (Willd. spec. 4. p. 1008.) leaves with 2 pairs of distant pinnæ, each bearing 2 pairs of oval, acutish leaflets, with a large, elongated gland at the base of the common petiole; heads of flowers axillary and terminal, disposed in loose, panicle corymbs. *h. S.* Native of the Moluccas, and of Cochin-china, in woods. *Mimosa saponaria*, Lour. coch. p. 653. — Rumph. amb. 4. t. 66. The bark yields excellent soap, which is used by the inhabitants of Cochin-china.

*Soap Inga.* Shrub.

112 *I. BRACHYSTACHYA* (D. C. prod. 2. p. 440.) leaves with 3 pairs of pinnæ, each bearing 3-4 pairs of oval, rather obovate, obtuse, glabrous, shining leaflets, with a gland between each of the pairs of pinnæ, and also between the upper pair of the leaflets; petioles, branches, peduncles, and flowers clothed with velvety pubescence; spikes of flowers ovate. *h. S.* Native of Brazil. Peduncles rising 2-3-together from the axils of the leaves. Leaflets reticulately veined beneath.

*Short-spiked Inga.* Tree or shrub.

113 *I. SASSA* (Willd. spec. 4. p. 1027.) leaves with 3-4 pairs of pinnæ, each bearing 12 pairs of oblong-ovate leaflets; flowers umbellately panicle; stamiferous tube exerted beyond the corolla. *h. S.* Native of Abyssinia. *Sassa*, Bruce. trav. 5. t. 4 and 5. Flowers of two forms, some with a short stamiferous column, and some with a long one, as in the next species.

*Sassa Inga.* Tree.

114 *I. ZYGIA* (D. C. legum. mem. xii. t. 65. prod. 2. p. 440.) leaves with 3-4 pairs of pinnæ, each bearing 3-4 pairs of somewhat rhomboid-ovate leaflets, with a gland at the base of the common petiole; flowers umbellately panicle; stamens monadelphous, with the tube much exerted beyond the corolla. *h. S.* Native of the West Indies. Stamiferous tube twisted when the flowers are in æstivation. Legumes unknown. From the structure of the stamens the present plant, along with *I. Sassa*, *I. virgultosa*, and *I. Bourgoni*, will probably form a distinct genus or a section, which may be called *Zygia*, as in P. Browne, jam. t. 22. f. 38.

*Yoke Inga.* Tree.

115 *I. MERTENSIOIDES* (Nees. et Mart. act. bonn. 12. p. 35. t. 5.) leaves with 2-3 pairs of pinnæ, each bearing 12-15 pairs of sessile leaflets; common petiole hairy; spikes of flowers globose, pedunculate, disposed in terminal corymbs at the tops of the branches. *h. S.* Native of Brazil, in fields. *Acacia asplenioides*, Nees. in bot. zeit. 4. p. 203. bras. reis. 2. p. 192.

Corolla 4 rarely 5-cleft. Stamens red. Legume 2-3-seeded. Allied to *I. adiantifolia*.

*Mertensia-like Inga*. Shrub 2 to 4 feet.

116 *I. como'sa* (Willd. spec. 4. p. 1026.) leaves with 3 pairs of pinnae, each bearing 9-10 pairs of ovate leaflets, which are retuse at the base; flowers disposed in paniced corymbs; petioles, branches, and flowers glabrous. *h. S.* Native of Jamaica, on rocks. *Mimosa como'sa*, Swartz, fl. ind. occ. 980. Leaves usually twin. There are holes instead of glands on the partial petioles, which are edged with hairs. Ovary pubescent. Legume glabrous. Flowers white.

*Tufted Inga*. Clt. 1818. Tree 20 to 30 feet.

117 *I. trapezifolia* (D. C. prod. 2. p. 441.) leaves with 2-4 pairs of pinnae, each bearing 5-9 pairs of rhomboid-ovate leaflets, which are glabrous and shining above, but clothed with pubescence beneath, as well as petioles, branches, peduncles, and flowers; glands between the lower pinnae, and some along the upper side of the partial petioles beneath the upper pairs of leaflets; heads of flowers pedunculate, solitary, axillary. *h. S.* Native of Cayenne. *Mimosa trapezifolia*, Vahl. ecl. amer. 3. p. 36. t. 28. Legume glabrous, twisted.

*Trapezoid-leafed Inga*. Tree.

118 *I. cyclocarpa* (Willd. spec. 4. p. 1026.) leaves with usually 9 pairs of pinnae, each bearing 20-30 pairs of leaflets, outer ones largest, with a gland in the middle of the petiole; spikes of flowers globose, pedunculate, axillary; legumes cochleate. *h. S.* Native of Caraccas. *Mimosa cyclocarpa*, Jacq. fragm. t. 34. f. 1. Flowers white. The pulp in the legume is saponaceous.

*Circle-podded Inga*. Tree 60 feet.

119 *I. cinerea* (Humb. et Bonpl. in Willd. spec. 4. p. 1024. et H. B. et Kunth, nov. gen. amer. 6. p. 304.) leaves with 5 pairs of pinnae, each bearing 6 pairs of obliquely ovate leaflets, which are glabrous above and pubescent beneath, with a gland between each pair of pinnae and one between each pair of leaflets; heads of flowers pedunculate, globose; stamens 20-22. *h. S.* Native of Caraccas. Branchlets pubescent. *Mimosa pubigera*, Poir. suppl. 1. p. 47. Stamens red. This species, with the following, will perhaps form a distinct genus.

*Grey Inga*. Tree 30 to 40 feet.

120 *I. salutaris* (H. B. et Kunth, nov. gen. amer. 6. p. 304.) leaves with 4 pairs of pinnae, each bearing 6-7 pairs of somewhat rhomboid-ovate leaflets, which are glabrous above but clothed with soft pubescence beneath, with a gland between each pair of pinnae, and also between each pair of leaflets; heads of flowers globose; stamens about 40; legumes rather torulose. *h. S.* Native of New Granada, between Turbaco and Carthagena. Stamens red.

*Salutary Inga*. Tree 20 to 30 feet.

121 *I. saman* (Willd. spec. 4. p. 1024.) leaves with 4-6 pairs of pinnae, outer pairs of pinnae bearing 6 pairs of leaflets, inner pair bearing 2 or 3 pairs; leaflets ovate-oblong, obtuse, glabrous above but pubescent beneath, as also the petioles and branchlets, with a gland between each pair of pinnae, as well as one between each pair of leaflets; heads of flowers pedunculate, axillary, lower ones solitary, the upper ones rising 3-6-together. *h. S.* Native of Caraccas and Jamaica. *Mimosa saman*, Jacq. fragm. t. 9. Legume linear, 7-8 inches long, flat on both sides, and channelled on both sutures. Branchlets striated, when young they are clothed with velvety tomentum, as well as the leaves.

*Saman Inga*. Tree 60 feet.

122 *I. pedicellaris* (D. C. prod. 2. p. 441.) leaves with 6-7 pairs of pinnae, each bearing about 20 pairs of oblong-linear, obtuse leaflets, which are glabrous above and pubescent beneath, as well as the peduncles, petioles, branches, and flowers, with a thick gland between the upper pair of pinnae, and a small one

between the upper pair of leaflets; heads of flowers usually twin, axillary; flowers pedicellate. *h. S.* Native of Cayenne. Legume oblong, straight,  $2\frac{1}{2}$  inches long and an inch broad, chinky on the inside after the seeds have fallen.

*Pedicellate-flowered Inga*. Tree 20 to 40 feet.

123 *I. pterocarpa* (D. C. prod. 2. p. 441.) leaves with 8-9 pairs of pinnae, each bearing about 12 pairs of oval, very blunt, glabrous leaflets; petioles velvety, glandless; legumes compressed, winged, nearly lanceolate, glabrous. *h. S.* Native of the island of Timor. Flowers unknown.

*Winged-fruited Inga*. Tree.

124 *I. hirsuta*; densely clothed in every part with white hairs; leaves with 3-4 pairs of pinnae, each pinna bearing many pairs of small leaflets, which are densely clothed with white hairs beneath, but glabrous above; heads of flowers solitary, axillary, on long peduncles; flowers silky. *h. S.* Native of New Spain. *Mimosa hirsuta*, Ruiz et Pav. in herb. Lamb. Stamens red, much exerted.

*Hairy Inga*. Tree.

\* \* *Spinose (spinösus, full of spines). Spines stipular. Leaves bipinnate, with from 4-7 pairs of pinnae, each pinna bearing from 10-20 pairs of leaflets.*

125 *I. leptophylla* (Tag. gen. et spec. 16. no. 203.) spines stipular, recurved; leaves with 4-7 pairs of pinnae, each pinna bearing 10-18 pairs of leaflets; heads of flowers globose, pedunculate; legumes lanceolate, nearly falcate. *h. S.* Native of South America. *Mimosa leptophylla*, Cav. Flowers all hermaphrodite. Perhaps a species of *Acacia*.

*Slender-leaved Inga*. Shrub 4 to 6 feet.

126 *I. marthæ* (Spreng. in herb. Balb. syst. 3. p. 132.) spines lateral, straight, solitary; leaves with 6-8 pairs of pinnae, each pinna bearing from 15-25 pairs of linear leaflets; petioles pubescent, bearing a gland at the base, and one between each of the 2 ultimate pairs of pinnae; heads of flowers axillary and lateral, on short peduncles, somewhat umbellately globose. *h. S.* Native of St. Martha. Young branches rising from scaly stipulaceous buds. Stipulas oblong. Spines usually absent. Corolla glabrous, 5-cleft. Stamens numerous. Legume rather falcate, compressed, 4 inches long, bearing gum on the inside.

*St. Martha Inga*. Tree.

127 *I. ? corcondiana* (D. C. prod. 2. p. 441.) spines lateral, solitary, straight; leaves with 2 pairs of pinnae, each pinna bearing 5-6 pairs of oblong, glabrous, obtuse leaflets, ultimate ones obovate, with a small gland between each pair of pinnae; heads of flowers axillary, pedunculate, somewhat umbellately-globose. *h. S.* Native of Coromandel. *Mimosa Corcondiana*, Roxb. hort. beng. p. 40. Branchlets grey, glabrous. Petioles pubescent. Flowers glabrous, 5-cleft. Stamens numerous, much exerted. Legumes unknown.

*Corcondian Inga*. Tree.

128 *I. alternifolia*; smooth; leaves bipinnate, with many pairs of pinnae, each pinna bearing many alternate, glaucous, coriaceous leaflets; spines stipular, straight; peduncles solitary, axillary; heads of flowers globular; legumes smooth, twisted in the form of a shell. *h. S.* Native of Mexico. *Mimosa circinnatus*, Sesse et Moc. in herb. Lamb.

*Alternate-leafletted Inga*. Shrub 2 to 3 feet.

\*\*\* *Multifoliolate (from. multus, many, and foliolum, a leaflet; in reference to the leaves bearing many pairs of pinnae, as well as leaflets). Unarmed trees. Leaves bipinnate, with from 10-30 pairs of pinnae, each pinna bearing above 20 pairs of leaflets.*

129 *I. pendula* (Willd. spec. 4. p. 1025.) leaves with about 20 pairs of pinnae, each pinna bearing numerous pairs of linear ciliated leaflets; petiole pubescent, bearing a gland above its

base; spikes of flowers globose, on long compressed peduncles, pendulous. *h. S.* Native of Para, in Brazil. Legume unknown. Perhaps a species of *Parkia*.

*Pendulous-spiked Inga.* Tree 30 feet.

130 *I. FILICINA* (Willd. spec. 4. p. 1025.) leaves with 10 pairs of pinnæ, each pinna bearing numerous pairs of linear, obtuse, mucronulate, shining leaflets; petioles and peduncles clothed with rusty pubescence; spikes of flowers oblong, on long peduncles, drooping. *h. S.* Native of Para, in Brazil. Perhaps a species of *Parkia*.

*Fern-like-leaved Inga.* Tree.

131 *I. FÆCULIFERA* (Hamilt. prod. fl. ind. occ. p. 61.) unarmed; leaves with usually 7 pairs of pinnæ, each pinna bearing 45-50 pairs of narrow, linear, acute leaflets, which are cordate and auricled at the base; rachis and petioles pubescent; heads of flowers oblong, on long peduncles; legume pedicellate, twin. *h. S.* Native of St. Domingo, where it is called *Pois doux*. Legume 8-10 inches long, marginated, filled with sweet yellow edible pulp inside.

*Fæcula-bearing Inga.* Tree 20 to 30 feet.

§ 4. *Annesleya* (in honour of George Annesley, Lord Mountnorris). Leaves bipinnate, with 6-50 pairs of pinnæ, each pinna bearing many pairs of linear leaflets. Anthers 2-celled; the pollen in 4 globular masses. This division will certainly form a distinct genus.

132 *I. GLANDULOSA* (Steud. nom. p. 431.) leaves with 17 pairs of pinnæ, each pinna bearing 8 pairs of linear acute leaflets, which are glabrous, as well as the corollas, with a sessile gland seated between each pair of leaflets; spikes of flowers axillary, solitary, erect, longer than the leaves. *h. S.* Native of Cayenne. *Mimosa glandulosa*, Vahl. ecl. amer. 3. p. 38. but not of Smith nor Michx. Corolla 5-cleft. Stamens numerous, monadelphous. Legumes unknown.

*Glandular Inga.* Shrub 6 to 10 feet.

133 *I. PENNA'TULA* (Schlecht. et Cham. in Linnæ. 5. p. 593.) clothed with white mealy tomentum; branches flexuous, angular, striated, pubescent; leaves with 40-50 pairs of pinnæ, each pinna bearing many pairs of small, oblong, obtuse, ciliated and densely imbricated leaflets, with a large gland beneath the lower pair of pinnæ on the petiole; prickles stipular, connate, straight, spreading, conically-subulate; heads of flowers axillary, on short peduncles; legume in an immature state fleshy; seeds immersed in pulp. *h. S.* Native of Mexico, near Hacienda de la Laguna, and also near Jalapa.

*Feathered-leaved Inga.* Shrub.

134 *I. ANOMALA* (Kunth, mim. 70. t. 22. nov. gen. amer. 6. p. 303.) leaves with 15-17 pairs of rather unequal pinnæ, each pinna bearing many pairs of linear leaflets, which are obtuse at both ends and glabrous, but adpressedly ciliated on the margins; petioles glandless, and are, as well as the branches, peduncles, and flowers puberulous; heads usually twin, few-flowered, disposed in a terminal raceme. *h. S.* Native of Mexico, near Pascuaro, and on mount Jorullo. *Mimosa grandiflora*, Lher. sert. ang. t. 30. *Acacia grandiflora*, Willd. spec. 4. p. 1074. Coll. hort. rip. 2. t. 9. Legume linear, acute, glabrous, attenuated at the base, having the margins thickened. Flowers of a pleasing red colour, sessile on the apex of the peduncle. Anthers 2-celled; the pollen in 4 globular masses.

*Var. β, pedicellata* (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 442.) flowers distinctly pedicellate at the apex of the peduncles; pedicels longer than the calyx. *h. S.* Native of Mexico. Hern. mex. p. 104. f. 1-2.

*Anomalous Inga.* Fl. May, Aug. Clt. 1729. Sh. 6 to 10 feet.

135 *I. HOUSTONI* (D. C. prod. 2. p. 442.) leaves with 5-7 pairs of pinnæ, the upper ones longer than the rest, each pinna bearing many pairs of linear leaflets, which are somewhat ob-

liquely-truncate at both extremities, and pubescent beneath; petioles glandless, and are, as well as the peduncles and flowers, clothed with rufous tomentum; heads usually twin, few-flowered, disposed in a terminal raceme. *h. S.* Native of Mexico, about Vera Cruz. *Gleditschia inermis*, Lin. spec. 1509. *Mimosa Houstoni*, Lher. sert. t. 30. *Acacia Houstoni*, Willd. spec. 4. p. 1062. Ker. bot. reg. 98. Mill. fig. t. 5. *Mimosa hirsuta*, Vahl. Flowers white. Anthers like those of *I. anomala*. Legume linear, flat, very hairy.

*Houston's Inga.* Fl. May, Aug. Clt. 1729. Sh. 6 to 10 ft.

136 *I. ? TIMORIANA* (D. C. prod. 2. p. 442.) leaves with usually about 30 pairs of pinnæ, each pinna bearing numerous pairs of linear leaflets, which are obliquely truncate at both ends, and pubescent beneath; petioles glandless, and are, as well as branchlets, velvety. *h. S.* Native of the island of Timor. Leaflets about 50 pairs. Flowers unknown. The legume is described by *the Candellia* being on a long pedicel within the calyx, oblong, compressed, flat, 8-angled, and glabrous, but as it was only on the same sheet of paper with the specimen, and separated from it, it is doubtful whether it belonged to the plant or not.

*Timor Inga.* Tree 60 feet.

*Cult.* *Inga* is a fine genus of trees and shrubs, bearing delicate compound leaves, and beautiful flowers; for which some of the species are much admired. They are all increased by young cuttings, which should be taken off at a joint, and placed in a pot of sand, placing a bell-glass over them, then the pot to be plunged in heat.

CCXXVI. *PARKIA* (in memory of Mungo Park, the celebrated African traveller). R. Brown, in Denham et Clapp. trav. append. p. 29.—*Inga* species of D. C.—*Mimosa* species of Willd.

LIN. SYST. *Monadelphina*, *Dicandria*. Calyx tubular, bilabiate, the mouth imbricate in æstivation. Petals 5, nearly equal, the upper one a little broader than the rest, connately imbricated in æstivation. Stamens 10, hypogynous, monadelphous. Legume many-seeded, 2-valved, separated into 1-seeded divisions, filled with farinaceous pulp.—African and East Indian unarmed trees, with bipinnate leaves with many pairs of pinnæ, and each of the pinna bearing many pairs of leaflets, with minute stipulas, axillary pedunculate spikes of vermilion flowers, which are seated on a club-shaped or orbicular receptacle, the lower ones usually male.

1 *P. AFRICANA* (R. Brown, l. c.) leaves with usually 20 pairs of pinnæ, each pinna bearing about 30 pairs of obtuse pubescent leaflets, with a gland at the base of the petiole, and with a small umbilicate gland between 2 or 3 of the upper pairs of leaflets; heads of flowers biglobular. *h. S.* Native of Africa, in various places, particularly on the western coast, in the kingdoms of Benin and Waree; and also of North Africa, in Soudan, where it is called *Douro*. *Inga biglobosa*, Beauv. fl. d'ow. 2. p. 53. t. 90. D. C. prod. 2. p. 442. *Mimosa biglobosa*, Jacq. amer. t. 176. f. 87. *Mimosa taxifolia*, Pers. ench. 2. p. 266. In Soudan the seeds are roasted as we roast coffee, then bruised, and allowed to ferment in water; when they begin to become putrid they are well washed and pounded, the powder made into cakes, somewhat in the manner of our chocolate; they form an excellent sauce for all kinds of food. The farinaceous matter surrounding the seeds is made into a pleasant drink, and they also make it into a kind of sweetmeat.

*African Nitta-tree.* Fl. Feb. Clt. 1822. Tree 30 to 40 ft.

2 *P. UNIGLOBOSA* (G. Don, in Loud. hort. brit. p. 277.) leaves bipinnate, pubescent, with many pairs of pinnæ, each pinna bearing many pairs of leaflets; heads of flowers globular, on very long peduncles. *h. S.* Native of Sierra Leone, where it is

called *Locust-tree*. Heads of flowers pendulous. Flowers of a vermilion colour. The pulp within the pods is sweet and farinaceous, and is eaten by the natives of Africa. This is probably the *Nitta* mentioned by Mr. Mungo Park.

*One-globed-flowered Nitta-tree*. Fl. Feb. Clt. 1822. Tr. 30 ft.

3 P. ROXBURGHII; leaves with usually 20-24 pairs of pinnae, each pinna bearing 50-65 pairs of linear, obtuse, rather falciform leaflets, with a gland between 2 or 3 of the upper pairs of pinnae; rachis pubescent; heads of flowers club-shaped. h. S. Native of Silhet, in the East Indies. *Inga biglobosa*, Roxb. Flowers vermilion.

*Roxburgh's Nitta Tree*. Tree 30 to 40 feet.

*Cult.* See *Inga* for culture and propagation, p. 396.

CCXXVII. SCHIRANKIA (in honour of Francis Von Paula Schrank, a celebrated German botanist, author of numerous botanical works). Willd. spec. 4. p. 1041. D. C. prod. 2. p. 443.

LIN. SYST. *Polygamia, Monœcia*. Flowers polygamous. Petals 5, joined into a cleft corolla. Stamens 8-10, free. Legume muricately echinate, tetragonal, and as if it were 4-valved in consequence of the valves being divisible into 2 parts longitudinally. Seeds numerous, oblong.—Herbs, with tuberous roots, and angular stems. Petioles and legumes beset with hooked prickles. Leaves bipinnate, sensible to the touch, as those of the sensitive plants. Flowers rose-coloured, collected into globose heads.

1 S. ACULEATA (Willd. spec. 4. p. 1041.) stem tetragonal; leaves with 2-3 pairs of pinnae, each pinna bearing numerous pairs of leaflets; legumes acute, a little longer than the peduncles; heads of flowers solitary. u. S. Native of Mexico, about Vera Cruz. *Mimosa quadrivalvis*, Lin. spec. 1508. Mill. fig. t. 182. f. 1. Banks, rel. Houtt. t. 25. Flowers red. Roots creeping.

*Prickly Schrankia*. Fl. July, Aug. Clt. 1733. Pl. 1 to 2 ft.

2 S. LEPTOCARPA (D. C. legum. mem. xii. prod. 2. p. 443.) stem tetragonal; leaves with 2-3 pairs of pinnae, each pinna bearing many pairs of leaflets; legumes ending in a long acumen, 10 times the length of the peduncles; heads of flowers solitary or twin. u. S. Native of St. Domingo. Prickles of the stem and petioles hooked, but those on the legume are subulate and straight. Flowers red.

*Slender-fruited Schrankia*. Pl. 1 to 2 feet.

3 S. HAMATA (Humb. et Bonpl. in Willd. spec. 4. p. 1042.) stem pentagonal; leaves with 4 pairs of pinnae, each pinna bearing many pairs of leaflets, which are unequal at the base; legumes ending in a beak-like acumen; heads of flowers on very short peduncles. u. S. Native of South America, on the banks of the river Magdalena near Mompox. H. B. et Kunth, nov. gen. amer. 6. p. 260. Flowers red.

*Hooked-prickled Schrankia*. Pl. 1 to 2 feet.

4 S. DISTACHYA (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 443.) stems pentagonal; leaves with 6 pairs of pinnae, each pinna bearing many pairs of leaflets; legumes acute at both ends, 3 times the length of the peduncles; heads of flowers twin. u. S. Native of New Spain. Flowers red.

*Two-spiked Schrankia*. Pl. 1 to 2 feet.

5 S. UNCINATA (Willd. spec. 2. p. 443.) stem pentagonal; leaves with 6 pairs of pinnae, each pinna bearing many pairs of leaflets; legumes ending in a beak-like acumen at the apex, twice the length of the peduncles; heads of flowers solitary or twin. u. F. Native of North America, from Virginia to Florida. *Mimosa horridula*, Michx. fl. bor. amer. 2. p. 154. Vent. choix. t. 28. *Mimosa Instia*, Walt. car. p. 252. Flowers red.

*Uncinate-prickled Schrankia*. Fl. July, Aug. Clt. 1789. Pl. 1 to 2 feet.

*Cult.* All the species of this genus are worth cultivating on account of their leaves, which fall at the slightest touch, as those of the sensitive plants. They grow best in a mixture of loam, peat, and sand, and may be propagated by young cuttings planted in sand, with a bell-glass placed over them in heat, or they may be increased by separating the tubers of the roots.

CCXXVIII. DARLINGTONIA (in honour of Dr. Darlington, an American botanist). D. C. in ann. sc. nat. jan. 1825. 4. p. 97. legum. mem. xii. no. 6. prod. 2. p. 443.

LIN. SYST. *Pentandria, Monogynia*. Flowers hermaphrodite. Petals 5, distinct. Stamens 5. Legume 2-valved, dry, continuous, lanceolate, few-seeded.—Smooth, unarmed, perennial herbs, natives of North America, with bipinnate leaves, having numerous pairs of pinnae and leaflets. Heads of flowers axillary, solitary, pedunculate. Flowers white. Legumes crowded, short, 4-8 lines long.

1 D. BRACHYLOBA (D. C. legum. mem. xii. t. 66.) plant herbaceous, unarmed, glabrous; leaves with 6-8 pairs of pinnae, each pinna bearing 16-24 pairs of linear leaflets, with a gland seated between the lower pair of pinnae; heads of flowers solitary, axillary, pedunculate; legumes straightish, lanceolate. u. F. Native of meadows in the region of Illinois and Kentucky. *Acacia brachyloba*, Willd. spec. 4. p. 1071. *Mimosa Illinoisensis*, Michx. fl. bor. amer. 2. p. 254. Legume glabrous, 6-7 lines long, and 2½ broad. Flowers white.

*Short-podded Darlingtonia*. Fl. Jul. Oct. Clt. 1803. Pl. 1½ ft.

2 D. GLANDULOSA (D. C. l. c.) plant herbaceous, glabrous, unarmed; leaves with 12-14 pairs of pinnae, each pinna bearing 20-30 pairs of linear leaflets, with a gland situated on the petiole between each of the pairs of pinnae; heads of flowers solitary, pedunculate, axillary; legumes falcate. u. F. Native of the plains along the banks of the rivers Tennessee and Mississippi. *Mimosa glandulosa*, Michx. fl. bor. amer. 2. p. 254. Vent. choix. t. 27. but not of Smith. *Acacia glandulosa*, Willd. spec. 4. p. 1071. *Mimosa contortuplicata*, Zucc. obs. cent. 1. no. 100. Flowers white.

*Glandular Darlingtonia*. Fl. Sept. Oct. Clt. 1806. Pl. 1½ ft.

3 D. INTERMEDIA (Torrey in ann. lyc. 2. p. 191.) unarmed, herbaceous, and glabrous; leaves with 8-9 pairs of pinnae, each pinna bearing many pairs of oblong-linear leaflets, with a gland seated on the petiole between the lower pair of pinnae; heads of flowers solitary, axillary, pedunculate; legumes falcate. u. F. Native of North America, on the Canadian river. Flowers white.

*Intermediate Darlingtonia*. Pl. 1 foot.

*Cult.* Peat and sand, mixed with some vegetable mould is the best soil for the species of *Darlingtonia*. They should be grown in pots, and placed among the Alpine plants, and they may be increased by dividing at the root, or by young cuttings planted in sand, with a bell-glass placed over them.

CCXXIX. DESMANTHUS (from *δεσμη*, *desme*, a bundle, and *ανθος*, *anthos*, a flower; in reference to the flowers, which are collected into bundles or spikes). Willd. spec. 4. p. 1044. Kunth, mim. p. 115. D. C. prod. 2. p. 443.

LIN. SYST. *Polygamia, Monœcia*. Flowers polygamous. Calyx 5-toothed. Petals 5, distinct, oblong-spatulate or joined, but usually wanting in the neuter flowers. Stamens 10, rarely 5, with the filaments in the lower flowers of the spike sterile, membranous, and dilated or filiform. Legume dry, continuous, 2-valved.—Herbs or shrubs, with bipinnate leaves, and linear leaflets. Spikes of flowers axillary, pedunculate, ovate or cylindrical. Flowers white, but with the fertile filaments usually yellow. Perhaps it would have been better to have divided the present genus into three separate genera instead of sections.

SECT. I. NEPTUNIA (so called on account of the species contained in this section being inhabitants of lakes and ponds). Lour. coch. p. 654. D. C. legum. mem. xii. prod. 2. p. 444. Legume oblong, 4-6-seeded, broadest at the base. Sterile filaments all petaloid.—Prostrate, usually rooting, aquatic herbs, furnished with bipinnate leaves, which are sensible to the touch, as those of the sensitive plants, and axillary solitary peduncles. Leaves with 2-3 pairs of pinnæ, each pinna bearing 10-12 pairs of leaflets.

1 *D. LACUSTRIS* (Willd. spec. 4. p. 1044.) stems creeping, terete; leaves with 3 pairs of pinnæ, each pinna bearing many pairs of leaflets; peduncles bracteate; spikes of flowers ovate. *W. S.* Native of South America, near Mompox, floating in stagnant water, as well as in the river Magdalena. *Mimosa lacustris*, Humb. et Bonpl. pl. equin. 1. t. 16. *Mimosa aquatica*, Pers. ench. no. 58. Sterile stamens white tipped with yellow.

*Lake Desmanthus.* Fl. July. Clt. 1818. Pl. fl.

2 *D. NATANS* (Willd. l. c.) stems terete, creeping, inflated in parts; leaves with 2-3 pairs of pinnæ, each pinna bearing many pairs of leaflets; spikes of flowers ovate; peduncles naked, or only furnished with one bractea. *W. S.* Native of the East Indies and Cochinchina, floating in stagnant water. *Mimosa natans*, Roxb. cor. 2. t. 119. Andr. bot. rep. 629. *Neptunia oleracea*, Lour. coch. p. 804. *Mimosa prostrata*, Lam. dict. 1. p. 10. —Pluk. alm. t. 307. f. 4.—Rheed. mal. t. 20. Sterile stamens yellow.

*Floating Desmanthus.* Fl. July, Sept. Clt. 1800. Pl. fl.

3 *D. STOLONIFERA* (D. C. prod. 2. p. 444.) stems terete, creeping; leaves with 2-3 pairs of pinnæ, each pinna bearing many pairs of leaflets; spikes of flowers nearly globose; peduncles long, naked, or furnished with one bractea in the middle. *W. S.* Native of Senegal, floating in stagnant water. The plant throws out large branched roots. Stamens long, petaloid. *Mimosa stolonifera*, Perr. in litt. *Mimosa aquatica*, Bacle in litt.

*Stolon-bearing Desmanthus.* Pl. fl.

4 *D. POLYPHYLLUS* (D. C. prod. 2. p. 444.) stem erect? angular; leaves with 1 pair of pinnæ, each pinna bearing many pairs of leaflets; peduncles furnished with 2 bracteas each; spikes of flowers ovate. *W. S.* Native country unknown. Leaflets 30-40 pairs. Legume oval-oblong, tapering into a stipe at the base, 5-seeded.

*Many-leafletted Desmanthus.* Pl. fl.

5 *D. TRIQUETRUS* (Willd. spec. 4. p. 1045) stems prostrate, compressed, triquetrous at the base; leaves with 2-3 pairs of pinnæ, each pinna bearing 12 pairs of leaflets; spikes of flowers globose; peduncles furnished with 2 deciduous bracteas. *W. S.* Native of the East Indies. *Mimosa triquetra*, Vahl. symb. 3. p. 101. *Mimosa natans*, Lin. fil. suppl. 439.

*Triquetrous-stemmed Desmanthus.* Fl. July. Clt. 1820. Pl. fl.

6 *D. PLENUS* (Willd. spec. l. c.) stems prostrate, compressed; leaves with 2-4 pairs of pinnæ, each pinna bearing 12 pairs of leaflets; peduncles bracteate. *W. S.* Native of Mexico, about Vera Cruz, in water. *Mimosa plena*, Lin. spec. 1502. Mill. fig. t. 182. f. 2. Banks, rel. Hout. t. 23. Bracteas 2 on each peduncle, broad, ovate-lanceolate, acuminate. Flowers white and yellow.

*Full Desmanthus.* Fl. July, Sept. Clt. 1733. Pl. fl.

SECT. II. DESMANTHEA (an alteration from the generic name). D. C. legum. mem. xii. prod. 2. p. 444. Legumes linear, 10-15-seeded. Sterile stamens almost filiform. Neuter flowers usually apetalous.—Shrubs or subshrubs, with leaves which are not sensible to the touch as those of the last section. Leaves bipinnate, with from 2-5 pairs of pinnæ, each pinna bearing from 12-15 pairs of leaflets.

7 *D. DEPRESSUS* (Humb. et Bonpl. in Willd. spec. 4. p. 1516.)

stems suffruticose, prostrate; leaves with 2 pairs of pinnæ; petiole bearing one gland at the apex; spikes capitate, few-flowered; flowers decandrous; legume narrow, linear. *h. S.* Native of Peru, near Moche, and of Guadaloupe. Kunth, mim. p. 115. t. 35. nov. gen. amer. 6. p. 262. *Mimosa depréssa*, Poir. suppl. 1. p. 58. Flowers white.

*Depressed Desmanthus.* Shrub prostrate.

8 *D. DIFFUSUS* (Willd. l. c.) stems suffruticose, prostrate; leaves with 4-5 pairs of pinnæ; spikes capitate, few-flowered; flowers pentandrous; legumes narrow, linear. *h. S.* Native of New Andalusia, in shady places near Cumana. H. B. et Kunth, nov. gen. amer. 6. p. 262. *Mimosa Pernambucana*, Lin. spec. 1503.—Pluk. phyt. t. 307. f. 3. Very nearly allied to the following species. Flowers white.

*Diffuse Desmanthus.* Fl. July, Aug. Clt. 1731. Sh. pros.

9 *D. LEPTOPHYLLUS* (H. B. et Kunth, nov. gen. amer. 6. p. 264.) stems suffruticose; leaves with 6-7 pairs of pinnæ, each pinna bearing 16-20 pairs of leaflets; acute, ciliated leaflets, with a gland seated on the petiole between the lower pair of pinnæ; herbage few-flowered; flowers decandrous; legumes linear, elongated. *h. S.* Native of Cumana, near the bays. Flowers white.

*Slender-leaved Desmanthus.* Shrub 1½ foot.

10 *D. VIRGATUS* (Willd. spec. 4. p. 1047. exclusive of the synonymes of Pluk. and Rheed.) stems suffruticose, erect, angular; leaves with 3-4 pairs of pinnæ, with a gland situated between the lower pair; peduncles naked; spikes few-flowered, capitate; flowers decandrous; legume narrow, linear, 25-30-seeded. *h. S.* Native of the East Indies. *Mimosa virgata*, Lin. spec. 1502. Jacq. hort. vind. t. 80. Sims, bot. mag. 2454. Flowers white. Anthers yellow.

*Twiggy Desmanthus.* Fl. June, Aug. Clt. 1774. Shrub 1 to 2 feet.

11 *D. STRICTUS* (Bertol. vir. bon. 1824. p. 49.) stem suffruticose, erect, angular; leaves with 2-3 pairs of pinnæ, with a gland seated on the petiole beneath the lower pair; peduncles naked; spikes capitate, few-flowered; flowers decandrous; legume narrow, linear, 15-20-seeded. *h. S.* Native of the West Indies. *Mimosa angustisiliqua*, Lam. dict. 1. p. 10. Flowers white. Very like *D. virgatus* according to Bess. cat. hort. crem. 1816. p. 49. of which it is perhaps only a variety.

*Straight-stemmed Desmanthus.* Fl. June, Aug. Clt. 1800. Shrub 1 to 2 feet.

12 *D. PUNCTATUS* (Willd. l. c.) stem suffruticose, erect; leaves with 4-5 pairs of pinnæ, with a gland situated on the petiole beneath the lower pair; spikes of flowers ovate; peduncles furnished with deciduous bracteas at the base; flowers decandrous; legume linear-oblong, rather oblique at the base, hardly 5 times longer than broad. *h. S.* Native of Jamaica, St. Domingo, and Guadaloupe. *Mimosa punctata*, Lin. spec. 1502.—Comm. hort. 1. t. 31. Flowers white. The legume has the form of those species contained in the section *Neptunia*, but it contains from 12-15 seeds as in those of the present section.

*Dotted Desmanthus.* Fl. June, July. Clt. 1686. Shrub 2 to 3 feet.

13 *D. TENELLUS* (D. C. prod. 2. p. 445.) stems rather diffuse; leaves with 3-4 pairs of pinnæ, having a gland situated on the petiole beneath the lower pair; peduncles naked, shorter than the petioles; legume linear, 10-12-seeded, hardly 5 times longer than the breadth. *h. S.* Native of the East Indies. Legume 3-9 lines long, and 2 lines broad.

*Weak Desmanthus.* Shrub 1 foot.

SECT. III. DICHROSTACHYS (from *δίς*, *dis*, two, *χρῶμα*, *chroma*, colour, and *στάχυς*, *stachys*, a spike; in reference to the two colours of the spikes of flowers, from the white and yellow stamens).

D. C. legum. mem. xii. prod. 2. p. 445. Legume linear, twisted or somewhat falcate? Sterile filaments linear, and elongated; anthers of the fertile ones bearing a pedicellate gland at the apex of each. Petals 5, distinct or joined?—Shrubs, having the branches usually spinescent, with bipinnate pubescent leaves, bearing from 5-10 pairs of pinnæ, and each pinna bearing many pairs of leaflets, furnished with glands between the pairs of pinnæ, especially between the lower ones. Flowers disposed in oblong-cylindrical 2-coloured spikes, in consequence of the sterile stamens being white or variously coloured, and the fertile ones yellow.

14 D. DIVERGENS (Willd. spec. 4. p. 1048.) leaves with 8 pairs of pinnæ, each pinna bearing 10-15 pairs of ciliated leaflets; spikes of flowers twin, pendulous, cylindrically obovate; legumes twisted.  $\frac{1}{2}$ . S. Native of Abyssinia. Bruce, trav. 5. t. 61.

*Diverging Desmanthus.* Fl. June, July. Clt. 1816. Shrub 3 to 6 feet.

15 D. LEPTOSTACHYS (D. C. legum. mem. xii. prod. 2. p. 445.) leaves with 8 pairs of pinnæ, each pinna bearing 20-30 pairs of ciliated leaflets, furnished with a stipitate gland between each pair of pinnæ; petioles and peduncles hairy; spikes of flowers usually twin, cylindrically shorter than the leaves.  $\frac{1}{2}$ . S. Native of Senegal and Sierra Leone. Sieb. pl. exsicc. seneg. 47. Very nearly allied to the preceding species, but differs from the plant figured by Bruce, in the leaflets being more numerous, and in the spikes of flowers being more slender, and not pendulous, and, lastly, in the sterile filaments being filiform.

*Slender-spiked Desmanthus.* Fl. July. Clt. 1825. Shrub 3 to 5 feet.

16 D. CALLISTACHYS (D. C. prod. 2. p. 445.) leaves with 5 pairs of pinnæ, each pinna bearing about 20 pairs of leaflets; petioles and peduncles hairy; glands on the petiole sessile; spikes solitary, cylindrical, erect.  $\frac{1}{2}$ . S. Native country unknown. Spikes of flowers rose-coloured at the bottom, but yellow at the top. Sterile filaments linear. Anthers furnished with a black gland each. The specimens of this plant were collected in the gardens of Teneriffe.

*Beautiful-spiked Desmanthus.* Fl. June, July. Clt. 1824. Shrub 2 to 4 feet.

17 D. TRICHOSTACHYS (D. C. legum. mem. xii. t. 67.) leaves with 10 pairs of pinnæ, each pinna bearing 20 pairs of ciliated leaflets; petioles and peduncles puberulous; glands on the petioles pedicellate; spikes cylindrical, erect, interrupted at the base, rather longer than the leaves.  $\frac{1}{2}$ . S. Native of Senegal. Mimosa bicolor, Bacle in litt. 1820. Mimosa varia, Perr. in litt. 1825. Branches unarmed according to the specimen. Spikes 2 inches long. Sterile filaments very long, and hair-formed.

*Hair-spiked Desmanthus.* Shrub 3 to 4 feet.

18 D. CINEREUS (Willd. spec. 4. p. 1048.) leaves with 8-10 pairs of pinnæ, each pinna bearing about 12-15 pairs of ciliated leaflets; petioles pubescent; spikes of flowers solitary, nodding, rather shorter than the leaves; corolla gamopetalous, 5-toothed; legume linear, falcate, somewhat transversely loculate inside.  $\frac{1}{2}$ . S. Native of the East Indies. Mimosa cinerea, Lin. spec. 1505. Roxb. cor. 2. t. 174.—Burm. zeyl. t. 2. Spikes rose-coloured at the bottom and yellow at the apex. Branches white, when young pubescent.

*Cinereous Desmanthus.* Fl. June, July. Clt. 1739. Shrub 6 to 7 feet.

19 D. NUTANS (D. C. prod. 2. p. 446.) branches spiny, when young clothed with hairy tomentum; leaves with 10 pairs of pinnæ, each pinna bearing 20-25 pairs of ciliated leaflets; petioles villous; spikes pedunculate, rather shorter than the leaves, nodding; flowers decandrous, the filaments in the lower ones castrate and petaloid.  $\frac{1}{2}$ . S. Native of Senegal. Mimosa

nutans, Pers. ench. 2. p. 115. This is perhaps the same as *D. leptostachys*, but differs in the spines being straight, spreading, simple, hairy, but at length becoming glabrous.

*Nodding-spiked Desmanthus.* Shrub 3 to 4 feet.

*Cult.* A mixture of peat, loam, and sand suits the species of this genus, and young cuttings root readily if planted in a pot of sand, with a bell-glass placed over them. The kinds belonging to section 1. *Neptunia*, being aquatics with sensitive leaves, should be grown in tubs or large pans, with 4 or 5 inches of mould in the bottom, and filled up with water. The tubs or pans should be placed in a warm situation in a stove, or in a hot-bed in summer, where the plants will thrive and produce seeds.

CCXXX. ADENANTHERA (from *ἀδην*, *aden*, a gland, and *ανθήρα*, *anthera*, an anther; in reference to the anthers, which are terminated by a deciduous, pedicellate gland each). Lin. gen. no. 526. Lam. ill. t. 334. D. C. prod. 2. p. 446.

LIN. SYST. *Decandria*, *Monogynia*. Flowers hermaphrodite. Calyx 5-toothed. Petals 5, lanceolate, sessile. Stamens 10. Anthers terminated by a pedicellate, deciduous gland each. Legume compressed, linear, membranous, transversely many-celled inside, somewhat swollen above the seeds, destitute of pulp.—Trees or shrubs, with bipinnate leaves and racemose spikes of flowers. This genus is related to *Cassia*, according to Bronn. diss. p. 130. but differs in the petals being valvate in aestivation.

1 A. PAVONINA (Lin. spec. 553.) leaflets oval, obtuse, glabrous on both surfaces; legumes rather falcate.  $\frac{1}{2}$ . S. Native of the East Indies. Jacq. coll. 4. p. 212. t. 23. Rumph. amb. 3. t. 109. Flowers white and yellow mixed. Legume falcate, 10-12-seeded. Seeds highly polished, of a vivid scarlet colour, with a circular streak in the middle on each side. This is one of the largest trees in the East Indies, and its timber is much valued on account of its solidity. The natives use the powder of the leaves in their ceremonies. The seeds, besides being eaten by the common people, are of great use to jewellers and goldsmiths, on account of their equality, for weights, each of them weighing 4 grains; they also make a cement by beating them up with borax.

*Peacock Adenanthera.* Fl. May, Aug. Clt. 1759. Tr. 100 ft.

2 A. FALCATA (Lin. spec. 550.) leaflets oval, acutish, tomentose beneath; legume straight.  $\frac{1}{2}$ . S. Native of the Moluccas. Rumph. amb. 3. t. 111. Petals 4, yellowish. Seeds blackish.

*Falcate Adenanthera.* Clt. 1812. Tree 60 feet.

† *Species not sufficiently known.*

3 A.? BONPLANDIANA (H. B. et Kunth, nov. gen. amer. 6. p. 311.) leaflets oblong, puberulous beneath; spikes of flowers twin, nearly terminal.  $\frac{1}{2}$ . S. Native of Caraccas, in shady humid woods, near Higuerote and Guriepe. Legume unknown. Perhaps a species of *Prosopis*. Corolla green.

*Bonpland's Adenanthera.* Tree 25 feet.

4 A.? CIRCINNALIS (D. C. prod. 2. p. 446.) leaflets ovate, acute, tomentose beneath? legumes circinnately incurved.  $\frac{1}{2}$ . S. Native of the Moluccas. Clypearia rubra, Rumph. amb. 3. t. 112.

*Circinnate-podded Adenanthera.* Tree 30 feet.

*Cult.* See *Ungu* for culture and propagation, p. 396.

CCXXXI. PROSOPIS (from *προσωπον*, *prosopon*, a mask; a name given by Dioscorides to *Arctium lappa*). Lin. mant. 68. Kunth, mim. 106. D. C. prod. 2. p. 446.

LIN. SYST. *Polygamia*, *Monœcia*. Flowers polygamous. Calyx 5-toothed. Petals 5, free. Stamens 10, with the filaments hardly joined at the base. Legume continuous, filled

with pulp inside, linear, rather compressed, swollen above the seeds, and at length separable into 1-seeded divisions.—Unarmed or prickly trees or shrubs, with bipinnate leaves, having from 1-4 pairs of pinnae, each pinna bearing many pairs of oblong-linear leaflets, and pedunculate elongated axillary spikes of flowers. Flowers rather distant on the spikes, greenish, whitish, or yellow. The pulp in the pods of all the species is eaten by the natives in the various countries of their growth. The pericarp almost entirely consists of tannin.

SECT. I. ADENO'PIS (from *ἀδηνάδενος*, *aden adenos*, a gland; in reference to the anthers, which are terminated by a deciduous gland each, as in the genus *Adenanthëra*). D. C. prod. 2. p. 446. Anthers tipped by a deciduous gland each. Indian trees, furnished with a few scattered prickles.

1 *P. SPICIGERA* (Lam. mant. 68.) prickles scattered; leaves with 1-2 pairs of pinnae, each pinna bearing 7-10 pairs of oblong-linear, obtuse leaflets. *h. S.* Native of the coast of Coromandel. Roxb. cor. 1. t. 63.—Burm. ind. t. 25. f. 3. Flowers yellow. Legume linear, terete, attenuated at both ends, pendulous, filled with mealy pulp, which the natives of the coast of Coromandel eat; it has a sweetish agreeable taste, and may be compared to that of the Spanish *Algaroba*, or locust-tree, *Ceratonia siliqua*.

*Var. β*, *adenanthëra* (D. C. prod. 2. p. 446.) prickles scattered, compressed at the base; leaves with 1-2 pairs of pinnae, each pinna bearing 10-11 pairs of linear, acute leaflets. *h. S.* Native of the coast of Coromandel. *Adenanthëra aculeata*, Roxb. hort. beng. 90. Both this and the species are called *Tshamie* by the Telingas, and *Vanni-marum* by the Tamuls.

*Spike-bearing Algaroba.* Clt. 1812. Tree 40 to 50 feet.

SECT. II. ALGARO'BA (*Algaroba* is the name in South America for several of the species). D. C. prod. 2. p. 446. Anthers without glands.—American trees, which are either destitute of spines, or when present they are axillary.

2 *P. HORRIDA* (Kunth, mim. p. 106. t. 33. nov. gen. amer. 6. p. 306.) spines stipular, twin, very long; leaves with 2-3 pairs of pinnae, each pinna bearing 10-12 pairs of oblong leaflets, which are pubescent on both surfaces; rachis of leaves bearing 2 or 3 glands. *h. S.* Native at the bottom of the Andes, on the eastern side, and in the sand on the sea-shore along the Pacific ocean, where it is called *Algaroba* by the natives, who eat the pulp contained in the pods. Flowers white. Legume torulose, 17-24-seeded.

*Horrid Algaroba.* Tree 20 feet.

3 *P. GLANDULOSA* (Torrey, in ann. lyc. 2. p. 192. t. 2.) spines thick, cylindrically conical; leaves with 1 pair of pinnae, each pinna bearing 6-7 distant pairs of linear, rather falcate, obtuse, glabrous, rather coriaceous leaflets, with glands between the pair of pinnae, as well as between the pairs of leaflets; legumes straight, torulose, pulpy inside; spikes of flowers cylindrical. *h. F.* Native of North America, on the Canadian river.

*Glandular Algaroba.* Tree.

4 *P. INERMIS* (H. B. et Kunth, nov. gen. amer. 6. p. 307.) unarmed; leaves with 3 pairs of pinnae, each pinna bearing 6-13 pairs of linear oblong leaflets, which are finely pubescent beneath; rachis of leaves bearing 2-3 small, cup-shaped glands. *h. S.* Native of Peru. Flowers greenish white.

*Unarmed Algaroba.* Tree 60 feet.

5 *P. DULCIS* (Kunth, mim. p. 110. t. 34. nov. gen. amer. 6. p. 307.) spines stipular, or almost wanting or deciduous; leaves with 1-2 pairs of pinnae, each pinna bearing 18-25 pairs of glabrous leaflets, but which are a little ciliated at the apex; rachis of leaves bearing 1-2 small, convex glands. *h. S.* Native of New Spain. *Acácia laevigata*, Willd. spec. 4. p. 1059. and A.

*edulis*, Willd. enum. p. 1056. Corolla green. Filaments white. Legume torulose, containing 13-15 seeds. The pulp contained in the pods is very sweet, and is eaten by the inhabitants of the countries where the trees grow.

*Sweet-podded Algaroba.* Clt. 1818. Tree 40 to 50 feet.

6 *P. MICROPHYLLA* (H. B. et Kunth, nov. gen. amer. 6. p. 308.) spines stipular, subulate; leaves with 2-4 pairs of pinnae, each pinna bearing from 11-18 pairs of minute, oblong, pubescent, canescent leaflets; rachis of leaves bearing 2 glands. *h. S.* Native of Mexico, between Valladolid and Toluco. This is perhaps a species of *Ingá*, according to Kunth.

*Small-leafletted Algaroba.* Tree 20 feet.

7 *P. DUBIA* (H. B. et Kunth, nov. gen. amer. 6. p. 309.) unarmed; leaves with 12 pairs of pinnae, each pinna bearing 11-21 pairs of linear-oblong, acute, glabrous leaflets; rachis of leaves biglandular. *h. S.* Native of New Granada, near Turbaco. *Leg. ....* spirally convolute.

*Doubtful Algaroba.* *Spine ...*

8 *P. PALLIDA* (Kunth, mim. p. 110. t. 34. nov. gen. amer. 6. p. 308.) spinose or unarmed; leaves with 2 pairs of pinnae, each pinna bearing 11-12 pairs of linear, obtuse, pubescent leaflets; rachis of leaves bearing 2-3 concave glands; spikes of flowers solitary, filiform, exceeding the leaves. *h. S.* Native of South America, on hills about Bracamora, near Passo de Matara.

*Pale Algaroba.* Tree.

9 *P. SILIQUASTRUM* (D. C. prod. 2. p. 447.) spines stipular, twin, straight; leaves with 2-3 pairs of pinnae, each pinna bearing numerous pairs of linear, obtuse leaflets; legumes compressed, falcate. *h. S.* Native of Chili, where it is called *Algaroba de Chile*, and where the inhabitants eat the pulp contained in the pods. *Acácia siliquastrum*, Lag. nov. gen. et spec. 16. no. 205. Flowers white?

*Siliqua-podded or Chili Algaroba.* Tree 30 to 40 feet.

10 *P. FLEXUOSA* (D. C. prod. 2. p. 447.) spines stipular; leaves with only 1 pair of pinnae, each pinna bearing usually about 8 pairs of glabrous, linear, obtuse leaflets, which are narrowest at the base; legume rather terete, torulose. *h. G.* Native of Chili. *Acácia flexuosa*, Lag. nov. gen. et spec. 16. no. 205. Very like the preceding species.

*Flexuous Algaroba.* Tree.

11 *P. CUMANENSIS* (Kunth, mim. 106. nov. gen. amer. 6. p. 310.) unarmed; leaves with 1 pair of pinnae, each pinna bearing many pairs of linear leaflets, which are obtuse at both ends, and glabrous as well as the petioles, with a sessile, oblong, obtuse gland, seated on the petiole between the pair of pinnae; spikes filiform; flowers opposite. *h. S.* Native of Cumana. *Acácia Cumanensis*, Willd. spec. 4. p. 1058. Legumes unknown. Leaflets 11 pairs on each pinna, ex Willd., but in Bonpland's specimen there are 22 pairs on each of the pinna.

*Cumana Algaroba.* Clt. 1822. Tree 20 feet.

12 *P. BRACTEOLATA* (D. C. prod. 2. p. 447.) spines stipular, straight; leaves with 2 pairs of pinnae, each pinna bearing from 16-18 pairs of linear leaflets, which are obtuse at both ends, and are as well as petioles glabrous, with a sessile gland on the petiole between the pairs of pinnae; spikes filiform, bearing subulate erect bractcoles beneath the flowers. *h. S.* Native of St. Martha. Habit as well as flowers like that of the preceding species, from which it is hardly distinct.

*Bracteolate-flowered Algaroba.* Tree.

13 *P. DOMINGENSIS* (D. C. prod. 2. p. 447.) spines stipular, straight, small; leaves with 1 pair of pinnae, each pinna bearing from 16-18 pairs of linear leaflets, which are obtuse at both ends and glabrous as well as the petioles, with a sessile gland between the pair of pinnae; spikes filiform; legumes compressed, constricted between the seeds. *h. S.* Native of St. Domingo, where it is called *Bohahunda*, and therefore perhaps

the note in Coll. hort. rip. p. 2. no. 3. is referrible to this species.

*St. Domingo Algaroba.* Clt. 1818. Tree.

14 *P. JULIFLORA* (D. C. prod. 2. p. 447.) spines stipular, straight, small; leaves with 1-2 pairs of pinnæ, each pinna bearing from 18-20 pairs of linear leaflets, which are acutish at both ends, and are glabrous as well as petioles, with a sessile gland seated on the petiole between the pairs of pinnæ; spikes cylindrical, sessile; legume much compressed. *h. S.* Native of the south of Jamaica, in dry places. *Mimosa juliflora*, Swartz, prod. p. 85. *Mimosa piliflora*, Swartz, fl. ind. occ. 2. p. 986. Spikes of flowers almost like the aments of *Salix fragilis*. Flowers yellowish. Legume filled with a fleshy substance between the seeds, which is eatable. Leaflets 6-8 lines long. *Acacia falcata*, Desf. cat. hort. par. ed. 2. p. 207. is probably not distinct from this tree.

*July-flower Algaroba.* Clt. 1800. Tree.

† *Species not sufficiently known.*

15 *P. TORQUATA* (D. C. prod. 2. p. 448.) spines twin, stipular; leaves with 1-2 pairs of pinnæ, each pinna bearing many pairs of linear leaflets, with a gland between the pairs of pinnæ on the petiole; spikes of flowers cylindrical, on short peduncles; legume torquate and constricted between the seeds, and filled with mealy pulp inside. *h. S.* Native of South America. *Acacia torquata*, L.f. nov. gen. et spec. 16. no. 206. Stamens 10, free.

*Colobed-podded Algaroba.* Tree.

16 *P. AFFINIS* (Spreng. syst. 2. p. 326.) spines straight; leaves with only one pair of pinnæ, each pinna bearing many pairs of remotish, quite glabrous leaflets; petioles without glands; branches tubercled; spikes filiform, twin. *h. S.* Native of Monte Video.

*Allied Algaroba.* Tree.

*Cult.* See *Inga* for culture and propagation, p. 396.

CCXXXII. LAGONYCHIUM (from *λαγος*, *lagos*, a hare, and *ονυχιον*, *onychion*, a little nail; in reference to the spines on the shrub). Bieb. suppl. 288. D. C. prod. 2. p. 418.

LIN. SYST. *Decandria*, *Monogynia*. Flowers hermaphrodite, many of which are abortive. Calyx 5-toothed. Petals 5, free. Stamens 10, hypogynous, free. Anthers without glands. Style twisted at the apex. Legume stipitate, indehiscent, ovate-cylindrical, somewhat didymous, rather incurved, never torulose, filled with pulp inside.—A small shrub, with scattered, prickles, bipinnate leaves, bearing 3-5 pairs of pinnæ, and each pinna bearing 10 pairs of leaflets, which are pubescent beneath. This is a doubtful genus, which is perhaps not distinct from *Acacia*.

1 *L. STEPHANIA'NUM* (Bieb. l. c.). *h. II.* Native of the arid plains between the Caucasus and the Caspian sea, and of Persia, between Mossul and Bagdad. *Acacia Stephaniæna*, Bieb. fl. taur. 2. p. 449. *Mimosa micrantha*, Vahl. in herb. Michx.—Buxb. cent. 3. t. 48. bad.—Breyn. cent. 1. t. 56. f. 4.

*Stephan's Lagonychium.* Fl. Jul. Aug. Clt. 1816. Sh. 1 to 2 ft.

*Cult.* This shrub should be planted in a warm situation in the open border, and sheltered by a mat in severe weather in winter. It may be increased by seeds or layers, and very young cuttings will root if taken off at a joint, and planted in sand, with a hand-glass placed over them.

CCXXXIII. ACACIA (from *ac*, a point, in Celtic, or from *ακαζω*, *akazo*, to sharpen; many of the species are furnished with spines). Neck. elem. no. 1297. Willd. spec. 4. p. 1019. Kunth, mim. p. 74. D. C. prod. 2. p. 418.

LIN. SYST. *Polygamia*, *Monœcia*. Flowers polygamous (f. 53. c. f. 54. b.). Calyx 4-5-toothed (f. 54. a.). Petals 4-5, sometimes free (f. 53. a.), and sometimes joined together into

a 4-5-cleft corolla. Stamens variable in number from 10 to 200 in each flower. Legume continuous, dry, 2-valved.—Shrubs or trees, very variable in habit and leaves. Spines stipular, scattered, or wanting. Flowers yellow, white, rarely red, disposed in globular heads or spikes, decandrous, or polyandrous, eleutherandrous or monadelphous. This is a very polymorphous genus, which may hereafter be divided into several genera, when the characters of the species are better known. The barks of many of the species abound to such a degree in tanning principle as to have become an object of commercial importance.

SECT. I. PHYLLODINÆ (from *φυλλον*, *phyllon*, a leaf; leaves simple). Leaves of two forms, those in seedling plants are bipinnate, but in the adult plants the leaflets are abortive, and there only remains the dilated petiole, which is called a phyllodium. *Acaciæ aphyllæ*, Wendl. diss. 1820. Flowers in all yellow. The species are mostly natives of New Holland.

§ 1. *Capitæ* (from *capitatus*, headed; disposition of flowers). Flowers collected into globular heads; heads solitary on the peduncles.

\* *Stipulas spinosæ.*

1 *A. ALATA* (R. Br. in hort. kew. ed. 2. vol. 5. p. 464.) stipulas spinose, permanent; stem bifurciously winged; phyllodia decurrent, 1-nerved, ending in a spine at the apex, and with the upper margin furnished with a glandular tooth; heads of flowers solitary or twin. *h. G.* Native of New Holland, on the western coast. Ker. bot. reg. 396. Wendl. diss. no. 1. t. 1. Coll. hort. rip. 1. t. 17. Reich. mag. gart. t. 83. Flowers yellow.

*Winged-stemmed Acacia.* Fl. April, July. Clt. 1803. Sh. 6 to 10 feet.

2 *A. DOLABRIFORMIS* (Wendl. l. c. no. 38.) stipulas deciduous or wanting; branches rather angular; phyllodia linear, somewhat falcate, rather decurrent at the base, obliquely and emarginately truncate at the apex, with the lower lobe ending in a pungent mucrone. *h. G.* Native of New Holland. Flowers yellow.

*Dolabriform-leaved Acacia.* Fl. April, July. Clt. 1818. Shrub 4 to 6 feet.

3 *A. DECIPiens* (R. Br. l. c. p. 165.) stipulas spinescent, deciduous; phyllodia triangular and somewhat trapezoid, with the nerve approximating the lower side, and drawn out into a spine at the apex, the superior margin furnished with one acute gland-bearing tooth; heads many-flowered, usually solitary. *h. G.* Native of New Holland, on the south-west coast. *Adiantum truncatum*, Burm. fl. ind. t. 66. f. 1. *Mimosa decipiens*, Kœn. ann. bot. 1. p. 366. t. 8. Sims, bot. mag. 1745. *A. dolabriformis*, Coll. hort. ripul. p. 1. but not of Wendl. Peduncles longer than the phyllodia. Branches glabrous. Flowers yellow.

*Var. β, trapezoidæa* (D. C. prod. 2. p. 419.) stipulas deciduous; phyllodia irregularly trapezoid, with the nerve approximating the lower margin, and drawn out into a spine at the apex, but the upper margin is furnished with 2 obtuse, gland-bearing teeth; young heads of flowers axillary, sessile, and usually solitary. *h. S.* Native of New Holland, on the eastern coast. Branches angular, glabrous. Perhaps a proper species.

*Deceiving Acacia.* Fl. Mar. Ju. Clt. 1813. Sh. 3 to 6 ft.

4 *A. DELTOIDEA* (Cunningh. mss.) stipulas acicular, spinescent, twin; phyllodia dolabriform, smooth, ending in a spine-like mucrone, many-nerved, convex on the upper side, and nearly straight on the lower; branches slightly angular, pubescent; heads of flowers solitary, on peduncles, which are longer than the phyllodia. *h. S.* Native of New Holland, within the tropic.

*Deltoid-leaved Acacia.* Clt. 1824. Shrub 3 to 6 feet.

5 *A. BIFLORA* (R. Br. hort. kew. 5. p. 463.) stipulas spinescent, twin; phyllodia linear, smooth, ending in a spine-like mucrone, many-nerved, convex on the upper side, and nearly straight on the lower; branches slightly angular, pubescent; heads of flowers solitary, on peduncles, which are longer than the phyllodia. *h. S.* Native of New Holland, within the tropic.

Permanent; phyllodia triangular, with 1 nerve, which approximates the lower side, and is drawn out into a spine at the apex, the superior margin furnished with 1 gland-bearing tooth; heads solitary, on short peduncles, 2-flowered. *h. G.* Native of New Holland, on the western coast. Wendl. diss. no. 3. t. 2. Branches pubescent. Corolla 4-cleft.

*Two-flowered Acacia.* Fl. Mar. Jul. Clt. 1803. Sh. 2 to 4 ft.

6 *A. HASTULATA* (Smith, in Rees' cycl. suppl.) stipulas spinescent, permanent; phyllodia glabrous, rhomboid, ending in a spinose acumen, with 1 nerve in the centre, and the superior margin furnished with 1 gland-bearing, obtuse tooth; branchlets hispid; heads solitary, 3-4-flowered. *h. G.* Native of New Holland, at King George's Sound. Stipulas bristle-formed, erect.

*Hastulate-leaved Acacia.* Fl. April, June. Clt. 1824. Sh. 3 to 6 feet.

7 *A. NERVOSA* (D. C. legum. mem. xii. prod. 2. p. 149.) stipulas spinescent, permanent; phyllodia oval-oblong, acuminate at both ends, ending in a spine, with 1 nerve in the middle, and with nerve-formed, entire margins; heads pedunculate, usually twin, 5-8-flowered. *h. G.* Native of New Holland.

*Nerved-leaved Acacia.* Fl. April, Ju. Clt. 1824. Sh. 3 to 6 ft.

8 *A. ORNITHOPHORA* (Sweet, fl. austr. 24.) stipulas spinescent, permanent, a little shorter than the phyllodia; phyllodia obliquely oblong-lanceolate, 1-nerved, rather pilose, ending in a hooked beak at the apex, and furnished on the upper margin with a gland-bearing tooth; branches hairy; heads of flowers pedunculate, solitary, or twin, numerous. *h. G.* Native of New Holland. The outline of the leaves gives the form of the body and head of a bird.

*Bird-bearing Acacia.* Fl. Apr. Ju. Clt. 1824. Sh. 4 to 8 ft.

9 *A. PARADOXA* (D. C. cat. hort. monsp. p. 74.) stipulas spinescent, permanent; phyllodia obliquely oblong-lanceolate, quite entire, undulate, 1-nerved; branches clammy, glabrous; heads of flowers solitary. *h. G.* Native of New Holland, on the eastern coast. *A. undulata*, Willd. enum. suppl. p. 68. Wendl. diss. no. 4. t. 3.

*Paradoxical Acacia.* Fl. Apr. June. Shrub 2 to 6 feet.

10 *A. ARMA'TA* (R. Br. in hort. kew. 5. p. 463.) stipulas spinescent, permanent; phyllodia obliquely ovate-oblong, quite entire, 1-nerved; branches hairy; heads of flowers solitary; legumes velvety. *h. G.* Native of New Holland, on the southern coast. Sims, bot. mag. 1653. Bonpl. nav. t. 55.

*Armed Acacia.* Fl. Apr. June. Clt. 1803. Sh. 6 to 10 ft.

11 *A. GENISTIFOLIA* (Link. enum. 2. p. 448.) stipulas spinescent, very minute; phyllodia linear, ending in a subulate pungent point, approximate; branches glabrous, angular; heads of flowers solitary. *h. G.* Native of New Holland.

*Genista-leaved Acacia.* Fl. Mar. Aug. Clt. 1825. Sh. 3 to 6 ft.

12 *A. JUNIPERINA* (Willd. spec. 4. p. 1049.) stipulas setaceous, spinescent, permanent; phyllodia linear-subulate, ending in a pungent mucrone; branches terete, pubescent; heads of flowers solitary. *h. G.* Native of New Holland, on the eastern coast. Lodd. bot. cab. 398. *Mimosa juniperina*, Vent. malm. t. 64. *Mimosa ulicifolia*, Wendl. coll. 2. t. 6. *A. verticillata*, Sieb. pl. exsic. nov. holl. no. 449. Calyx 5-parted. Petals 5.

*Juniper-like Acacia.* Fl. Mar. Ju. Clt. 1790. Sh. 4 to 8 ft.

13 *A. ASPARAGOIDES* (Cunning. in Field's new south wales, p. 343.) stipulas permanent; phyllodia linear, sulcate, stiff, mucronate, alternate, and crowded, somewhat dilated near the base, where it bears a glandular tooth; heads of flowers axillary, solitary; branches glabrous, diffuse. *h. G.* Native of New South Wales, on the Blue Mountains. Intermediate between *A. acicularis* and *A. juniperina*.

*Asparagus-like Acacia.* Fl. March, June. Clt. 1818. Sh. diffuse.

14 *A. BROWNII* (Steud. nom. phan. 1. p. 2.) stipulas setosely-spinescent, small, deciduous; phyllodia linear-subulate, ending in a pungent mucrone, distant, spreading; branches terete, glabrous; heads of flowers solitary, unarmed; peduncles a little shorter than the phyllodia. *h. G.* Native of New Holland, in King's Island. *A. acicularis*, R. Br. in hort. kew. 5. p. 450, but not of Willd. *A. juniperina*, Sieb. pl. exsic. nov. holl. no. 463. The phyllodia are much more distant from each other than those of *A. juniperina*.

*Brown's Acacia.* Fl. Mar. Aug. Clt. 1796. Sh. 4 to 8 ft.

15 *A. ECHINATA* (D. C. prod. 2. p. 449.) stipulas setaceous, spinescent, permanent; phyllodia linear-subulate, ending in a pungent mucrone; branches terete, hairy-pubescent; heads of flowers solitary; bracteas ending in a spine-like bristle, each longer than the corolla. *h. G.* Native of New Holland. *A. juniperina*, Sieb. pl. exsic. nov. holl. no. 447. Very like *A. juniperina*, but ~~it is~~ <sup>it is</sup> in the young heads of the flowers being ~~celebrated~~ <sup>celebrated</sup> from the ~~spinescent~~ <sup>spinescent</sup> bracteas.

*Echinate-headed Acacia.* Fl. Mar. July. Clt. 1824. Sh. 3 to 6 feet.

16 *A. PUGIONIFORMIS* (Wendl. diss. no. 2. t. 9. exclusive of the synonyme of R. Brown.) stipulas very ~~erect~~ <sup>erect</sup>, small, and almost permanent; phyllodia linear-terete, smooth, obtuse, obliquely mucronate; branches terete, glabrous; heads of flowers solitary; peduncles 3-times shorter than the phyllodia. *h. G.* Native of New Holland, on the eastern coast.

*Dagger-formed-leaved Acacia.* Fl. March, July. Clt. 1818. Shrub 4 to 6 feet.

\* \* *Stipulas not spinescent, but are either very small or wanting, and usually deciduous.*

17 *A. DIFFUSA* (Ker. bot. reg. 634.) stipulas small, caducous; phyllodia linear, 1-nerved, ending in an oblique acumen, with the spinula continuous along the lower margin; branches diffusely procumbent, glabrous, angular; heads of flowers usually twin. *h. G.* Native of New South Wales, on the Blue Mountains, Sims, bot. mag. 2117. *A. prostrata*, Lodd. bot. cab. 631. *A. daviesioides*, Cunningham. mss.

*Diffuse Acacia.* Fl. Apr. June. Clt. 1818. Shrub diffuse.

18 *A. SULCATA* (R. Br. in hort. kew. 5. p. 460.) stipulas small, concave, deciduous; phyllodia linear-terete, sulcate, mucronate; branches nearly terete, glabrous; heads of flowers usually twin. *h. G.* Native of New Holland, on the western coast. Wendl. diss. no. 27. t. 10. Calyx 5-parted. Petals 5, ex Wendl. Bracteas concave, permanent. Legume flexuous.

*Furrowed-leaved Acacia.* Fl. May, Aug. Clt. 1803. Sh. 2 to 6 feet.

19 *A. SALIGNA* (Wendl. diss. no. 16.) stipulas almost wanting; phyllodia linear, attenuated at both ends, quite entire, almost nerveless; branches angular, glabrous; heads of flowers solitary, on short peduncles; legumes contracted between the seeds, loment-formed. *h. G.* Native of New Holland, at Cape Van Diemen and about Port Jackson. *Mimosa saligna*, Labill. nov. holl. 2. p. 86. t. 235. There is a variety with broader phyllodia, and another with very narrow ones.

*Willow Acacia.* Fl. Mar. Ju. Clt. 1818. Sh. 6 to 10 ft.

20 *A. EMARGINATA* (Wendl. diss. no. 17.) stipulas wanting; phyllodia linear-spatulate, attenuated at the base, emarginate at the apex, and mucronate; heads of flowers twin; peduncles longer than the heads. *h. G.* Native of New Holland. Perhaps a variety of the following species, the calyx being sinuately 5-toothed in both.

*Emarginate-leaved Acacia.* Fl. Mar. July. Clt. 1824. Sh. 6 to 10 feet.

21 *A. STRICTA* (Willd. spec. 4. p. 1052.) stipulas wanting;

phyllodia linear, attenuated at the base, but rounded and mucronate at the apex, 1-nerved in the middle; heads of flowers twin; peduncles shorter than the heads. *h. G.* Native of New Holland, on the eastern coast. *Mimosa stricta*, Andr. bot. rep. t. 53. Sims, bot. mag. 1121. *Mimosa suavæolens*, Desf.

*Straight Acacia.* Fl. Feb. May. Clt. 1790. Sh. 3 to 6 ft.

22 *A. LEPROSA* (Sieb. pl. exsic. nov. holl. no. 2455.) stipulas almost wanting; phyllodia linear-lanceolate, leprously dotted, 1-nerved, attenuated at the base, and terminating in a callous, incurved mucrone; branches angularly-furrowed; heads of flowers 2-3-together, axillary; peduncles clothed with hoary pubescence, shorter than the heads. *h. G.* Native of New Holland. Very like *A. dodonæifolia*.

*Leptous Acacia.* Fl. Mar. June. Clt. 1817. Sh. 4 to 8 ft.

23 *A. DODONÆIFOLIA* (Willd. enum. suppl. p. 68.) stipulas wanting; phyllodia linear-lanceolate, rather foliate, attenuated at the base, 1-nerved in the middle, terminating by an incurved callous mucrone; branches angular, and are as well as the phyllodia clammy; heads of flowers twin; peduncles longer than the heads. *h. G.* Native of New Holland, on the eastern coast. *Mimosa dodonæifolia*, Pers. ench. 2. p. 261. *A. viscosa*, Wendl. diss. no. 19. t. 7. Calyx 5-toothed.

*Dodonæa-leaved Acacia.* Fl. Mar. Ju. Clt. 1816. Sh. 4 to 8 ft.

24 *A. MALTINE'RVIA* (D. C. legum. mem. xii. prod. 2. p. 450.) stipulas wanting; phyllodia linear-lanceolate, attenuated at the base, many-nerved, furnished with a gland-like tooth on the upper margin; heads of flowers solitary or twin, on short peduncles. *h. G.* Native of New Holland, on the eastern coast. Young branches angular, adult ones terete.

*Many-nerved-leaved Acacia.* Fl. Mar. June. Clt. 1824. Shrub 5 to 6 feet.

25 *A. EGLANDULOSA* (D. C. legum. mem. xii. prod. 2. p. 450.) stipulas wanting; phyllodia linear-lanceolate, attenuated at the base, entire on both sides, and glandless, many-nerved at the base; heads of flowers solitary; peduncles rather longer than the heads. *h. G.* Native of New Holland.

*Glandless-leaved Acacia.* Fl. Mar. June. Clt. 1824. Sh. 4 to 6 feet.

26 *A. LANIGERA* (Cunning. in Field's new south wales, p. 245.) shrub villous; phyllodia lanceolate, acute, stiff, nerved, falcate, ending in a pungent mucrone; heads of flowers twin, axillary; upper part of branches and legume very woolly. *h. G.* Native of New Holland, frequent on rocky barren ranges in the interior of the country. Hook. bot. mag. 2922.

*Wool-bearing Acacia.* Fl. Mar. May. Clt. 1824. Sh. 6 to 8 ft.

27 *A. RIGENS* (Cunningh. mss. in Lond. hort. brit. p. 406.) stipulas almost wanting or deciduous; phyllodia filiform, compressed, ending in an oblique, callous mucrone at the apex, 3-nerved at the base, and furnished with a gland-bearing tooth on the upper margin at the base; branches straight, angular, pubescent; heads axillary, solitary; peduncles clothed with rufous scales, much shorter than the phyllodia. *h. G.* Native of New Holland. Phyllodia 3-4 inches long.

*Stiff Acacia.* Fl. Mar. June. Clt. 1824. Shrub 4 to 6 feet.

28 *A. LINEATA* (Cunningh. mss.) stipulas wanting or deciduous; phyllodia linear, ending in an oblique, callous mucrone at the apex, glandless, 1-nerved, the nerve parallel with the superior margin, and contiguous to it; phyllodia as well as the branches hairy; heads of flowers usually twin; peduncles filiform, longer than the phyllodia. *h. G.* Native of New Holland. Phyllodia  $\frac{1}{2}$  an inch long.

*Lined-leaved Acacia.* Fl. Mar. May. Clt. 1824. Sh. 4 to 6 ft.

29 *A. HISPIDULA* (Willd. spec. 4. p. 1054.) stipulas small, deciduous; phyllodia oblong, 1-nerved, with both the nerve and margins denticulately hispid; heads of flowers solitary. *h. G.* Native of New Holland, on the eastern coast. Todd. bot. cab.

836. *Mimosa hispida*, Smith, new holl. t. 16. Calyx 4-toothed. Petals 4. Legume oval-oblong, 2-seeded.

*Hispid Acacia.* Fl. April, May. Clt. 1794. Sh. 2 to 4 ft.

30 *A. COCHLEARIS* (Wendl. diss. no. 7.) stipulas almost wanting; phyllodia linear-lanceolate, many-nerved at the base, rather pilose, quite entire, mucronate; heads solitary. *h. G.* Native of New Holland, in Van Leuwin's Land. *Mimosa cochlearis*, Tab. nov. holl. 2. p. 85. t. 234. Calyx 5-parted. Legume linear-oblong, straightish, 4-8-seeded, somewhat contracted between the seeds.

*Spoon-leaved Acacia.* Fl. April, Ju. Clt. 1818. Sh. 4 to 6 ft.

31 *A. CORIACEA* (D. C. legum. mem. xii. prod. 2. p. 451.) stipulas wanting; phyllodia very long and linear, quite entire, nerveless, thick, and coriaceous, when young they are clothed with adpressed, velvety down, but in the adult state they are glabrous; heads of flowers solitary; branches terete. *h. G.* Native of New Holland, on the eastern coast. Legume linear, curved into a circle, when young clothed with cinereous down. The down on the leaves is at first yellowish, but at length becomes cinereous.

*Coriaceous-leaved Acacia.* Fl. May, June. Clt. 1824. Sh. 4 to 6 feet.

32 *A. AXCEPS* (D. C. legum. mem. xii. prod. 2. p. 451.) stipulas wanting; phyllodia obovate-oblong, tapering to the base, obtuse at the apex, quite entire, and with 1 nerve in the middle; heads of flowers solitary; branches angularly 2-edged. *h. G.* Native of New Holland, on the east coast.

*Two-edged-branched Acacia.* Fl. April, June. Clt. 1820. Shrub 4 to 6 feet.

33 *A. MANGIUM* (Willd. spec. 4. p. 1053.) stipulas almost wanting; phyllodia ovate, acute, attenuated at the base; longitudinal nerve parallel to the lower margin of the leaf, and sending out oblique nerves on the upper side; heads of flowers usually solitary; branches triquetrously-angular. *h. S.* Native of the Moluccas, where it is called *Mangi Gocnung*. *Mangium montanum*, Rumph. amb. 3. p. 123. t. 81.

*Mangium Acacia.* Clt. 1820. Tree 10 to 20 feet.

34 *A. LAURIFOLIA* (Willd. spec. 4. p. 1053.) stipulas almost wanting; phyllodia obliquely ovate-oblong, 7-8-nerved, emarginate at the apex, and oblique at the base; heads of flowers globose, usually solitary; branches hardly angular; legumes falcate. *h. G.* Native of the Friendly Islands and the Hebrides, as well as of New Caledonia. Labill. nov. cal. p. 68. t. 68. *Mimosa simplicifolia*, Lin. suppl. 436. *Mimosa Mangium*, Forst. prod. no. 395. Legume moniliform.

*Laurel-leaved Acacia.* Clt. 1775. Tree 20 to 25 feet.

35 *A. TRISERVATA* (Sieb. l. c. no. 445.) stipulas almost wanting; phyllodia linear, mucronate, smoothish, with 3 nerves running the whole length without any gland on the side, twice the length of the peduncles; heads of flowers sometimes solitary, sometimes disposed in short racemes on long pedicels. *h. G.* Native of New Holland. Phyllodia nearly like those of the preceding species, but  $1\frac{1}{2}$  inch long, and ending in a long oblique mucrone. Branches and phyllodia rather pilose at the top. This is an ambiguous species, apparently joining the present division of the genus to the following.

*Three-nerved Acacia.* Fl. Apr. Ju. Clt. 1820. Sh. 4 to 6 ft.

36 *A. ELONGATA* (Sieb. pl. exsic. nov. holl. no. 443.) stipulas almost wanting; phyllodia linear-falcate, 3-nerved, ending in a callous mucrone, bearing 1 gland on the upper margin at the base; branches angular, glabrous, as well as the phyllodia; heads of flowers solitary, twin, or tern; peduncles canescent, much shorter than the phyllodia. *h. G.* Native of New South Wales. *A. hebecéphala*, Cunningh. mss. in Lond. hort. brit. p. 406. Branches angular, drooping. Phyllodia  $\frac{1}{2}$  inches long and 1 line broad. Corolla 5-cleft.

— *Elongated-leaved Acacia*. Fl. March, May. Clt. 1817. Sh. 6 to 10 feet.

37 *A. VERNICIFLUA* (Cunning. in Field's new south wales, p. 344.) phyllodia linear-lanceolate, 2-nerved, falcate, attenuated at the base; heads of flowers globose, axillary, twin; young branches viscid. *h. G.* Native of New Holland, on rocky hills near Cox's River, &c.

*Varnish-flowing Acacia*. Fl. March, May. Clt. 1817. Sh. 4 to 6 feet.

38 *A. CALAMIFOLIA* (Sweet, in Colv. cat. ed. 2. and bot. reg. 839.) stipulas almost wanting; phyllodia filiform, compressed, spreading, ending in an incurved mucrone at the apex, glabrous as well as the branches; peduncles solitary, much shorter than the phyllodia. *h. G.* Native of New Holland, in the interior of the country. *A. uncinata*, Lodd. bot. cab. t. 909. Sieb. pl. exsic. no. 522. The legume is said to be articulated, arched, and compressed.

*Reed-leaved Acacia*. Fl. May, June. Clt. 1823. Sh. 3 to 4 ft.

39 *A. QUADRILATERALIS* (D. C. prod. 2. p. 451.) stipulas almost wanting; phyllodia filiform, tetragonal, straight, ending in a straight mucrone, without any gland on the side, glabrous as well as the branches, and with a slight nerve on both the lower and upper side; heads of flowers sometimes solitary and sometimes racemose. *h. G.* Native of New Holland. *A. calamifolia*, Sieb. pl. exsic. nov. holl. no. 442. *A. arida*, Cunningh. mss. This appears to be an intermediate species between the first division of the genus *Capitata*, and the second division *Capitato-racemosa*. Very like *A. calamifolia*.

*Four-sided-leaved Acacia*. Fl. April, June. Clt. 1820. Sh. 3 to 4 feet.

40 *A. CUNNINGHAMI*; leaves linear, falcate, mucronate, 2-3-nerved, scattered, twice the length of the peduncles; heads of flowers axillary, solitary; legume very narrow, elongated. *h. G.* Native of New Holland, at Spring-wood. *A. taxifolia*, Cunning. in Field's new south wales, p. 344. Lodd. bot. cab. 1225, but not of Willd.

*Cunningham's Acacia*. Fl. Apr. Ju. Clt. 1823. Sh. 10 to 12 ft.

41 *A. UNDULATIFOLIA* (Cunning. mss. Loud. hort. brit. p. 407.) stipulas almost wanting; phyllodia obliquely ovate, undulated, and marginated, 1-nerved, glabrous, ending in a hooked or twisted point, bearing an obsolete gland on the upper margin at the base; branches terete, hairy; heads of flowers axillary, solitary; peduncles beset with adpressed pili, longer than the phyllodia. *h. G.* Native of New South Wales. Lodd. bot. cab. 1544. Phyllodia an inch long. The heads of flowers being so numerous, appear like a raceme at the tops of the branches.

*Waved-leaved Acacia*. Fl. Apr. Ju. Clt. 1824. Sh. 3 to 4 ft.

42 *A. CYCLOPS* (Cunning. mss. Loud. hort. brit. 407.) stipulas almost wanting; phyllodia oblong-lanceolate, obtuse, ending in an oblique callous mucrone, but attenuated at the base, 5-7-nerved, having one gland in front on the upper margin; heads of flowers solitary, axillary, few; peduncles shorter than the phyllodia. *h. G.* Native of New Holland, on the south-west coast.

*Circle-eye-seeded Acacia*. Fl. April, June. Clt. 1824. Sh. 4 to 6 feet.

43 *A. BRUNIOIDES* (Cunning. mss.) phyllodia disposed in something like whorles, they are crowded and very short, compressed, subulate, and mucronate; branches rather hairy; heads of flowers solitary; peduncles twice the length of the phyllodia. *h. G.* Native of New South Wales. Phyllodia 2 lines long.

*Brunia-like Acacia*. Shrub 2 to 4 feet.

44 *A. GRAYI* (Cunning. mss. Loud. hort. brit. 407. Lodd. bot. cab. 1460.) stipulas almost wanting; phyllodia lanceolate, tapering at both ends, shining, 2-nerved, furnished with a gland

on the upper margin at the base, and are, as well as the young branches, clammy; heads of flowers usually twin, axillary; peduncles much shorter than the phyllodia; branches erect. *h. G.* Native of New South Wales. Heads of flowers somewhat secund.

*Strong-scented Acacia*. Fl. April, June. Clt. 1820. Shrub 6 to 10 feet.

45 *A. RUNCIFORMIS* (Cunningh. mss.) young branches slightly pubescent; phyllodia rather clammy, linear-lanceolate, somewhat falcate, ending in a stiff hooked mucrone, having one longitudinal nerve, which is parallel to the superior margin, and contiguous to it; heads of flowers axillary, usually twin, on short peduncles. *h. G.* Native of New South Wales. Phyllodia half an inch long, bearing one gland on the upper margin at the base. Very like *A. ornithophora* of Sweet.

*Hedge-bill-formed leaved Acacia*. Shrub 5 to 6 feet.

§ 2. *Capitato-racemosa*. Flowers collected into globose heads, the heads disposed in racemes along the axillary peduncles. Stipulas of all nearly obsolete, or when present they are unmarked.

46 *A. FALCATA* (Willd. spec. 4. p. 1053.) phyllodia oblong, falcate, tapering much at the base, acute, 1-nerved, and feather-veined, glandless; the longitudinal nerve parallel to the upper margin, and contiguous to it; heads of flowers racemose, rarely solitary. *h. G.* Native of New Holland, on the eastern coast. Wendl. diss. no. 11. t. 14. *A. obliqua*, Desv. journ. bot. 314. p. 67. *Mimosa falcata*, Pers. ench. 2. p. 261. Calyx 5-part. There are two varieties of this species; one with very acute leaves, and the heads of flowers in racemes, and another with bluntish leaves, and the heads of flowers usually solitary.

*Falcate-leaved Acacia*. Fl. May, June. Clt. 1790. Shrub 4 to 8 feet.

47 *A. FALCIFORMIS* (D. C. prod. 2. p. 452.) phyllodia oblong, falcate, much attenuated at the base, but bluntish at the apex, with a longitudinal nerve in the middle, as well as being finely feather-nerved, bearing one gland in front on the upper margin. *h. G.* Native of New Holland. Sieb. pl. exsic. nov. holl. no. 616. Phyllodia 5-6 inches long, and 8-9 lines broad. Heads of flowers racemose. Legume stipitate, flat, rather glaucous, 2 inches long, and 8-10 lines broad.

*Falciform-leaved Acacia*. Fl. April, June. Clt. 1818. Shrub 4 to 8 feet.

48 *A. SPIROLÆUS* (Labill. cal. p. 69. t. 69.) unarmed; phyllodia lanceolate, falcate, obtuse, 3-nerved, tapering to both ends; heads of flowers twin, in racemes; legumes coarsely-orbicular. *h. G.* Native of New Caledonia. Racemes shorter than the phyllodia.

*Spire-podded Acacia*. Shrub 8 feet.

49 *A. PENNINERVIS* (Sieb. pl. exsic. nov. holl. no. 458.) phyllodia oblong, acuminate at both ends, straight, with one longitudinal nerve in the middle, having feathered veins running from it, and furnished with one gland in front at the base. *h. G.* Native of New Holland. *A. impressa*, Cunningh. mss. Lindl. bot. reg. 1115. Lodd. bot. cab. 1319. Hook. bot. mag. 2754. Phyllodia 2-3 inches long, and 5-6 lines broad, pale. The feathered veins rise from the base of the phyllodia, both in this and the preceding species, growing obliquely from the gland. Heads of flowers about the size of a pea, racemose.

*Feather-nerved-leaved Acacia*. Fl. April, June. Clt. 1824. Shrub 4 to 6 feet.

50 *A. PENDULA* (Cunningh. mss. Loud. hort. brit. 490.) aspect greyish; phyllodia linear-lanceolate, rather arcuate, attenuated at both ends, ending in a somewhat hooked mucrone, having one gland in front at the base, and 2-3 longitudinal nerves; heads of flowers racemose; branches slender, pendulous. *h. G.*

Native of New South Wales. Phyllodia 3 inches long, and 3 lines broad. Habit of *Salix Babylónica* or *Weeping-willow*.  
 anchored Acacia. Fl. April. Clt. 1824. Shrub 6 to 10 feet.

51 *A. MELANÓXYLON* (R. Br. in hort. kew. 5. p. 462.) phyllodia lanceolate-oblong, rather falcate, obtuse, quite entire, many nerved; heads of flowers very few, disposed in a kind of raceme. *h. G.* Native of New Holland, on the south coast, and of Van Diemen's Land. Sims, bot. mag. 1659. Wendl. diss. no. 14. t. 6. *A. arcuata*, Sieb. pl. exsic. nov. holl. no. 459. Legume linear, arched, length of phyllodia. Umbilical funicle coloured, plicate, girding the seed.

*Black-wooded Acacia.* Fl. April, June. Clt. 1808. Shrub 6 to 10 feet.

52 *A. HETEROPHYLLA* (Willd. spec. 4. p. 1054.) phyllodia linear, attenuated at both ends, rather falcate, many nerved; there are also sometimes bipinnate leaves at the tops of the branches; heads of flowers disposed in a kind of raceme. *h. S.* Native of the island of Bourbon. *Mimosa heterophylla* Lam. dict. 1. p. 14. exclusive of var. *β*. Heads 2 or 3 in each raceme.

*Variable-leaved Acacia.* Clt. 1824. Tree.

53 *A. AMARA* (Wendl. diss. no. 8. t. 4.) phyllodia oblong, tapering much at the base, 1-nerved, bearing 1-3 glands in front on the upper margin; heads of flowers racemose; flowers 5-cleft. *h. G.* Native of New Holland. Very like the following species, but differs in the racemes being one-half shorter than the phyllodia. Petals 5, distinct. Ovary tomentose. The plant under name in Sieb. pl. exsic. nov. holl. no. 452. differs from Wendl. diss. in the phyllodia being scarcely margined, and only furnished with one gland in front on the upper margin, although perhaps the same.

*Pleasing Acacia.* Fl. April, June. Clt. 1820. Shrub 4 to 6 ft.

54 *A. MYRTIFOLIA* (Willd. spec. 4. p. 1054.) phyllodia oblong-lanceolate, tapering much at the base, 1-nerved, and furnished with one gland in front on the upper margin; heads few-flowered, racemose; flowers 4-cleft. *h. G.* Native of New Holland, on the eastern coast. Sweet, austr. t. 49. *Mimosa myrtifolia*, Smith, new holl. t. 15. Curt. bot. mag. 302. Calyx sinuately 4-toothed. Petals connected at the base. Ovary glabrous. Perhaps not sufficiently distinct from *A. lunata* of Lodd. bot. cab. 324.

*Myrtle-leaved Acacia.* Fl. Feb. May. Clt. 1789. Shrub 3 to 6 ft.

55 *A. OLEIFOLIA* (Cunningh. mss. Loud. hort. brit. 407.) stipulas small, caducous; phyllodia ovate-oblong, oblique, margined, falcate at the apex, mucronate, and are, as well as the branches, pubescent; heads solitary, axillary, length of the phyllodia. *h. G.* Native of New South Wales. *A. uncinata*, Lindl. bot. reg. 1332.

*Olive-leaved Acacia.* Fl. June, July. Clt. 1824. Sh. 4 to 6 ft.

56 *A. PODALYRIÆFOLIA* (Cunningh. mss. Loud. hort. brit. p. 407.) plant clothed with hoary powder; phyllodia elliptic, obtuse, rather undulated, 1-nerved, ending in an oblique mucrone; heads of flowers racemose, axillary, elongated. *h. G.* Native of New South Wales. Phyllodia 1 inch long, and  $\frac{1}{2}$  inch broad. Peduncles forming panicles at the tops of the branches.

*Podalyria-leaved Acacia.* Fl. March, May. Clt. 1824. Sh. 4 to 6 feet.

57 *A. SCAPULIFORMIS* (Cunningh. mss.) aspect white; phyl-

lodia roundly triangular or obliquely obovate, mucronate at the apex, with an angle on the upper margin above the middle, wherein one gland is seated, having only one nerve, which is curved; heads of flowers disposed in axillary and terminal racemes, crowded. *h. G.* Native of New South Wales. *A. papuliformis*, Loud. hort. brit. 407. Phyllodia  $\frac{1}{2}$  inch long, and 4 lines broad.

*Scapula-formed-leaved Acacia.* Shrub 4 to 6 feet. \*

58 *A. VESTITA* (Ker. bot. reg. t. 698.) phyllodia obliquely elliptic-lanceolate, 1-nerved, ending in an awn-like mucrone, and are, as well as the branches, hispid; heads of flowers loosely racemose along the peduncles, upper ones solitary. *h. G.* Native of New Holland, in the interior of the country. *A. conspicua*, Cunningh. mss. Racemes longer than the phyllodia. Petals 5.

*Clothed Acacia.* Fl. April, July. Clt. 1820. Sh. 4 to 6 feet.

59 *A. MARGINATA* (R. Br. in hort. kew. 5. p. 462.) phyllodia lanceolate, elongated, 1-nerved, bearing one gland on the upper margin in front; heads few-flowered, racemose; flowers 4-cleft. *h. G.* Native of New Holland, on the western coast. This species has much the appearance of *A. myrtifolia*, but the ovary is tomentose. Wendl. diss. 1. t. 5. A.

*Margined-leaved Acacia.* Fl. April, June. Clt. 1803. Sh. 3 to 6 feet.

60 *A. FURFURACEA*; glaucescent; leaves elliptic or ovate, glabrous, oblique, ending in an innocuous mucrone, bearing a gland on the upper margin; racemes erect, axillary; legumes covered with white furfuraceous powder. *h. G.* Native of New Holland, on hills on Gagee-gong river, 50 miles from Bathurst. *A. dealbata*, Cunningh. in Field's new south wales, p. 315. but not of Link. A slender shrub.

*Scurfy Acacia.* Fl. April, June. Clt. 1824. Sh. 2 to 4 feet.

61 *A. UMBROSA* (Cunningh. mss. Loud. hort. brit. p. 407.) phyllodia obliquely ovate-lanceolate, tapering at both ends, smooth, 3-nerved, with the nerves to one side, acute at the apex, and ending in a hooked mucrone, and bearing a gland on the upper margin not far from the base; heads of flowers racemose; racemes shorter than the phyllodia. *h. G.* Native of New South Wales. Phyllodia 4 inches long, and 1 inch broad.

*Shady Acacia.* Fl. March, May. Clt. 1824. Sh. 4 to 6 feet.

62 *A. ASTRINGENS* (Cunningh. mss.) phyllodia glaucescent, broad, obliquely ovate-oblong, obtuse, somewhat arcuate, and margined, feather-nerved, smooth, furnished with one gland on the upper margin at the base; heads of flowers racemose. *h. G.* Native of New South Wales. Phyllodia 3-4 inches long, and 1 inch broad.

*Astringent Acacia.* Shrub 6 to 10 feet.

63 *A. PYRIFOLIA* (D. C. legum. mem. xii. prod. 2. p. 452.) stipulas hard, permanent; phyllodia broad, oval, ending in a pungent mucrone, furnished with a middle nerve, as well as with feathered and reticulated veins, quite entire, and are, as well as the branches, glaucescent; heads numerous, racemose; flowers 5-cleft. *h. G.* Native of New Holland, on the eastern coast.

*Pear-leaved Acacia.* Fl. April, June. Clt. 1824. Shrub 4 to 6 feet.

64 *A. BINERVA'TA* (D. C. prod. 2. p. 452.) phyllodia oblong, acuminate at both ends, and furnished with a gland on the upper margin at the base, and with 2 nerves, which run the whole length of the phyllodia; heads of flowers racemose; racemes shorter than the phyllodia. *h. G.* Native of New Holland. Sieb. pl. exsic. nov. holl. 504.

*Two-nerved-leaved Acacia.* Fl. April, June. Clt. 1824. Sh. 4 to 8 feet.

65 *A. BIVENOSA* (D. C. legum. mem. xii. prod. 2. p. 452.) phyllodia oblong, obtuse, rather attenuated at the base, quite entire, glaucous, smoothish, furnished with 2 fine nerves at the

FIG. 53.

base; heads of flowers disposed in loose racemes; racemes rather longer than the phyllodia; flowers 5-cleft. *h. G.* Native of New Holland, on the eastern coast. Heads of flowers on long pedicels.

*Two-veined-leaved Acacia.* Fl. April, June. Clt. 1824. Sh. 2 to 3 feet.

66 *A. CULTRIFORMIS* (Cunningh. mss.) branches smooth, angular; phyllodia cultriform, ending in an acute hooked mucrone, which leans to one side, and furnished with a gland on the middle of the upper margin, 1-nerved, the nerve nearly parallel with the lower margin; heads crowded, disposed in racemes, which are either axillary or terminal. *h. G.* Native of New South Wales. Phyllodia 8-10 lines long, and 4 lines broad.

*Cultriform-leaved Acacia.* Shrub 4 to 6 feet.

67 *A. PROMINENS* (Cunningh. mss. Loud. hort. brit. 407.) phyllodia divaricate, retrorsely falcate, linear-lanceolate, acute, 1-nerved, ending in a hooked mucrone, with a rather prominent gland on the upper margin at the base; heads of flowers in terminal and axillary racemes. *h. G.* Native of New South Wales. Phyllodia  $1\frac{1}{2}$  inch long, and  $1\frac{1}{2}$  line broad.

*Prominent Acacia.* Fl. Feb. June. Clt. 1824. Sh. 4 to 6 feet.

68 *A. FIMBRIATA* (Cunningh. mss.) phyllodia straight, linear, obtuse, mucronulate, 1-nerved in the middle, and furnished with one gland on the upper margin at the base; branches angular, the angles fringed, as well as the phyllodia; heads of flowers racemose, axillary. *h. G.* Native of New South Wales. Phyllodia  $1\frac{1}{2}$  inch long, and 2 lines broad.

*Fringed Acacia.* Shrub 4 to 6 feet.

69 *A. LUNATA* (Sieb. pl. exsicc. nov. holl. no. 461.) phyllodia obliquely oblong, rather falcate, narrowed at the base, terminating in an oblique callous mucrone, convex beneath the middle on the margin, and furnished with a minute gland in the convex part, and are glabrous, as well as the branches; heads of flowers disposed in racemes, which are longer than the phyllodia. *h. G.* Native of New Holland. Phyllodia an inch long, and 3 lines broad, almost veinless, with a lateral nerve running along the straight side. *h. G.* Native of New Holland. Lindl. bot. reg. 1352. Lodd. bot. cab. 384. Sweet, fl. austr. t. 42.

*Lunate-leaved Acacia.* Fl. April, May. Clt. 1810. Shrub 2 to 4 feet.

70 *A. BREVIFOLIA* (Lodd. bot. cab. 1235.) phyllodia elliptic, ending in a spine-like mucrone, 1-nerved, and feather-nerved, glaucous, glabrous, with a gland on one side; branches angular, smooth; heads of flowers racemose, longer than the phyllodia. *h. G.* Native of New South Wales.

*Short-leaved Acacia.* Fl. April, June. Clt. 1820. Shrub 3 to 4 feet.

71 *A. OBTUSATA* (Sieb. pl. exsicc. nov. holl. no. 441.) phyllodia oblong-cuneate, obtuse, attenuated at the base, 1-nerved, entire, and glandless, coriaceous, and are, as well as the branches, glabrous; heads of flowers disposed in racemes, which are shorter than the phyllodia; flowers 5-cleft. *h. G.* Native of New Holland. Phyllodia 20 lines long, and 3-4 lines broad.

*Blunted-leaved Acacia.* Fl. Ap. Ju. Clt. 1824. Sh. 4 to 6 ft.

72 *A. BUXIFOLIA* (Cunningh. in Field's new south wales, p. 344.) glabrous; phyllodia ovate, acute, bearing a gland on the upper margin; heads of flowers axillary, twice the length of the phyllodia. *h. G.* Native of New Holland, in pine ranges at Macquarie river. *A. conferta*, Cunningh. mss.

*Box-leaved Acacia.* Fl. Feb. Ju. Clt. 1824. Sh. 4 to 6 feet.

73 *A. CRASSIUSCULA* (Wendl. diss. no. 20. t. 8.) phyllodia linear, 1-nerved, thickish, quite entire, attenuated at the base, rounded at the apex, and ending in an inflexed mucrone; heads of flowers usually 3 in a raceme; flowers 5-cleft. *h. G.* Native of New Holland, on the east coast. Sieb. pl. exsicc. nov. holl. no. 464.

*Thickish-leaved Acacia.* Fl. April, June. Clt. 1824. Shrub 4 to 6 feet.

74 *A. SUAVEOLENS* (Willd. spec. 4. p. 1050.) phyllodia linear, tapering a little at the base, acute, mucronulate, 1-nerved, quite entire; heads of flowers racemose; calyx 5-parted; ovary glabrous. *h. G.* Native of New Holland, on the east coast. *Mimosa suaveolens*, Smith in Lin. soc. trans. 1. p. 253. Labill. nov. holl. 2. t. 236. Lodd. bot. cab. 730. Legume oblong, glaucous from grey powder, 15 lines long, and 5 lines broad.

*Var. β, platycarpa* (D. C. prod. 2. p. 453.) legumes nearly twice the length of the breadth, especially 15 lines long, and 9 lines broad. *Mimosa ambigua*, Salisb. prod. 325.

*Sweet-scented Acacia.* Fl. Feb. June. Clt. 1790. Sh. 4 to 8 ft.

75 *A. ANGUSTIFOLIA* (Wendl. diss. no. 22.) phyllodia linear, tapering a little to the base, acute, mucronate, 1-nerved, quite entire; heads of flowers racemose; calyx 4-toothed; ovary tomentose. *h. G.* Native of New Holland, about Port Jackson. Lodd. bot. cab. 768. *Mimosa angustifolia*, Jacq. schœnbr. 3. t. 394. *A. odorata*, Desv. Very like the preceding species, but differs in the fructification.

*Narrow-leaved Acacia.* Fl. April, May. Clt. 1816. Shrub 3 to 6 feet.

76 *A. ADUNCA* (Cunningh. mss.) phyllodia straight, elongated, linear, attenuated at the base, but rounded at the apex, ending in a callous mucrone, which forms a right angle with the phyllodia, 1-nerved, and bearing a gland on the upper margin between the middle and the base; heads of flowers crowded, disposed in terminal and axillary racemes. *h. G.* Native of New South Wales.

*Hooked Acacia.* Shrub 3 to 6 feet.

77 *A. LIMIFOLIA* (Willd. spec. 4. p. 1051.) phyllodia narrow, linear, mucronate, 1-nerved, quite entire; heads of flowers racemose; racemes length of the phyllodia; calyx sinuately 5-toothed; ovary glabrous. *h. G.* Native of New Holland, on the east coast. *Mimosa limifolia*, Vent. cels. t. 2. Andr. bot. rep. 394. *Mimosa linearis*, Wendl. hort. herrensch. t. 18. Sims, bot. mag. t. 2168. Bonpl. nav. t. 19.

*Flax-leaved Acacia.* Fl. May, June. Clt. 1790. Sh. 3 to 4 ft.

78 *A. ABIETINA* (Willd. spec. 4. p. 1051.) phyllodia narrow, linear, mucronate, 1-nerved, quite entire; heads of flowers racemose; racemes longer than the phyllodia. *h. G.* Native of New Holland. Perhaps this is merely a variety of the preceding species.

*Fir-like Acacia.* Fl. April, June. Clt. 1823. Sh. 3 to 6 ft.

79 *A. SUBULATA* (Bonpl. nav. t. 45.) phyllodia very long and linear, subulate and mucronate at the apex; heads of flowers racemose; racemes one-half shorter than the phyllodia; calyx 5-cleft; ovary tomentose. *h. G.* Native of New Holland. Wendl. diss. no. 25.

*Subulate-leaved Acacia.* Fl. April, June. Clt. 1824. Shrub 3 to 6 feet.

80 *A. RUBIDA* (Cunningh. in Field's new south wales, p. 344.) phyllodia ovate-lanceolate, ending in an oblique innocuous mucrone at the apex, bearing a gland on the upper margin; racemes small, pedunculate, axillary, and terminal; the rib and margins of the leaves coloured with red. *h. G.* Native of New Holland, frequent on the edge of hills on the blue mountains.

*Reddish Acacia.* Fl. April, June. Clt. 1823. Sh. 4 to 6 feet.

§ 3. *Spicate* (from *spicatus*, spiked; disposition of flowers). Flowers disposed in cylindrical spikes. *Stipulas usually wanting, or when present they are small and unarmed.*

81 *A. TAXIFOLIA* (Willd. spec. 4. p. 1050.) phyllodia in whorles of threes, lanceolate; spikes axillary, solitary, rather ovate; flowers 4-cleft, tetrandrous. *h. G.* Native of Cochinchina.

china, on the mountains. *Mimosa stellata*, Lour. coch. p. 651. *Mimosa ternata*, Pers. ench. 2. p. 261.

*Yew-leaved Acacia*. Clt. 1825. Shrub 8 feet.

82 *A. oxycedrus* (Sieb. pl. exsic. nov. holl. no. 457.) stipulas spinose; phyllodia scattered or somewhat verticillate, lanceolate-linear, ending in a pungent point, 3-nerved, glabrous, with nerve-formed glandless margins; spikes axillary, solitary, elongated; flowers 4-cleft. *h. G.* Native of New South Wales. Sweet, fl. austr. 6. Hook. bot. mag. 2928. *A. pugioniformis*, Cunning. mss. *A. taxifolia*, Lodd. bot. cab. 1225. Branches and rachis of spikes clothed with velvety villi.

*Sharp-cedar Acacia*. Fl. Ap. Ju. Clt. 1823. Sh. 6 to 10 ft.

83 *A. verticillata* (Willd. spec. 4. p. 1049.) phyllodia linear, ending in a pungent mucrone, disposed somewhat verticillately; spikes axillary, solitary, oblong; flowers 5-cleft; young legumes pubescent. *h. G.* Native of New Holland, on the south coast, and of Van Diemen. Phyllodia probably tern, the middle one the proper phyllodium, and the lateral ones are probably dilated stipulas, assuming the form of phyllodia.

*Var. a, glabra* (D. C. prod. 2. p. 453.) branches and peduncles glabrous; phyllodia linear, subulate; legumes very narrow.

*Var. b, angusta* (D. C. l. c.) branches and peduncles velvety; phyllodia linear-subulate; legumes very narrow. *Mimosa verticillata*, Lodd. ser. angl. 30. Curt. bot. mag. 110. Vent. malm. t. 63.

*Var. c, latifolia* (D. C. l. c. p. 454.) branches and peduncles velvety; phyllodia oblong-obovate or oblong-lanceolate; legumes broadish. *Mimosa ulicifolia*, Salisb. prod. 324. *Mimosa verticillata*, Wendl. coll. 1. t. 30.

*Whorled-leaved Acacia*. Fl. March, May. Clt. 1780. Shrub 6 to 10 feet.

84 *A. ruscifolia* (Cunningh. mss.) phyllodia lanceolate, ending in a pungent mucrone, somewhat verticillately disposed; spikes axillary, solitary, cylindrical; branches stiff, deflexedly-divaricate. *h. G.* Native of New Holland. Nearly allied to *A. verticillata*, but differs in the more rigid dwarf habit.

*Butcher's-broom-leaved Acacia*. Fl. March, May. Clt. 1824. Shrub 2 to 3 feet.

85 *A. linearis* (Sims, bot. mag. t. 2156.) phyllodia narrow-linear, very long, 1-nerved, and quite entire; spikes axillary, numerous, usually branched; calyx sinuately 4-toothed. *h. S.* Native of New Holland. Legume narrow-linear, attenuated at both ends, when young pubescent. Petals 4, distinct.

*Var. b, longissima* (Wendl. diss. no. 31. t. 11.) phyllodia longer, and more spreading, but not erect. *h. G.* Native of New Holland. Ker. bot. reg. 680. *A. linearis*, Lodd. bot. cab. 595. is a plant intermediate between the species and the variety.

*Linear-leaved Acacia*. Fl. May, June. Clt. 1819. Shrub 3 to 6 feet.

86 *A. mucronata* (Willd. enum. suppl. 68.) phyllodia linear-spatulate, 1-3-nerved, rounded and mucronate at the apex; spikes axillary, solitary or twin, simple; calyx sinuately 4-toothed. *h. G.* Native of New Holland. Wendl. diss. no. 32. t. 12. Sims, bot. mag. 2747. Petals 4, joined at the base. Ovary clothed with white tomentum.

*Mucronate-leaved Acacia*. Fl. May, June. Clt. 1818. Sh. 3 to 6 feet.

87 *A. floribunda* (Willd. spec. 4. p. 1051.) phyllodia linear-lanceolate, attenuated at both ends, quite entire, with 3-5 fine nerves; spikes axillary, solitary, simple; calyx sinuately 4-toothed. *h. G.* Native of New Holland, on the east coast. *Mimosa floribunda*, Vent. choix. t. 13. *A. longifolia*, Sieb. pl. exsic. nov. holl. no. 440. Petals 4, joined at the base, reflexed at the apex. Ovary rather silky.

*Bundle-flowered Acacia*. Fl. May, June. Clt. 1796. Shrub 6 to 10 feet.

88 *A. homomalla* (Wendl. diss. no. 34. t. 13.) phyllodia linear-lanceolate, attenuated at both ends, falcate, 3-nerved, white on both surfaces, but pubescent at the base; spikes twin, but solitary on the peduncles, axillary; calyx 5-toothed. *h. G.* Native of New Holland. Petals 5, joined at the base.

*Equal-wooled Acacia*. Fl. Ap. Ju. Clt. 1822. Sh. 6 to 8 ft.

89 *A. holosericea* (Cunningh. mss.) aspect silky-white; phyllodia oblong-lanceolate, obliquely-cuneated at the base, ending in a soft mucrone at the apex, 3-nerved, and furnished with one gland on the upper margin; spikes axillary, usually twin. *h. S.* Native of New Holland within the tropic. *A. heteromalla*, Sweet. *A. leucophylla*, Sweet. Phyllodia 6 inches long, and 1 inch broad.

*Whole-silky Acacia*. Fl. May, July. Clt. 1818. Tr. 10 to 20 ft.

90 *A. longifolia* (Willd. spec. 4. p. 1052.) phyllodia lanceolate, attenuated at both ends, 2-3-nerved at the base, and quite entire, the rest many nerved; spikes axillary, twin, on short peduncles; calyx 4-cleft. *h. G.* Native of New Holland, on the east coast. *Mimosa longifolia*, Andr. bot. rep. 107. Vent. malm. 62. *M. macrostachya*, Poir. suppl. 1. p. 61. *A. floribunda*, Sieb. pl. exsic. nov. holl. no. 438 and 439. There are varieties of this species with acute and obtuse, narrower (Sims, bot. mag. 1827.) and broader (Sims, bot. mag. 2166.) phyllodia. Petals 4, joined at the base.

*Long-leaved Acacia*. Fl. March, May. Clt. 1792. Tree 10 to 20 feet.

91 *A. doratylon* (Cunningh. in Field's new south wales, p. 345.) leaves lanceolate-linear, falcate, striated, attenuated at the base; spikes cylindrical, axillary, twin, nearly sessile. *h. G.* Native of New Holland, on pine ridges on the Macquarie river. This is the spearwood of certain tribes in the interior of the country.

*Spear-wood Acacia*. Fl. March, May. Clt. 1823. Tree 20 ft.

92 *A. intertexta* (Sieb. pl. exsic. nov. holl. no. 453.) phyllodia long-lanceolate, bluntish, straight, attenuated at the base, bearing on the upper margin at the base an inconspicuous gland, 2-nerved, reticulated with anastomosing veins, and are, as well as the branches, glabrous; spikes twin; flowers 4-cleft. *h. G.* Native of New Holland. *A. obtusifolia*, Cunningh. in Field's new south wales, p. 345. *A. thegonocarpa*, Cunningh. mss. in Loud. hort. brit. p. 407. no. 2470. Phyllodia 6 inches long, and half an inch broad. Spikes an inch long.

*Intervene-nerved Acacia*. Fl. April, June. Clt. 1824. Shrub 4 to 6 feet.

93 *A. glaucescens* (Willd. hort. berol. t. 101.) phyllodia oblong, rather falcate, quite entire, many-nerved, 2 or 3 of the nerves very evident; spikes axillary, solitary, pedunculate; calyx 5-toothed. *h. G.* Native of New Holland. Petals 5, joined at the base, and spreading at the apex.

*Glaucescent Acacia*. Fl. Feb. Ju. Clt. 1790. Sh. 3 to 6 ft.

94 *A. cinerascens* (Sieb. pl. exsic. nov. holl. no. 448.) phyllodia oblong, somewhat falcate, acuminate at both ends, quite entire, many-nerved, 2 or 3 of the nerves very evident; spikes axillary, solitary, pedunculate; flowers 4-cleft. *h. G.* Native of New Holland. Branches angular, and are, as well as rachis of the spikes, clothed with short, velvety, white down. Very nearly allied to *A. Sophora*.

*Greyish Acacia*. Fl. March, May. Clt. 1824. Sh. 4 to 6 ft.

95 *A. sophoræ* (R. Br. in hort. kew. 5. p. 462.) phyllodia obovate-oblong or lanceolate, quite entire, many-nerved. sometimes there are bipinnate leaves at the tops of the branches, young ones and branchlets rather velvety; spikes axillary, usually twin; calyx 4-cleft. *h. G.* Native of New Holland, on the south coast, and at Cape Van Diemen. *Mimosa sophoræ*, Labill. nov. holl. 2. t. 237. Legume torose. Umbilical funicle plicate. Petals 4, distinct.

*Sophora*-podded Acacia. Fl. April, Ju. Clt. 1805. Tr. 20 ft.

SECT. II. CONJUGATO-PINNATÆ. Leaves with one pair of pinnae, each pinna bearing few or many pairs of leaflets. This is an artificial section, composed of a heterogeneous mass of species, the most part of which are not well known.

96 *A. AMENTACEA* (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 455.) glabrous; spines stipular, straight; pinnae bearing 2 pairs of oblong leaflets; petiole very short; spikes oblong-cylindrical, axillary, sessile. *h. S.* Native of New Spain. Spikes dense, resembling the aments of a *salix*. Legumes unknown. Flowers yellow.

*Amentaceous Acacia.* Tree.

97 *A. LAXIFLORA* (D. C. prod. 2. p. 455.) unarmed, glabrous; pinnae bearing 3 pairs of petiolulate oval leaflets; petiole elongated; panicles axillary, loosely branched; heads 1-3-flowered. *h. S.* Native of the island of Timor. Flowers polyandrous. Leaflets 2-3 inches long, and 1½ inch broad. A very distinct species.

*Loose-flowered Acacia.* Tree.

98 *A. CORONILLIFOLIA* (Desf. cat. hort. par. ed. 2. p. 207.) glabrous; spines stipular, straight; pinnae bearing 5-9 pairs of linear, obtuse, rather glaucous leaflets; petiole very short, or hardly any, bearing a sessile gland between the pair of pinnae. *h. G.* Native of the north of Africa, near Mogodor. *Mimosa Giraffæ*, Brouss. in hort. monsp. *Mimosa coronillæfolia*, Pers. ench. no. 44. Heads of flowers ovate, pedunculate. It differs from the following species in the petioles being very short.

*Coronilla-leaved Acacia.* Clt. 1817. Tree.

99 *A. GUMMIFERA* (Willd. spec. 4. p. 1056.) glabrous; spines stipular, straight; pinnae bearing 6 pairs of linear obtuse leaflets; petiole bearing a sessile gland between the pair of pinnae; spikes oblong, axillary; legumes somewhat moniliform, clothed with white tomentum. *h. G.* Native of the north of Africa, near Mogodor. *Sassa gummifera*, Gmel. syst. Very like *A. Arabica*. Gum-arabic is obtained from this species as well as from many others.

*Gum-bearing Acacia.* Clt. 1823. Tree.

100 *A. STROMBULIFERA* (Willd. spec. 4. p. 1055.) glabrous; spines stipular, or nearly wanting; pinnae bearing 4-6 pairs of alternate or opposite, linear, obtuse leaflets, without any gland between the pinnae; legume terete, spirally twisted. *h. S.* Native of Peru, in woods, where it is vulgarly called *retortuna* from the shape of the pods. *Mimosa strombulifera*, Lam. dict. 1. p. 15. Flowers unknown. Legume indehiscent, which character indicates a separate genus.

*Strombus-bearing Acacia.* Shrub 6 to 8 feet.

101 *A. MAGDALENÆ* (Bert. in herb. Balb. D. C. prod. 2. p. 455.) unarmed; stipulas lanceolate, striated, erect; pinnae bearing 25 pairs of linear, obtuse, smoothish leaflets; petiole pubescent, glandless, much shorter than the pinnae. *h. S.* Native of St. Martha. Flowers unknown. Legume 2 inches long, thickish, straight, and glabrous, with the valves thick and furrowed on the outside.

*Magdalena Acacia.* Tree.

102 *A. PILOSA* (Bert. in herb. Balb. ex D. C. prod. 2. p. 455.) spines nearly axillary, spreading, straight; stipulas lanceolate, striated, erect; pinnae with 12 pairs of linear obtuse leaflets; petiole very short, glandless, and is, as well as the branches, pilose. *h. S.* Native of Jamaica. Flowers and legumes unknown. This is a very singular species from having stipular spines, and the stipulas existing at the same time.

*Pilose Acacia.* Clt. 1800. Tree.

103 *A. RETICULATA* (Willd. enum. 1051.) spines stipular, straight, length of the leaflets; leaves with one or more pairs of pinnae, each pinna bearing 6-9 pairs of oblong-linear, obtuse, dis-

tant leaflets; petiole furnished with a gland at the apex, and terminated by a spine-like mucrone; spikes globose, pedunculate; legumes oval, compressed. *h. G.* Native of the Cape of Good Hope? *Mimosa reticulata*, Lin. mant. 129.—Pluk. alm. t. 123. f. 2. Flowers white.

*Reticulated Acacia.* Clt. 1816. Tree 10 to 12 feet.

104 *A. PULCHELLA* (R. Br. in hort. kew. 5. p. 264.) smoothish; spines stipular, straight, slender; pinnae bearing 5-7 pairs of oblong-obovate, obtuse leaflets; petiole short, bearing a pedicellate gland between the pair of pinnae; heads of flowers solitary. *h. G.* Native of New Holland. Lodd. bot. cab. 212. Flowers yellow. Perhaps the same as *A. pulchella* of Link, enum. 2. p. 144. but the spines are said to be scattered in it.

*Neat Acacia.* Fl. April, July. Clt. 1803. Sh. 3 to 5 ft.

105 *A. HISPIDISSIMA* (D. C. prod. 2. p. 455.) stem and branches very hispid; spines stipular, straight, slender; pinnae bearing 5-7 pairs of linear, obtuse leaflets; petiole short, bearing a pedicellate gland between the pair of pinnae; heads of flowers solitary. *h. G.* Native of New Holland, on the east coast. Very like the preceding species, but differs from it in the stems, branches, and petioles being beset with long, white stiff hairs. Peduncles glabrous.

*Very hispid Acacia.* Fl. April, Jul. Clt. 1800. Sh. 3 to 6 ft.

106 *A. HEMASTOMA* (Bert. ined. D. C. legum. men. xii. t. 68. prod. 2. p. 456.) stem glabrous; spines stipular, spreading, straight; pinnae bearing 4-6 pairs of obovate-elliptic, obtuse, rather pilose leaflets; petiole short, glandless; heads of flowers solitary or twin, somewhat racemose. *h. S.* Native of St. Domingo. *Mimosa spartioides*, Vahl. ined. in herb. Juss. Peduncles, corolla, and legumes hairy. Stamens purple, 15, or only 13 or 14 from abortion. Legume linear, bluntish, attenuated at the base, straightish. Leaflets 2 lines long. Very like *Inga purpurea*, of which it is probably a congener, but differs in there being no pulp in the pods.

*Bloody-mouthed Acacia.* Shrub 3 to 6 feet.

107 *A. DETINENS* (Burch. trav. 1. p. 310. cat. no. 1628.) spines stipular, recurved, very short; leaflets obovate; petioles pubescent; flowers capitate; legume oval, flat, membranous, few-seeded. *h. G.* Native of the Cape of Good Hope, where it forms impenetrable masses.

*Detaining Acacia.* Fl. April, Jul. Clt. 1824. Sh. 3 to 6 ft.

108 *A. VIRIDICRANIS* (Burch. trav. 1. p. 300. cat. no. 1586.) spines stipular, very short, recurved; pinnae bearing 6-8 pairs of small, oval, approximate leaflets. *h. G.* Native of the Cape of Good Hope, in a place called *Carel Krieger's Grave*. Branches green, flexuous. Buds white from wool.

*Green-branched Acacia.* Clt. 1816. Shrub 4 to 5 feet.

109 *A. CINERARIA* (Willd. spec. 4. p. 1057.) prickles scattered, hooked; pinnae bearing 8-9 pairs of oblong-linear, equal leaflets. *h. S.* Native of the East Indies. *Mimosa cineraria*, Lin. spec. 1500.—Pluk. alm. t. 2. f. 1.

*Greyish Acacia.* Tree.

110 *A. ERIANTHA* (Desv. journ. bot. 1814. 1. p. 68.) spinose; pinnae bearing usually about 6 pairs of nearly elliptic, pubescent leaflets; flowers capitate; calyxes quite glabrous, but the corolla is clothed on the outside with silky pili. *h. S.* Native of the East Indies.

*Woolly-flowered Acacia.* Tree.

111 *A. CASSIOIDES* (Willd. enum. 1051.) spines stipular, setaceous; pinnae bearing 4-6 pairs of lanceolate leaflets, which are acute at both ends, the outer ones the largest. *h. S.* Native country, flowers, and fruit unknown.

*Cassia-like Acacia.* Clt. 1820. Tree 20 feet.

112 *A. DIPTERA* (Willd. enum. 1051.) spines stipular, very short, subulate; pinnae bearing 20-24 pairs of linear, obtuse, glabrous leaflets. *h. S.* Native of South America. Flowers

and legumes unknown. Perhaps a species of *Prosopis*, according to H. B. et Kunth, nov. gen. amer. 6. p. 281.

*Two-winged Acacia*. Clt. 1818. Tree.

113 A. ? *SALINARUM* (D. C. prod. 2. p. 456.) spines solitary, straight, rising from the sides of the buds; pinnae bearing 19-20 pairs of linear, obtuse leaflets, which are glabrous as well as branches and corollas, with a gland at the top of the petiole, and one between each pair of leaflets; spikes solitary, pedunculate. *h. S.* Native of Jamaica, in salt marshes. *Mimosa salinarum*, Vahl. ecl. amer. 3. p. 35. Stamens 10. Ovary hairy.

*Salt-marsh Acacia*. Tree.

114 A. *STRIGOSA* (Spreng. syst. 3. p. 137.) leaves with 1 pair of pinnae, each pinna bearing 2 pairs of oblique leaflets, which are pilose beneath; heads of flowers globose; legume strigose. *h. S.* Native of Peru. *Mimosa strigosa*, Pers. ench. 2. p. 263.

*Strigose Acacia*. Shrub.

115 A. *SELLOI* (Spreng. syst. 3. p. 137.) leaves almost sessile, with 1 pair of pinnae, each pinna bearing about 1 pair of linear, shining leaflets; heads of flowers pedunculate, usually solitary; legumes straight, lanceolate, with thickened margins. *h. S.* Native of Brazil.

*Sello's Acacia*. Tree.

116 A. *FLACCIDA* (Spreng. syst. 3. p. 137.) branches and petioles elongated and filiform, flaccid, glabrous; stipules linear; leaves with 1 pair of pinnae, each pinna bearing 6 pairs of obliquely oblong, nerved, pubescent leaflets; heads of flowers pedunculate. *h. S.* Native of Brazil.

*Flaccid-branched Acacia*. Shrub.

117 A. *INCA'NA* (Spreng. syst. 3. p. 137.) branches clothed with flocky down; leaves with 1 pair of pinnae, each pinna bearing about 20 pairs of oblong, obtuse, nerveless leaflets, which are hoary and lepidotied beneath; heads of flowers twin, pedunculate. *h. S.* Native of Brazil.

*Hoary Acacia*. Shrub.

118 A. *SETOSA* (Spreng. syst. 3. p. 137.) branches hairy; leaves with 1 pair of pinnae, each pinna bearing many pairs of linear leaflets, which are ciliated with strigæ on the margins. *h. S.* Native of Brazil.

*Setose Acacia*. Shrub.

SECT. III. *SPICIFLORÆ* (from *spica*, a spike, and *flos*, a flower; in reference to the disposition of the flower in spikes). Leaves bipinnate, with few or many pairs of pinnae, each pinna bearing many pairs of leaflets. Flowers disposed in spikes.

\* *Unarmed trees or shrubs*.

119 A. *CAUDATA* (D. C. prod. 2. p. 456.) unarmed; leaves with 2-3 pairs of pinnae, each pinna bearing 7-8 pairs of linear-oblong, very blunt, somewhat emarginate, quite glabrous leaflets, which are oblique at the base, the outer ones largest; petioles glandless; spikes twin, disposed in a terminal raceme. *h. S.* Native of Cayenne. *Mimosa caudata*, Vahl. ecl. amer. 3. p. 35. Petals 5. Stamens 10. Legume unknown.

*Tailed Acacia*. Tree.

120 A. *CYCLOSPERMA* (D. C. prod. 2. p. 456.) unarmed; leaves with 3 pairs of pinnae, each pinna bearing 3-4 pairs of ovate-oblong, rather coriaceous leaflets, which are cuneated at the base, and are glabrous as well as the petioles, with a depressed gland between each of the pairs of pinnae, and also between each of the pairs of leaflets; spikes supra-axillary, solitary; seeds flat, orbicular. *h. G.* Native of New Caledonia. Flowers 5-cleft. Legume 4-5 inches long, compressed.

*Circle-seeded Acacia*. Tree.

121 A. *GRANULOSA* (Labill. cal. p. 67. t. 66.) unarmed; leaves with 5 pairs of pinnae, each pinna bearing 12 pairs of alternate, obliquely ovate-oblong, obtuse leaflets; spikes axillary,

solitary; stamens monadelphous; branches granular. *h. G.* Native of New Caledonia. Legumes moniliform, 6-7-seeded.

*Granular-branched Acacia*. Shrub 4 to 6 feet.

122 A. *FULGENS* (Labill. cal. p. 68. t. 67.) unarmed; leaves with 2-3 pairs of pinnae, each pinna bearing 3 pairs of broad, elliptic, obtuse leaflets, which are attenuated at both ends; spikes of flowers length of leaves. *h. G.* Native of New Caledonia.

*Shining Acacia*. Shrub 12 feet.

123 A. *DISTACHYA* (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 456.) unarmed; leaves with 4 pairs of pinnae, each pinna bearing 3-4 pairs of oval, obtuse leaflets, which are rather villous as well as the petioles; spikes axillary, twin. *h. S.* Native of New Spain. Partial petioles jointed at the base. Corolla 5-parted. Stamens 9? monadelphous at the base. Legume unknown.

*Two-spiked Acacia*. Tree.

124 A. *THIBAUDIANA* (D. C. prod. 2. p. 456.) unarmed; leaves with 4 pairs of pinnae, each pinna bearing 7-9 pairs of ovate, somewhat rhomboid leaflets, which are rather oblique at the base, and villous beneath, as well as the petioles, which bear a sessile gland each; legumes compressed, contracted between the seeds. *h. S.* Native of South America, but in what place is unknown. *Sophora obliqua*, Pers. ench. 1. p. 452.

*Thibaud's Acacia*. Tree.

125 A. *ROHRRIANA* (D. C. prod. 2. p. 457.) unarmed; leaves with 4 pairs of pinnae, each pinna bearing about 10-11 pairs of somewhat trapeziform, obtuse, glabrous leaflets, which are beset with yellow villi on the ribs, with a gland between each of the pairs of leaflets; spikes solitary, pedunculate, axillary, length of leaves. *h. S.* Native of South America. *Mimosa nigricans*, Vahl. ecl. amer. 3. p. 37. t. 29. but not of Labill. Plant becoming black on drying.

*Rhor's Acacia*. Tree.

126 A. *NUDIFLORA* (Willd. spec. 4. p. 1058.) unarmed; leaves with 4-6 pairs of pinnae, each pinna bearing 12-15 pairs of elliptic, obtuse leaflets, with a depressed gland between each of the pairs of pinnae; spikes of flowers axillary and lateral, filiform. *h. S.* Native of Porto Rico. Leaves downy beneath as well as the petioles, when young. Legume linear, flat, glabrous.

*Naked-flowered Acacia*. Tree 20 feet.

127 A. *MURICATA* (Willd. spec. 4. p. 1058.) unarmed; leaves with 5 pairs of pinnae, each pinna bearing 12-15 pairs of ovate, retuse, rather emarginate leaflets, with a depressed gland between each of the pairs of pinnae; spikes cylindrical, subulate, aggregate at the tops of the branches; branches warted. *h. S.* Native of the West Indies. *Mimosa muricata*, Lin. spec. 1504. —Plum. ed. Burm. t. 11. Flowers white.

*Muricate-branched Acacia*. Tree.

128 A. *ROSTRATA* (Humb. et Bonpl. in Willd. spec. 4. p. 1060.) unarmed; leaves with 6 pairs of pinnae, each pinna bearing numerous pairs of linear, glabrous leaflets; petioles pilose, bearing an ureolar gland at the base; spikes axillary. *h. S.* Native of South America. *Mimosa ignavi*, H. B. et Kunth, nov. gen. amer. 6. p. 259. Flowers unknown. Legume linear, beaked at the apex.

*Beaked-podded Acacia*. Tree.

129 A. *CALLOSA* (Spreng. syst. 3. p. 138.) branches beset with callous warts; petioles pubescent, bearing a gland at the base; leaves with 7 pairs of pinnae, each pinna bearing many pairs of linear, shining leaflets; spikes disposed in panicles. *h. S.* Native of Brazil.

*Callous-warted Acacia*. Tree or shrub.

130 A. *ARENOSA* (Willd. l. c.) unarmed; leaves with 6 pairs of pinnae; each pinna bearing 16 pairs of linear, acute, ciliated leaflets; petioles pubescent, bearing a gland between each of

the pairs of pinnæ; spikes twin, filiform. *h. S.* Native of Caraccas, on the sandy banks of rivers.

*Sand Acacia.* Clt. 1818. Tree 10 to 12 feet.

131 *A. LOPHANTHOIDES* (D. C. prod. 2. p. 457.) unarmed; leaves with 8-9 pairs of pinnæ, each pinna bearing 12 pairs of oval-oblong, obtuse leaflets; petioles glandless, and are as well as the branchlets pubescent; racemes usually twin, short, axillary; calyxes glabrous. *h. S.* Native of Jamaica. Flowers and habit of the following species. Legumes unknown.

*Lophantha-like Acacia.* Clt. 1820. Tree.

132 *A. LOPHANTHA* (Willd. spec. 4. p. 1070.) unarmed; leaves with 8-10 pairs of pinnæ, each pinna bearing 25-30 pairs of linear, bluntish leaflets; petioles and calyxes clothed with velvety down, with a gland at the base of the common petiole, and one between each of the two extreme pairs of leaflets; racemes ovate-oblong, axillary, twin. *h. G.* Native of New Holland. Sims, bot. mag. 2108. *Mimosa distachya*, Vent. cels. t. 20. but not of Cav. *Mimosa elegans*, Andr. bot. rep. t. 563. *A. lophantha*, Lodd. bot. cab. 716. This and the preceding species would almost constitute a proper section from the flowers. Perhaps *A. insignis* of Hoffmanns. verz. 1824. p. 159. is not distinct from the present species. Flowers yellow.

*Crest-flowered Acacia.* Fl. May, Jul. Clt. 1803. Sh. 6 to 10 ft.

133 *A. GUIANENSIS* (Willd. spec. 4. p. 1061.) unarmed; leaves with 10 pairs of pinnæ, each pinna bearing 10 pairs of elliptic, obtuse, glabrous leaflets; petiole rather velvety, furnished with a convex gland at the base; spikes filiform, solitary, axillary. *h. S.* Native of Guiana and Cayenne. Legume lanceolate, flat. *Mimosa Guianensis*, Aubl. guian. 2. t. 357. Flowers small, glabrous, white.

*Guiana Acacia.* Clt. 1803. Tree 40 feet.

134 *A. PSILOSTACHYA* (D. C. prod. 2. p. 457.) unarmed; leaves with 7-10 pairs of pinnæ, each pinna bearing 15-20 pairs of oblong-linear, obtuse, glabrous leaflets, which are truncate at the base, with an adpressed gland at the base of the petiole, and one between the extreme pair of pinnæ; spikes filiform, slender, solitary, axillary. *h. S.* Native of French Guiana. Flowers small, as in the preceding, but pubescent.

*Smooth-spiked Acacia.* Tree.

135 *A. ACAPULCENSIS* (Kunth, mim. 78. t. 24. nov. gen. amer. 6. p. 267.) unarmed; leaves with 8-9 pairs of pinnæ, each pinna bearing 35-45 pairs of oblong-linear, glabrous leaflets, with a gland between 2 or 3 of the extreme pairs of pinnæ, and one at the base of the petiole; spikes cylindrical, axillary, solitary, twin, or tern. *h. S.* Native of Mexico, about Acapulco, in the sand by the sea-side. Flowers white. Stamens numerous, monadelphous. Legumes unknown.

*Acapulco Acacia.* Clt. 1825. Tree.

136 *A. ELEPHANTHORHIZA* (Burch. cat. geogr. no. 2410.) unarmed; leaves with 10-12 pairs of pinnæ, each pinna bearing 25 pairs of linear, glabrous leaflets; petioles glandless; branches and flowers glabrous; spikes axillary, cylindrical, solitary. *h. G.* Native of the Cape of Good Hope. Petals 15. Stamens 10. Perhaps a species of *Prosopis*.

*Elephant-root Acacia.* Clt. 1818. Shrub.

137 *A. SCLERXYLA* (Tussac, fl. antil. t. 21.) unarmed; leaves with 10-15 pairs of pinnæ, each pinna bearing an indefinite number of leaflets, with an urceolar gland below the lower pair of pinnæ; spikes filiform, solitary; branches warted. *h. S.* Native of the French West India Islands, where it is called *Tendre à caillon batard*, with many other species.

*Hard-wooded Acacia.* Tree 60 feet.

138 *A. FULCHERRIMA* (Willd. spec. 4. p. 1061.) unarmed; leaves with 13 pairs of pinnæ; each pinna bearing numerous pairs of oblong-linear, obtuse leaflets, which are pubescent beneath as well as the petioles, and with a convex gland at the

base of the petiole; spikes of flowers axillary, twin, filiform. *h. S.* Native of Para, in Brazil. Flowers pilose, 5-cleft.

*Fairest Acacia.* Clt. 1823. Tree 50 feet.

139 *A. DUMETORUM* (D. C. prod. 2. p. 458.) stem furnished with a few prickles; branches sulcate, pubescent; leaves bipinnate, each pinna bearing many pairs of minute, linear-elliptic leaflets, which are glandularly dotted beneath; spikes axillary, twin, slender; corolla profoundly 5-cleft; stamens free; ovary villous. *h. S.* Native of Brazil, in the province of Minas Novas. *Mimosa dumetorum*, St. Hil. pl. rem. bras. 1. p. 1. Legume unknown.

*Bush Acacia.* Shrub 1 to 2 feet.

140 *A. ADSTRINGENS* (Mart. reis. bras. ex Schlecht. Linnæa. 5. p. 41.) unarmed; leaves with 4-5 pairs of pinnæ, each pinna bearing 4-5 pairs of broad-ovate, glaucescent leaflets, which are unequal at the base, obtuse, and glabrous, with a gland between the superior pair of pinnæ; petioles and young branches clothed with chestnut-coloured tomentum; spikes cylindrical, axillary, with the rachis and calyxes tomentose. *h. S.* Native of Brazil. Legume oblong, compressed.

*Astringent Acacia.* Shrub 2 to 3 feet.

141 *A. MACROLOBA* (Willd. spec. 4. p. 1060.) unarmed; leaves with 16 pairs of pinnæ, each pinna bearing many pairs of linear, falcate, acuminate leaflets, which are angular at the base; petioles with 2 hairy lines on the upper side; spikes filiform, solitary, axillary. *h. S.* Native of Para, in Brazil.

*Long-podded Acacia.* Tree 40 to 50 feet.

142 *A. SPRENGELII*; branches glandless; petioles hairy; leaves with 6 pairs of pinnæ, each pinna bearing 15 pairs of oblong, obtuse, pubescent leaflets; spikes short, twin. *h. S.* Native of Jamaica. *A. Berteriæna*, Spreng. syst. 3. p. 138. but not of Spreng. in herb. Balb. D. C.

*Sprengel's Acacia.* Tree.

143 *A. ASPIDIODES* (Meyer. prim. esseq. 165.) unarmed; leaves with 15-18 pairs of pinnæ, each pinna bearing many pairs of linear, glabrous leaflets, and bearing on the under side at the base a transverse gland each; petioles glandless, pubescent; spikes cylindrical, disposed in terminal racemes. *h. S.* Native of Guiana, in the island of Arowabiseh, in humid places. Petals 5, white, hardly connected at the base. Stamens 10. Legume curved.

*Aspidium-like Acacia.* Tree 30 to 40 feet.

144 *A. DEALBATA* (Link. enum. 2. p. 445.) unarmed; leaves with 15 pairs of pinnæ, each bearing many pairs of minute, equal, pubescent leaflets, with a perforated gland seated between one of the pairs of pinnæ; racemes lateral. *h. S.* Native country and legumes unknown.

*Whitened Acacia.* Tree.

145 *A. WALLICHIANA* (D. C. prod. 2. p. 458.) unarmed; branches and leaves pubescent; leaves with 10-12 pairs of pinnæ, each pinna bearing about 50 pairs of approximate, linear leaflets; petiole bearing a gland beneath the pinnæ, and one between each of the pairs of pinnæ; spikes cylindrical, elongated; legumes flat, lanceolate; quite glabrous, 6-10-seeded. *h. S.* Native of the East Indies. Stamens 20-25.

*Wallich's Acacia.* Clt. 1820. Tree 30 feet.

\* \* Prickly or spiny trees or shrubs.

146 *A. FERRUGINEA* (D. C. prod. 2. p. 458.) spines stipular, straightish, conical, broadest at the base; leaves with 3-4 pairs of pinnæ, each pinna bearing 10-12 pairs of linear, bluntish, glabrous, glaucous leaflets; petiole furnished with a large, depressed gland; spikes of flowers cylindrical, slender, disposed in a panicle; legumes oval, hard, compressed, 1-2-seeded, indehiscent. *h. S.* Native of Cocomandel. *Mimosa ferruginea*, Roxb. hort. beng. p. 41. Stamens 20-25. Allied to *A. Sûndra* and *A. Câtechu*.

*Rusty Acacia.* Clt. 1818. Tree 12 to 20 feet.

147 *A. SU'NDRA* (D. C. prod. 2. p. 458.) spines stipular, hooked, decurrent at the base; leaves with about 20 pairs of pinnae, and each pinna bearing about the same number of leaflets, which are linear, obtuse, and glabrous, with a gland at the base of the petiole, and one between each of the 3 outer pairs of pinnae; spikes axillary, usually solitary, cylindrical; legumes flat, compressed, 2-3-seeded, acuminate at both ends. *h. S.* Native of the coast of Coromandel, in woods and on the mountains. *Mimosa Sunda*, Roxb. cor. 3. t. 225. *Acacia Chundra*, Willd. spec. 4. p. 1078. Flowers yellow. Stamens 20-25. Allied to *A. Catechu*. Wood hard, chocolate-coloured. The tree is called *Sundra* by the Telingas.

*Sundra Acacia.* Clt. 1789. Tree 12 to 15 feet.

148 *A. CA'TECHU* (Willd. spec. 4. p. 1079.) prickles stipular, when young straightish, but at length becoming hooked; leaves with 10 pairs of pinnae, each pinna bearing 10 pairs of linear pubescent leaflets, with 1 depressed gland at the base of the petiole, and 2 or 3 between the extreme pairs of pinnae; spikes cylindrical, solitary, twin, or tern, axillary. *h. S.* Native of the East Indies. *Mimosa Catechu*, Lin. fil. suppl. 439. Roxb. cor. 2. t. 175. Flowers yellow, 5-cleft, with about 20 stamens. Legume lanceolate, flat, 3-6-seeded. This is a small tree, about a foot in diameter, covered with brown bark. The drug known by the name *Catechu* (from *cate*, a tree, and *chu*, juice) is the product of this tree. In Bengal the extract of *catechu*, which was formerly termed, with peculiar impropriety, *Japan earth*, is principally prepared from the external coloured part of the wood, by decoction, evaporation, and exsiccation in summer. But *catechu* is also prepared in India from other species of *Acacia*, and even from the wood, bark, and fruits of other genera, as the *Nauclea Gambir*. In Mysore it is chiefly prepared from the nuts of *Arca Catechu*. *Catechu* has the appearance of a dried extract of various forms, rounded masses, or cut into squares or lozenges. It is perfectly opaque, and has always an earthy fracture. The Bombay *catechu* is of an uniform texture, and of a red-brown hue, its specific gravity being generally about 1.39. The extract from Bengal is more friable and less consistent. Its colour is like that of chocolate externally, but when broken its fracture presents streaks of chocolate and of red brown. Its specific gravity is 1.28. Their tastes are precisely similar, being astringent, but leaving in the mouth a sensation of sweetness. They do not deliquesce by exposure to the air, and are not fusible. Sir H. Davy states that *catechu* contains one-half of tannin, 35 per cent. of extractive, 6 to 8 of mucilage, and 5 to 7 of impurities. Chemists have not succeeded in presenting the astringent principle in a state of purity. In medicine *catechu* is one of the most convenient and powerful astringents we possess, and may be exhibited in every case where astringents are indicated. It is particularly serviceable in diarrhoea, in hoarseness from relaxation of the fauces, ulcers, and aphthæ in the mouth, and in excoriations, with lymphatic exudation.

*Catechu Acacia.* Clt. 1790. Tree 20 to 40 feet.

149 *A. SUBTILIFOLIA* (H. B. et Kunth, nov. gen. amer. 6. p. 268.) spines stipular, nearly erect; leaves with 5-10 pairs of pinnae, each pinna bearing about 30-45 pairs of linear leaflets, which are puberulous beneath; petioles bearing 1 gland in the middle and one at the top of the rachis; spikes cylindrical, solitary; legumes oblong, unarmed. *h. S.* Native of New Granada, on the banks of the river Chota. Stamens 10, free.

*Subtile-leaved Acacia.* Tree.

150 *A. FASCICULATA* (Kunth, mim. 75. t. 23. nov. gen. amer. 6. p. 267.) prickles scattered, or twin, straight; leaves with 15 pairs of pinnae, each pinna bearing 9-14 pairs of obliquely oblong leaflets; petioles glandless, rather prickly, and are as well as the

branchlets pubescent; spikes cylindrical, fasciculately panicled. *h. S.* Native of Mexico, near Guanajuato. Flowers white, 5-cleft, octandrous or decandrous. Legume unknown.

*Fascicled-spiked Acacia.* Tree.

151 *A. VIRIDIFLORA* (Kunth, mim. 81. t. 25. nov. gen. amer. 6. p. 269.) prickles recurved; leaves with 6-15 pairs of pinnae, each pinna bearing 15-35 pairs of linear-oblong leaflets, which are puberulous beneath as well as the petioles, which are furnished with 1 gland at the base, and 2 or 3 along the rachis; spikes cylindrical, solitary. *h. S.* Native of South America, in the province of Bracamora, near St. Felipe. Flowers greenish-white, 5-cleft. Stamens 10, free. Legume unknown.

*Green-flowered Acacia.* Clt. 1823. Shrub 4 to 6 feet.

152 *A. CA'FFRA* (Willd. spec. 4. p. 1078.) prickles stipular, twin, incurved; leaves with 5-10 pairs of pinnae, each pinna bearing 20-30 pairs of lanceolate-linear, obtuse, glabrous leaflets, with a depressed gland at the base of the petiole; spikes cylindrical, axillary. *h. G.* Native of the Cape of Good Hope. *Mimosa Caffra*, Thunb. prod. 92. fl. cap. 433. Legumes linear-lanceolate.

*Caffrarian Acacia.* Clt. 1800. Tree 12 to 20 feet.

153 *A. POLYACANTHA* (Willd. spec. 4. p. 1079.) prickles stipular, dilated; leaves with 10 pairs of pinnae, each pinna bearing 30-40 pairs of linear, obtuse, ciliated leaflets, with a gland both at the base and apex of the common petiole, which is prickly beneath; spikes cylindrical, twin, axillary. *h. S.* Native of the East Indies. *Mimosa spinosissima*, Poir. suppl. 1. p. 78.

*Many-spined Acacia.* Tree.

154 *A. STELLATA* (Willd. spec. 4. p. 1078.) prickles stipular, recurved; leaves with 10 pairs of pinnae, each pinna bearing 13 pairs of oblong leaflets, which are obtuse at both ends; petioles bearing 2 or 3 recurved prickles at the origin of each pinna; racemes of flowers compound. *h. G.* Native of Arabia Felix, on Mount Kurma. *Mimosa stellata*, Forsk. descript. 177. Vahl. symb. 1. p. 81. Petals 5. Stamens 10. Legume compressed, lanceolate, membranous.

*Starry Acacia.* Tree.

155 *A. VELUTINA* (D. C. prod. 2. p. 459.) prickles petiolar, scattered, hooked; leaves with 11 pairs of pinnae, each pinna bearing 25-35 pairs of oblong, linear leaflets, which are pubescent as well as the petioles, peduncles, and flowers; petiole furnished with a gland at the base, and one between each of the two extreme pairs of pinnae. *h. S.* Native of Brazil. Corolla 5-furrowed, pubescent. Stamens numerous. Legume unknown.

*Velvety Acacia.* Tree.

156 *A. ATAXACANTHA* (D. C. prod. 2. p. 459.) prickles hooked, scattered in a loose manner along the branches and petioles; leaves with 6-8 pairs of pinnae, each pinna bearing 20-30 pairs of linear, ciliated leaflets, with an oblong gland on the petiole, both between the lower and upper pair of pinnae; stipulas lanceolate, dilated on the outside at the base; spikes twin, axillary, cylindrical. *h. S.* Native on the banks of the rivers Senegal and Gambia. Stamens 20-25. Legumes unknown.

*Unorderly-spined Acacia.* Shrub 6 to 8 feet.

157 *A. MACROSTACHYA* (Reichb. in Sieb. pl. exsic. seneg. no. 44.) prickles hooked, scattered without any order along the branches; stipulas foliaceous, large, rather reniform, acute; leaves with 20 pairs of pinnae, each pinna bearing 20-30 pairs of linear, villous, and ciliated leaflets; spikes of flowers elongated, and are as well as the petioles and branches velvety. *h. S.* Native of Senegal and Gambia, where we have seen it and the preceding species growing in plenty about Bathurst, near the mouth of the river. Spikes of flowers clothed with hoary tomentum, 3 inches long. Flowers glabrous, 5-cleft.

*Long-spiked Acacia.* Shrub 8 to 10 feet.

158 *A. SENEGAL* (Willd. spec. 4. p. 1077. exclusive of figure cited,) prickles stipular, straight, short; leaves with 5-8 pairs of pinnae, each pinna bearing 15-18 pairs of oblong-linear obtuse leaflets, which are glabrous, as well as the petioles and branches, with a sessile gland between each of the pairs of pinnae on the petiole; spikes axillary, solitary, slender. *h. S.* Native of Arabia, and the interior of Africa. *Mimosa Senegal*, Lin. spec. 1506. Flowers small, glabrous, distant. Branches white. Prickles sometimes wanting. Axillary branches abortive, and becoming spines. The spines at the base of the leaves are said to be three by Linnaeus. Gum-senegal is the produce of this tree; it is usually sold in the shops as gum-arabic; its medicinal uses are the same, and it is procured in the same way from the trees. It was not until the beginning of the 17th century that the Dutch made gum-senegal known in Europe. After the French got possession of that river they directed their attention to it as an important object of commerce, and ascertained by experiments made in the latter half of the 17th century that gum-senegal was superior to the best gum-arabic. M. Adanson examined all the gum trees of West Africa with great care. They amount to 40 in number, but the three great forests which supply the Senegal market consist chiefly of two kinds, one which produces a white gum called verceek, and another called nebueh, which yields a red gum.

*Senegal Acacia.* Clt. 1823. Tree 20 feet.

159 *A. ALBIDA* (Delil. fl. aegypt. 143. t. 52. f. 3.) prickles stipular, straight; leaves with 3-4 pairs of pinnae, each pinna bearing 9-10 pairs of oblong-linear, obtuse, rather mucronate, glaucous leaflets, which are glabrous, as well as the branches, with a sessile gland between each of the pairs of pinnae; spikes cylindrical, exceeding the leaves. *h. G.* Native of Upper Egypt, near Syene. Legume unknown.

*White-leaved Acacia.* Tree 20 feet.

160 *A. MONACANTHA* (Willd. enum. 1056.) prickles stipular, infra-axillary, solitary, recurved; leaves with usually 8 pairs of pinnae, each pinna bearing 17-20 pairs of oblong leaflets; spikes cylindrical, paniced, axillary. *h. S.* Native of Brazil.

*One-spiked Acacia.* Clt. 1818. Tree.

161 *A. DALEA* (Desv. journ. bot. 1814. vol. 1. p. 69.) spines straight, elongated, solitary, pubescent, stipular; leaves bipinnate, pubescent; spikes 3-together, axillary, on short peduncles. *h. S.* Native of the East Indies. Flowers rose-coloured.

*Dalea-like Acacia.* Tree.

162 *A. SPINI* (Balb. in Spin. cat. supp. 1823. p. 8. Col. hort. ripul. append. t. 5.) prickles stipular, infra-axillary, solitary, hooked; leaves with 3-4 pairs of pinnae, each pinna bearing 3-5 pairs of elliptic leaflets, the lower ones the smallest; spikes cylindrical, solitary or twin, axillary. *h. S.* Native country unknown. Flowers greenish yellow. Legumes coarctate between the seeds, prickly on the sutures.

*Spini's Acacia.* Shrub 5 to 8 feet.

163 *A. CORNIGERA* (Willd. spec. 4. p. 1080.) prickles or spines stipular, connate at the base, compressed, large; leaves with 6 pairs of pinnae, each pinna bearing about 20 pairs of glabrous leaflets; gland petiolar; spikes axillary, cylindrical. *h. S.* *Mimosa cornigera*, Lin. spec. ed. 1. p. 520. Flowers pale yellow. The two large connate spines resemble the horns of an ox.

*Var. α, Americana* (D. C. prod. 460.) spines brown. *h. S.* Native of Mexico, Cuba, and in the woods of Carthagea.—Pluk. phyt. t. 122. f. 1.—Comm. hort. 1. t. 107. Jacq. amer. 266. The legume is filled with pulp according to Jacquin, and it is therefore probably a species of *Inga* or *Prosopis*.

*Var. β, Indica* (D. C. l. c.) spines yellow. *h. S.* Native of the East Indies.—Seba, thes. 1. t. 70. f. 13.

*Horn-bearing Acacia* or *Cuckold-tree.* Clt. 1692. Tree 10 to 14 feet.

164 *A. TENUIFLORA* (Willd. spec. 4. p. 1088.) prickles scattered, incurved; leaves with 5 pairs of pinnae, each pinna bearing many pairs of ciliated leaflets; petioles pubescent, rather prickly; spikes filiform, length of the leaves. *h. S.* Native of Caraccas. Legumes membranous, sub-lanceolate, 3-5-seeded.

*Fine-flowered Acacia.* Tree.

165 *A. MODESTA* (Wall. pl. rar. asiat. 2. p. 27. t. 130.) arborescous; branches flexuous; spines axillary, subulate; leaves with 2-3 pairs of pinnae, each pinna bearing 4 pairs of oblong, obtuse, glabrous, glaucous leaflets; petioles pilose, bearing 1 gland in the middle; spikes axillary and terminal, usually solitary, cylindrical, nodding, on short peduncles; flowers hermaphrodite; filaments distinct, twice the length of the corolla; legume stipitate, linear-oblong, flat, glabrous, rather membranous, 6-seeded, acute at both ends. *h. S.* Native of Hindostan. Flowers white, fragrant. Spines twin, stipular.

*Modest Acacia.* Shrub 8 to 12 feet.

166 *A. LATRONUM* (Willd. spec. 4. p. 1077.) spines stipular, twin, serrate; leaves with 4 pairs of pinnae, each pinna bearing many pairs of small leaflets; spikes usually twin, elongated, axillary; legume semi-lunate. *h. S.* Native of the East Indies. *Mimosa latronum*, Lin. fil. suppl. 438. Spines milk-coloured, straight. Flowers white. This species of *Acacia* form impenetrable thickets from their interwoven branches and terrible spines in the mountainous parts of India, and are the secure retreat of the smaller animals and rogues. Lin. suppl.

*Rogue's Acacia.* Clt. 1820. Shrub 4 to 6 feet.

167 *A. AZAK* (Willd. l. c.) spines stipular, 3-together, straight; leaves with 3 pairs of pinnae, each pinna bearing 5 pairs of leaflets, with a gland on the petiole between the lower pair of pinnae. *h. G.* Native of Arabia Felix. *Mimosa Azak*, Forsk. descr. 176. Vahl. symb. 2. p. 104. Flowers and fruit unknown. *Azak* is the Arabian name of the tree.

*Azak Acacia.* Shrub.

168 *A. CADUCEA* (Humb. et Bonpl. in Willd. spec. 4. p. 1089.) prickles scattered, rather hooked; leaves with 4-6 pairs of pinnae, each pinna bearing 5-10 pairs of oblique, oval, obtuse leaflets, which are pubescent beneath, without any gland on the petioles; spikes ovate, pedunculate, axillary, solitary or twin; stamens 8-10; legumes ciliated, with prickles. *h. S.* Native of Peru, near Gualtaquillo on the banks of the river Cachiyacu. Kunth, nov. gen. amer. 6. p. 266. Legume hardly known.

*Caduceous Acacia.* Tree.

169 *A. PROSOPOIDES* (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 460.) prickles few, scattered, hooked at the apex; leaves with 2-3 pairs of pinnae, and each pinna bearing 2-3 pairs of oval, oblong, obtuse, glabrous leaflets; spikes usually twin. *h. S.* Native of New Spain. Corolla 5-cleft, reddish. Stamens 10. Legume unknown.

*Prosopis-like Acacia.* Tree.

170 *A. ADIANTOIDES* (Spreng. syst. 3. p. 146.) prickles short, few, straight; petioles tomentose; leaves with 4 pairs of pinnae, each pinna bearing usually 8 pairs of alternate, dimidiately-oblong, obtuse, shining leaflets; spikes axillary, sessile. *h. S.* Native of Brazil, Sello.

*Adiantum-like Acacia.* Tree.

171 *A. HOSTILIS* (Mart. reis. bras. ex Schlecht. Linnæa. 5. p. 43.) shrubby, branches elongated, spreading; prickles scattered, straight; leaves bipinnate, clothed with clammy pubescence, with 4-6 pairs of pinnae, each pinna bearing 20 pairs of linear leaflets; stipular prickles and those between the stipulas straight; spikes solitary; legumes membranous, linear-oblong, 2-3-seeded, pubescent. *h. S.* Native of Brazil.

*Hostile Acacia.* Shrub.

SECT. IV. *GLOBIFLORÆ* (from *globus*, a globe, and *flos*, a

flower; in reference to the flowers being collected into globose heads on the tops of the peduncles). Leaves bipinnate, with few or many pairs of pinnae, each pinna bearing few or many pairs of leaflets. Flowers collected into globose heads at the tops of the peduncles.

\* *Prickles all stipular and straight. Legumes unarmed. Stamens 20 or more.*

§ 1. *Aculeatæ* (from *aculeatus*, prickly; plants furnished with stipular prickles).

172 *A. NITIDA* (Willd. spec. 4. p. 1086.) spines twin; leaves with 2 pairs of pinnae, each pinna bearing 5 pairs of oblong leaflets, which are narrowest at the base, and shining above, with a gland between each of the pairs of pinnae; petioles pubescent; heads of flowers pedunculate, twin. *h. S.* Native of the East Indies. *Mimosa nitida*, Vahl. symb. 2. p. 803. Flowers polyandrous. Legume unknown.

*Shining-leaved Acacia. Tree.*

173 *A. SEYAL* (Delil. fl. ægypt. 142. t. 52. f. 2.) spines twin, straight, about the length of the leaves; leaves with 2 pairs of pinnae, each pinna bearing 8-12 pairs of oblong-linear glabrous leaflets; legumes compressed, linear, falcate, acute, glabrous. *h. G.* Native of Egypt, where it is called *Sejal*. *Mimosa Sejal*, Forsk. deser. p. 177. In a specimen received by De Candolle from Sieber the branches are brown, the prickles stipular, shorter than the leaves, and sometimes wanting; the heads of flowers are globose and yellow, and the legume is striated with nerves. It is perhaps the same as the plant of Delile.

*Sejal Acacia. Shrub.*

174 *A. HORRIDA* (Willd. spec. 4. p. 1082.) spines twin, about equal in length to the leaves, and are glabrous, as well as the leaves and branches; leaves with 2-3 pairs of pinnae, each pinna bearing 9-12 pairs of oblong obtuse leaflets, with the rib biglandular; heads of flowers pedunculate, axillary, usually aggregate. *h. G.* Native of the south of Africa and of Arabia. *Mimosa horrida*, Lin. spec. 1505. *Mimosa leucacantha*, Jacq. schænbr. t. 393. *Mimosa eburnea*, Lam. dict. 1. p. 18. *A. Capensis*, Burch. trav. 189. with a figure. *Mimosa Orfota*, Forsk. deser. 177. *Mimosa Capensis*, Burm. fl. cap. prod. 27.—Pluk. phyt. 121. f. 4. with white spikes. Young branches almost unarmed. Flowers yellow, polyandrous. Legume unknown. There is a variety of this species bearing 1-3 glands on the petiole, either beneath or between the pairs of pinnae. Spines in pairs, white, purple at the top.

*Horrid Acacia. Clt. 1823. Shrub.*

175 *A. EBURNEA* (Willd. spec. 4. p. 1081.) spines twin, connate, and are, as well as the branches and leaves, glabrous; leaves with 4-8 pairs of pinnae, each pinna bearing 6-12 pairs of oblong small leaflets, with a gland situated on the petiole between the lower pair of pinnae; heads of flowers pedunculate, crowded, axillary. *h. S.* Native of the East Indies, in woods. Roxb. cor. 2. t. 199. Flowers yellow, polyandrous. Legume linear, a little twisted, 8-10-seeded. Spines white, 1-2 inches long.

*Ivory-thorned Acacia. Clt. 1792. Shrub 5 to 6 feet.*

176 *A. TORTUOSA* (Willd. spec. 4. p. 1083.) spines twin, connate, and are, as well as the branches and petioles, pubescent; leaves with 2-6 pairs of pinnae, each pinna bearing 12-16 pairs of leaflets, with a gland between the lower pair of pinnae, and sometimes between the extreme pair; heads of flowers solitary, axillary; legumes compressed, thickish, pubescent, rather corniculate. *h. S.* Native of Jamaica, in sandy fields, and of the island of St. Thomas. *Mimosa tortuosa*, Lin. spec. 1505. Swartz, obs. 391. but not of Burm. Spines  $\frac{1}{2}$  inch long, white, downy at the base. Legumes with fleshy juicy valves. Heads of flowers yellow.

*Twisted Acacia. Clt. 1824. Shrub 4 to 6 feet.*

177 *A. BURMANNIA'NA* (D. C. prod. 2. p. 461.) spines twin, glabrous; branches angular, smoothish; petioles pubescent; leaves with 6 pairs of pinnae, each pinna bearing 15-20 pairs of leaflets; gland small, petiolar; heads of flowers solitary, on long axillary peduncles. *h. S.* Native of the East Indies. *Mimosa tortuosa*, Burm. fl. ind. p. 224. Heads of flowers larger than those of *M. tortuosa*. Legume unknown.

*Var.  $\beta$* ; peduncles 3-together, axillary. *h. S.* Native of the East Indies. *Mimosa cæsia*, Burm. fl. ind. 224. but not of Lin. *A. Ceylanica sarmentosa flore luteo globoso*, Burm. zeyl. p. 3.

*Burmans' Acacia. Clt. 1818. Shrub 4 to 6 feet.*

178 *A. VERA* (Willd. spec. 4. p. 1085.) spines twin; branches and leaves glabrous; leaves with 2 pairs of pinnae, each pinna bearing 8-10 pairs of oblong-linear leaflets, with glands on the petioles, one between each pair of pinnae; heads of flowers usually twin, pedunculate, axillary; legume (ex Willd.) moniliform. *h. S.* Native of Africa, from Senegal to Egypt. *Mimosa Nilotica*, Lin. spec. 1506. but not of hort. cliff. Woodv. med. bot. 187. t. 67.—Lob. icon. 2. p. 95. f. 1.—Hern. mex. 866. f. 1. *Gommier rouge*, Adans. Branches and spines red. Flowers yellow. This is the tree which yields the gum-arabic of the shops, and succus acacie. According to Hasselquist the Arabs call it *chasad*. The gum is gathered in vast quantities from the trees growing in Arabia Petraea, near the north bay of the Red Sea at the foot of mount Sinai; this gum is called by dealers *Thur* or *Thor*, which is the name of the harbour in the north bay of the Red Sea, thereby distinguishing it from gum-arabic. The gum-thur is also more pellucid and white, whereas gum-arabic is of a brown or dirty yellow colour, and generally opaque.

Gum-arabic is a concrete juice, which exudes from various species of *Acacia*, but especially from *A. vera*, *A. Arabica*, and *A. Senegal*, natives of the sandy deserts of Africa, Arabia, and other parts of Asia. It either exudes spontaneously or from incisions made in the bark, and afterwards hardens in the air. The barks of all the species are highly astringent, and some are used in India for tanning. There are two kinds of gum found in the shops in this country, and often sold promiscuously, but distinguished in commerce by the names of gum-arabic and East India gum. Gum-arabic consists of roundish transparent tears, colourless, or of a yellowish colour, without smell or taste, and almost perfectly soluble in water. The pieces which are most transparent and have least colour are reckoned the best. They are sometimes selected from the gum-arabic and sold for about double the price, under the name of picked gum. The East India gum is darker coloured than gum-arabic, and is not so readily soluble in water. Gum-thur, the produce of *Acacia Arabica*, is almost colourless, and resembles the picked gum, and gum-senegal resembles the East India gum.

About the middle of November, that is, after the rainy season, which begins early in July, a gummy juice exudes spontaneously from the trunk and principal branches. In about 15 days it thickens in the furrow down which it runs, either into a vermicular shape, or more commonly assuming the form of round or oval tears, about the size of a pigeon's egg, of different colours, as they belong to the white or red gum tree. About the middle of December the Moors encamp on the borders of the forest, and the harvest lasts 5 weeks. The gum is packed in very large sacks of tanned leather, and brought on camels and bullocks to certain ports, where it is sold to the French and English merchants. Mr. Jackson, in his account of the empire of Morocco, informs us, that from Mogodor they export two sorts of gum, one is common gum-arabic, the other finer, called gum-soudan, brought from Tumbuctoo by the caravans. He also says that the gum called Morocco or Barbary-gum, is produced from a thorny tree called *Attaleh*. It yields most gum during the parch-

ing heat of July and August, and the hotter the weather, and the more sickly the tree appears, the more gum it yields.

The gum is highly nutritious. During the whole time of the gum harvest, of the journey, and of the fair, the Moors of the desert live almost entirely upon it, and experience has proved that six ounces are sufficient for the support of an adult during twenty-four hours. The characters generally given of gum as a vegetable principle belong only to fine gum-arabic, which is transparent and colourless, easily reduced to powder, without smell, and of a slightly sweetish taste. The solution of gum in water constitutes mucilage; it is thick and adhesive, and soon dries when exposed to the air. Gum is also soluble in weak acids, but is totally insoluble in alcohol. Gum is very little disposed to spontaneous decomposition. By oxygenization with nitric acid it forms successively mucic, malic, and oxalic acid; with oxymuriatic acid it forms citric acid. By exposure to heat it does not melt, but softens, swells, and becomes charred.

In medicine gum-arabic possesses the powers of a mucilaginous demulcent in a high degree. It is useful in all cases where there seems to be a natural deficiency of mucus in the intestinal canal; dissolved in milk, barley-water, or almond emulsions, it removes tenesmus. It is useful in an irritable state of the respiratory passages in catarrh, hoarseness, and cough; for this purpose it may be either administered in substance as a troche, or in a strong solution, and may be combined with a little opium. It is also useful in salivation after mercury, or in small pox. Externally it is applied in powder to bleeding vessels of a small size as a styptic, operating by gluing them up. It is also used in solution as an injection in gonorrhœa.

*True Acacia* or *Gum-Arabic-tree*, or *Egyptian-thorn*. Clt. 1596. Tree 20 feet.

179 *A. ARABICA* (Willd. spec. 4. p. 1085.) spines twin; branches and petioles pubescent; leaves with 4-6 pairs of pinnae, each pinna bearing 10-20 pairs of oblong linear leaflets, with a gland on the petiole beneath the lower pair of pinnae, and usually with one between the upper pair; heads of flowers pedunculate, axillary, usually 3-together; legume moniliform.  $\frac{1}{2}$ . S. Native of the East Indies, Senegal, Egypt, and Arabia. *Mimosa Arabica*, Lam. dict. 1. p. 19. Roxb. cor. 2. t. 149. *A. Nilotica*, Delil. ill. fl. ægypt. p. 31. Legume at length smooth. Flowers yellow, polyandrous. This is the tree from which the white transparent gum-arabic, called gum-thur, is obtained; the brown or common gum-arabic being the produce of the preceding species. The wood is strong, tough, and durable, and makes excellent knees and crooked timber in ship building. The bark is astringent and is used for tanning leather, and to dye various shades of brown. A decoction of the bark is used as a substitute for soap. According to Dr. Roxburgh, a large portion of East India gum is also obtained from this species. Perhaps the Arabian plant is distinct from the East Indian one.

*Arabian Acacia* or *Gum-thur-tree*. Clt. 1820. Tr. 30 to 40 ft.

180 *A. HERCULADA* (D. C. monsp. p. 73.) spines twin; branches, petioles, and peduncles pubescent, and rather hispid; leaves with 3-5 pairs of pinnae, each pinna bearing 10 pairs of oblong-linear, glabrous leaflets; gland petiolar; heads of flowers pedunculate, 2-3-together, axillary.  $\frac{1}{2}$ . G. Native of the south of Africa. *A. stolonifera*, Burch. cat. no. 2267. The heads of flowers are very like those of *A. Farnesiàna*, but without scent.

*Young-branched Acacia*. Clt. 1816. Shrub 3 to 6 feet.

181 *A. MAUROCENIA* (D. C. cat. hort. monsp. p. 74.) spines twin; branches, petioles, and peduncles pubescent; leaves with 3-8 pairs of pinnae, each pinna bearing 10-20 pairs of oblong, linear, glabrous leaflets, with a gland on the petiole beneath the lower pair of pinnae; heads of flowers solitary or 2-4-together, axillary, pedunculate.  $\frac{1}{2}$ . G. Native of Morocco. *Mimosa Maurocènia*, Desf. cat. 181. Heads of flowers white.

*Moor's Acacia*. Shrub 4 to 6 feet.

182 *A. FARNESIANA* (Willd. spec. 4. p. 1083.) spines twin; tops of branches, petioles, and peduncles rather pubescent; leaves with 5-8 pairs of pinnae, each pinna bearing from 15-20 pairs of linear glabrous leaflets, with a gland on the petiole between the lower pair of pinnae, and usually between the extreme pair; heads of flowers axillary, usually twin, on unequal peduncles; legume terete, rather attenuated at both ends.  $\frac{1}{2}$ . G. Native of St. Domingo, but now cultivated in the south of Europe and the north of Africa. Ald. farn. p. 2. 4. and 7. with a figure. *Mimosa Farnesiàna*, Lin. spec. 1506. Duham. ed. nov. 2. p. 28. *Mimosa scorpioides*, Forsk. Heads of flowers yellow, sweet-scented, sessile when in a young state, but at length becoming pedunculate. This species of *Acacia* has been dispersed through most parts of Europe, has been made familiar to the Italian gardens since it was introduced to the Farnese garden in 1616, and is cultivated in great plenty in Spain and Portugal. In Italy it is called *gazia*.

*Var.  $\beta$ , pedunculata* (Willd. spec. 4. p. 1084.) branches and petioles hardly pubescent; peduncles a little longer than those of the species, scarcely glabrous at the apex.  $\frac{1}{2}$ . S. Native of Java and Timor. Perhaps this is hardly different from *A. Giraffæ* of Sieb. pl. exsicc. seneg. no. 45. which only differs from Willdenow's specimen in the situation of the glands.

*Var.  $\gamma$ , curispina* (D. C. prod. 2. p. 462.) spines somewhat incurved; leaves with 2 pairs of pinnae; leaflets ovate. *Farnesiàna*, Coll. hort. rip. p. 2. Perhaps a distinct species.

*Farnesian Acacia*. Fl. July, Aug. Clt. 1656. Shrub c. to 10 feet.

183 *A. PARVIFOLIA* (Willd. spec. 4. p. 1086.) spines stipular; branches glabrous; petioles pubescent; leaves with 5-9 pairs of pinnae, each pinna bearing 10-20 pairs of small linear leaflets, with a gland situated on the petiole beneath the lower pair of pinnae; heads of flowers axillary, solitary, pedunculate.  $\frac{1}{2}$ . S. Native of the West Indies, in sandy places by the sea side. *Mimosa parvifolia*, Swartz, fl. ind. occ. 2. p. 984. *Mimosa Antillàrum*, Poir. suppl. 1. p. 80. *Mimosa Mangensis*, Jacq. amer. 267. ? The spines, according to Jacquin, are stipular and distinct, but according to Swartz they are solitary under the branchlets. Heads of flowers white and green, void of scent.

*Small-leaved Acacia*. Tree 20 feet.

184 *A. ALBA* (Willd. ex Steud. nom. phan. 1. p. 1.) spines stipular; leaves with 7-10 pairs of pinnae, each pinna bearing 16-20 pairs of leaflets; heads of flowers globose, disposed in a panicle; legumes compressed, linear, tomentose.  $\frac{1}{2}$ . S. Native of the East Indies. *Mimosa alba*, Roxb. ex Rottl. et Willd. nov. act. nat. cur. berol. 1813. vol. 1. p. 208. Heads of flowers white.

*White Acacia*. Tree 20 feet.

185 *A. ALBICANS* (Kunth, mim. 87. t. 27. nov. gen. amer. 6. p. 272.) spines twin; branchlets and petioles pubescent; leaves with 8-9 pairs of pinnae, each pinna bearing 19-32 pairs of oblong-linear glabrous leaflets, with glands on the petiole, one between the superior and another beneath the inferior pair of pinnae; heads 2-5, aggregate, rising in racemes from the axils of the leaves.  $\frac{1}{2}$ . S. Native of Mexico, on the sea shore near Campeachy. Flowers white, polyandrous. Legume unknown.

*Whitish Acacia*. Shrub.

186 *A. LEUCOPHLEA* (Roxb. cor. 2. t. 150.) spines twin; branches, leaves, and peduncles glabrous; leaves with 8-12 pairs of pinnae, each pinna bearing 20-30 pairs of linear-oblong leaflets, with a gland on the petiole between the lower and higher pairs of pinnae; heads of flowers racemose; the racemes disposed in a terminal panicle.  $\frac{1}{2}$ . S. Native of Coromandel, on dry mountains. Flowers pale yellowish, polyandrous. Legume linear, compressed, rather falcate. The specimen in Willdenow's

herbarium, under the name of *A. leucophlœa*, has the branches and petioles puberulous, and the leaflets rather ciliated. The bark is very astringent, and the natives distil an ardent spirit from it, mixed with palm wine and a little coarse sugar.

*White-juiced Acacia.* Tree.

187 *A. COCHLIACANTHA* (Humb. et Bonpl. in Willd. spec. 4. p. 1081.) spines twin, compressed, concave; branches glabrous; petioles and peduncles pubescent; leaves with 9-10 pairs of pinnae, each pinna bearing 19-24 pairs of linear, very minute, ciliated leaflets; rachis of leaves bearing 4 glands; heads of flowers axillary, twin, pedunculate. *h. S.* Native of Quito, near Guayaquil, Kunth, mim. 93. t. 29. nov. gen. amer. 6. p. 274. Flowers white, polyandrous. Legume unknown.

*Twisted-spined Acacia.* Shrub 6 to 10 feet.

188 *A. HEMATÓXYLON* (Willd. enum. 2. p. 1056.) spines twin, slender, and are, as well as the branches, glabrous; branchlets, leaves, peduncles, and flowers clothed with hoary velvety down; leaves with 8-16 pairs of pinnae, each pinna bearing 18-24 pairs of very minute, obtuse, crowded leaflets, with a gland below or between the lower pair of pinnae; heads of flowers axillary, 2-3 together, pedunculate. *h. G.* Native of the Cape of Good Hope. *A. atomiphýlla*, Burch. trav. 1. p. 341. cat. no. 1685 and 2449. Leaflets so much crowded as to appear joined together. Legume, according to Burchell, tomentose, linear, and indehiscent.

*Red-wooded Acacia.* Clt. 1816. Shrub 2 to 3 feet.

189 *A. TOMENTOSA* (Willd. spec. 4. p. 1087.) spines twin; branches, petioles, peduncles, and under side of leaves tomentose; leaves with 10 pairs of pinnae, each pinna bearing 20 pairs of linear obtuse leaflets, with a gland on the petiole below the pinnae, and one between each of the extreme pairs of leaflets; heads of flowers axillary, aggregate, pedunculate. *h. S.* Native of the East Indies. *Mimosa Kleinii*, Poir. suppl. 1. p. 82. Perhaps the same as *Mimosa cavatý-todua*, Roxb. which is the same as *Mimosa tomentosa*, Rottl. nov. act. nat. cur. 1813. p. 208. of which it is said that the peduncles are bracteate, and that the legumes are involute and compressed.

*Tomentose Acacia.* Clt. 1816. Tree 15 to 20 feet.

190 *A. INDICA* (Desv. journ. bot. 1814. 1. p. 69.) spines twin; leaves with 12-15 pairs of pinnae, each pinna bearing 15-18 pairs of oblong-linear obtuse leaflets, which are pilose, as well as the petioles, when examined by a lens; heads of flowers axillary. *h. S.* Native of the East Indies. *Mimosa Indica*, Poir. suppl. 1. p. 80. Pers. ench. 2. p. 266. Habit of *A. Farnesiána*. Branches terete, brown.

*Indian Acacia.* Clt. 1800. Tree 20 feet.

191 *A. PUNCTATA* (Humb. et Bonpl. in Willd. spec. 4. p. 1084.) spines twin; leaves with 8-12 pairs of pinnae, each pinna bearing about 25-30 pairs of linear, obtuse, ciliated leaflets, with an urceolar gland at the base of the petiole; heads of flowers axillary, usually twin; peduncles tomentose. *h. S.* Native of South America. *Mimosa atomária*, Poir. suppl. 1. p. 81. Like *A. Farnesiána*. Legume unknown.

*Dotted Acacia.* Tree.

192 *A. MACRACANTHA* (Humb. et Bonpl. in Willd. spec. 4. p. 108.) spines twin, lanceolate, compressed; branchlets and petioles pubescent; leaves with 14-18 pairs of pinnae, each pinna bearing 30 pairs of oblong-linear ciliated leaflets, with a gland between the ultimate pair of pinnae, and 2 or 3 between the pairs of leaflets; heads of flowers axillary, 2-8 together, pedunculate. *h. S.* Native of Quito, near Guayaquil. Kunth, mim. 90. t. 28. nov. gen. amer. 6. p. 273. Flowers yellow. Spines very long. Petiole furnished with a gland at the base.

*Long-spined Acacia.* Tree large.

193 *A. MACRACANTHOIDES* (Bert. in herb. Balb. D. C. prod. 2. p. 463.) spines twin, terete; branches, petioles, and peduncles

pubescent; leaves with 12-14 pairs of pinnae, each pinna bearing about 25 pairs of oblong-linear glabrous leaflets, with a gland on the petiole beneath the lower pair, and one between the extreme pair of pinnae; heads of flowers twin, axillary, pedunculate. *h. S.* Native of Jamaica. Very like the preceding species.

*Macracantha-like Acacia.* Clt. 1820. Tree.

194 *A. SIEBERIANA* (D. C. prod. 2. p. 463.) spines twin, terete, rather connate at the base, and are, as well as the branches, glabrous; leaves with 15-20 pairs of pinnae, each pinna bearing 25-30 pairs of elliptic-oblong, obtuse, rather ciliated leaflets; heads of flowers globose, twin; peduncles twice the length of the heads, and are, as well as the petioles, puberulous. *h. S.* Native of Senegal. *A. flexuosa* affinis, Sieb. pl. exsicc. seneg. no. 43. but it differs from *A. flexuosa* in the spines being white, not brown, as in that species, and in the peduncles being twice the length, and fewer.

*Sieber's Acacia.* Tree.

195 *A. FLEXUOSA* (Humb. et Bonpl. in Willd. spec. 4. p. 1082.) spines twin, connate; leaves with 16 pairs of pinnae, each pinna bearing 25 pairs of linear, obtuse, ciliated leaflets, with a depressed gland above the base of the petiole, and one between the extreme pair of leaflets; heads pedunculate, 3-6-together, axillary, about the length of their own peduncles. *h. S.* Native of South America, near Cumana. *H. B. et Kunth*, nov. gen. amer. 6. p. 271. Spines brown, shining. Legume unknown.

*Var. β, ambigua* (D. C. prod. 2. p. 463.) spines shorter than the peduncles. *h. S.* Native of Guadaloupe. Spines 3 lines long. Peduncles 5-6-lines long. Legumes glabrous, straight, thickish. Perhaps a proper species.

*Flexuous Acacia.* Clt. 1824. Shrub.

196 *A. OBTUSA* (Humb. et Bonpl. in Willd. spec. 4. p. 1087.) spines twin; leaves with 16-20 pairs of pinnae, each pinna bearing many pairs of glabrous, ciliated, linear leaflets, with a gland at the base of the petiole, and one on the petiole between each of the 2 extreme pairs of pinnae; legume linear, arched, obtuse, glabrous. *h. S.* Native of Caraccas, ex Kunth, on the banks of the Orinoco, ex Willd. *H. B. et Kunth*, nov. gen. amer. 6. p. 272.

*Obtuse-leafletted Acacia.* Tree.

197 *A. SUBNERMIS* (Bert. in herb. Balb. D. C. prod. 2. p. 463.) spines twin, subulate, short, sometimes wanting; branches, petioles, and peduncles pubescent; leaves with 30-40 pairs of pinnae, each pinna bearing 30-40 pairs of linear-oblong, glabrous leaflets, with 2 glands beneath the lower pair of pinnae, and 2 or 4 between the ultimate pairs of pinnae; heads of flowers pedunculate, 2-3-together, axillary. *h. S.* Native of Jamaica. Flowers yellow. Legume linear, flat, glabrous, 6-7-seeded.

*Almost-unarmed Acacia.* Tree.

\* \* *Prickles stipular, twin, usually also petiolar, and along the ribs of the legume. Stamens 10.*

198 *A. ACANTHOCAERPA* (Willd. enum. 1057.) stipular; prickles twin, hooked; petioles glandless, prickly; leaves with 6-8 pairs of pinnae, each pinna bearing 6-15 pairs of oblong, pubescent leaflets; heads of flowers axillary, twin, pedunculate; legumes flat, compressed, falcate, prickly on the rib on both sides. *h. S.* Native of New Spain. *Mimosa aculeaticarpa*, Ort. dec. 134. *A. aculeaticarpa*, Lag. nov. gen. et spec. 16. Flowers dirty white, or rather flesh-coloured. Leaves irritable or sensible to the touch.

*Var. β, uncinella* (D. C. prod. 2. p. 463.) petioles unarmed, bearing 1 gland at the base. *Mimosa uncinella*, Poir. suppl. 1. p. 80.

*Spiny-fruited Acacia.* Clt. 1822. Shrub 6 to 8 feet.

199 *A. REVOLUTA* (Kunth, mim. 84. t. 26. nov. gen. amer. 6. p. 270.) stipular spines twin, straight; petioles unarmed; leaves with 2-3 pairs of pinnae, each pinna bearing 8-12 pairs of oblong, ciliate-scabrous leaflets; heads axillary, 2-3-together, pedunculate; legumes flat, compressed, falcate, prickly on the exterior or convex suture.  $\frac{1}{2}$ . S. Native of Peru, at Caxamarca. Flowers white, but the petals are green.

*Revolute-podded Acacia.* Shrub 6 feet.

200 *A. CAVENIA* (Hook. in Beech, voy. append. bot. p. 21.) spines stipular, about half an inch long, twin, straight; petioles furnished with 1 obscure gland; leaves with usually about 5 pairs of pinnae, each pinna bearing 9-10 pairs of linear-oblong leaflets, which are clothed with scabrous pubescence; peduncles axillary, aggregate; heads of flowers globose; flowers polyandrous.  $\frac{1}{2}$ . G. Native of Chili. *Mimosa Cavenia*, Mol. chil. At Valparaiso the flowers are called *Flor d'Aroma*, and the tree *Espino* by the inhabitants. It is used for various purposes, especially as yielding the best charcoal.

*Cavenia Acacia.* Tree 20 feet.

201 *A. DOMINGENSIS* (Bert. ined. ex D. C. prod. 2. p. 164.) stipular spines hooked, sometimes wanting; petioles prickly, glandless; leaves with 4 pairs of pinnae, each pinna bearing 7 pairs of elliptic-oblong, glabrous leaflets; heads of flowers 2-3-together, axillary, ultimate ones disposed in a branched panicle; legumes unarmed.  $\frac{1}{2}$ . S. Native of St. Domingo. Flowers white. Legume flat, compressed, quite glabrous, falcate, irregularly coracate on one side.

*St. Domingo Acacia.* Tree.

202 *A. ACANTHOLOBA* (Humb. et Bonpl. in Willd. spec. 4. p. 1089.) prickles scattered, hooked; petioles unarmed, pubescent; leaves with 3-4 pairs of pinnae, each pinna bearing about 10-12 pairs of leaflets, which are pubescent beneath; heads of flowers almost sessile, racemose; legumes flat, membranous, prickly on both margins.  $\frac{1}{2}$ . S. Native of South America. H. B. et Kunth, nov. gen. amer. 6. p. 279. Flowers pale rose-coloured. Perhaps belonging to the following division.

*Spiny-podded Acacia.* Clt. 1823. Shrub 6 feet.

\* \* \* *Rameal prickles scattered without order. Stems erect.*

203 *A. ? PSORALEA* (D. C. prod. 2. p. 464.) rameal prickles scattered; petioles unarmed, but are beset with brown warts as well as the peduncles; leaves with 2-5 pairs of pinnae, each pinna bearing about 7-8 pairs of oblong-linear, obtuse, glabrous leaflets; heads of flowers axillary, solitary, pedunculate.  $\frac{1}{2}$ . S. Native of Madagascar. Legumes unknown.

*Scuffy-branched Acacia.* Shrub.

204 *A. ? CONCI'NNA* (D. C. prod. 2. p. 164.) rameal prickles scattered; branches clothed with velvety villi; petioles prickly, bearing 1 gland above the base; leaves with 5-6 pairs of pinnae, each pinna bearing many pairs of linear-cultrate, ciliated leaflets; stipulas cordate, upper ones in the form of bracteas; heads of flowers disposed in a terminal panicle.  $\frac{1}{2}$ . S. Native of the East Indies. *Mimosa saponaria*, Roxb. in herb. Lamb. *Mimosa concinna*, Willd. spec. 4. p. 1039. Legume unknown.

*Neat Acacia.* Clt. 1823. Tree.

205 *A. TAMARINDIFOLIA* (Willd. spec. 4. p. 1092.) rameal prickles straight, scattered; leaves with 4-6 pairs of pinnae, each pinna bearing 10-15 pairs of oblong, obtuse, quite glabrous leaflets; petioles rather prickly, and furnished with a gland at the base; stipulas cordate, upper ones in the form of bracteas; heads of flowers pedunculate, disposed in a panicle.  $\frac{1}{2}$ . S. Native of the West India islands and South America. *Mimosa tamarindifolia*, Lin. spec. 1509. Jacq. schœnbr. 3. t. 396.—Plum. ed. Burm. t. 7. Flowers white. Legume broad-linear, flat, straight.

*Tamarind-leaved Acacia.* Clt. 1774. Tree 40 feet.

206 *A. GUADALUPE'NSIS* (D. C. prod. 2. p. 464.) rameal and petiolar prickles very few, scattered, and recurved; leaves with 7-9 pairs of pinnae, each pinna bearing 15-20 pairs of oblong-linear, glabrous leaflets; petioles glandless; heads of flowers pedunculate, disposed in a terminal panicle.  $\frac{1}{2}$ . S. Native of Guadeloupe. Flowers yellow, polyandrous. Legumes flat, glabrous, on short stipes, 3-4 inches long, and 9 lines broad.

*Guadeloupe Acacia.* Tree or shrub.

207 *A. INTSIA* (Willd. spec. 4. p. 1091.) rameal as well as petiolar prickles scattered and recurved; leaves with 6 pairs of pinnae, each pinna bearing about 12 pairs of incurved leaflets, with a gland between the lower pairs of leaflets; prickles shorter than the stipulas; heads of flowers pedunculate.  $\frac{1}{2}$ . S. Native of the East Indies.—Rheed. mal. 6. t. 4.—Pluk. phyt. 122. f. 2. *Mimosa Intsia*, Lin. spec. 1508. *Intsi* is the Malabar name of the tree.

*Intsia Acacia.* Clt. 1778. Tree 20 feet.

208 *A. INTSIOIDES* (D. C. prod. 2. p. 464.) rameal as well as petiolar prickles scattered and recurved; leaves with 8-10 pairs of pinnae, each pinna bearing about 25 pairs of linear-oblong, somewhat incurved leaflets, with a gland at the base of the petiole; heads of flowers pedunculate, aggregate, somewhat panicled, with the branches between the flowers unarmed.  $\frac{1}{2}$ . S. Native country unknown. Leaves and branches glabrous. Heads of flowers about the size of those of *A. Farnesiæna*. It has very much the appearance of the preceding species and to the figure of Rheed, and it differs at first sight from the following in heads of flowers being larger.

*Intsia-like Acacia.* Tree.

209 *A. PENNATA* (Willd. spec. 4. p. 1090.) rameal as well as petiolar prickles scattered and recurved; leaves with 8-16 pairs of pinnae, each pinna bearing 20-30 pairs of linear-oblong leaflets, with a depressed gland at the base of the petiole; heads of flowers on short peduncles, aggregate, disposed in a terminal prickly panicle.  $\frac{1}{2}$ . S. Native of Ceylon (Burm. zeyl. t. 1.), and Madagascar (Commerson). *Mimosa pennata*, Lin. spec. 1507. The whole plant is glabrous. Heads of flowers yellow, smaller than those of *A. Farnesiæna*. Legume unknown. Perhaps different from *A. pterophylla* of Hoffmans. verz. 1824. p. 207. which has glands between the exterior pairs of pinnae. In Cochinchina the bark is converted into a sort of tow, which is used to fill up cracks in houses as well as in boats.

*Feather-leaved Acacia.* Clt. 1773. Shrub.

210 *A. WESTIANA* (D. C. prod. 2. p. 464.) rameal as well as petiolar and peduncular prickles recurved; leaves with 8 pairs of pinnae, each pinna bearing 15-27 pairs of linear acute leaflets, with a gland at the base of the petiole, and one between the outer pair of leaflets; heads of flowers disposed in a terminal panicle; pedicels from 2-5, rising from the same dot or centre.  $\frac{1}{2}$ . S. Native of the island of Santa Cruz. *Mimosa paniculata*, West. beschr. 312. ex Vahl. ecl. amer. 13. p. 39. It differs from *A. paniculata* of Willd. It is perhaps the same as *Mimosa tenuifolia*, Lin. spec. 771. but the description is not sufficient to decide this point.

*West's Acacia.* Tree.

211 *A. CÆSIA* (Willd. spec. 4. p. 1090.) rameal as well as petiolar prickles scattered and recurved; leaves with 5-7 pairs of pinnae, each pinna bearing 12-16 pairs of oval-lanceolate leaflets, with an oblong gland above the base of the petiole; heads of flowers pedunculate, disposed in a terminal panicle; branches of panicle prickly.  $\frac{1}{2}$ . S. Native of the East Indies. Pluk. t. 330. bad. *Mimosa cæsia*, Lin. spec. 1507. but not of Burm. Legume unknown.

*Grey Acacia.* Clt. 1773. Tree.

212 *A. CENTROPHYLLA* (D. C. prod. 2. p. 465.) prickles of the branches, petioles, and panicles numerous, scattered, and re-

curved; petioles glandless, bearing subulate prickles between the pairs of pinnae; leaves with 6-9 pairs of pinnae, which are callous and bistipellate at the base, each pinna bearing 8-12 pairs of oblong-linear, mucronate, glabrous leaflets, which are obtuse at both ends; heads of flowers pedunculate, disposed in a terminal raceme. *h. S.* Cultivated in the gardens of Jamaica, where it was observed by Bertero. Flowers white, decandrous. A very distinct species, but the legume is unknown.

*Spur-leaved Acacia.* Clt. 1818. Tree 20 feet?

213 *A. COURRANTIA'NA* (D. C. prod. 2. p. 465.) prickles on the branches, petioles, and panicles, few and recurved; petioles glandless; leaves with 8-10 pairs of pinnae, each pinna bearing 15-20 pairs of linear-oblong leaflets; heads of flowers pedunculate, disposed in terminal and axillary racemes. *h. S.* Native country unknown, but is cultivated in the gardens of Teneriffe. The whole plant is of a greyish or greenish glaucous colour, and is related to *A. caesia*.

*Courrant's Acacia.* Clt. 1818. Tree.

214 *A. RIPA'RIA* (H. B. et Kunth, nov. gen. amer. 6. p. 276.) prickles scattered, hooked; leaves with 10-11 pairs of pinnae, each pinna bearing 30-50 pairs of linear, ciliated leaflets, with a gland above the base of the common petiole, and one between each of the 2 ultimate pairs of leaflets; heads axillary, solitary; legumes linear, flat, rather hooked at the apex. *h. S.* Native at the confluence of the Amazon and Chamaya. Flowers unknown.

*River-side Acacia.* Tree very tall.

215 *A. STRIA'TA* (Humb. et Bonpl. in Willd. spec. 4. p. 1089.) rameal prickles scattered, erect; branches striated, and are as well as petioles pubescent; leaves with 9 pairs of pinnae, each pinna bearing 13-16 pairs of leaflets, which are rather pilose beneath; heads of flowers pedunculate, disposed in a terminal panicle; legume compressed, rather falcate, obtuse, beset with a few short hairs. *h. S.* Native of South America. Heads of flowers small.

*Striated-branched Acacia.* Shrub.

216 *A. MEGALADE'NA* (Desv. journ. bot. 1811. 1. p. 69.) rameal as well as petiolar prickles scattered and minute; leaves with many pairs of pinnae, each pinna bearing many pairs of leaflets, which are linear and glabrous, with a peltate gland above the base of the petiole; heads of flowers pedunculate, disposed in racemes; legumes compressed, rather falcate, quite glabrous. *h. S.* Native of the East Indies.

*Large-glanded Acacia.* Tree.

217 *A. ARROPHU'LA* (D. Don, prod. fl. nep. 247.) rameal as well as petiolar prickles recurved; petiole furnished in the middle with a large depressed broad gland; leaves with many pairs of pinnae, each pinna bearing many pairs of linear, unequal-sided, obtuse leaflets, which are ciliated as well as the rachis; panicle terminal; heads of flowers globose, solitary, or 5, pedunculate. *h. S.* Native of Sirinagur, where it is called *Arroophul* by the natives.

*Arroophul Acacia.* Clt. 1818. Tree 20 feet.

\*\*\*\* Prickles scattered. Stem climbing.

218 *A. SCA'NDENS* (Willd. enum. 1057.) prickly; stem climbing, sulcate, tomentose; leaves with many pairs of pinnae, each pinna bearing many pairs of leaflets, with a gland between each of the 10 or 12 ultimate pairs of pinnae; heads of flowers paniced, axillary, and terminal. *h. S.* Native of Brazil. The rest unknown.

*Scandent Acacia.* Clt. 1780. Shrub cl.

219 *A. ? GUILANDINÆ* (D. C. prod. 2. p. 465.) rameal as well as petiolar prickles small, and recurved; stem sub-scandent; branches and leaves glabrous; leaves with 4 pairs of pinnae, each pinna bearing 2 pairs of leaflets, with a gland under the

ultimate pair of leaflets; heads of flowers pedunculate, disposed in a loose terminal panicle. *h. S.* Native of Cayenne. Heads of flowers small, yellow. Legume unknown.

*Guilandina-like Acacia.* Clt. 1820. Shrub cl.

220 *A. SARMENTOSA* (Desv. journ. bot. 1814. 1. p. 70.) quite glabrous; rameal and petiolar prickles scattered and hooked; leaves bipinnate, with 7 pairs of pinnae, each pinna bearing many pairs of obtuse, linear, somewhat imbricate leaflets, with a minute gland above the base of the petiole. *h. S.* Native country, flowers, and fruit unknown. *Mimosa sarmentosa*, Desf. cat. hort. par. 180. Pers. ench. 2. p. 265.

*Sarmentose Acacia.* Clt. 1820. Shrub cl.

§ 2. Unarmed trees or shrubs.

\* *Trichodes* (from *τριχος*, *thrix trichos*, hair; in reference to the hairy anthers). *Anthers hairy. Stigma pencil-formed. Perhaps a proper genus.*

221 *A. TRICHODES* (Willd. spec. 4. p. 1063.) unarmed, glabrous; leaves with 2-3 pairs of pinnae, each pinna bearing 3-5 pairs of ovate, acute leaflets, with an oblong, erect gland between the lower pair of pinnae; heads of flowers twin, pedunculate, axillary. *h. S.* Native of Caraccas, ex Jacq., and about Lima, ex Dombey. *Mimosa trichodes*, Jacq. schenb. t. 394. Branches dotted. Legume flat, compressed, linear, rather obtuse at both ends, and somewhat mucronate at the apex, glabrous. Seeds flat, compressed. Flowers white.

*Hairy-anthered Acacia.* Clt. 1818. Shrub 6 to 10 feet.

222 *A. PSEUDOTRICHODES* (D. C. prod. 2. p. 466.) unarmed, glabrous; leaves with 2 pairs of pinnae, each pinna bearing 2-4 pairs of leaflets; petioles glandless; heads of flowers 3-5, axillary, pedunculate. *h. S.* Native of St. Domingo. Legume like that of the preceding species, linear, flat, glabrous, somewhat stipitate at the base. Branches glabrous.

*False Trichodes Acacia.* Shrub.

\* \* *Anthers glabrous. Stigma simple. Julibrissine.*

223 *A. FORMOSA* (Kunth, mim. p. 102. t. 32. nov. gen. et spec. 6. p. 278.) unarmed, glabrous; leaves with 2 pairs of pinnae, each pinna bearing 5-6 pairs of obovate-elliptic leaflets; petioles glandless; stipulas large, oblong, obtuse; heads of flowers axillary, 2-5 on a common peduncle. *h. S.* Native of Mexico, near Guanaxuato. Flowers white, polyandrous. Legume unknown.

*Beautiful Acacia.* Clt. 1825. Shrub 6 to 12 feet.

224 *A. NIGRICANS* (R. Br. in Ait. hort. kew. 4. p. 465.) unarmed, glabrous; leaves with 2 pairs of pinnae, bearing 5-7 pairs of obovate-oblong, obtuse leaflets on each of the superior pinnae, and 2 or 3 pairs on each of the lower pinnae, with 1 or 2 glands on the petiole; stipulas subulate-setaceous; heads of flowers solitary. *h. G.* Native of New Holland, on the south-west coast. *Mimosa nigricans*, Labill. nov. holl. 2. t. 238. *A. nigricans*, Sims, bot. mag. 2188. The whole plant becomes black on drying. Legume linear, flat, straight, 6-7-seeded. Flowers yellow, polyandrous.

*Blackish Acacia.* Fl. May, Jul. Clt. 1803. Sh. 6 to 10 feet.

225 *A. STRIGOSA* (Link. enum. 2. p. 414.) unarmed, pilose; leaves with 2 pairs of pinnae, each pinna bearing 2-3 pairs of leaflets; stipulas somewhat setaceous, caducous; heads of flowers solitary. *h. G.* Native of New Holland, on the south-west coast. *A. ciliata*, R. Br. in hort. kew. 5. p. 465. but not of Willd. Flowers yellow.

*Strigose Acacia.* Fl. Mar. Ju. Clt. 1803. Sh. 6 to 10 ft.

226 *A. UNGULATA* (Desv. journ. bot. 1814. 1. p. 68.) unarmed; branches and branchlets pubescent; leaves with usually 3 pairs of pinnae, each pinna bearing several pairs of linear, nearly glabrous leaflets; heads of flowers on long peduncles;

legumes mucronate, cartilaginous, thickened, ending in an incurved point.  $\frac{1}{2}$ . S. Native of the West Indies. The rest unknown.

*Claw-podded Acacia.* Shrub or tree.

227 *A. VA'GA* (Willd. spec. 4. p. 1066.) unarmed; leaves with 3 pairs of pinnæ; leaflets smoothish, with 3 pairs on each of the terminal pinnæ, and either 1 or 2 pairs on the lower pinnæ; heads of flowers pedunculate, 2 or 3-together, axillary.  $\frac{1}{2}$ . S. Native of Brazil. *Mimosa vâga*, Lin. spec. 1503. exclusive of the country, and the synonyme of Breynius, which is evidently referrible to a species of *Inga*.—Pis. bras. p. 80. f. 2. Marcg. bras. p. 111. f. 1.

*Wandering Acacia.* Clt. 1818. Tree.

228 *A. MULTIFLORA* (H. B. et Kunth, nov. gen. amer. 6. p. 277.) unarmed; leaves with 3 pairs of pinnæ, each pinna bearing 6-9 pairs of oblong, acute, glabrous leaflets; petioles glandless; racemes axillary, 2-5-together; heads in fascicles; stamens 15.  $\frac{1}{2}$ . S. Native of the eastern declivities of the Andes, near St. Felipe. Legume unknown.

*Many-flowered Acacia.* Tree 20 feet.

229 *A. LE'BBEK* (Willd. spec. 4. p. 1066.) unarmed, smoothish; leaves with 2-4 pairs of pinnæ, each pinna bearing about 6-8 pairs of oval, somewhat dimidiate leaflets, which are obtuse at both ends; petioles glandless; heads of flowers pedunculate, aggregate; flowers pedicellate.  $\frac{1}{2}$ . S. Native of Upper Egypt, but now cultivated in both the East and West Indies. *Mimosa Lébbek*, Lin. spec. 1503. *A. Hábbas*, Link. enum. 2. p. 444. ? but not of Delile. *Cássia planisiliqua*, Burm. ind. 96. but probably exclusive of the leaves. Legume broad-linear, flat, rather long, attenuated at both ends, 7-8-seeded.—Pluk. mant. 2. t. 331. f. 1. The Arabs call the tree *Læbach*. It is cultivated in gardens for the sake of the beauty and scent of the flowers.

*Lebbek Acacia.* Fl. Mar. June. Clt. 1823. Tree 20 feet.

230 *A. PRO'CERA* (Willd. spec. 4. p. 1063.) unarmed, smoothish; leaves with 4 pairs of pinnæ, each pinna bearing 5-8 pairs of ovate, acutish leaflets, with a depressed gland at the base of the petiole; heads of flowers pedunculate, disposed in a terminal panicle.  $\frac{1}{2}$ . S. Native of the East Indies. *Mimosa pro'cera*, Roxb. cor. 2. t. 21. Flowers pale yellow, polyandrous. Stamens monadelphous. Legume flat, glabrous, attenuated at both ends, 6-7 inches long.

*Tall Acacia.* Clt. 1816. Tree 60 feet.

231 *A. ODORATÍSSIMA* (Willd. spec. l. c.) unarmed, smoothish; leaves with 3-4 pairs of pinnæ, each pinna bearing 10-12 pairs of oval-oblong leaflets, lower ones very minute, with a depressed gland at the base of the petiole, and one beneath the extreme pair of pinnæ; heads pedunculate, aggregate, forming a terminal panicle.  $\frac{1}{2}$ . S. Native of the coast of Coromandel. *Mimosa odoratissima*, Roxb. cor. 2. t. 120. Flowers pale yellow, very sweet-scented. Legume nearly like that of the preceding species.

*Very-sweet-scented-flowered Acacia.* Clt. 1790. Tr. 30 to 40 ft.

232 *A. LEBBEKIOIDES* (D. C. prod. 2. p. 467.) unarmed, smoothish; leaves with 3-8 pairs of pinnæ, each pinna bearing 10-20 pairs of oval-oblong, glabrous leaflets; petioles puberulous, glandless; legumes flat, glabrous, 7-9-seeded.  $\frac{1}{2}$ . S. Native of the Island of Timor. Very nearly allied to *A. Lébbek*, but differs in the leaflets being narrower, more numerous, as well as in other respects.

*Lebbek-like Acacia.* Tree 30 feet.

233 *A. LA'XA* (Willd. spec. 4. p. 1069.) unarmed, glabrous; leaves with 4 pairs of pinnæ, each pinna bearing 12-24 pairs of linear-oblong leaflets, which are glaucous beneath; petioles beset with rusty villi; heads of flowers axillary, on long peduncles.  $\frac{1}{2}$ . S. Native of Caraccas. Branches terete, divaricate. Fi-

laments purple. Legume compressed, narrowed at the base, 4 inches long.

*Loose Acacia.* Tree 15 to 20 feet.

234 *A. SPECIOSA* (Willd. l. c.) unarmed, glabrous; leaves with 4-5 pairs of pinnæ, each pinna bearing 7-11 pairs of oval-oblong, obtuse, somewhat dimidiate leaflets, with a gland at the base of the petiole; heads 2-3-together, axillary, on long peduncles.  $\frac{1}{2}$ . S. Native of the East Indies. *Mimosa speciosa*, Jacq. coll. 1. p. 47. icon. rar. 1. t. 198. Flowers white, polyandrous.

*Shony Acacia.* Fl. Aug. Sept. Clt. 1742. Sh. 6 to 10 ft.

235 *A. JUPUNBA* (Willd. l. c.) unarmed; leaves with 4-5 pairs of pinnæ, each pinna bearing 6-8 pairs of ovate, obtuse leaflets, which are clothed with hoary pubescence beneath; spikes of flowers somewhat capitate, axillary.  $\frac{1}{2}$ . S. Native of Para, in Brazil, where it is called *Jupunba*.

*Jupunba Acacia.* Tree.

236 *A. BI'CEPS* (Willd. spec. 4. p. 1075.) unarmed; leaves with 4-5 pairs of pinnæ, each pinna bearing about 16 pairs of distant, lanceolate, ciliated leaflets, with a gland on the petiole beneath the lower pair of pinnæ; heads of flowers axillary, twin, pedunculate.  $\frac{1}{2}$ . S. Native of Para, in Brazil. Very like *A. glauca*, of which it is only a variety, according to Steudel.

*Two-headed Acacia.* Tree.

237 *A. GLAU'CA* (Willd. l. c.) unarmed, glabrous; leaves with 4-6 pairs of pinnæ, each pinna bearing about 12-15 pairs of linear, distant, acute leaflets, which are glaucous beneath; petiole downy, sometimes glandular beneath the lower pair of pinnæ; heads of flowers axillary, pedunculate, usually twin; legume nearly sessile.  $\frac{1}{2}$ . S. Native of South America. *Mimosa glauca*, Lin. spec. 504. Mill. fig. 4. t. 4.—Cat. car. 2. t. 42. Trew. chret. t. 46. Flowers white, 5-parted, decandrous. Legume linear, flat, glabrous, acute at both ends, 4 inches long and 2 lines broad.

*Glaucous Acacia.* Fl. June, Jul. Clt. 1690. Sh. 5 to 10 ft.

238 *A. LEUCOCÉPHALA* (Link. enum. 2. p. 444.) unarmed, smoothish; leaves with 4-5 pairs of pinnæ, each pinna bearing 12-15 pairs of oblong-linear, acute leaflets; petioles downy, sometimes bearing a gland or glands beneath the lower pair of pinnæ; heads of flowers pedunculate, axillary, usually twin; legume standing on a stipe, which is about equal in length to the peduncle, when young it is clothed with velvety down.  $\frac{1}{2}$ . S. Native of South America. *Mimosa leucocéphala*, Lam. dict. 1. p. 12. Flowers white. Very nearly allied to *A. glauca*, and is often confused with it in gardens, but differs in the legume being broader, shorter, and standing on a long stipe.

*White-headed Acacia.* Fl. Ju. Aug. Clt. 1823. Sh. 5 to 10 ft.

239 *A. LOMATOCA'RA* (D. C. prod. 2. p. 467.) unarmed, glabrous; leaves with 5 pairs of pinnæ, each pinna bearing 15 pairs of oblong rather falcate leaflets, with a gland between each pair of leaflets; legume flat, girded by a thickened margin.  $\frac{1}{2}$ . S. Native of Pondicherry. *Mimosa marginata*, Lam. dict. 1. p. 12.—Wâga, Rheed. mal. 6. t. 5. where the flowers drawn in the figure are loosely paniced, 4-parted, and polyandrous. Perhaps the same.

*Fringe-podded Acacia.* Clt. 1821. Tree 30 feet.

240 *A. LATISÍLIQUA* (Willd. spec. 4. p. 1067.) unarmed, glabrous; leaves with 5 pairs of pinnæ, each pinna bearing 10 pairs of elliptic obtuse leaflets; stipulas in the form of bractæas, obliquely cordate; heads of flowers pedunculate, aggregate, forming a terminal panicle.  $\frac{1}{2}$ . S. Native of South America. *Mimosa latisiliqua*, Lin. spec. 1504.—Plum. ed. Burm. t. 6. Flowers white. Legume oblong, flat, acute at both ends, and standing on a long stipe.

*Var.  $\beta$ , paucifoliola* (D. C. prod. 2. p. 467.) leaves with 3-4 pairs of pinnæ, each pinna bearing 4-6 pairs of leaflets.  $\frac{1}{2}$ . S.

Native of St. Domingo. Flowers not seen, and therefore its affinity with the present species is rather doubtful.

*Broad-podded Acacia.* Fl. March, June. Clt. 1777. Shrub 6 to 10 feet.

241 *A. PORTORICENSIS* (Willd. l. c.) unarmed; leaves with 5 pairs of pinnae, each pinna bearing 20 pairs of linear, obtuse, smoothish leaflets; petioles glandless, and are, as well as the branches, pubescent; heads of flowers 2-3-together, axillary; calyx with ciliated margins. *h. S.* Native of Porto-Rico. *Mimosa Portoricensis*, Jacq. icon. rar. t. 633. coll. 4. p. 143. *A. alba*, Hortul. Stamens with long white filaments.

*Porto-Rico Acacia.* Fl. June, Aug. Clt. 1824. Shrub 6 to 10 feet.

242 *A. CARACASSANA* (Willd. l. c.) unarmed, smoothish; leaves with 4-5 pairs of pinnae, each pinna bearing about 20 pairs of linear bluntish leaflets; petioles glandless, and are, as well as the branches, rather pubescent; heads of flowers pedunculate, 2-3-together, axillary, and somewhat terminal; calyxes with glandular margins. *h. S.* Native of Caraccas. *Mimosa Caracassana*, Jacq. icon. rar. t. 632. coll. 4. p. 142. Stamens with purple filaments.

*Caraccas Acacia.* Clt. 1817. Shrub 6 to 12 feet.

243 *A. LYCOPODIODES* (Desv. journ. bot. 1814. 1. p. 69.) unarmed; branches tetragonal; leaves with 3 pairs of pinnae, each pinna bearing many pairs of minute rather pubescent leaflets; flowers in capitate spikes, on long peduncles; stipulas distinct, lanceolate, striated. *h. S.* Native country unknown. *Mimosa lycopodioides*, Pers. ench. 2. p. 263. Poir. suppl. 1. p. 68.

*Club-moss-like Acacia.* Shrub.

244 *A. LAMBERTIANA* (D. Don, in bot. reg. t. 721.) unarmed; branches terete, and are, as well as the leaves, villous; leaves with 2-3 pairs of pinnae, each pinna bearing 9-12 pairs of oval-oblong leaflets, which are obtuse at both ends; petiole glandless; heads of flowers 3-5-together, disposed in a raceme. *h. S.* Native of Mexico. Stamens 20-25, with purple exerted filaments, like those of *Inga purpurea*. Legume unknown.

*Lambert's Acacia.* Fl. May, Jun. Clt. 1818. Sh. 6 to 10 feet.

245 *A. QUADRANGULARIS* (Link. enum. 2. p. 445.) unarmed; branches tetragonal; leaves with 5 pairs of pinnae, each pinna bearing many pairs of linear, acute, ciliated leaflets, the lower and outer ones the shortest; petioles pubescent, glandless; heads of flowers usually tern, pedunculate, axillary. *h. S.* Native country, as well as the legumes, unknown. Stipulas lanceolate, and are, as well as the peduncles, striated longitudinally. Filaments long, white.

*Quadrangular-branched Acacia.* Fl. June, July. Clt. 1825. Shrub 6 to 10 feet.

246 *A. TETRAGONA* (Willd. spec. 4. p. 1069.) unarmed, glabrous; branches tetragonal; leaves with 5-6 pairs of pinnae, each pinna bearing 16-29 pairs of linear acute leaflets, the outer ones the largest; heads of flowers pedunculate, usually tern, axillary; legume linear, obtuse, with thickened margins. *h. S.* Native of Caraccas, in sand on the banks of rivers. Flowers white.

*Tetragonal-branched Acacia.* Clt. 1820. Shrub 6 to 8 feet.

247 *A. DISCOLOR* (Willd. spec. 4. p. 1068.) unarmed; leaves with 5 pairs of pinnae, each pinna bearing 9-12 pairs of oblong, glabrous, acute leaflets, which are pale beneath; petioles glandular at the base, and are, as well as the branches, pubescent; heads of flowers pedicellate, disposed along the axillary peduncles in long racemes. *h. G.* Native of New Holland. *Mimosa discolor*, Andr. bot. rep. 235. *Mimosa botrycephala*, Vent. cels. t. 1. *A. discolor*, Sims, bot. mag. 1750. Branches nearly terete. Flowers yellow. Legume flat, broad-linear, obtuse,  $2\frac{1}{2}$  inches long, and 8-10 lines broad.

*Discoloured-leaved Acacia.* Fl. March, June. Clt. 1788. Shrub 6 to 10 feet.

248 *A. ANGULATA* (Desv. journ. bot. 1814. 2. p. 68.) unarmed, quite smooth; branches tetragonal; leaves with 5-7 pairs of pinnae, each pinna bearing about 30 pairs of very narrow linear leaflets, with one perforated gland beneath the pinnae, and one between each pair of pinnae; heads of flowers pedicellate, disposed in long racemes along the axillary peduncles. *h. G.* Native of New Holland. *A. sulcipes*, Sieb. pl. exsicc. nov. holl. no. 460. Heads of flowers small, yellow. Leaflets usually alternate. Legumes unknown.

*Angular-branched Acacia.* Fl. June, July. Clt. 1820. Tree 10 to 15 feet.

249 *A. PUBESCENS* (R. Br. in hort. kew. 5. p. 467.) unarmed; branches terete, hairy; leaves with 8-10 pairs of pinnae, each pinna bearing 6-18 pairs of linear glabrous leaflets; petiole glandless; heads of flowers globose, pedicellate, disposed in racemes along the axillary peduncles. *h. G.* Native of New Holland, on the east coast. *Mimosa pubescens*, Vent. malm. t. 21. Sims, bot. mag. 1263. Sieb. pl. exsicc. nov. holl. no. 466. Heads of flowers small, yellow. Legume unknown.

*Pubescent Acacia.* Fl. March, June. Clt. 1790. Shrub 6 to 10 feet.

250 *A. FILICINA* (Willd. spec. 4. p. 1072.) unarmed; branches terete, and are, as well as the petioles, glandless, and pilose; leaves with usually 6 pairs of pinnae, each pinna bearing 50-70 pairs of linear, acute, ciliated leaflets; heads of flowers pedicellate, disposed in long racemes along the panicle peduncles. *h. S.* Native of Mexico. *Mimosa filicoides*, Cav. icon. 1. t. 78. *Mimosa ptericina*, Poir. suppl. 1. p. 74. Flowers polyandrous. Legume linear, flat, pilose, with thickened margins.

*Fern-like Acacia.* Clt. 1825. Shrub 3 to 6 feet.

251 *A. VILLOSA* (Willd. spec. 4. p. 1067.) unarmed; leaves with 5-6 pairs of pinnae, each pinna bearing about 12 pairs of ovate leaflets, which are, as well as the branches, villous; petioles glandless; heads pedicellate, disposed in a terminal panicle. *h. S.* Native of Jamaica, on the mountains on the south side. *Mimosa villosa*, Swartz, fl. ind. occ. 2. p. 982. Flowers white. Legume short, flat, hairy.

*Villous Acacia.* Clt. 1806. Shrub 6 to 8 feet.

252 *A. FRONDOSA* (Willd. spec. 4. p. 1076.) unarmed; leaves with 6 pairs of pinnae, each pinna bearing 14 pairs of distant lanceolate leaflets, which are pubescent beneath, as well as the branches and petioles, with a gland between the inferior pair of pinnae; heads of flowers axillary, pedunculate, solitary. *h. S.* Native of the East Indies. Legume linear, flat, with the margin rather repand on the outside.

*Leafy Acacia.* Clt. 1816. Tree.

253 *A. OUYRAREMA* (D. C. prod. 2. p. 469.) unarmed; leaves with 6 pairs of pinnae, each pinna bearing 30 pairs of oblong, obtuse, glabrous, 2-nerved leaflets, which are obliquely truncate at the base; petioles acutely trigonal or tetragonal, a little winged, bearing an oblong depressed gland at the base. *h. S.* Native of Guiana. *Mimosa Ouyrarema*, Aubl. guian. 946. exclusive of the synonyme. The Guiana name of the tree is *Ouyrarema*.

*Ouyrarema Acacia.* Tree.

254 *A. STIPULACEA* (D. C. prod. 2. p. 469.) unarmed; leaves with 5-7 pairs of pinnae, each pinna bearing 20-30 pairs of oblong leaflets, which are pubescent beneath, as well as the petioles, peduncles, and branches; stipulas ovate, cordate, acute, large, permanent; heads of flowers pedunculate, somewhat corymbose. *h. S.* Native of Bengal. *Mimosa stipulata*, Roxb. hort. beng. p. 40. Legume linear, flat, glabrous, straight, 6 inches long, and 9 lines broad. Gland ovate, striated in the middle of the naked part of the petiole.

*Large-stipuled Acacia.* Clt. 1800. Tree 40 feet.

255 *A. BIMUCRONATA* (D. C. prod. 2. p. 469.) unarmed; branches, petioles, and pedicels pubescent; leaves with 6-8 pairs of pinnæ, each pinna bearing 28 pairs of oblong-linear glabrous leaflets, with 2 retrograde mucrones on the lower part of each pinna, and with an obsoletely villous gland between each pair of pinnæ; heads of flowers forming a loose terminal panicle. *h. S.* Native of Brazil. Legume unknown.

*Two-pointed-leaved Acacia.* Tree.

256 *A. DIVARICATA* (Willd. spec. 4. p. 1070.) unarmed, glabrous; leaves with 6-9 pairs of pinnæ, each pinna bearing 40 pairs of linear obtuse leaflets, with a convex sessile gland beneath the lower pair of pinnæ; stipulas semi-ovate, falcate; heads of flowers pedunculate, 1-3-together, axillary. *h. S.* Native of the East Indies. Flowers white, polyandrous. *Mimosa divaricata*, Jacq. schænbr. t. 395. Legume unknown.

*Divaricate Acacia.* Clt. 1820. Tree.

257 *A. FLAVA* (Spreng. in herb. Balb. D. C. prod. 2. p. 469.) unarmed, glabrous; leaves with 7-9 pairs of pinnæ, each pinna bearing 18-25 pairs of linear, mucronate, glabrous leaflets; petiole pubescent, with a gland at the base; legume flat, compressed, glabrous, obtuse, ending in a short mucrone, 8-10-seeded. *h. S.* Native of St. Martha. Flowers yellow.

*Yellow Acacia.* Tree.

258 *A. UMBELLIFERA* (Kunth, mim. p. 100. t. 31. nov. gen. amer. 6. p. 275.) unarmed; leaves with 7-10 pairs of pinnæ, each pinna bearing 17-37 pairs of linear ciliated leaflets; peduncles axillary, bearing numerous umbellules of flowers; flowers pedicellate. *h. S.* Native near the city of Mexico. Flowers white, polyandrous. Legume unknown.

*Umbellule-bearing Acacia.* Tree.

259 *A. ARBOREA* (Willd. spec. 4. p. 1064.) unarmed; branches and petioles clothed with rusty velvety down; leaves with 7-12 pairs of pinnæ, each pinna bearing 16-18 pairs of oblong, dimidiate, glabrous leaflets, with a depressed gland on the petiole between each pair of pinnæ; heads of flowers 2-3-together, axillary, pedunculate. *h. S.* Native of Jamaica and Porto-Rico. *Mimosa arborea*, Lin. spec. 1503. Swartz, obs. 390. *Mimosa filicifolia*, Lam. dict. 1. p. 12.—Pluk. phyt. 251. f. 2.—Sloan, hist. 2. t. 182. f. 1 and 2. Flowers of a pale flesh colour. The legume, according to Swartz, is nearly terete, arched, and twisted.

*Tree Acacia.* Clt. 1768. Tree 40 feet.

260 *A. AMARA* (Willd. spec. 4. p. 1071.) unarmed; branches, petioles, and peduncles clothed with velvety hairs; leaves with 8-10 pairs of pinnæ, each pinna bearing 20-25 pairs of linear, bluntish, glabrous leaflets; heads of flowers axillary, from 2-6-together, pedunculate. *h. S.* Native of the East Indies. *Mimosa amara*, Roxb. cor. 2. t. 122. Flowers yellow, polyandrous. The legume, according to Roxburgh, is linear, flat, acute, and 8-seeded. The bark is bitter and astringent.

*Bitter Acacia.* Clt. 1816. Tree 30 feet.

261 *A. NEMU* (Willd. spec. 4. p. 1065.) unarmed; leaves with usually 9 pairs of pinnæ, each pinna bearing many pairs of acute dimidiate leaflets, with a gland at the base of the petiole; heads of flowers pedunculate, forming a terminal panicle; legumes linear, pubescent. *h. G.* Native of Japan. *Mimosa arborea*, Thunb. fl. jap. 229. Banks, icon. Kœmpf. t. 19. *Mimosa speciosa*, Thunb. in Lin. soc. trans. 2. p. 356. The tree is called *Nemu* in Japan.

*Nemu Acacia.* Tree.

262 *A. JULIBRISSIN* (Willd. spec. 4. p. 1065.) unarmed, glabrous; leaves with 8-12 pairs of pinnæ, each pinna bearing about 30 pairs of dimidiate-oblong, acute, rather ciliated leaflets, with a depressed orbicular gland at the base of the petiole; heads of flowers pedunculate, forming a terminal somewhat corymbose panicle; legumes flat, membranous, glabrous. *h. H.* Native of the Levant. *Mimosa arborea*, Forsk. descr. 177. Lam. dict.

1. p. 13. *Mimosa Julibrissin*, Scop. del. 1. t. 8. Flowers white. Stamens flesh-coloured at the apex. The specific name is of Persian origin, where the tree is called *Gul-ebrouschim* according to Fischer, or *Ghul-ibrichim* according to Mangles, from its silky flowers. In Turkey it is called *Irbzim*. It is an elegant, hardy, deciduous tree.

*Julibrissin Acacia* or Silk-tree. Fl. Aug. Clt. 1745. Tree 30 to 40 feet.

263 *A. POLYPHYLLA* (D. C. cat. hort. monsp. p. 74.) unarmed, glabrous; leaves with 11-12 pairs of pinnæ, each pinna bearing 30 pairs of dimidiate-oblong ciliated leaflets, which are somewhat puberulous beneath, with a small orbicular gland in the middle of the petiole, and one between each of the 2 or 3 uppermost pairs of pinnæ; heads of flowers pedunculate, forming an ample terminal panicle; legumes flat, membranous, glabrous. *h. S.* Native of St. Martha. *Acacia riparia*, Bertero, but not of Kunth. Leaves like those of *A. Julibrissin*, but the heads of flowers are much smaller, and the stamens are about 40 in each flower, hardly 3 lines in length, while those of *A. Julibrissin* are nearly an inch long.

*Many-leafletted Acacia.* Clt. 1824. Tree 20 feet.

264 *A. BERTERIA'NA* (Balbis, herb. ex D. C. prod. 2. p. 470.) unarmed, glabrous; leaves with 9-10 pairs of pinnæ, each pinna bearing about 40 pairs of oblong-linear glabrous leaflets, which are shining above, and pale beneath, with a sessile gland at the base of the petiole, and one between the extreme pair of pinnæ; heads of flowers pedunculate, disposed in a panicle; legumes flat, membranous, glabrous. *h. S.* Native of St. Domingo. Stamens 15, 3 times the length of the corolla.

*Bertero's Acacia.* Tree.

265 *A. DECURRENS* (Willd. spec. 4. p. 1072.) unarmed, glabrous; leaves with 9-11 pairs of pinnæ, each pinna bearing 30-40 pairs of narrow, linear, distant leaflets, with a gland on the rachis between each pair of pinnæ; petioles and branches with acute angles; heads pedicellate, disposed in racemes along the axillary peduncles. *h. G.* Native of New Holland, about Port Jackson. *Mimosa decurrens*, Vent. malin. t. 61. Sieb. pl. exsic. nov. holl. no. 436. Flowers yellow, polyandrous.

*Decurrent Acacia.* Fl. May, Jul. Clt. 1790. Tree 10 to 20 ft.

266 *A. ADENOPHORA* (Spreng. syst. 3. p. 140.) branches and petioles glandular and glabrous; leaves with 8 pairs of pinnæ, each pinna bearing many pairs of linear, bluntish, glabrous leaflets; heads of flowers disposed in axillary racemes. *h. G.* Native of New Holland, Sieber. Flowers yellow.

*Gland-bearing Acacia.* Tree 10 to 20 feet.

267 *A. MOLLISSIMA* (Willd. enum. 1053.) unarmed; branches and petioles angular, pubescent; leaves with from 8-18 pairs of pinnæ, each pinna bearing 30-40 pairs of linear, much crowded, pubescent leaflets, with glands on the rachis, one between each pair of pinnæ; heads of flowers pedicellate, disposed in racemes along the axillary peduncles. *h. S.* Native of Van Diemen's Land. *A. decurrens*  $\beta$ , môllis, Ker. bot. reg. 371. *A. môllis*, Sweet, fl. austr. t. 12. Leaves glaucous, when young clothed with yellowish velvety down. Legume linear, glabrous, obtuse, flat; seeds 8-9 in each legume, rather tumid, cuneated and narrowed at the base. (f. 54.)

*Very-soft Acacia.* Fl. July, Aug. Clt. 1810. Tr. 10 to 20 ft.

268 *A. DEALBATA* (Link. enum. 2. p. 445. Sieb. pl. exsic.

FIG. 54.

nov. holl. no. 446.) unarmed; branches rather angular, and are, as well as the petioles, clothed with short velvety down; leaves with 15 pairs of pinnæ, each pinna bearing 30-35 pairs of linear, much crowded, pubescent leaflets, with glands on the rachis, one between almost every pair of pinnæ; heads of flowers pedicellate, disposed in racemes along the axillary peduncles. *h. G.* Native of New Holland. Flowers yellow. The glands between the pairs of pinnæ perforated.

*Whitened Acacia.* Fl. Ju. Aug. Clt. 1820. Tree 10 to 20 ft.

269 *A. MOLLIS* (Wall. pl. rar. asiat. 2. p. 76. t. 177.) arborescous, erect, unarmed; leaves with 4-8 pairs of pinnæ, each pinna bearing numerous pairs of villous, half-ovate, acute leaflets, with a concave gland above the base of the petiole, and one between each of the ultimate pairs of pinnæ; heads of flowers in fascicles, on long peduncles, disposed in corymbs at the tops of the branches; filaments very long, monadelphous at the base. *h. G.* Native of Nipaul, where it is grown in gardens at Katmandu, under the name of *Lakkay*. Corolla yellow. Filaments red. Tree villous in every part.

*Soft Acacia.* Tree 40 to 50 feet.

270 *A. IRRORATA* (Sieb. ex Spreng. syst. 3. p. 141.) branches brown, as well as petioles, which are glandless; leaves with 15-20 pairs of pinnæ, each pinna bearing numerous pairs of linear, bluntish, pruinose leaflets; heads of flowers disposed in terminal panicles. *h. G.* Native of New Holland.

*Bedewed Acacia.* Shrub.

271 *A. CONTORTA* (D. C. prod. 2. p. 470.) unarmed; branches nearly terete, and are, as well as the leaves, glabrous; leaves with 12-16 pairs of pinnæ, each pinna bearing 30-35 pairs of linear approximate leaflets, with an urceolate gland on the petiole beneath the lower pair of pinnæ; legume very long, spirally twisted, flat, glabrous. *h. S.* Native of Brazil. Flowers unknown. Peduncles axillary, solitary, an inch long. Legume a foot long.

*Twisted-podded Acacia.* Clt. 1825. Tree.

272 *A. PENICILLIFERA* (Lag. nov. gen. et spec. 16. no. 208.) unarmed; petioles clothed with adpressed pubescence, glandless, and emarginate; leaves with about 12 pairs of pinnæ, each pinna bearing 20-30 pairs of linear, obtuse, rather ciliated leaflets; heads of flowers pedunculate. *h. S.* Native of New Spain. A weak twiggy shrub, with the habit of *A. filicina*. Legume unknown.

*Pencil-bearing Acacia.* Shrub 2 to 3 feet.

273 *A. ESCULENTA* (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 470.) unarmed, glabrous; leaves with 17 pairs of pinnæ, each pinna bearing 32 pairs of linear obtuse leaflets; heads pedunculate, twin, disposed in a terminal panicle; legumes linear, flat, glabrous, tapering much to the base. *h. S.* Native of Mexico, where it is called *Guaxe*. Legume eatable. Flowers white, decandrous.

*Esculent-podded Acacia.* Clt. 1825. Tree.

274 *A. PEREGRINA* (Willd. spec. 4. p. 1073.) unarmed, nearly glabrous; leaves with 15-20 pairs of pinnæ, each pinna bearing 25-30 pairs of oblong-linear ciliated leaflets, bearing one gland in the middle of the petiole, and 1 or 2 at the top of the pinnæ; heads of flowers 2-4-together, pedunculate; anthers bearing a pedicellate gland at the apex. *h. S.* Native of New Granada, at the river Chota. Kunth, mim. p. 96. t. 30. nov. gen. amer. 6. p. 274. *Mimosa peregrina*, Lin. spec. 1504. Flowers white, decandrous.

*Foreign Acacia.* Tree 40 feet.

275 *A. BELLA* (Spreng. syst. 3. p. 141.) branches and petioles hairy; petioles glandless; leaves with 15 pairs of pinnæ, each pinna bearing many pairs of minute, imbricated, linear, strigose leaflets; heads of flowers disposed in racemes. *h. S.* Native of Brazil.

*Pretty Acacia.* Tree.

276 *A. ANGUSTIFOLIA* (D. C. prod. 2. p. 470.) unarmed, nearly glabrous; leaves with 15-20 pairs of pinnæ, each pinna bearing 30-40 pairs of linear, acute, ciliated leaflets, with a gland at the base of the petiole, and one between the extreme pair of pinnæ; heads of flowers 2-4-together, pedunculate; anthers glandless. *h. S.* Native of the West India Islands. *Mimosa angustifolia*, Lam. dict. 1. p. 12. but not of Wendl. Legume flat, glabrous, with the margins rather sinuated, tapering into a stipe at the base, 6 inches long, and 8-9 lines broad.

*Narrow-leafletted Acacia.* Tree.

277 *A. GRATA* (Willd. enum. 1056.) unarmed; leaves with 20 pairs of pinnæ, each pinna bearing many pairs of linear leaflets, with scabrous margins; petiole glandular above the base; legumes repand. *h. S.* Native of Brazil. The rest unknown.

*Grateful Acacia.* Tree.

278 *A. MICROPHYLLA* (Willd. enum. p. 1056.) unarmed; leaves with 25 pairs of pinnæ, each pinna bearing 50-60 pairs of linear, acute, ciliated leaflets, with a large gland at the base of the petiole; branches and petioles pubescent; heads of flowers axillary, pedunculate, twin. *h. S.* Native of the Caraccas, on stony hills. *Mimosa parvifolia*, Poir. suppl. 1. p. 74. Legume linear, 9 inches long.

*Small-leafletted Acacia.* Tree.

279 *A. PANICULATA* (Willd. spec. 4. p. 1074.) unarmed; leaves with 20-25 pairs of pinnæ, each pinna bearing 10 pairs of linear ciliated leaflets, with a gland on the petiole beneath the lower pair of pinnæ; petioles and branches pubescent; heads of flowers pedunculate, disposed in axillary panicles. *h. S.* Native of Para, in Brazil. Legume unknown. The specimen of this species sent by Willdenow to Desfontains is furnished with hooked scattered spines; it is, therefore, perhaps a different plant, or it should be placed in a different division of the genus.

*Panicle-flowered Acacia.* Tree.

280 *A. BRASILIENSIS* (Spreng. syst. 3. p. 142.) branches terete, hairy, as well as the petioles, which are glandless; leaves with many pairs of pinnæ, each pinna bearing many pairs of linear, minute, strigose, imbricated leaflets; heads of flowers disposed in spikes. *h. S.* Native of Brazil, Sello.

*Brazil Acacia.* Tree.

281 *A. MULTIFLORA* (Spreng. syst. 3. p. 142.) branches angular, glabrous; petioles glandless; leaves with many pairs of pinnæ, each pinna bearing many pairs of smooth, lanceolate, falcate leaflets; heads of flowers disposed in panicles. *h. S.* Native of Brazil, Sello.

*Many-flowered Acacia.* Tree.

282 *A. ? PECTINATA* (H. B. et Kunth, nov. gen. amer. 6. p. 282. but not of Hoffmannsegg.) unarmed; leaves with 15-16 pairs of pinnæ, each pinna bearing 50-60 pairs of linear, obtuse, mucronate leaflets, which are glabrous above, but clothed with rusty pubescence beneath, as well as the petioles; petioles glandless. *h. S.* Native of South America, at the river Cassiquiare. Leaflets on each pinna usually about 60 pairs. *Inga pectinata*, Willd. spec. 4. p. 1126. Flowers and fruit unknown.

*Pectinate-leaved Acacia.* Tree.

283 *A. NIPO* (Humb. rel. hist. 2. p. 620. H. B. et Kunth, nov. gen. amer. 6. p. 282.) unarmed; leaves with 20-25 pairs of pinnæ, each pinna bearing 50-70 pairs of linear, rather falcate, acute, membranous, glabrous, ciliated, obsolete 1-nerved leaflets, with a gland on the petiole above the base, and one between the extreme pair of pinnæ; legumes linear, beaked. *h. S.* Native of South America, near Maypures and Atures, &c. on the Orinoco. *Inga Niopa*, Willd. spec. 4. p. 1027. *Niopo* is the South American name of the tree.

*Niopo Acacia.* Tree.

284 *A. CHRYSANTHA* (D. C. prod. 2. p. 471.) unarmed; leaves and branches glabrous; leaves with 20-28 pairs of pinnae, each pinna bearing 8 pairs of linear-oblong, obtuse leaflets; petioles glandless; peduncles 3-4-together, axillary; heads of flowers oblong. *h. S.* Native of Cayenne. *Mimosa chrysantha*, Vahl. ecl. amer. 3. p. 38. Stamens innumerable, golden yellow. Legume unknown.

*Golden-flowered Acacia.* Tree.

285 *A. ASPLENIODES* (Neuw. reis. bras. 2. with a figure, ex flora, 1821. p. 303.) unarmed; leaves with 2-3 pairs of pinnae, each pinna bearing 12-15 pairs of leaflets; petioles hairy; spikes terminal, corymbose, globose, pedunculate. *h. S.* Native of Brazil. Stamens long, purple.

*Spleenwort-like Acacia.* Tree or shrub.

286 *A. INUNDATA* (Mart. reis. bras. ex Schleicht. Linnæa. 5. p. 43.) arboreous, glabrous; petiole bearing one gland in the middle, and one at the apex; leaves with 3 pairs of pinnae, each pinna bearing 12-13 pairs of oblong-lanceolate, oblique, unequal-sided, nerved leaflets, which are shining above, but glaucous beneath; heads of flowers pedicellate, disposed in racemes along the axillary peduncles, shorter than the leaves; petioles and peduncles pubescent. *h. S.* Native of Brazil.

*Inundated Acacia.* Tree.

† *Species of Acacia not sufficiently known.*

\* *Leaves with only one pair of pinnae, each pinna bearing few or many pairs of leaflets.*

287 *A. RUTEFOLIA* (Link. enum. 2. p. 444.) leaves with one pair of pinnae; leaflets unequal; flowers yellowish. *h. S.* Native country unknown.

*Rut-leaved Acacia.* Clt. 1810. Shrub.

288 *A. OLIGOPHYLLA* (Hoffmans. verz. 1824. p. 201.) unarmed; leaves with one pair of pinnae, each pinna bearing 3-4 pairs of ovate-oblong, apiculated leaflets; stipulas filiform. *h. S.* Native country unknown, as well as the flowers and fruit.

*Few-leafletted Acacia.* Clt. 1817. Tree.

• • *Unarmed trees and shrubs, with bipinnate leaves.*

289 *A. HOFFMANSEGGII* (D. C. prod. 2. p. 471.) unarmed; leaves with 4 pairs of pinnae, each pinna bearing many pairs of linear, equal-sided, bluntly acute leaflets, which are unequal at the base; petioles pubescent, with a gland below the lower pair of pinnae, and one between the upper pair of pinnae. *h. S.* Native of Brazil, about Rio Janeiro. *H. pectinata*, Hoffmans. verz. 1824. p. 201. but not of others. Said to be allied to *A. rostrata*, but the flowers and fruit are unknown.

*Hoffmansegg's Acacia.* Tree.

290 *A. VENUSTA* (Willd. enum. p. 1052.) unarmed; leaves with 3-5 pairs of pinnae, each pinna bearing from 15-20 pairs of falcate, acutish, quite glabrous leaflets. *h. S.* Native of South America. Flowers and fruit unknown.

*Beautiful Acacia.* Tree.

291 *A. ? JAVA'NICA* (D. C. prod. 2. p. 471.) unarmed; leaves with 4 pairs of pinnae, each pinna bearing 70 pairs of oval, lucid, obtuse leaflets. *h. S.* Native of Java. *Gleditschia Javanica*, Lam. dict. 2. p. 466. Lower leaves bearing fewer leaflets than the upper ones.

*Java Acacia.* Tree.

292 *A. GUACHAPELE* (H. B. et Kunth, nov. gen. amer. 6. p. 281.) unarmed; leaves with 4-5 pairs of pinnae, each pinna bearing 5-6 pairs of obovate or subelliptic-oblong membranous leaflets, which are pubescent on both surfaces, with a gland on the middle of the petiole, and between each of the 2 superior pairs of pinnae; flowers capitate; stamens monadelphous; legumes linear, ending in a long beak. *h. S.* Native of Quito, in woods near Guayaquil. *Guachapele* is the vernacular name of the tree.

*Guachapele Acacia.* Tree 50 to 60 feet.

293 *A. HADIE'NSIS* (D. C. prod. 2. p. 472.) unarmed; leaves with 3 pairs of pinnae, lower pair furnished with one scale, upper pair furnished with a double scale, each pinna bearing about 14 pairs of oval-linear leaflets, middle ones the longest. *h. G.* Native of Arabia, about Hadie. *Mimosa Sejal*, Forsk. descrip. p. 197. but not of Delile.

*Hadie Acacia.* Tree.

294 *A. PRISMATICA* (Hoffmansegg, verz. 1824. p. 159.) unarmed; leaves with 7-8 pairs of pinnae, each pinna bearing 14-17 pairs of oblong two-coloured leaflets; branches angled; petioles glabrous; young leaves clammy. *h. S.* Native country unknown. Said to be allied to *A. discolor*, but the flowers and fruit are unknown.

*Prismatic Acacia.* Tree.

295 *A. COCHILIOCARPA* (Gomez, mem. acad. das. sci. lib. 3. p. 104. under *Mimosa*.) leaves with 3 pairs of pinnae, each pinna bearing about 3 pairs of leaflets; legumes compressed and spiral. *h. S.* Native of Brazil. Abaremotemo, Pis. bras. Its root is known by the name of *Cortex Brasiliensis*, and is a very powerful astringent. The plant is known in Brazil by the name of *Barbatimao*.

*Twisted-fruited Acacia.* Tree.

\*\*\* *Prickles stipular, twin, but without any petiolar ones.*

296 *A. PLATYLOBA* (Bert. ined. in herb. Balb. ex D. C. prod. 2. p. 472.) glabrous; prickles stipular, hooked; leaves with 3 pairs of pinnae, each pinna bearing 2-3 pairs of obovate obtuse leaflets; petioles glandless; legumes flat, rather stipitate. *h. S.* Native of St. Domingo. *Ynga Magdalena*, Spreng. in herb. Balb. Legume 6 inches long, and  $1\frac{1}{2}$  inch broad, 2-valved, dry inside. Seeds flat, shining. Flowers unknown. A very doubtful species, allied to *A. lébbek* and *A. latisiliqua*, but differs in being prickly. Perhaps it ought to be inserted between the sections *Globifloræ* and *Spicifloræ*.

*Broad-podded Acacia.* Tree.

297 *A. ? LEPTOPHYLLA* (D. C. cat. hort. monsp. p. 74.) prickles stipular, straight, setaceous, distinct, short; leaves with 4-5 pairs of pinnae, each pinna bearing 12 pairs of oblong distant leaflets, which are pubescent beneath, as well as the petioles and branches, with a gland on the petiole between the lower pair of pinnae. *h. S.* Native of South America. Flowers and fruit unknown.

*Slender-leaved Acacia.* Clt. 1824. Tree.

298 *A. ? VIRE'SCENS* (D. C. l. c.) glabrous; prickles stipular, setaceous, straight, distinct; leaves with 2 pairs of pinnae, each pinna bearing 12-20 pairs of oblong-linear leaflets, with an obsolete gland on the petiole between the lower pair of pinnae. *h. S.* Native of South America. Flowers and fruit unknown.

*Greenish-flowered Acacia.* Clt. 1820. Tree.

299 *A. LENTISCIFOLIA* (Desf. cat. hort. par. ed. 2. p. 208.) glabrous; spines subulate, stipular, straight; leaves with usually 4 pairs of pinnae, each pinna bearing about 10 pairs of ovate, mucronate, rather coriaceous, shining leaflets, with a sessile gland between each of the pairs of pinnae. *h. S.* Native of Mexico. *Mimosa lentiscifolia*, Pers. ench. 2. p. 263. Poir. suppl. 1. p. 84. Flowers and fruit unknown.

*Lentiscus-leaved Acacia.* Tree.

300 *A. PATULA* (Humb. et Bonpl. in Willd. enum. 1055.) spines stipular, connate, twin, compressed at the base and dilated; leaves with 5 pairs of pinnae, each pinna bearing 15-20 pairs of linear leaflets, which are glabrous on both surfaces; petioles rather pilose and glandless. *h. S.* Native of South America. Flowers and fruit unknown.

*Spreading Acacia.* Clt. 1818. Tree.

301 *A. PERUVIANA* (Humb. et Bonpl. in Willd. enum. p.

1055.) spines stipular, setaceous, twin; leaves with 2 pairs of pinnæ, each pinna bearing 11-15 pairs of obtuse, glabrous leaflets. *h. S.* Native of Peru. Allied to *A. diptera*, according to habit.

*Peruvian Acacia.* Clt. 1820. Tree.

302 *A. ? GUAYAQUIL'NSIS* (Desf. hort. par. ed. 2. p. 208.) spines stipular, opposite; leaves with 2 pairs of pinnæ, each pinna bearing 3-5 pairs of ovate, obtuse, glaucescent leaflets, lower ones the smallest. *h. S.* Native of Peru, near Guayaquil. Flowers and fruit unknown.

*Guayaquil Acacia.* Tree.

303 *A. BRACHYACA'NTHA* (Humb. et Bonpl. in Willd. enum. 1055.) spines stipular, twin, hooked; leaves with usually 10 pairs of pinnæ, each pinna bearing about 10-12 pairs of ciliated leaflets. *h. S.* Native of South America. Flowers and fruit unknown.

*Short-spined Acacia.* Clt. 1824. Tree.

304 *A. ? CILIA'TA* (Humb. et Bonpl. in Willd. enum. 1055. but not of Ait.) spines stipular, twin, straight, subulate; leaves with 3-4 pairs of pinnæ, each pinna bearing 13 pairs of ciliated leaflets. *h. S.* Native of South America. Flowers and fruit unknown.

*Ciliated-leafletted Acacia.* Clt. 1822. Tree.

305 *A. ? ACICULA'RIS* (Humb. et Bonpl. in Willd. enum. 1056. but not of Ait.) spines stipular, subulate, twin, straight; leaves with 4 pairs of pinnæ, each pinna bearing 15 pairs of distant, ciliated leaflets. *h. S.* Native of South America. Flowers and fruit unknown.

*Acicular-spined Acacia.* Tree.

306 *A. GIRA'FFÆ* (Willd. enum. 1054.) spines stipular, twin, connate, about equal in length to the leaves; leaves with 3-6 pairs of pinnæ, each pinna bearing 10-20 pairs of leaflets, with 1 gland between each pair of pinnæ on the petiole. *h. G.* Native of the Cape of Good Hope, in the interior of the country. Flowers and fruit unknown. It is on this tree that the Cape giraffe or camel-leopard feeds.

*Giraffe's Acacia.* Tree 40 to 70 feet.

307 *A. ? MICRACA'NTHA* (Desv. journ. bot. 1814. 1. p. 69.) prickles stipular, very slender; leaves pubescent, bipinnate; leaflets linear, rather falcate, very thin; flowers disposed in spike-like racemes, on short peduncles. *h. S.* Native of Cayenne. *Mimosa semi-spinosa*, Lin. ex Desv.

*Small-spined Acacia.* Tree.

\*\*\* Spines or prickles all scattered in an irregular manner, or some of them are stipular, and those on the branches and petioles are scattered.

308 *A. ? RHODACA'NTHA* (Desf. cat. hort. par. ed. 2. p. 208.) glabrous; stipular prickles twin, petiolar ones scattered; leaves with about 7 pairs of pinnæ, lower pair the smallest, each pinna bearing from 8-20 pairs of oblong-linear, somewhat ciliated leaflets, with a depressed gland at the base of the petiole. *h. S.* Native country, flowers, and fruit unknown. *Mimosa rhodacantha*, Pers. ench. 2. p. 266.

*Red-spined Acacia.* Tree.

309 *A. HETEROCA'NTHA* (Burch. cat. no. 1710. ex trav. 1. p. 389.) some of the spines are twin, short, recurved, and brown, others are straight, longer, and white; leaves pubescent as well as the branches, with 4-6 pairs of pinnæ, each pinna bearing 10-14 pairs of approximate, oblong leaflets. *h. G.* Native of the Cape of Good Hope, near the river Gariep or Orange River. Legume linear.

*Variable-spined Acacia.* Clt. 1816. Tree.

310 *A. BANCROFTIA'NA* (Bent. in herb. Balb. Coll. hort. ripul. p. 1.) glabrous; rameal prickles scattered, petiolar ones twin at the origin of the pinnæ; leaves with 2-5 pairs of pinnæ, each

pinna bearing about 2-5 pairs of obovate, obtuse leaflets; petioles glandless. *h. S.* Native of Jamaica. This species approaches in habit to *A. platyloba*. Flowers unknown. Fruit ovate-oblong, glabrous, rather fleshy, few-seeded, sessile.

*Bancroft's Acacia.* Tree 20 feet.

311 *A. ? POLYCE'PHALA* (D. C. prod. 2. p. 473.) rameal as well as petiolar prickles scattered and a little hooked; leaves with 6-9 pairs of pinnæ, each pinna bearing 20 pairs of linear, acute leaflets, which are puberulous beneath and on the margins; petioles furnished with a large depressed gland at the base, and one between the extreme pair of pinnæ; petioles, branches, and peduncles clothed with velvety hairs; heads of flowers numerous, pedunculate, in fascicles, which are disposed in terminal racemes. *h. S.* Native of the Mauritius. Heads of flowers globose, reddish brown before the flowers expand. Stamens numerous, white. Legume unknown. The species is very like *A. concinna*, but differs in the absence of stipulas.

*Many-headed Acacia.* Tree.

312 *A. SPHEROC'EPHALA* (Schlecht. et Cham. in Linnæa. 5. p. 394.) leaves unknown; racemes axillary, usually tern; heads on short peduncles, ovate-roundish; flowers polyandrous; legume inflated, acinaciform, tapering to both ends, 12-18-seeded; seeds egg-shaped, compressed; spines red, white, or black. *h. S.* Native of Mexico, near Actopan and Vera Cruz. Prosopis species, Schiede. in litt.

*Round-headed Acacia.* Tree.

313 *A. SPADIGERA* (Schlecht. et Cham. l. c.) leaves unknown; racemes usually twin, leafy; spikes referrible to the spadix of an aroidous plant, cylindrically clavate; spines twin, stipular; peduncles very thick; flowers dense, polyandrous, propped by scales as in the preceding species. *h. S.* Native of Mexico, near La Laguna Verde.

*Spadix-bearing Acacia.* Tree.

† Species, the names of which are only known from Roxburgh's *Hortus Bengalensis*, under *Mimosa*.

1 *A. Kalkora*, Roxb. 2 *A. fruticosa*, Roxb. 3 *A. Smithiana*, Roxb. 4 *A. semicordata*, Roxb. 5 *A. dumosa*, Roxb. 6 *A. pedunculata*, Roxb.

*Cult.* The greenhouse or New Holland species of *Acacia* are the most ornamental of greenhouse plants in the winter season and early in spring, bearing flowers from Christmas to April. They are hardy and easily managed. The best soil for them is an equal quantity of sand, loam, and peat. Cuttings taken off by a joint from young wood, and planted in a pot of sand, with a bell-glass placed over them, root freely. Some of the kinds that do not strike readily by cuttings may be increased by taking off pieces of the roots, planting them in the same kind of soil as recommended for the plants, leaving only their points above the surface, and then plunging them in a little bottom heat. The greater part of the species might be propagated by this means. The stove species are furnished with very elegant foliage, but seldom flower in this country. Their culture and propagation are the same as for the greenhouse species, with the exception that they require more heat. The *Acacia Julibrissin*, *A. acanthocarpa*, *A. decurrens*, and *A. mollissima* are the only species that can be considered sufficiently hardy to stand our climate in the open air, and these are liable to be injured in severe winters, unless protected by mats. The best situation for them is against a south wall, where they will make a very fine appearance. They may be propagated either by slips of the root or by young cuttings, planted in sand, with a bell-glass placed over them. The surest way to raise all the kinds is by seeds, when they can be procured.

red; in reference to the red juice which flows from the tree when cut). Afzelius, mss. R. Br. Congo, and in Denh. and Clapp. trav. append. p. 30.

LIN. SYST. *Decándria, Monogýnia*. Flowers hermaphrodite, regular. Calyx 5-cleft. Petals 5. Stamens perigynous. Legume compressed, 2-valved, many-seeded.—A lofty tree with a spreading top and bipinnate leaves. Leaflets opposite, oval, oblique, from roundish to lanceolate, repand, acuminate, and entire. Racemes of flowers terminal and lateral.

1 E. GUINEE'NSE (G. Don, in Edinb. phil. journ. 1824.).  
 h. S. Native of Sierra Leone and other parts of Guinea. The red juice in which the tree abounds is used as an ordeal by the natives of many parts of western Africa, as well as of the interior, to detect the innocence or guilt of those who are accused of any crime. The red juice is taken in large draughts, and those who are not sufficiently strong to withstand this ordeal are pronounced guilty, and those who are considered innocent.

*Guinea* Grege-tree or Ordeal-tree. Fl. Feb. Clt. 1823. Tree 100 feet.

Cult. See *Aquicia* for culture and propagation, p. 424.

SUBORDER IV. *CÆSALPINEÆ* (plant agreeing with *Cæsalphinia* in some important characters). R. Br. gen. rem. p. 19. congo. p. 10. D. C. legum. mem. xiii.—Lomentacearum and Papilionacearum, Lin. gen.—Rectembriæ, Cassiæ, and Cérceæ, Bronn. mem. Flowers more or less irregular, sometimes papilionaceous, but usually regular (f. 55. c. f. 56. b.). Petals irregularly imbricate in æstivation, never valvate, sometimes wanting, but never joined together, always free (f. 55. c. f. 56. b.). Stamens more or less unequal (f. 56. c. f. 57. d.) always perigynous, and usually free, rarely as in Tribe *Geoffrææ* having the filaments concrete. Embryo straight (f. 21. g. h. l. m.) with the plumule usually large and conspicuous.

#### Tribe IX.

GEOFFRÆ (plants agreeing with *Geoffrøya* in particular characters). D. C. legum. mem. xiii. prod. 2. p. 473. Petals perigynous, unequal, disposed in a papilionaceous or sub-papilionaceous manner (f. 55. c.), imbricate in æstivation. Stamens monadelphous or diadelphous. Cotyledons fleshy or oily (f. 21. l.). This is an artificial tribe, which ought perhaps to have been brought in among the *Papilionacæ*, from the perigynous papilionaceous flowers and connected stamens, but it agrees with the sub-order *Cæsalphineæ* in the embryo being straight, as in the rest of that suborder. The genera belonging to this tribe are also very dissimilar in habit, and ought perhaps to have formed 4 or 5 distinct tribes.

CCXXXV. ARA'CHIS (*Aracos*, a name under which Pliny speaks of a plant with neither leaves nor branches, which comes from a priv. and *páke*, *rakis*, a branch; the present plant, however, has nothing to do with the plant of Pliny). Lin. gen. no. 876. Lam. ill. 615. D. C. prod. 2. p. 474.

LIN. SYST. *Diadélphia, Decándria*. Calyx a long pedicel-like tube, with a bilabiate limb. Corolla resupinate. Stamens and petals inserted in the throat of the calyx, 9 of the stamens are joined together, and the free one sterile. Ovary stipitate, enclosed in the tube of the calyx; the stipe short at first but afterwards becoming elongated. Style filiform. Legume ovate-oblong, obtuse at both ends, gibbous, torulose, coriaceous, indehiscent, 2-4-seeded, and reticulated with veins. Seeds thick, oily inside. Embryo straight, with a short obtuse radicle, and semi-elliptic cotyledons. An American herb, with elongated stipulas which are adnate to the petioles, abrupt, pinnate leaves bearing 2 pairs of leaflets, without any tendril. Flowers yellow, 5-7 together in the axils of the leaves, lower ones subterranean and fertile, those above ground flowering but sterile.

1 A. HYPOGÆA (Lin. spec. 1040.) ☉. S. Native of South America, from whence it has been transported to Africa, Asia, and the south of Europe, where it is extensively cultivated for its seeds. Trew. chret. t. 3. f. 3. Niss. act. par. 1723. t. 19. Rumph. amb. 5. t. 136. D. C. legum. mem. ii. t. 20. f. 105. A. Asiática, Lour. coch. p. 430. Branches diffusely procumbent. All the European settlements in America abound with ground-nuts, but it is generally supposed that it was brought by the slaves from Africa. In South Carolina it is cultivated in great quantities, where the inhabitants roast the nuts, as they are commonly called, and make use of them as chocolate. In the eastern countries they are a substitute for almonds. They abound in a thin limpid oil proper for lamps, and it is much used for this purpose in Cochinchina; it supplies the place also of their oil of olives for the use of the table—but is inferior to it in flavour. About Paris it is raised on hot-beds, and transplanted into the open garden, where it ripens its seeds, which are used as other legumes. The pods are sold in most fruiterers' shops in London.

Var. β, *glabra* (D. C. prod. 2. p. 474.) ☉. S. A. Africana, Lour. coch. p. 430. Leaves glabrous, not as in the species rather pilose.

*Underground* or *Earth-nut*. Fl. May, July. Clt. 1712. Pl. 1 foot or procumbent.

Cult. The seeds of the *Underground-nut* require to be sown on a hot-bed, and when the plants have grown a sufficient size they should be planted singly into separate pots, and set in the stove among other tender annuals. After the plant has done flowering, and the pods begin to lengthen, the pedicels force them into the earth, where they ripen their seeds.

CCXXXVI. VOANDZEIA (*Voandzou* is the name of the plant in Madagascar). Pet. Th. gen. mad. no. 777. D. C. prod. 2. p. 474.—*Cryptolobus*, Spreng. ex Bronn.

LIN. SYST. *Polygámia, Monœcia*. Flowers polygamous, outer ones male, sterile and bibracteolate, with a campanulate calyx, and papilionaceous corolla, with horizontal wings. Stamens diadelphous. Style incurved, hairy. Female flowers usually solitary and fertile, borne on reflexed peduncles, with a campanulate calyx, but the corolla and stamens are wanting. Ovary 2-seeded. Style short, ending in a hooked stigma. Legumes subterranean, roundish, fleshy, usually 1-seeded from abortion.—A tufted creeping herb, with trifoliate leaves on long petioles; the leaflets oblong, the terminal one stalked. Seeds esculent. The peduncles bend down, and penetrate the earth after the flowers have decayed and pods begin to form. This genus is allied to *Arachis*, or more probably to *Amphicarpæa*, but the structure of the seeds is not sufficiently known to decide this point.

1 A. SUBTERRANEA (Pet. Th. l. c.) ☉. S. Native of Madagascar, many parts of the continent of Africa within the tropics, Brazil, and Surinam. D. C. legum. mem. ii. t. 20. f. 106. Voandzou, Flac. mad. 118. Glycine subterranea, Lin. dec. 37. t. 17. *Arachis* Africana, Burm. ind. p. 22. Flowers yellow. In Surinam and various parts of Africa the seeds are very good, and are boiled in an unripe state like peas. They are also very good when ripe. The Surinam name of the plant is *Gobbe*.

*Underground*-podded *Voandzou*. Fl. June, Aug. Clt. 1823. Pl.  $\frac{1}{2}$  foot.

Cult. See *Arachis* for culture and propagation.

CCXXXVII. PERALTEA (in honour of Joseph Peral, of New Spain, who communicated dried specimens and seeds of plants to Humboldt). H. B. et Kunth, nov. gen. amer. 6. p. 469. D. C. legum. mem. xiii. D. C. prod. 2. p. 474.

LIN. SYST. *Diadélphia, Decándria*. Calyx furnished with 2

opposite bracteoles, which are longer than it, with a short tube, the 3 lower segments deep, elongated, and linear-lanceolate, the 2 superior ones joined into a lip, which is bidentate at the apex. Stamens diadelphous. Style filiform, simple at the apex. Legume oblong, compressed, flat, 4-8-seeded, apiculated by the style, sessile, winged on the seminiferous suture, and somewhat sheathed at the base by the lengthened torus. Embryo straight, with rather fleshy cotyledons.—Mexican subshrubs, clothed with silky villi. Leaves impari-pinnate, with many pairs of leaflets, the terminal one not remote from the rest. Pedicels twin, axillary, 1-flowered. Flowers large, purple. This genus is perhaps not distinct from *Brongniartia*, and probably both are referrible to tribe *Phaseoleæ*.

1 *P. LUPINOIDES* (H. B. et Kunth, nov. gen. amer. 6. p. 471. t. 589.) leaflets clothed with silky wool, oval-oblong, obtuse at both ends, mucronate at the apex; ovary sessile; legume furnished with a narrow wing on the seminiferous suture. *h. S.* Native of New Spain, between Chilpancingo and Zumpango. Pedicels 5-10 lines long. Flowers violaceous.

*Lupine-like Peraltea.* Shrub 1 to 2 feet.

2 *P. OXYPHYLLA* (D. C. legum. mem. xiii.) leaflets clothed with silky wool, 12-13 pairs, with the terminal one ovate-lanceolate, and very much acuminate; ovary nearly sessile. *h. S.* Native of New Spain. Peduncles an inch long. Corollas glabrous, and are, as well as the bracteas, very villous, 8-10 lines long. The immature pod is emarginate on the back. Stamens connected farther up than those of *P. lupinoides*.

*Sharp-leaved Peraltea.* Shrub 1 to 2 feet.

*Cult.* The species of *Peraltea* are very elegant when in flower; they thrive best in a mixture of loam, peat, and sand, and young cuttings root readily if planted in a pot of sand, with a bell-glass placed over them in heat.

CCXXXVIII. BRONGNIARTIA (in honour of Adolph Brongniart, a distinguished botanist, one of the editors of *Annales des Sciences Naturelles*). H. B. et Kunth, nov. gen. amer. 6. p. 465. D. C. prod. 2. p. 475.

*Lin. syst.* *Diadélphia, Decándria*. The characters of the genus are the same as *Peraltea*, but differs in the legume being seated on a more distinct stipe, and in the seminiferous suture being without any wing. Perhaps it ought to be joined to *Peraltea*.

1 *B. MOLLEIS* (H. B. et Kunth, nov. gen. amer. 6. p. 465. t. 587.) leaves with 4-5 pairs of ovate-elliptic acute leaflets, which are puberulous above, but clothed with soft villous pubescence beneath, as well as on the margins. *h. S.* Native of New Spain, on the mountains between Zumpango and Tasco. Legume on a long pedicel. Flowers large, purple.

*Soft Brongniartia.* Shrub 1 to 2 feet.

2 *B. PODALYRIOIDES* (H. B. et Kunth, nov. gen. amer. 6. p. 465. t. 588.) leaves with 2-5 pairs of leaflets; leaflets elliptic-oblong, rounded, and mucronate at the apex, clothed with adpressed villi on both surfaces, but silky when young; branches and petioles glabrous. *h. S.* Native of New Spain, in warm places between Tasco and Cuernavaca. Legume on a short pedicel. Flowers large, purple.

*Podalyria-like Brongniartia.* Shrub 1 foot.

*Cult.* Elegant plants when in flower. For their culture and propagation see *Peraltea*.

CCXXXIX. ANDIRA (the Brazilian name of some of the species). Lam. dict. 1. p. 171. Kunth, nov. gen. amer. 6. p. 385. D. C. prod. 2. p. 475.—Vouacapoua, Aubl. guian. suppl. p. 10. t. 373.

*Lin. syst.* *Diadélphia, Decándria*. Calyx turbinate-campanulate, 5-toothed; teeth nearly equal, acute, and erect. Co-

VOL. II.

rolla papilionaceous, with a roundish emarginate vexillum, which is longer than the keel. Stamens diadelphous, 9 joined, and 1 free. Ovary 3-ovulate. Legume stipitate, rather orbicular, hard, 1-celled, 1-seeded, when mature it is divisible into 2 valves according to Swartz.—Unarmed trees, with impari-pinnate leaves, opposite petiolulate stipellate leaflets, and terminal panicles of purple flowers. This genus is nearly allied to *Geoffrôya*, from which it is probably not distinct.

1 *A. RACEMOSA* (Lam. dict. 1. p. 17.) leaflets 13, ovate-oblong, acuminate, glabrous on both surfaces; flowers in paniced racemes; fruit obovate-globose, bluntly mucronate. *h. S.* Native of Cayenne and Brazil. Pison, bras. p. 81. f. 2. Geoffræa racemosa, Poir. dict. 8. p. 182. Lam. ill. t. 604. f. 1. Vouacapoua Americana, Aubl. guian. suppl. p. 10. t. 373. Geoffræa Pisonis, Ræusch.

*Racemose-flowered Andira.* Clt. 1818. Tree 20 to 60 feet.

2 *A. EXCELSA* (H. B. et Kunth, nov. gen. amer. 6. p. 385.) leaflets 13, oblong, ending in a short acumen, obtuse at the base, glabrous; panicle simple; calyx urceolate, clothed with fine tomentum. *h. S.* Native of Mexico. Petiolules exstipulate, hairy. Flowers rose-coloured.

*Tall Andira.* Tree 40 feet.

3 *A. RIPARIA* (H. B. et Kunth, nov. gen. amer. 6. p. 385.) leaflets 13, oblong, acuminate, rounded at the base, quite glabrous, and shining above; panicle simple; calyx turbinate-campanulate, clothed with rusty down. *h. S.* Native of New Granada, on the banks of the river Magdalena near the mouth of the Rio Opon. Petiolules stipellate, glabrous. Flowers red.

*River-side Andira.* Tree 20 to 30 feet.

4 *A. INERMIS* (H. B. et Kunth, nov. gen. amer. 6. p. 385. in a note,) leaflets 13-15, ovate-lanceolate, acute, glabrous on both surfaces; flowers paniced on short pedicels; calyx urceolate, clothed with rusty pubescence. *h. S.* Native of Jamaica, Trinidad, Martinico, Porto-Rico, St. Domingo, and Guiana, in woods and on river banks. Geoffræa inermis, Swartz, fl. ind. occid. 1255. Wright in phil. trans. 1777. p. 512. t. 70. The bark of this tree is of a grey colour externally, but black and furrowed on the inside. The powder looks like jalap. It has a mucilaginous and sweetish taste, and a disagreeable smell. Its medical effects are great. When properly exhibited it operates as a powerful anthelmintic. It is given in the form of powder, decoction, syrup, and extract, but should always be given in small doses. The decoction is preferred, and is made by slowly boiling an ounce of the dried bark in a quart of water until it assumes the colour of Madeira wine. This sweetened is the syrup; evaporated it forms the extract. It commonly produces some sickness and purging, and sometimes violent effects, as vomiting, delirium, and fever, but these are usually the effects of an over dose, and are relieved by warm water, castor oil, or vegetable acid. The tree is called *Cabbage-tree*.

*Unarmed Andira.* Clt. 1773. Tree 20 to 30 feet.

5 *A. RETUSA* (H. B. et Kunth, nov. gen. amer. l. c. in a note,) leaflets 11-13, oval, retuse, and somewhat emarginate, glabrous on both surfaces. *h. S.* Native of Cayenne. Geoffræa retusa, Lam. ill. 602. f. 2. dict. 8. p. 182.

*Var. β, Surinamensis* (D. C. prod. 2. p. 476.) leaflets oblong. *h. S.* Native of Surinam. Geoffræa Surinamensis, Bondt. monogr. p. 13. with a figure.

*Retuse-leafletted Andira.* Tree 20 to 30 feet.

† *A doubtful species.*

6 *A. ? HORSEFIELDII* (Lesch. ann. mus. 16. p. 481. t. 12.) leaflets 2-5, oval, acute, glabrous; flowers disposed in loose racemes; calyx gibbous above at the base; legume olive-formed. *h. S.* Native of Java, on the mountains. Seeds bitter.

3 I

Flowers white. This plant ought to be removed from the present genus.

*Horsfield's Andira.* Shrub.

*Cult.* See *Geoffroya* for culture and propagation.

**CCXL. GEOFFROYA** (in honour of M. E. F. Geoffroy; he was author of a *Materia Medica*, and died in 1731.) Jacq. amer. 207. Lin. gen. no. 878. D. C. prod. 2. p. 476.—*Acourò*, Aubl. guian. 3. p. 10. and 753.—*Drakensteinia*, Neck. elem. no. 1314.

**LIN. SYST.** *Diadelphia*, *Decándria*. Calyx campanulate, half-5-cleft, somewhat bilabiate. Corolla papilionaceous, with the wings and keel about equal in length, but shorter than the vexillum. Stamens diadelphous, 9 joined, and one free. Ovary bi-ovulate. Legume drupaceous, egg-shaped, 1-celled, 1-seeded, marked with a furrow on both sides, 2-valved inside. Seeds thick. Cotyledons fleshy. Embryo straight.—American thorny or unarmed trees, with impari-pinnate leaves, axillary racemes or panicles of flowers, and edible seeds. This genus is closely allied to *Amygdalaceæ*.

1 *G. SPINOSA* (Jacq. amer. 207. t. 180. f. 62.) spines on the trunk and branches few, and subulate; leaflets 13-15, oblong, obtuse, glabrous.  $\frac{1}{2}$ . S. Native of Carthage, in woods by the sea side, and perhaps of Brazil, if the *Umari* of Marcgraff, brasil. p. 121. f. 1. be the same. Flowers of a dirty fulvous colour, diffusing widely a most fetid odour. The drupe is very like an almond, with a tomentose rind of a greenish yellow colour. The pulp is soft, sweet, and yellowish, has a nauseous smell, and stains the hand with rust colour not easily washed out. The nut or stone is white, adheres closely to the pulp, and contains a white kernel that has a farinaceous astringent taste. This plant having papilionaceous flowers, and a drupe for a fruit indicates the close relationship of *Leguminosæ* with *Amygdalaceæ*, the following order.

*Spinose Geoffroya.* Clt. 1818. Tree 12 to 20 feet.

2 *G. SPINULOSA* (Mart. reis. ex Schlecht. Linnæa. 5. p. 45.) trunk unarmed; branches covered with spongy bark; leaflets 7, ovate, obtuse, pubescent, and reticulated beneath; petioles winged, the wing spinulose at the base of the leaflets; racemes forming a spreading panicle.  $\frac{1}{2}$ . S. Native of Brazil.

*Spinulose-leaved Geoffroya.* Tree.

3 *G. SUPERBA* (Humb. et Bonpl. pl. equin. 2. p. 69. t. 100.) unarmed; leaflets 13-17, oblong, obtuse, somewhat emarginate; branches and calyxes pubescent.  $\frac{1}{2}$ . S. Native on the banks of the river Amazon near Tomependa, where it is called *Almendron* or *Almond*. Flowers yellow. Leaves nearly like those of the tamarind-tree (ex Kunth), shining and puberulous above, but glaucous and paler beneath (ex Bonpland), glabrous above, and pubescent beneath (ex D. C.). The fruit is much like that of the last species.

*Superb Geoffroya.* Tree 24 feet.

4 *G. BREDEMEYERI* (H. B. et Kunth, nov. gen. amer. 6. p. 379.) unarmed; leaflets 17-25, oblong, shining above, but with a few scattered hairs, pubescent beneath; adult branches glabrous; calyx clothed with canescent tomentum.  $\frac{1}{2}$ . S. Native of Caraccas, on dry hills and in valleys near New Valencia, and at Cumana. *Robinia striata*, Willd. spec. 3. p. 1132. Flowers yellow. Drupe similar to the two preceding species.

*Bredemeyer's Geoffroya.* Shrub 6 to 8 feet.

5 *G. PUBESCENS* (Rich. in act. soc. hist. nat. par. p. 121.) unarmed; leaflets 11-13, elliptic-obovate, obtuse, and somewhat emarginate, clothed with white pubescence beneath, as well as the calyx.  $\frac{1}{2}$ . S. Native of Cayenne. Flowers pedunculate, purple. Leaflets 2 inches long, and about an inch broad.

*Pubescent Geoffroya.* Tree.

6 *G. VERMIFUGA* (Mart. reis. ex Schlecht. Linnæa. 5. p. 44.)

trunk unarmed; branches covered with spongy bark; leaves with 9-11 roundly elliptic leaflets, which are glabrous above; petioles wingless, furrowed, covered with rusty tomentum, as well as the primary veins of the leaves on the under surface; racemes paniced, pyramidal, clothed with fulvous tomentum, as well as the calyxes.  $\frac{1}{2}$ . S. Native of Brazil.

*Vermifuge Geoffroya.* Tree.

7 *G. VIOLACEA* (Pers. ench. 2. p. 278.) unarmed; leaflets 7, alternate, ovate-oblong, acuminate, and somewhat emarginate, glabrous on both surfaces.  $\frac{1}{2}$ . S. Native of Guiana, on the banks of rivers. *Acourò violacea*, Aubl. guian. 753. t. 301. Flowers violaceous.

*Violaceous-flowered Geoffroya.* Tree 50 feet.

8 *G. ? TOMENTOSA* (Poir. dict. 8. p. 181.) leaflets 11, oval, oblong, obtuse or emarginate, glabrous above, and tomentose beneath, as well as the calyxes, peduncles, and branches.  $\frac{1}{2}$ . S. Native of Senegal. Petals nearly equal, velvety on the outside. Stamens 8? monadelphous, very villous. Legume unknown. This is a very doubtful species of the present genus.

*Tomentose Geoffroya.* Tree.

*Cult.* The species of *Geoffroya* grow freely in sandy loam, or a mixture of loam and peat, and cuttings will strike root if planted in sand, with a hand-glass placed over them in heat.

**CCXLI. BROWNEA** (in honour of Patrick Browne, M.D., author of a history of Jamaica). Jacq. amer. 194. fragin. p. 24. exclusive of *Palovea*. Lin. gen. no. 833. Lam. ill. 575. D. C. prod. 2. p. 476.

**LIN. SYST.** *Monadelphia*, *Deca-Polyándria*. Bracteoles 2, constituting a bifid sheath to the calyx (f. 55. a.). Calyx coloured, 5-cleft (f. 55. b.), with the tube permanent, and the lobes long, usually cohering to each other in various ways. Petals 5 (f. 55. c.), unguiculate (f. 55. e.). Stamens 10-15, monadelphous, with the tube or sheath cleft longitudinally. Ovary furnished with a stipe, which is adnate to the calyx. Style filiform. Legume 1-celled, many-seeded, acinaciform, compressed. Seeds ovate, covered with fungous fibres.—Small American trees, with abruptly-pinnate leaves, when young they are flaccid, and with the leaflets revolute at the edges. Leaf-bud long and stipulaceous. Flowers elegant, of a rose scarlet colour, rising in fascicled heads from the axillary buds.

1 *B. ROSA* (Pers. ench. 2. p. 237.) leaves with 2-3 pairs of oval-oblong acuminate leaflets; stamens twice the length of the corolla; branches and petioles glabrous; flowers in dense heads; leaflets of the involucre roundish, imbricated, and when in a young state are rather velvety.  $\frac{1}{2}$ . S. Native of South America, about Porto-bello, also of Guadaloupe, where it is cultivated. *Hermèsias*, Læfl. itin. 278. *B. rosa de monte*, Ber. act. angl. 1771. p. 171. t. 8, 9. Lam. ill. 575. f. 3. *B. speciosa*, of Reichb. in Sieb. fl. trin. exsic. no. 68. does not differ from the present plant unless in the stamens being less elongated. Flowers scarlet.

*Rose Brownea.* Fl. June, Aug. Clt. 1820. Shrub 8 feet.

2 *B. COCCINEA* (Jacq. amer. 194. t. 121.) leaves with 2-3 pairs of oval-oblong, acuminate leaflets; flowers in fascicles; branches and petioles glabrous.  $\frac{1}{2}$ . S. Native of Venezuela, in hilly and woody places. Lam. ill. t. 575. f. 1. Calyx ferruginous. Corolla scarlet. Stamens 10.

*Scarlet-flowered Brownea.* Fl. July, Aug. Clt. 1793. Sh. 6 to 10 feet.

3 *B. LATIFOLIA* (Jacq. fragm. p. 25. t. 17.) leaves with 1-3 pairs of ovate or obovate cuspidate leaflets; flowers in dense fascicles; involucre tomentose; calyx compressed, with the two inferior lobes joined together into an emarginate lip.  $\frac{1}{2}$ . S. Native of Caraccas and Trinidad. Flowers red. Stamens 11.

*Broad-leaved Brownea.* Clt. 1824. Shrub 6 to 8 feet.

4 *B. RACEMOSA* (Jacq. fragm. p. 25. t. 16.) leaves with 4 pairs of unequal-sided, oblong or oblong-obovate, cuspidately-acuminate leaflets, which are glanduliferous at the base; flowers in racemes; involucre and calyx clothed with fine tomentum; calyx apparently of 3 lobes, one free, and the 4 others joined by pairs. *h. S.* Native of Caraccas, at Guriepe, and of Trinidad. *H. B. et Kunth*, nov. gen. amer. 6. p. 312. Flowers rose-coloured. Stamens 11-12.

*Racemose-flowered Brownea.* Shrub 4 feet.

5 *B. CAPITELLA* (Jacq. fragm. p. 26. t. 18 and 19.) leaves with from 2-7 pairs of oblong cuspidate leaflets; flowers disposed in dense heads; ovary villous. *h. S.* Native of Caraccas, where it is called *Rosa-Macho*. Flowers scarlet.

*Headed-flowered Brownea.* Shrub 6 to 10 feet.

6 *B. LEUCANTHA* (Jacq. fragm. p. 26. t. 20 and 21.) leaves with 6-8 pairs of oblong-lanceolate cuspidate leaflets, outer ones the largest, lower ones small, ovate, cordate; flowers disposed in heads. *h. S.* Native of Caraccas. Flowers white.

*White-flowered Brownea.* Shrub 8 feet.

7 *B. GRANDIFLORA* (Jacq. coll. 3. p. 287. t. 22. f. a. i. fragm. t. 22 and 23.) leaves with usually 12 pairs of oblong-lanceolate glandless leaflets, ending in a long cuspidate acumen; branches and petioles pubescent; flowers in dense capitate spikes. *h. S.* Native of mountain woods at Caraccas, and in woods near Cumana, also of Trinidad. *H. B. et Kunth*, nov. gen. amer. 6. p. 313. Lam. ill. 575. f. 2. Corolla red. Stamens 11.

*Large-headed Brownea.* Clt. 1829. Tree 60 feet.

*Cult.* All the species of *Brownea* are very splendid when in bloom, and are therefore worthy a place in every collection of stove plants. A mixture of loam, peat, and sand is a soil well adapted for them, and care should be taken not to over water the plants in winter, as too great a supply of water at that season is almost sure to destroy them. Cuttings should be taken off from ripened wood, and planted in a pot of sand, and placed under a hand-glass in a moist heat, where they will strike root freely.

CCXLII. DIPTERIX (from *δίς*, *dis*, double, and *πτερυξ*, a wing; in reference to the 2 upper lobes of the calyx, which appear like 2 wings). Schreb. gen. no. 1161. D. C. prod. 2. p. 477.—*Baryosma*, Pers. ench. 2. p. 278.

*LIN. SYST.* *Monadelphica*, *Octo-Decandria*. Calyx turbinate tubular, 3-5-lobed, 2 superior lobes largest and wing-formed, and nearly opposite, the lower ones smaller. Petals 5, disposed into a papilionaceous corolla. Stamens 8-10, monadelphous, with the sheath or tube cleft longitudinally above. Style ascending. Legume ovate, rather compressed, thick, 2-valved, 1-celled, 1-seeded. Seed ovate-oblong, pendulous in the cell, exalbuminous. Embryo straight, with thick cotyledons.—Trees, with abruptly-pinnate coriaceous leaves, and panicles of flowers.

SECT. I. COUMAROUNA (*Coumarou* is the name of the tree in Guiana). Aubl. guian. 2. p. 740. t. 296. *Cumaroua*, Lam. ill. t. 601.—*Baryosma*, Gaertn. fruct. 2. t. 93.—*Heinzia*, Scop. Stamens 8. Lower segment of calyx undivided; perhaps it is simple, or perhaps composed of 3 joined sepals.

1 *D. ODORATA* (Willd. spec. 3. p. 910.) leaves alternate, com-

FIG. 55.

posed of 5-6 alternate leaflets; petiole marginated. *h. S.* Native of Guiana, in woods. *Coumaroua odorata*, Aubl. l. c. *Baryosma Tonga*, Gaertn. l. c. Flowers purple dashed with violet, disposed in racemose panicles. The seeds of this tree are the Tongo or Tonquin-beans, well known as giving a grateful scent to snuff. The Creoles put them into chests in order to drive away insects, as well as for their fragrance.

*Sweet-scented Tonquin-bean.* Clt. 1793. Tree 60 feet.

SECT. II. TARA'LEA (*Tarala* is the name of the tree in Guiana). Aubl. guian. 2. p. 745. t. 298. D. C. prod. 2. p. 478.—*Bolducia*, Neck. elem. no. 1342. Stamens 10; lower segments of the calyx 3 or only one, which is trifid.

2 *D. OPPOSITIFOLIA* (Willd. spec. 3. p. 910.) leaves opposite, bearing 6-8 nearly opposite leaflets; petiole wingless. *h. S.* Native of Guiana, in woods. *Taralea oppositifolia*, Aubl. l. c. *Baryosma oppositifolia*, Pers. ench. 2. p. 278. Flowers in axillary and terminal panicles, when blown their fragrance is very diffusive. Petals violaceous.

*Opposite-leaved Tonquin-bean.* Tree 60 feet.

*Cult.* These trees grow best in a loamy soil, and ripened cuttings will strike root if planted in a pot of sand, with a hand-glass placed over them, in a moist heat.

### Tribe X.

CASSIÆ (plants agreeing with *Cassia* in important characters). D. C. legum. mem. xiii. prod. 2. p. 478.—*Cassia* and *Cercæa*, Bronn. diss. Lobes of calyx imbricate before expansion (f. 57. a.). Petals perigynous, nearly equal (f. 56. b. f. 57. b.), rarely somewhat papilionaceous, always imbricate in aestivation. Stamens distinct (f. 56. c. f. 57. c.), never with the filaments concrete. Legume usually dry, and 2-valved (f. 56. c. f. 58. g.). Cotyledons foliaceous, rarely fleshy. Leaves sometimes bipinnate, sometimes tripinnate, sometimes simply pinnate, but rarely simple. The habit variable. This tribe will need still to be further divided when the characters of the genera are better known. Some of the genera have the sepals joined at the base, or in a long tube, which is stamiferous at the apex.

CCXLIII. MORINGA (*Muringo* is the Malabar name of the first species). Burm. zeyl. 161. Lam. ill. t. 337. Gaert. fruct. 2. p. 314. t. 147. *Alandina*, Neck. elem. no. 1293.

*LIN. SYST.* *Decandria*, *Monogynia*. Calyx of 5 nearly equal, oblong, deciduous sepals, which are a little concrete at the base. Petals 5, nearly equal, oblong, the upper one ascending. Stamens 10, unequal, separate, sometimes 5 of which are sterile. Style filiform, acute. Legume silique-formed, 3-valved. Seeds trigonal, exalbuminous, fixed to the centre of the fruit. Embryo straight, with thick oily cotyledons, which are inclosed within the spermatoderm through germination. Plumule none.—Unarmed trees, with impari-bipinnate or tripinnate leaves. Racemes panicled. Legume constantly composed of 3 carpels, which are closely joined together, but which separate at maturity, leaving only the seminiferous sutures. Perhaps a proper tribe.

1 *M. PTERYGOSPERMA* (Gaertn. fruct. 2. p. 314. t. 147.) legumes triquetrous; seeds trigonal, with the angles expanded into wings; leaves sub-bipinnate. *h. S.* Native of the East Indies and South America, where it has probably been introduced. *Guilandina Moringa*, Lin. spec. 540. *Hyperanthera Moringa*, Vahl. symb. 1. p. 30. *Moringa oleifera*, Lam. l. c. *Anona Moringa*, Lour. coch. p. 279. *Moringa Zeylanica*, Pers. ench. 1. p. 460.—*Rheed. mal. 6. t. 11.*—*Rumph. amb. t. 74. and t. 75.* Flowers pale yellow, the upper petal whitish. The root of this tree when young is scraped, and used by the inhabitants of the places of its natural growth as horse-radish is in Europe, having much the same sharp taste, as have also the seeds.

Horse-radish-tree or *Winged-seeded Moringa*. Clt. 1759. Tree 20 to 30 feet.

2 *M. POLYGONA* (D. C. prod. 2. p. 478.) legumes many-angled; seeds trigonal, with the angles expanded into wings. *h. S.* Native of Bengal and other places in the East Indies. *Anoma Moringa*, Lour. 879. *Hyperanthera decandra*, Willd. 2. p. 535. *Burm. zeyl. t. 75?* Flowers pale yellow. Perhaps only a variety of the preceding species.

*Many-angled-fruited Moringa*. Tree 15 to 20 feet.

3 *M. APTERA* (Gaertn. fruct. 2. p. 315.) legumes triquetrous; seeds trigonal, wingless. *h. S.* Native of the East Indies. *Balanus myrēpsica*, Black. herb. t. 386. *Ben album officinale*. Seeds snow white. Oil of ben is the produce of the seeds of this tree. It is a fixed, inodorous insipid oil, and is prepared in the Levant, in Egypt, Syria, and in Italy by expression. It is used very largely in perfumery, as a basis into which the art of the perfumer is able to infuse the fine fragrant scent of various delicate flowers, which do not of themselves retain a sufficient basis in which to fix their scent. Thus the great proportion of the oily essences of the shops is only perfumed oil of ben.

*Wingless-seeded Moringa* or *Oil of ben-tree*. Tree 15 to 20 ft.

4 *M. ? ARA'BICA* (Pers. ench. 1. p. 460.) legume cylindrical, with 6 keels, articulately thickened; common petiole bearing glands between the pinnæ. *h. S.* Native of Arabia, near Beit-el-fakhl. *Hyperanthera semidecandra*, Forsk. *descript. 67*. Vahl. symb. 1. p. 30. *Gymnocladus Arabica*, Lam. dict. 1. p. 733. *Hyperanthera peregrina*, Spreng. syst. 2. p. 337.

*Arabian Moringa*. Tree 30 to 40 feet.

*Cult.* The species of *Moringa* thrive well in light loamy soil, and cuttings strike root readily in sand, under a hand-glass, in heat.

CCXLIV. GLEDITSCHIA (in honour of Gottlieb Gleditsch, of Leipsic, once a professor at Berlin, and defender of Linnaeus against Siegesbeck; author of *Methodus Fungorum*, 1753; *Systema Plantarum a Stamina situ*, 1764, and many other smaller works). Lin. gen. 1159. Lam. ill. 857. D.C. prod. 2. p. 479.

LIN. SYST. *Polygamia, Diaecia*. Flowers unisexual from abortion, or hermaphrodite. Calyx of 3-4-5 equal sepals, which are connected together at the base into a cupula. Petals equal in number to the sepals, rising from the tube of the calyx, sometimes fewer or abortive, or 2 of them are connected together into a carina. Stamens equal in number to the sepals, or fewer from abortion. Style short. Stigma pubescent above. Legume continuous, divided internally in many cells by disseminents, furnished with more or less pulp, which surrounds the seeds, rarely 1-celled, 1-seeded, or dry. Seeds compressed.—Trees with the supra-axillary branches usually converted into branched spines. Leaves abruptly pinnate and bipinnate on the same tree. Flowers greenish, disposed in spikes.

1 *G. TRIACANTHOS* (Lin. spec. 1509.) spines robust, compressed at the base, but cylindrically conical at the apex, simple, or trifid; leaflets linear-oblong, lucid; legumes compressed, flat, a little twisted, many-seeded, 10 times or more longer than broad. *h. H.* Native of Virginia and Carolina, and other parts of North America. *Duham. arb. 1. t. 105. ed. nov. 4. t. 25.* Michx. fil. arb. 2. p. 164. t. 10. *Hort. ang. t. 21.* Wats. dend. brit. t. 138.—*Pluk. mant. t. 352. f. 2.* Spines supra-axillary. This tree is known in North America by the name of *Honey-locust*, and it is called by gardeners the *Three-thorned Acacia*.

*Var. β, inermis* (D. C. prod. 2. p. 479.) stem unarmed; branches furnished with a few spines. *h. S.* D. C. legum. mem. ii. t. 22. f. 109. *G. laevis*, Hortul. Catesb. carol. 1. t. 43. —*Pluk. alm. t. 123. f. 3.*

*Three-thorned Acacia* or *Honey-locust*. Fl. June, July. Clt. 1700. Tree 30 to 50 feet.

2 *G. BRACHYCARPA* (Pursh, fl. amer. sept. 1. p. 221.) spines thick, short, and ternate; leaflets oblong, obtuse; legumes oblong, short. *h. H.* Native of Virginia and the Alleghany mountains. *G. triacanthos β*, Michx. fil. bor. amer. 2. p. 257. Compare Michx. fil. arb. 3. p. 171. Spines sometimes solitary.

*Short-fruited Gleditschia*. Fl. June, July. Tr. 30 to 50 feet.

3 *G. MONOSPERMA* (Walt. car. 254.) spines slender, few, usually trifid; leaflets ovate-oblong, acute; legumes flat, compressed, roundish, 1-seeded. *h. H.* Native of Carolina, Florida, and Illinois, in humid woods. Michx. fil. arb. 3. p. 169. t. 10. *G. Carolinensis*, Lam. dict. 2. p. 461. *G. triacantha*, Gaertn. fruct. 2. p. 149. Mill. fig. t. 5.

*One-seeded Gleditschia*. Fl. June, July. Clt. 1723. Tree 30 to 40 feet.

4 *G. SINENSIS* (Lam. dict. 2. p. 465.) spines robust, conical, ramal ones simple or branched, cauline ones in fascicles, branched; leaflets ovate-elliptic, obtuse; legumes compressed, elongated. *h. H.* Native of China. D. C. legum. mem. i. t. 1. *G. horrida*, Willd. spec. 4. p. 1098. Spines axillary. A tree beset with strong branched thorns.

*China Gleditschia*. Fl. June, Jul. Clt. 1774. Tr. 30 to 50 ft.

5 *G. MACRACANTHA* (Desf. arb. 2. p. 246.) spines strong; branched, conical, numerous; leaflets lanceolate, rather rigid; legumes elongated, thickened, pulpy inside. *h. H.* Native country unknown. Trunk very spiny; spines of the branches axillary. Leaflets nearly 2 inches long, crenately toothed. The pulp in the fruit is more austere than in any other species.

*Long-spined Gleditschia*. Fl. Ju. Jul. Clt. ? Tr. 40 to 50 ft.

6 *G. FEROX* (Desf. arb. 2. p. 247.) spines robust, much compressed, trifid; leaflets lanceolate, acute. *h. H.* Native country unknown. *G. orientalis*, Bosc. Spines of the branches supra-axillary, large, compressed almost their whole length, furnished with short, lateral, opposite branchlets. The trunk of the tree is thickly beset with strong, branching thorns.

*Fierce Gleditschia*. Fl. Ju. Jul. Clt. ? Tree 30 to 50 feet.

7 *G. CASPICA* (Desf. arb. 2. p. 247.) spines slender, trifid, compressed; leaflets elliptic-lanceolate, obtuse. *h. S.* Native of Persia, at the Caspian sea, and at Lenkeran. Flowers and fruit unknown. Spines of the branches supra-axillary, decurrent along the bark at the base on all sides. Leaves usually bipinnate. Flowers and fruit unknown.

*Caspian Gleditschia*. Clt. 1822. Tree 30 to 40 feet.

8 *G. INDICA* (Pers. ench. 2. p. 623.) spines slender, conically-subulate, simple, or branched; leaflets elliptic-oblong, acutish. *h. G.* Native of Bengal. Spines axillary.

*Indian Gleditschia*. Clt. 1812. Tree.

† The following names occur in the gardens, but they are in all probability synonyme. of some of those above.

1 *G. micracantha*, Lodd. cat. 2 *G. latifolia*, Lodd. cat.

*Cult.* The trees are remarkable in producing large strong branching thorns on the main stems. They will grow in any kind of soil, and are generally raised from seeds, which are usually procured from the native countries of the trees. The seeds may be sown one inch deep in a bed prepared for the purpose, and if the spring prove dry they will not vegetate until the second year. The first year from seed the plants should be sheltered from frost.

CCXLV. GYMNOCLADUS (from *γυμνος*, *gymnos*, naked, and *κλαδος*, *klados*, a branch; appearance of branches). Lam. dict. 1. p. 733. ill. t. 823. D. C. prod. 2. p. 479.

LIN. SYST. *Diaecia, Decandria*. Flowers dioecious from abortion. Calyx tubular, 5-cleft. Petals 5, equal, oblong, ex-

serted from the tube. Stamens 10, inclosed. Legume oblong, thick, filled with pulp inside.—An unarmed tree, with obtuse branches, bipinnate leaves, with 4-7 pairs of pinnae, the lower pinna bearing 1 leaflet, the rest bearing 6-8 pairs of leaflets. Flowers white, disposed in racemes.

1 *G. CANADENSIS* (Lam. l. c. Michx. fl. bor. amer. 2. p. 241. t. 51.).  $\frac{1}{2}$ . H. Native of Canada, in woods, State of New York, Tennessee, Ohio, and Kentucky. Reich. mag. t. 40. *Guilandina dioica*, Lin. spec. 546. *Hyperanthra dioica*, Vahl. symb. 1. p. 31. Duham. arb. 1. t. 103. Bark of branches of a bluish ash-colour. Petals white.

*Canadian Gymnocladus*. Clt. 1748. Tree 30 to 40 feet.

*Cult.* A fine deciduous tree, with large, bipinnate leaves. It will grow in any common soil, and is increased by slips from the roots, which should be planted in spring, with their ends upwards.

CCXLVI. ANOMA (*ανομος*, *anomos*, without law, irregular; the corolla as well as the legume are irregular). Lour. coch. p. 279. Juss. in ann. mus. 9. p. 327. D. C. prod. 2. p. 480.

LIN. SYST. *Decandria*, *Monogynia*. Calyx of 5, nearly equal sepals, which are concrete at the base. Petals 5, oblong, nearly equal. Stamens 10, ascending, the 5 alternate ones sterile. Legume oblong, thick, 1-celled, 2-valved, many-seeded.—A small tree, with opposite, bipinnate leaves, according to Loureiro, but perhaps they are alternate and tripinnate, somewhat ovate, tomentose leaflets, and panicles of white flowers.

1 *A. COCHINCHINENSIS* (Lour. l. c.).  $\frac{1}{2}$ . G. Native of Cochinchina, in woods. *Hyperanthra Cochinchinensis*, Willd. spec. 2. p. 537. *Hypelate Cochinchinensis*, Smith, in Rees' cycl. vol. 19.

*Cochin-china Anoma*. Tree.

*Cult.* See *Cesalpinia* for culture and propagation, p. 432.

CCXLVII. GUILANDINA (in honour of Melchior Guilandinus, or Wieland, of Prussia, a great traveller, he succeeded Anquillara at Padua in 1561, and Tallopius in 1564; he died in 1589. His publications are, *De Stirpibus*, 1558, and *De Papyro*, in 1572). Lin. gen. no. 517. Juss. gen. 350. Gærtn. fruct. 2. t. 148. Lam. ill. t. 336. D. C. prod. 2. p. 480.—*Bonduc*, Plum. gen. 25. *Guilandina* species of Lin.

LIN. SYST. *Decandria*, *Monogynia*. Calyx of 5 nearly equal sepals, joined together into a short tube at the base. Petals 5, sessile, nearly equal. Stamens 10, with the filaments villous at the base. Style short. Legume ovate, compressed, rather ventricose, echinated with prickles on the outside, 2-valved, 1-2-seeded. Seeds bony, shining, nearly globose, exalbuminous.—Trees and shrubs, furnished with hooked prickles both on the stems and petioles. Leaves abruptly bipinnate. Flowers yellow, disposed in racemose spikes. Bractees elongated.

1 *G. BONDUCE* (Lin. spec. 545.) leaves pubescent, velvety; leaflets ovate; prickles solitary; seeds yellow.  $\frac{1}{2}$ . S. Native of the East Indies, Africa, Arabia, and South America, on the sea-shore. Rumph. amb. 5. t. 48. *G. Bonduc*, var.  $\alpha$ , majus, D. C. prod. 2. p. 480. Flowers yellow. Seeds large, yellowish. Leaves with 7 pairs of pinnae each, bearing as many pairs of leaflets. *Bondug*, a necklace in Arabic; use of seeds.

*Bonduc* or Nicker-tree. Clt. 1610. Shrub 6 to 10 feet.

2 *G. BONDUCELLA* (Lin. spec. 545.) leaves pubescent; leaflets ovate-oblong; prickles twin; seeds grey.  $\frac{1}{2}$ . S. Native of the East Indies, Africa, and South America. Schrank, hort. mon. t. 68. *Glycyrrhiza aculeata*, Forsk. desc. 135.—Rumph. amb. t. 49. f. 1. This plant differs from the last in having much smaller leaves set close together, and below each pair of leaflets are two short, stiff, crooked spines, which are opposite, not solitary, as in the last species. The seeds of this plant are

usually used by boys instead of marbles, they being about the same size and shape. In Egypt the seeds of both this and the preceding are used by women, strung in necklaces, and hung about their children by way of amulet, to guard them from sorcery. They are often thrown on shore on the coast of Scotland and Ireland, and are called by the inhabitants of the former Molucca beans. The bark and seeds are bitter and tonic.

*Small Bonduc* or Nicker-tree. Clt. 1700. Sh. 6 to 8 feet.

3 *G. CILIATA* (Berg. herb. Wicks. obs. fl. St. Barth. p. 411.) branches clothed with rusty tomentum; leaves pubescent, with 3-6 pairs of pinnae; leaflets nearly orbicular, oblique at the base, emarginate at the apex, pilose beneath at the base on the middle nerve.  $\frac{1}{2}$ . S. Native of the island of St. Bartholomew. Flowers in terminal, spicate racemes. Peduncles and pedicels clothed with rusty tomentum.

*Ciliated Nicker-tree*. Shrub.

4 *G. MICROPHYLLA* (D. C. cat. hort. monsp. 114.) leaves smooth, with 3-4 pairs of opposite pinnae, each pinna bearing 6-8 pairs of oval obtuse leaflets.  $\frac{1}{2}$ . S. Native country, flowers, and fruit unknown. Perhaps this species is referrible to the figure in Rumph. amb. 5. t. 49. f. 2.

*Small-leaved Nicker-tree*. Shrub.

5 *G. GLABRA* (Mill. dict. no. 3.) leaves glabrous, with 4 pairs of alternate pinnae, pinna bearing oval, acute, opposite leaflets.  $\frac{1}{2}$ . S. Native about Campeachy.

*Glabrous Nicker-tree*. Tree.

6 *G. GEMINA* (Lour. coch. 265.) leaves glabrous, simply pinnate; legumes 2 from the same flower.  $\frac{1}{2}$ . S. Native of Cochinchina, in woods. Leaves abruptly pinnate. Flowers yellow, disposed in terminal, branched racemes.

*Twin-fruited Nicker-tree*. Shrub 6 to 10 feet.

*Cult.* See *Cesalpinia*, p. 432. for culture and propagation. The species require a considerable degree of heat to make them thrive.

CCXLVIII. COULTERIA (in honour of Thomas Coulter, M. D. author of a monograph on the natural order *Dipsacæ*). H. B. et Kunth, nov. gen. amer. 6. p. 328. D. C. prod. 2. p. 480.—*Adenocalyx*, Bertero, ined.—Tara, Mol. chil. ed. 2. gall. p. 283. Schult. syst. 978.

LIN. SYST. *Decandria*, *Monogynia*. Calyx turbinate at the base, 5-cleft, the 4 upper lobes nearly equal, the lower one is larger and pectinately toothed, with glands. Petals 5, the upper one the largest. Stamens 10, with the filaments free and somewhat bearded at the base, and with a nectariferous gland on the upper side of the ovary. Style short. Stigma glandularly ciliated. Legume compressed, flat, spongy, hardly deliscent but usually divided transversely into cells inside, 4-6-seeded. Embryo straight.—Shrubs or trees, native of South America, with spines in the axils of the leaves. Leaves abruptly bipinnate. Flowers yellow, disposed in racemes. Pedicels articulated, under the flower.

1 *C. MOLLIS* (H. B. et Kunth, nov. gen. amer. 6. p. 328. in a note.) leaves, calyxes, and fruit clothed with velvety pubescence; leaflets oval-oblong, retuse; petioles unarmed; legumes stipitate, obtuse.  $\frac{1}{2}$ . S. Native of St. Martha. *Adenocalyx remotus*, Bert. ined. *Cesalpinia mollis*, Spreng. syst. append. 169.

*Soft Coulteria*. Shrub 6 to 7 feet.

2 *C. HORRIDA* (H. B. et Kunth, nov. gen. amer. 6. p. 330. t. 568.) leaflets glabrous, oblong; petioles prickly; calyxes hairy; legumes glabrous, sessile, obliquely oblong.  $\frac{1}{2}$ . S. Native of the province of Popayan, near Cartagena.

*Horrid Coulteria*. Clt. 1824. Shrub 6 to 8 feet.

3 *C. TINCTORIA* (H. B. et Kunth, nov. gen. amer. 6. p. 330. t. 569.) leaflets glabrous, oval, emarginate; petioles armed, sometimes somewhat puberulous; calyxes smoothish; legumes gla-

brous, curved, obtuse. *h. S.* Native of the province of Popayan, near Carthagena. *Cæsalpīnia pectināta*, Cav. præl. D. C. cat. hort. monsp. 84. Turp. dict. sc. nat. icon. *Cæsalpīnia tinctōria*, Domb. ined. *Cæsalpīnia Tárra*, Ruiz, et Pav. fl. per. 4. t. 376. Flowers orange-coloured. Legume 5-6-seeded. Leaves with 3 pairs of pinnæ, each pinna bearing 6 pairs of leaflets. The wood is used in dyeing.

*Dyers' Tara.* Clt. 1822. Shrub 6 to 10 feet.

4 *C. MEXICANA* (D. C. prod. 2. p. 481.) leaves, calyces, and legumes glabrous; leaflets obovate, emarginate; legumes rather torose at the seeds, acuminate at both ends. *h. S.* Native of New Spain. *Cæsalpīnia vesicaria*, Sesse et Moc. fl. mex. icon. ined. Flowers yellow, but with the superior petal reddish. Stamens approximate. Leaves with 4 pairs of pinnæ.

*Mexican Tara.* Shrub.

5 *C. CHILENSIS* (D. C. prod. 2. p. 481.) flowers pentandrous. *h. G.* Native of Chili. *Tara tinctōria*, Mol. chil. l. c. ex Schult. syst. 5. p. 407. The leaves are said to be opposite.

*Chili Tara.* Shrub.

*Cult.* See *Cæsalpīnia* for culture and propagation, p. 432.

CCXLIX. CÆSALPINIA (in honour of Andreas Cæsalius, chief physician to Pope Clement VIII., the father of systematic arrangement in plants; in his work entitled *De Planti Libri sedecem*, Florence 4to. 1583. He died in 1602, at Rome). Plum. gen. 28. t. 9. Lin. gen. no. 516. Lam. ill. t. 335. Gärtn. fruct. 2. p. 144. D. C. legum. mem. xiii. prod. 2. p. 481.

LIN. SYST. *Decandria, Monogynia*. Calyx cup-shaped at the base, 5-lobed; lobes unequal, the lower one largest and a little arched. Petals 5, unequal, unguiculate, the upper one shorter than the rest. Stamens 10, with the filaments villous at the base and ascending; anthers all fertile. Style filiform. Legume unarmed, compressed, 2-valved. Seeds oval-oblong, compressed. Embryo with an elongated plumule.—Prickly or unarmed trees or shrubs, with abruptly bipinnate leaves, and simple or branched racemes of yellow flowers, with the pedicels bractless at the base.

SECT. I. NUGARIA (*Nuga* is the Molucca name of the first species). D. C. legum. mem. xiii. Legume 1-2-seeded. Seeds very thick, transversely oblong. Calyx glabrous. Perhaps a proper genus, allied to *Moringa* or *Guilandina*.

1 *C. NUGA* (Ait. hort. kew. 3. p. 32.) primary petiole prickly beneath; leaves with 3-4 pairs of pinnæ, each pinna bearing 2-3 pairs of ovate, acute leaflets; flowers in racemose panicles. *h. S.* Native of the Moluccas. Rumph. amb. 5. t. 50. *Guilandina Nuga*, Lin. spec. 546. Legume flat, short, ending in an incurved mucrone. *Guilandina Nuga* of Burm. ind. 99. is very different from this plant in the simply pinnate leaves. Roots diuretic.

*Nuga* Brasiletto. Clt. 1801. Tree.

2 *C. PANICULATA* (Desf. cat. ed. 2. p. 210.) petioles and branches prickly; leaves with 2-4 pairs of pinnæ; leaflets oval; flowers paniced; pedicels longer than the flowers. *h. S.* Native of Malabar, in humid places. *Guilandina paniculata*, Lam. dict. 1. p. 435. Legume oval, acute at both ends.—Rheed. mal. 6. t. 19.

*Paniced-flowered* Brasiletto. Clt. 1817. Tree.

3 *C. AXILLARIS* (D. C. prod. 2. p. 481.) petioles and branches prickly; leaves simply pinnate; leaflets ovate, acute; flowers axillary, usually solitary. *h. S.* Native of Malabar, in woods. *Guilandina axillaris*, Lam. dict. 1. p. 435.—Rheed. mal. 6. t. 20. Legume like those of the first species.

*Axillary-flowered* Cæsalpīnia. Tree.

SECT. II. BRASILETTIA (*Brasiletto* is the name of *C. Brasi-*

*liensis* in the Antilles). D. C. legum. mem. xiii. Legume oblong, acuminate at both ends, indehiscent, samaroid, 1-seeded. Seeds flat, transversely oblong. Calyx clothed with rufous down. Perhaps a proper genus.

4 *C. scandens* (Roth, nov. spec. 209.) petioles and branches prickly; leaves with 3 pairs of pinnæ, each pinna bearing 4 pairs of ovate, acuminate leaflets, which are tomentose beneath; flowers disposed in loose panicles. *h. S.* Native of the East Indies. Legume roundish, oval, glabrous, 2 inches long and  $1\frac{1}{2}$  inch broad. Flowers and seeds unknown.

*Climbing* Brasiletto. Clt. 1800. Shrub cl.

5 *C. BRASILIENSIS* (Lin. spec. 544. exclusive of Catesby's synonyme) unarmed; leaves with 7-9 pairs of pinnæ, each pinna bearing about 15 or 16 pairs of oval-oblong, obtuse, glabrous leaflets; rachis and calyces pubescent; racemes rather paniced; pedicels rather shorter than the corollas, flowers and stamens. *h. S.* Native of Jamaica, St. Domingo, and perhaps of Brazil, according to the name. This is the tree which affords the *Brasiletto* or *Brazil-wood* of commerce, much used in dyeing. It is an excellent timber wood, but seldom exceeds 8 or 10 inches in diameter. It is elastic, tough, and durable, and bearing a fine polish; it is of a beautiful orange and red colour, full of resin, and yields a fine tincture by infusion.

*Common Brasiletto.* Clt. 1739. Tree 20 feet.

6 *C. FERREA* (Martius, mss. in herb. Lamb.) unarmed, pubescent in every part; leaves with 3 pairs of pinnæ, each pinna bearing 4-6 pairs of elliptic, oblique leaflets; racemes paniced; legume oblong-ovate, mucronate, pedicellate. *h. S.* Native of Brazil, in the province of Bahia, where it is called *Pao-ferro* or *Iron-tree*.

*Iron* Brasiletto. Tree.

SECT. III. SAPPANIA (*Sappan* is the Malabar name of the tree). D. C. legum. mem. xiii. prod. 2. p. 482. Campêcia, Adans. fam. 2. p. 318. Legume compressed, many-seeded, 1-celled, with dry valves. Seeds oblong. Upper petal short.

7 *C. SAPATAN* (Lin. spec. 544.) leaves with 10-12 pairs of pinnæ, each pinna bearing 10-12 pairs of unequal-sided, obliquely oval-oblong leaflets, which are emarginate at the apex; flowers paniced; calyces glabrous. *h. S.* Native of the East Indies. Roxb. cor. 1. t. 16.—Rheed. mal. 6. t. 2. Legume compressed, woody, glabrous, obliquely truncate at the apex. Flowers yellow. Ovary pubescent, ending in the short style. The uses of the wood of this tree in dyeing are numerous throughout Asia; it is an ingredient in the red dye on the coast of Coromandel, commonly called the chay dye. Where a cheap red is required for cotton cloth, the wood is employed by the Telinga dyers, but they cannot make it stand. The process of the Telinga dyers is as follows:—The cotton cloth is well washed, to remove any remains of the quick-lime, &c. used in bleaching; an infusion of half a pound of the powdered caducay in a pint and a half of cold water strained is employed to prepare the cloth, which is done by wetting it twice in the same infusion, drying it between and after. The following day it is twice wetted in a strong solution of alum, and as often dried in the sun. Next day a decoction of the Sappan-wood is prepared as follows: take 1 pound of Sappan-wood in powder, water 12 quarts, boil it till a third is consumed, divide the remaining 8 quarts into 3 parts, one of 4 and the other two of 2 quarts each; into the 4 quarts put the cloth, wet it well, wring it gently, and half dry it, it is again wetted in one of the small portions, and when half dry wetted for the third and last time in the other remaining portion of the decoction; dry in the shade, which finishes the process. The wood therefore seems to be possessed of nearly the same qualities as the Brasiletto or Brazil-wood.

*Sappan* Brasiletto. Clt. 1773. Tree 40 feet.

8 *C. DIGYNA* (Rottl. ex Willd. nov. act. nat. cur. 1803. vol. 4. p. 198. t. 3.) prickly; leaves with 8-10 pairs of pinnæ, each pinna bearing 10-12 pairs of oblong-linear, obtuse leaflets; racemes simple; flowers usually digynous. *h. S.* Native of the East Indies. Ovary hairy. Stamens not exceeding the petals. Legumes 1-2, glabrous, ovate, oblong, ending in an incurved mucrone. Pedicels of flowers very long. Flowers yellow.

*Digynous-flowered Brasiletto.* Tree.

9 *C. MIMOSOIDES* (Lam. dict. 1. p. 462. ill. t. 335. f. 2.) prickly; leaves with 6-12 pairs of pinnæ, each pinna bearing 8-12 pairs of oval-oblong, obtuse leaflets; racemes hispid; calyxes glabrous. *h. S.* Native of Malabar.—Rheed. mal. 6. t. 8. Leaves sensible to the touch. Flowers yellow. Legume oval-oblong, few-seeded, woolly.

*Mimosa-like Brasiletto.* Clt. 1806. Shrub 6 to 8 feet.

10 *C. CUCULLATA* (Roxb. hort. beng. p. 32.) prickly; prickles hooked; leaves with 4-5 pairs of pinnæ, each pinna bearing 4-5 pairs of elliptic, acuminate, glabrous leaflets; racemes forming terminal panicles; flowers crowded; upper segment of the calyx long, cucullate, and arched. *h. S.* Native of the East Indies. Flowers yellow. Legume unknown.

*Cucullate-sepalled Brasiletto.* Shrub cl.

11 *C. TORTUOSA* (Roxb. hort. beng. p. 32.) prickly; prickles hooked; young branches and rachis clothed with rusty down; leaves with about 15 pairs of pinnæ, each pinna bearing 18-20 pairs of sessile, linear, oblong, retuse leaflets, which are glaucous beneath; flowers racemose; stamens length of petals. *h. S.* Native of Sumatra. Flowers yellow.

*Twisted Brasiletto.* Clt. 1820. Shrub cl.

12 *C. MICROPHYLLA* (Martius, mss. in herb. Lamb.) unarmed; leaves with 8-10 pairs of pinnæ, each pinna bearing 8-10 pairs of small, oblong-roundish leaflets, which are pubescent and pale beneath, but shining above; rachis of leaves beset with pedicellate glands and pubescence; racemes terminal, simple; legume straight, acuminate, 3-4-seeded. *h. S.* Native of Brazil, in the desert of Bahia. Flowers yellow.

*Small-leafletted Brasiletto.* Shrub.

13 *C. DESERTO'RUM* (Martius, mss. in herb. Lamb.) unarmed; leaves usually with 1-2 pairs of pinnæ, each pinna bearing usually 7 broad, alternate, ovate-elliptic, glabrous leaflets, which are sessile and oblique at the base; racemes crowded with flowers, terminal, aggregate. *h. S.* Native of Brazil, in the desert of Bahia. Flowers yellow. Legumes unknown.

*Desert Brasiletto.* Tree.

14 *C. BIJUGA* (Swartz, obs. 166.) prickly, but glabrous in every part; leaves with 2 pairs of pinnæ, each pinna bearing 2 pairs of obcordate leaflets; flowers panicked, on short pedicels. *h. S.* Native of Jamaica. *Ponciàna bijuga* and *Cæsalpìnia vesicària*, Lin. spec. 545.—Sloan. hist. 2. t. 181. f. 2, 3. Flowers yellow. Stamens equal in length to the corolla. Legume oval-oblong, few-seeded, black, furrowed. All parts of the tree have a strong balsamic scent when bruised. The leaflets are broad.

*Two-paired-leaved Brasiletto.* Clt. 1770. Tree 15 to 20 ft.

15 *C. BAHAMENSIS* (Lam. dict. 1. p. 461.) prickly, but glabrous in every part; leaves with 3 pairs of pinnæ, each pinna bearing 3 pairs of obovate, emarginate leaflets; flowers panicked. *h. S.* Native of the Bahama islands. Catesb. car. 2. t. 51. Flowers whitish. Legume somewhat stipitate, linear, acute. The value of this wood for dyeing has occasioned a scarcity of it in the Bahama islands.

*Bahama Brasiletto.* Tree.

16 *C. CRISTA* (Lin. spec. 544.) prickly, but glabrous in every part; leaves with 1-3 pairs of pinnæ; leaflets obovate, nearly obcordate; racemes simple; pedicels thrice the length of the flowers; petals shorter than the calyx. *h. S.* Native of Ja-

maica. Plum. gen. 28. t. 9. Flowers yellow. Legume linear, somewhat stipitate, acute, glabrous, 7-8-seeded. Leaflets broad. Great quantities of the wood are sent yearly from the West Indies to England for dyeing, under the name of *Brazil-wood*.

*Crested Brasiletto.* Clt? Tree 15 to 20 feet.

17 *C. GLANDULOSA* (Bert. in herb. Balb. D. C. prod. 2. p. 482.) prickly; leaves with 3 pairs of pinnæ, each pinna bearing 5 pairs of oval, glabrous leaflets, with glandular margins; racemes simple, and are as well as the calyxes pubescent. *h. S.* Native of St. Domingo. Legume sessile, flat, oblong-linear, apiculated by the style, beset with pubescence, and a few brown glands, which are only seen under a lens. C. Bertèrii, Spreng. in herb. Balb.

*Glandular Brasiletto.* Tree.

18 *C. GLABRATA* (H. B. et Kunth, nov. gen. amer. 6. p. 326.) unarmed, quite glabrous; leaves with 3-4 pairs of pinnæ, each pinna bearing 4-5 pairs of oblong-elliptic leaflets, which are rounded at both ends and coriaceous; racemes numerous, crowded at the tops of the branches; stamens hardly exceeding the corolla in length; legumes oblong, rather torulose. *h. S.* Native of Peru, between Caxamarca and Magdalena. Flowers yellow.

*Glabrous Brasiletto.* Tree.

19 *C. CACALACO* (Humb. et Bonpl. pl. equin. 2. t. 137.) prickly, glabrous; leaves with 4-5 pairs of pinnæ, each pinna bearing 3-4 pairs of obovate-roundish, emarginate, membranous, shining leaflets; racemes terminal, simple; rachis and pedicels rather hairy; stamens hardly exceeding the corolla; legumes torulose. *h. S.* Native of Mexico, between Chilpancingo and Zumpango. H. B. et Kunth, nov. gen. amer. 6. p. 328. *Cacalaco* is the vernacular name of the tree.

*Cacalaco Brasiletto.* Clt. 1824. Tree 10 to 20 feet.

20 *C. PAPAI* (Ruiz, et Pav. fl. per. 4. t. 375.) unarmed; leaves impari-bipinnate, with 5-7 pairs of pinnæ, each pinna bearing 6-7 pairs of small, obtuse leaflets; racemes lateral; filaments filiform, hairy; legumes straight, mucronate. *h. S.* Native of Peru. Flowers small.

*Papai Brasiletto.* Shrub.

21 *C. PRÆCOX* (Ruiz, et Pav. fl. per. 4. t. 376.) leaves abruptly bipinnate; petiole ending in a spine; pinnæ 3 pairs, each pinna bearing 5-7 pairs of small, emarginate leaflets; stipular spines strong, conical; legumes straight. *h. S.* Native of Peru.

*Early Brasiletto.* Tree.

22 *C. EXOSTEMMA* (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 483.) unarmed, glabrous; leaves with 3-4 pairs of pinnæ, each pinna bearing 3-4 pairs of ovate, obtuse leaflets; racemes terminal, simple; stamens twice the length of the corolla. *h. S.* Native of Mexico. Corolla yellow. Calyx and stamens reddish. This species comes very near *C. Cacalaco*.

*Exserted-crowned Brasiletto.* Tree 20 feet.

23 *C. PULCHERRIMA*; unarmed; petioles, calyx, and rachis of flowers clothed with rusty down; leaves with numerous pairs of pinnæ and leaflets; leaflets elliptic-lanceolate, oblique at the base and mucronate at the apex, pubescent beneath, with revolute edges; calyx rusty; racemes forming a terminal panicle. *h. S.* Native of Brazil, in the province of Bahia, Martius. (v. s. in herb. Lamb.)

*Very-fair Brasiletto.* Tree.

24 *C. SELLOI*; unarmed; young branches and rachis of leaves beset with glandular bristles; panicle, calyx, and under side of leaves rusty; leaves with numerous pairs of pinnæ and leaflets; leaflets lanceolate, mucronate, shining above; racemes forming a terminal panicle. *h. S.* Native of Brazil. Sello. Flowers yellow. (v. s. in herb. Lamb.)

*Sello's Brasiletto.* Tree.

SECT. IV. LIBIDI'RIA (*Libidibi* is the name of the legume at Curaçoa). Legume oblong, spongy, incurved laterally, concrete between the seeds inside, and somewhat many-celled.

25 *C. CORIÀRIA* (Willd. spec. 2. p. 532.) unarmed, glabrous; leaves with 6-7 pairs of pinnæ, each pinna bearing 15-20 pairs of linear, obtuse leaflets; racemes panicle; pedicels shorter than the flowers. *h. S.* Native of Curaçoa, Carthagenæ, St. Domingo, in salt marshes by the sea-side. *Ponciàna coriària*, Jacq. amer. 123. t. 175. f. 36. *C. coriària*, Kunth, mim. t. 45. *C. Thomæa*, Spreng. in herb. Balb. The legumes are called *Libidibi*, and are used in tanning leather when ripe by the Spaniards and natives. The flowers are small and yellow.

*Hide Brasiletto.* Tree 15 to 20 feet.

26 *C. DU'BIA* (Spreng. syst. 2. p. 343.) leaves with 12 pairs of pinnæ, each pinna bearing 2-4 pairs of oblong, oblique, mucronate leaflets, which are discoloured beneath; racemes panicle, and are as well as the calyxes clothed with rusty down; legume 1-seeded, *h. S.* Native of Brazil. Sello.

*Doubtful Brasiletto.* Tree.

† *Species not sufficiently known.*

27 *C. LEBBEKOIDES* (D. C. prod. 2. p. 483.) nearly unarmed, glabrous; leaves abruptly bipinnate, with 3-4 pairs of pinnæ, each pinna bearing 6-7 pairs of ovate, obtuse, unequal leaflets; legumes compressed, flat, elongated, linear, membranous. *h. G.* Native of China. Protuberances under the leaves almost spinose. Legume almost like that of *Acacia Lebbeke*. Umbilical funicle straight. Flowers unknown.

*Lebbeke-like Brasiletto.* Tree.

28 *C. ? PUNCTATA* (Willd. enum. 445.) unarmed; leaves impari-bipinnate; pinnæ impari-pinnate; leaflets elliptic, obtuse, mucronate, dotted. *h. S.* Native of Brazil. *Ponciàna punctata*, Poir. suppl. 4. p. 449. The dots on the leaves vanish on drying. Perhaps a species of *Moringa*.

*Dotted-leaved Brasiletto.* Clt. 1820. Shrub 6 feet.

29 *C. ? ECHINATA* (Lam. dict. 1. p. 461.) prickly; leaves bipinnate; leaflets ovate, obtuse; legumes echinated. *h. S.* Native of Brazil, where the wood is used for dyeing. *Guilandina echinata*, Spreng. syst. 2. p. 327. Perhaps a true species of *Guilandina*. Flowers yellow. This species is said to produce the best Brazil-wood or *Brasiletto*.

*Echinated-podded Brasiletto.* Tree.

30 *C. ? CASSIOIDES* (Willd. enum. 444.) stipulas spinose; leaves with 2-3 pairs of pinnæ, each pinna bearing 6-7 pairs of oblong, retuse leaflets; petioles rather pilose. *h. S.* Native of South America. *Ponciàna cassioides*, Poir. suppl. 4. p. 448. Flowers and legumes unknown.

*Cassia-like Brasiletto.* Clt. 1821. Shrub.

31 *C. ? MUCRONATA* (Willd. enum. 444.) prickly; leaves bipinnate, with 3 pairs of pinnæ, each pinna bearing 7 pairs of oblong, obtuse, mucronate, glabrous leaflets. *h. S.* Native of Brazil. *Ponciàna mucronata*, Poir. l. c. Flowers and legumes unknown.

*Mucronate-leafletted Brasiletto.* Shrub.

32 *C. ? PLEUVIOSA* (D. C. prod. 2. p. 483.) unarmed; leaves impari-bipinnate, with 6-8 pairs of pinnæ, which are abruptly pinnate, bearing 10-12 pairs of unequal, rhomboid-ovate, glabrous leaflets; gland axillary, ovate; racemes terminal; pedicels and calyxes clothed with rufous velvety down. *h. S.* Native of Brazil. *Cuba'na pluviosa*, Leandr. sacr. ined. According to the testimony of Leandre, water flows from the young branches, and falls from them in drops like rain. The superior segment of the calyx is longer than the rest. The vexillum is shorter than the other petals. Stamens with the filaments villous at the base. Legume 1-celled, few-seeded. All ex Leandr.

*Rainy Brasiletto.* Tree 40 to 60 feet.

33 *C. PROCE'RA* (Poppig. ex Spreng. syst. 2. p. 343.) leaves simply pinnate, with many pairs of oblong-linear, obtuse, glabrous leaflets; racemes few-flowered; stamens about equal in length to the corolla. *h. S.* Native of Cuba. Flowers yellow. *Tall Brasiletto.* Clt. 1824. Tree.

† *Species only known by name from Roxburgh's Hortus Bengalensis*, p. 32. and p. 90.

1 *C. enncaphylla*, Roxb. 2 *C. oleosperma*, Roxb. 3 *C. Chinensis*, Roxb. 4 *C. lacerans*, Roxb. 5 *C. resupinata*, Roxb. 6 *C. paniculata*, Roxb. 7 *C. Sumatrana*, Roxb. 8 *C. polyphylla*, Roxb.

*Cult. Cæsalpinia* is a genus of fine flowering trees and shrubs, but in our collections they are never allowed to grow to a size large enough for flowering, in consequence of their being prickly, and are not admired on that account. A mixture of loam and peat suits them best. Cuttings are difficult to root, but sometimes will succeed if taken off from the mother plant in a growing state and planted in sand, with a hand-glass placed over them in a moist heat.

CCL. POINCIANA (in honour of M. de Poinci, once governor of the Antilles, and a patron of botany). Lin. gen. 515. Lam. ill. t. 333. Gært. fruct. 2. t. 150. D. C. prod. 2. p. 483. —Poincia, Neck. elem. 1282.

Lin. syst. *Decandria, Monogynia*. Calyx cup-shaped at the base, permanent, 5-cleft, lower segment arched. Petals 5, stipitate, upper one diffringed. Stamens 10, very long, all fertile, with the filaments hairy at the base. Style very long. Legume flat, compressed, 2-valved, somewhat many-celled from the seeds being separated by a kind of cellular spongy substance. Seeds obovate, compressed, with the endopleura gelatinous when placed in water. Embryo with flat cotyledons, and an oval plumule. — Very elegant prickly or unarmed shrubs and trees, with abruptly-bipinnate leaves, and corymbose panicles of shewy flowers, on long bractless pedicels.

1 *P. PULCHERRIMA* (Lin. spec. 554.) prickly; leaflets obovate; calyx glabrous; petals on long stipes, fringed. *h. S.* Native of the East Indies and tropical Africa, from whence it has migrated to South America and the West India Islands. Reich. gart. mag. t. 93. D. C. legum. mem. xi. t. 23. f. 111. Sims, bot. mag. 995. —Merian. sur. t. 45. —Rheed. mal. 6. t. 1. —Rumph. amb. 4. t. 20. *Cæsalpinia pulcherrima*, Swartz, obs. 166. To this species the *P. pulcherrima*, *P. alata*, and *P. trijuga* of Burm. ind. p. 333. appertain. The Barbadoes flower-fence is planted in the West Indies as hedges to divide the lands, whence the English name. It is called *Spanish carnation* in some of our West Indian colonies. Sir Hans Sloane calls it *wild-senna*, and Dr. Browne calls it *Barbadoes-pride*. Its French name is *Poinciade* or *fleurs de Paradis*. Ligon says the seeds were first carried to Barbadoes from the Cape de Verd Islands. The flowers are beautifully variegated with a deep red or deep orange colour, yellow, and some spots of green; they have a very agreeable odour, sometimes the flowers are deep orange, and sometimes yellow, without any admixture. All parts of the plant are thought to be very powerful amecogogues, and are frequently used for that purpose among the negroes.

*Beautiful Barbadoes-flower-fence.* Fl. Jul. Sept. Clt. 1691. Shrub 6 to 8 feet.

2 *P. INSI'GNIS* (Kunth, mim. t. 44. H. B. et Kunth, nov. gen. amer. 6. p. 333.) prickly; calyx glabrous; petals entire, standing on very short stipes. *h. S.* Native of South America. Flowers copper-coloured, painted with purple veins.

*Noble Flower-fence.* Fl. June, July. Clt. 1823. Shrub 6 to 10 feet.

3 *P. ELATA* (Lin. spec. 554.) unarmed; leaflets linear, obtuse,

ending in a small acumen; calyx clothed with velvety tomentum; petals fringed, on long stipes. *h. S.* Native of the East Indies and Abyssinia. *Casalpīnia clāta*, Swartz, obs. 166. Leaves with 5-6 pairs of pinnæ, each pinna bearing many pairs of small leaflets, which are clothed with white tomentum beneath. Flowers with yellow petals, and dark purple filaments. Buds and pods silky.

*Tall Flower-fence.* Clt. 1778. Tree 15 to 20 feet.

4 *P. ROXBURGHII*; unarmed; branches and panicle clothed with rusty down; leaves with 11 pairs of pinnæ, each pinna bearing 18-20 pairs of trapezoid-oblong, retuse leaflets; calyx and legumes woolly; petals fringed, stipitate. *h. S.* Native of the East Indies. *Casalpīnia inermis*, Roxb. hort. beng. p. 90. but not of Lin. Flowers with yellow petals, and purple filaments.

*Roxburgh's Flower-fence.* Tree.

5 *P. COMPRESSA* (Sesse et Moc. in herb. Lamb.) unarmed; leaves with 3 pairs of pinnæ, each pinna bearing 4-5 pairs of elliptic, obtuse, emarginate, glaucous leaflets; petals entire, about twice the length of the calyx, on short stipes; stamens much exserted. *h. S.* Native of Mexico and Peru. Racemes terminal, simple. Pedicels an inch long. Flowers with yellow petals and purplish stamens.

*Compressed Flower-fence.* Shrub 8 to 10 feet.

6 *P. MESPIDA*; branches beset with stiff curved bristles; leaves with 10 pairs of pinnæ, each pinna bearing 10-11 pairs of obovate emarginate leaflets, with a bristle in the notch at the end; petals crenated, on short stipes. *h. S.* Native of Mexico, Pavon. Racemes terminal, few-flowered. Pedicels 2 inches long. Flowers apparently yellow. (*v. s.* in herb. Lamb.)

*Hispid Flower-fence.* Shrub 6 to 10 feet.

7 *P. GILLIESII* (Hook. bot. misc. 1. p. 129. t. 34.) unarmed; leaves bipinnate; leaflets oblong; petals glandular, denticulate-ly-ciliated at the apex; legume acinaciform, glandular, 1-celled, dry. *h. S.* Native of Chili, about Mendosa. Flowers sulphur-coloured; they have a sickly disagreeable smell, and are considered by the common people in Chili to be injurious to the sight; hence the vernacular name *mal de ojos*. The shrub will not grow unless in irrigated places.

*Gillies's Flower-fence.* Shrub 4 to 6 feet.

*Cult.* Beautiful shrubs, with very showy flowers, and are therefore worth cultivating in every collection of stove plants. They require to be kept in a strong heat to have them to flower freely. A mixture of loam and peat is the best soil for them. Young cuttings may be rooted if planted in a pot of sand, with a hand-glass placed over them, in a moist heat; but the plants are usually raised from seeds received from abroad.

CCLI. MEZONEURUM (from *μεσος*, *mesos*, the middle, and *νευρον*, *neuron*, a nerve; in reference to the seminiferous suture of the pod being expanded into a wing). Desf. mem. mus. 4. p. 245. D. C. prod. 2. p. 484.

LIN. SYST. *Decándria, Monogýnia*. Calyx of 5 sepals, which are concrete at the base; the lower one arched, involving the others, which are orbicular before expansion. Petals 5, unguiculate, upper one the smallest. Stamens 10, declinate, villous at the base. Style incurved. Legume foliaceous, flat, ovate-oblong, indehiscent, 1-celled, many-seeded, having the seminiferous suture expanded into a wing.—Trees, with abruptly and oppositely bipinnate leaves, having twin hooked prickles at the base of each pair of pinnæ. Racemes simple, bractless. This genus is nearly allied to *Casalpīnia*, but it is distinguished from it by the winged legume.

1 *M. GLABRUM* (Desf. l. 4. t. 10.) leaves glabrous; legume very flat. *h. S.* Native of the Island of Timor.

*Glabrous Mezoneurum.* Tree 20 feet.

2 *M. PUBESCENS* (Desf. l. c. t. 11.) leaves pubescent; legume inflated and reticulated in the middle part. *h. S.* Native of Java.

*Pubescent Mezoneurum.* Tree 20 feet.

*Cult.* See *Poinciāna* for culture and propagation.

CCLII. REICHARDIA (in honour of John James Reichard, author of a *Systema Plantarum*, 4 vol. 8vo. Frankfort, 1779 and 1780., and other botanical works). Roth, nov. spec. 210. but not of his bot. abhandl. nor of his cat. bot. D. C. prod. 2. p. 484.

LIN. SYST. *Decándria, Monogýnia*. Sepals 5, joined into a campanulate crenulated calyx. Petals 6-10, unequal, disposed in a somewhat papilionaceous manner. Stamens 10, declinate, distinct, cohering together beneath the middle by a beard. Ovary somewhat pedicellate. Style filiform. Stigma dilated. Legume samaroid, ending in an oblong wing. This genus is not sufficiently known.

1 *R. HEXAPE'TALA* (Roth. l. c.) corolla 6-petalled; leaves abruptly bipinnate, and are, as well as the stems, prickly. *h. S.* Native of the East Indies. *Casalpīnia ligulata*, Heyne ex Roth. Flowers about the size of those of *E'rram*.

*Six-petalled Reichardia.* Clt. 1824. Tree 10 feet.

2 *R. ? DECAPE'TALA* (Roth, l. c.) corolla 10-petalled; leaves abruptly and simply pinnate; stem prickly. *h. S.* Native of the East Indies. *Casalpīnia*, spec. nov. Heyne ex Roth. Legume unknown.

*Ten-petalled Reichardia.* Tree.

*Cult.* See *Poinciāna* for culture and propagation.

CCLIII. LABICHEA (in memory of M. Labiche, an officer of the French ship Uranie, who accompanied Freycenet in his voyage round the world; he died on his passage to the Moluccas). Gaud. in Freycenet, voy. part. bot. p. 486. t. 16.

LIN. SYST. *Diándria, Monogýnia*. Calyx of 5 sepals, nearly regular, deciduous. Petals 5, roundish-obovate, rather orbicular, nearly equal, spreading, exceeding the calyx. Stamens 2, hypogynous; filaments very short; anthers 2-celled, thick, arched, unequal, opening by a suboperculate pore. Ovary on a short stipe, obliquely ovate-oblong, compressed, ending in a subulate style, containing 2 ovula. Stigma simple. Fruit unknown.—An unarmed shrub, with alternate, sessile, imparipinnate leaves, bearing 1-5 pairs of opposite, lanceolate, mucronate, coriaceous leaflets. Stipulas petiolar, minute. Racemes terminal, many-flowered. Flowers alternate, pedicellate, yellow. Pedicels bracteate at the base.

1 *L. CASSIOIDES* (Gaud. l. c.) *h. G.* Native of New Holland, on the western coast, at a place called in French Baie des chiens marins, and in English Shark's Bay.

*Cassia-like Labichea.* Shrub 3 to 4 feet.

*Cult.* This shrub will grow well in a mixture of loam and peat, and cuttings will probably root if planted in a pot of sand, with a bell-glass placed over them.

CCLIV. HOFFMANSEGGIA (in honour of John C. Hoffmannsegg, author of *Flore Portugaise*, in conjunction with Link Berlin, 1806 and following years). Cav. icon. 4. p. 63. D. C. prod. 2. p. 484.

LIN. SYST. *Decándria, Monogýnia*. Sepals 5, joined at the base, permanent. Petals 5, unguiculate, spreading, glandular at the base, the superior one the broadest. Stamens 10, with the filaments beset with glandular pili, one of which is usually castrated. Stigma clavate. Legume linear, compressed, dry, many-seeded.—Herbs or subshrubs, with bipinnate leaves,

the pinnae sometimes abruptly, sometimes impari-pinnate, and with a pedicellate gland at the base of the petiole on one or both sides. Racemes opposite the leaves. Flowers yellow.

1 *H. FALCARI* (Cav. icon. 4. t. 392.) stems decumbent, hardly suffruticose; leaves with 3-6 pairs of pinnae, with an odd one, each pinna bearing 3-6 pairs of oval-oblong, glaucous leaflets; legumes falciform. *℥. S.* Native of Chili, on the mountains about Mendoza, and of Peru. *Lárrea glauca*, Ort. dec. p. 15. Root creeping, tuberous. Flowers yellow.

*Sickle-podded Hoffmansëggia*. Fl. July, Aug. Clt. 1806. Pl. decumbent.

2 *H. TRIFOLIATA* (Cav. icon. 4. t. 393. f. 1.) stems almost wanting; leaves with 3 pinnae; leaflets ovate, hoary from tomentum; legumes straight, villous. *℥. S.* Native of South America, near Port Desire. Flowers yellow.

*Trifoliate Hoffmansëggia*. Pl.  $\frac{1}{2}$  foot.

3 *H. PROSTRATA* (Lag. in litt. ex D. C. prod. 2. p. 485.) stems almost wanting; leaves with 2 pairs of pinnae, without an odd one; leaflets ovate-oblong, rather villous; legumes straight, pubescent. *℥. S.* Native of Peru, about Lima. Flowers yellow.

*Prostrate Hoffmansëggia*. Pl.  $\frac{1}{2}$  foot, prostrate.

4 *H. PILOSA*; stems wanting; leaves radical, with 3 pairs of pinnae, each pinna bearing numerous, crowded, imbricate leaflets; racemes radical, simple, few-flowered. *℥. S.* Native of Peru. *Cæsalphinia pilosa*, Ruiz et Pav. in herb. Lamb. Petioles and peduncles very pilose. Root tapering. Flowers yellow.

*Pilose Hoffmansëggia*. Pl.  $\frac{1}{4}$  foot.

*Cult.* The species of this genus are small herbaceous plants. They grow best in a mixture of peat and loam, and are increased by seeds, which will ripen in this country.

**CCLV. MELANOSTICTA** (from *μελας*, *melas*, black, and *στικτος*, *stictos*, marked; in reference to the leaves and calyxes being beset with black glands, which have the appearance of black dots or marks). D. C. legum. mem. xii. prod. 2. p. 485.

*LIN. SYST. Decándria, Monogýnia.* Sepals 5, nearly equal, joined together at the base into a short permanent tube, but free at the apex, and deciduous. Petals 5, nearly equal, elliptic, attenuated at the base, length of the calyx. Stamens 10, distinct; filaments rather villous at the base from branched hairs. Legume compressed, ovate-oblong, hairy, 4-ovulate.—A humble shrub, native of the Cape of Good Hope, with somewhat fasciated roots, some of which are cylindrical, and others thickened into tubers. Leaves bipinnate, with 2 pairs of pinnae, each pinna bearing 6-8 pairs of leaflets, with the terminal leaflet elongated. Stipulas pinnatifid. Racemes elongated. This genus is very nearly related to *Pomaria*, but the fruit is not sufficiently known.

1 *M. BURCHELLII* (D. C. l. c. t. 69.) *℥. G.* Native of the Cape of Good Hope. Burch. cat. no. 2345. *Cæsalphinia Melanosticta*, Spreng. syst. append. p. 169. Leaves and calyxes dotted with black sessile glands, whence the generic name.

*Burchell's Melanosticta*. Shrub 1 foot.

*Cult.* See *Hoffmansëggia* for culture and propagation. The plant is increased by dividing at the root.

**CCLVI. POMARIA** (in honour of — Pomar, physician to Philip III. of Spain). Cav. icon. 5. p. 1. t. 402. D. C. prod. 2. p. 485.

*LIN. SYST. Decándria, Monogýnia.* Sepals 5, joined at the base into a short tube, 5-cleft at the apex (f. 56. a.), the segments deciduous. Petals 5 (f. 56. b.), on short claws, the uppermost one concave, and shorter than the rest. Stamens 10, free (f. 56. c.), declinate, hairy at the base (f. 56. c.). Style filiform, crowned by a capitate stigma. Legume oblong, compressed (f. 56. d.), 2-valved, 1-celled, 2-seeded (f. 56. e.). Seeds

ovate.—A shrub, with abruptly bipinnate leaves, pinnatifid stipulas, and axillary racemes of flowers. Branches, calyxes, and corollas beset with glands. This genus is very nearly allied to *Hoffmansëggia*.

1 *P. GLANDULOSA* (Cav. l. c.) *℥. S.* Native of New Spain, near Queretaro, and of North America, on the banks of the Canadian river. Flowers yellow.

*Glandular Pomaria*. Shrub 6 feet.

*Cult.* See *Hoffmansëggia* for culture and propagation.

**CCLVII. HÆMATOXYLON** (from *αἷμα*, *haima*, blood, and *ξύλον*, *xylon*, wood; logwood is well known for its red colour). Lin. gen. no. 525. Lam. ill. t. 340. D. C. prod. 2. p. 485.

*LIN. SYST. Decándria, Monogýnia.* Calyx 5-lobed, the tube permanent, but the lobes are deciduous, oblong, and obtuse. Petals 5, hardly longer than the calyx. Stamens 10; filaments pilose at the base; anthers glandless. Style capillary. Legume compressed, flat, lanceolate, acuminate at both ends, 1-celled, 2-seeded, with the sutures indehiscent, but the valves burst longitudinally to relieve the seeds. Seeds transversely oblong. Cotyledons 2-lobed.—A tree, with unarmed branches, or with spines under the leaves. Flowers racemose, hermaphrodite.

1 *H. CAMPECHIANUM* (Lin. spec. 549.) *℥. S.* Native of the Bay of Campeachy at Honduras, and other parts of the Spanish West Indies, but now cultivated in Jamaica and other West India Islands, &c. Plench. icon. t. 329. Woody. med. bot. p. 48. t. 17. Cat. car. 3. t. 66. Sloan. hist. 2. t. 10. f. 1-4. Leaves abruptly-pinnate, in fascicles; leaflets obovate, obcordate. Flowers yellow. Logwood is generally crooked, and seldom thicker than a man's thigh. It was first cultivated in Jamaica in 1715 from seeds brought from the Bay of Campeachy. It makes impenetrable and beautiful fences. Both the bark and wood are gentle subastringents; but the last excels, and adds a sweetness to its virtue, which makes it more agreeable to the palate. The wood is principally used in dyeing.

*Campeachy or Common Logwood*. Clt. 1732. Tree 20 ft.

*Cult.* Logwood grows well in a mixture of sand and peat; and cuttings will root if planted in a pot of sand, with a hand-glass placed over them in heat; but the plants are generally raised from seeds sent or brought from the West Indies.

**CCLVIII. PARKINSONIA** (in honour of John Parkinson, an apothecary of London, author of *Paradisus Terrestris*, 1629, and *Theatrum Botanicum*, 1649). Plum. gen. 25. Lin. gen. no. 513. Lam. ill. t. 336. D. C. prod. 2. p. 485.

*LIN. SYST. Decándria, Monogýnia.* Sepals 5, equal, spreadingly reflexed. Petals 5, ovate, flat, upper one roundish, on a long claw. Stamens 10, rather declinate, a little longer than the claw of the superior petal. Style filiform, rather ascending. Legume linear-oblong, acuminate at both ends, torose at the seeds, but compressed between them. Seeds oblong, with the endopleura tumid, and with a linear hylum. Embryo with oblong cotyledons, and an ovate radicle.—A shrub, furnished with solitary or tern straight prickles or spines. Leaves pinnate; leaflets usually deciduous or abortive. Petioles linear, very long, winged. Racemes loose. Flowers beautiful yellow.

1 *P. ACULEATA* (Lin. hort. cliff. 157. t. 13.) *℥. S.* Native of

South America and the West India Islands, and now cultivated in most parts of the world within the tropics. Jacq. amer. 121. t. 80. pict. 62. t. 119. D. C. legum. mem. xi. t. 21. f. 112. germ. Flowers yellow, sweet-scented, disposed in pendulous racemes. In Jamaica the shrub is called *Jerusalem-thorn*, and the French in the West Indies call it *Genet épineux*.

*Prickly Parkinsonia*. Clt. 1739. Shrub 8 to 10 feet.

*Cult.* This is a most elegant shrub in the West Indies when in flower, but in our stoves it is seldom preserved throughout the winter, although seeds of it are received annually from the West Indies, and great numbers of plants raised yearly.

**CCLIX. CADIA** (*Kadi* is the Arabic name of the tree). Forsk. descr. p. 90. D. C. prod. 2. p. 486.

*LIN. SYST. Decándria, Monogýnia.* Calyx campanulate, 5-cleft, glandular on the inside of the tube at the base. Petals 5, equal, inserted in the calyx. Stamens 10, with the filaments gibbously geniculated at the base; anthers glandless. Ovary pedicellate. Stigma sessile, acute. Legume linear, many seeded, 2-valved, on a short stipe.—An unarmed shrub, with impari-pinnate leaves, linear, opposite or alternate leaflets, and pedicellate solitary flowers.

1 *C. VARIA* (Lher. diss. in mag. ency. 5. p. 29.) *h. G.* Native of Arabia Felix. *C. purpurea*, Willd. spec. 548. *Span-dóncea tamarindifolia*, Desf. dec. phil. 7. p. 259. *Panciática purpurea*, Piccio, diss. Corolla at first white, but as it fades it becomes rose-coloured.

*Variable Cadia*. Clt. 1777. Shrub 5 to 6 feet.

*Cult.* See *Ceratonia* for culture and propagation.

**CCLX. ZUCCA'GNIA** (in honour of Attilius Zuccagni, M.D. once director of the botanic garden at Florence). Cav. icon. 5. p. 2. t. 403. but not of Thunb. D. C. prod. 2. p. 486.

*LIN. SYST. Decándria, Monogýnia.* Calyx 5-lobed, with a turbinate tube, and oblong obtuse lobes, the lower one rather the longest. Petals 5, ovate, the upper one broader and concave. Stamens 10, nearly equal, pilose at the base. Style filiform. Stigma funnel-shaped. Legume nearly ovate, compressed, 1-celled, 2-valved, 1-seeded, hairy. Seed fixed to the top of the suture.—Clammy shrubs, with abruptly pinnate leaves, and racemes of saffron-coloured flowers.

1 *Z. PUNCTATA* (Cav. icon. 5. p. 2. t. 403.) clammy; leaves abruptly pinnate; racemes terminal. *h. G.* Native of Chili, on the mountains. Flowers saffron-coloured.

*Dotted Zuccagnia*. Shrub 4 to 5 feet.

2 *Z. ? ANGULATA* (Hook. in Beech. voy. p. 22.) stems glabrous, and branches angular; leaves conjugately-pinnate and sub-bipinnate; leaflets minute, ovate-orbicular; racemes terminal, clothed with glandular pubescence. *h. G.* Native of Chili, about Coquimbo.

*Angular-branched Zuccagnia*. Shrub.

*Cult.* See *Ceratonia* for culture and propagation.

**CCLXI. CERATONIA** (from *κεράτωνα* of Theophrastus, from *κεράτιον*, *keration*, a horn or pod; shape of pods). Lin. gen. 1167. Lam. ill. t. 859. Siliqua, Tourn. inst. 344.

*LIN. SYST. Polygámia, Dia'cia.* Flowers polygamous or dioecious. Calyx 5-parted. Petals wanting. Stamens 5. Stigma sessile, orbicular. Legume linear, coriaceous, indehiscent, many seeded, many celled from the seeds being intercepted by a kind of fleshy substance, and with the valves thick and pulpy on the inside.—Trees, with thick trunks, ever-green abruptly-pinnate, coriaceous shining leaves, and racemes of small red flowers. Legumes containing edible pulp.

1 *C. SILIQUA* (Lin. spec. 1513.) unarmed; leaflets oval, ob-

tuse, flat, coriaceous, shining, dark green. *h. G.* Native of the south of Europe, Mauritania, and the Levant. Cav. icon. t. 113. Andr. bot. rep. 567. D. C. legum. xi. t. 23. f. 114. germ. Tasano in act. nap. 1787. p. 248. t. 18. f. 2.—Blackw. herb. t. 209. The carob-tree is much cultivated in the south of Europe for the sake of the pods, the pulp of which is eaten; they are 4 inches and more in length, of a dusky ferruginous colour, as well as the seeds. Ignorance of eastern manners and natural history induced some persons to fancy that the locusts which John the Baptist fed on were the tender shoots of this plant, and that the wild honey was the pulp in the pods of the carob, whence it has the name of St. John's bread; there is better reason to suppose that the shells of the carob-pod might be the husks which the prodigal son desired to partake of with the swine.

*Siliqua-podded Ceratonia* or Carob-tree, or St. John's-bread. Fl. Sept. Oct. Clt. 1570. Tree 30 to 50 feet.

2 *C. ? CHILE'NSIS* (Mol. chil. ed. gall. 338.) branches spiny; leaflets oval, keeled. *h. G.* Native of Chili. Perhaps a species of *Prosopis*.

*Chili Ceratonia*. Tree 20 to 30 feet.

*Cult.* Loam and sand is a good mixture for the carob-tree, and ripened cuttings will strike root if planted in sand, with a hand-glass placed over them.

**CCLXII. CASTANOSPERMUM** (from *καστανον*, *kastanon*, a chestnut, and *σπέρμα*, *sperma*, a seed; in reference to the seeds, which taste like chestnuts). Cunningham, in Hook. bot. misc. 1. p. 241. t. 51 and t. 52.

*LIN. SYST. Decándria, Monogýnia.* Calyx coloured, somewhat bilabiate, with a short tube, upper lip bifid, lower one trifid. Petals 5, papilionaceous, with the wings and keel nearly equal in length. Stamens 10, free. Ovary on a long stipe. Legume stipitate, large, oblong-cylindrical, 2-valved, usually 1-seeded; valves coriaceous, spongy inside.—A large tree, with impari-pinnate leaves, and lateral rather compound racemes of flowers. Leaflets broad, smooth, and entire.

1 *C. AUSTRALE* (Cunningh. l. c.) *h. G.* Native of New Holland, in Morton Bay. The legumes are produced from 2 years old wood, containing usually 4 seeds as large as Spanish chestnuts, which are eaten by the natives about Morton Bay on all occasions, and they have when roasted somewhat of the flavour of Spanish chestnuts, and even Europeans who have subsisted on them for 2 or 3-days together have found no bad effects from them when roasted.

*Southern Morton Bay Chestnut*. Clt. 1828. Tree 40 to 50 ft.

*Cult.* For culture and propagation see *Ceratonia*.

**CCLXIII. HARDWICKIA** (in honour of Major General Thomas Hardwicke, F.R.S. F.L.S. &c. of the East India Company's artillery). Roxb. cor. 3. p. 6. hort. beng. p. 33. D. C. prod. 2. p. 486.

*LIN. SYST. Octo-Decándria, Monogýnia.* Sepals 4, but usually 5, ovate, equal, hardly cohering at the base. Corolla none. Stamens 8, but usually 10, free, inserted in the bottom of the calyx, or perhaps in the torus, the 5 which alternate with the sepals are a little larger than the rest. Anthers ovate, somewhat apiculated. Style short. Stigma peltate. Legume lanceolate, 1-celled, 1-seeded, 2-valved, dehiscent at the apex. Seed hanging from the apex of the legume, cuneated, membranous on the posterior side.—Smooth Indian trees, with abruptly-pinnate leaves, bearing 1 or many pairs of leaflets. Stipulas small, caducous. Panicles terminal and axillary. Flowers of a dirty yellow colour.

1 *H. BINA'TA* (Roxb. cor. 3. t. 209.) leaves with 1 pair of leaflets; petiole ending in a bristle; leaflets opposite, obliquely

ovate, semi-cordate, 3-nerved. *h. S.* Native of Coromandel, on the mountains. Flowers dirty yellow. The wood is excellent.

*Binate-leaved Hardwickia.* Clt. 1820. Tree 40 feet.

2 *H. PINNATA* (Roxb. hort. beng. p. 33.) leaves with 3 pairs of alternate, ovate-lanceolate, acuminate leaflets, which are 1-nerved in the middle, the ultimate one almost terminal. *h. S.* Native of the East Indies. Flowers dirty yellow.

*Pinnate-leaved Hardwickia.* Clt. 1818. Tree 40 to 50 feet.

*Cult.* The species of *Hardwickia* grow freely in a light loamy soil, and large cuttings root readily if planted in sand, with a hand-glass placed over them, in heat.

CCLXIV. JONÉSIA (in honour of the celebrated Sir William Jones, whose knowledge of botany, independent of his other incomparable qualifications, entitles him to this mark of distinction). Roxb. in asiat. res. 4. p. 355. D. C. prod. 2. p. 487. —Saraca, Burm. ind.

LIN. SYST. *Heptadendria, Monogynia.* Calyx with 2 ovate-roundish opposite bracteas at the base, coloured and funnel-shaped, with a long closed fleshy tube, and a 4-lobed spreading limb, the lobes ovate. Petals none. Stamens 8 (sometimes 7-9), rising from the throat of the calyx, much exerted beyond the calyx, free, or sometimes connected at the base. Ovary stipitate, with the lower part of the stipe adnate to the tube of the calyx, but free in the upper part. Style filiform. Legume 1-8-seeded, compressed, flat, acinaciform, with callous sutures. —Asiatic unarmed trees, with abruptly-pinnate leaves, and somewhat fasciculate racemes of flowers. The more recent name of Roxburgh has been preferred to the more ancient one of Burman, and Linnaeus Saraca, to prevent its being confounded with *Saracha*.

1 *J. ASOCA* (Roxb. hort. beng. p. 26.) stem arboreous. *h. S.* Native of Malabar, Java, and Bengal. Hook. bot. mag. t. 3018. —Rheed. mal. 5. t. 59. *Jonésia pinnata*, Willd. spec. 2. p. 287. *Saraca arboréscens*, Burm. fl. ind. 85. t. 25. f. 2. *Saraca Indica*, Lin. mant. 98. Leaves with 2-3 pairs of oblong, shining, firm leaflets, and orange-red flowers. *Ushoka* is the Bengal name of the tree.

*Asoca* Jonesia. Fl. June, Jul. Clt. 1796. Tr. 12 to 20 ft.

2 *J. scandens* (Roxb. hort. beng. p. 26.) stem climbing. *h. S.* Native of Sumatra. The rest unknown.

*Cult.* For culture and propagation, see *Hardwickia*.

CCLXV. TACHIGALIA (*Tassi* or *Tachigali* is the name of *T. paniculata* in Guiana). Aubl. guian. 1. p. 372. exclusive of the fruit. Lam. ill. 339. D. C. prod. 2. p. 487. —Cubæa, Schreb. gen. no. 702. —Valentia, Neck. elem. no. 1283. but not of Swartz. —Tassia, Rich. ined. —Tachia, Pers. ench. no. 1077. but not of Aublet.

LIN. SYST. *Decandria, Monogynia.* Sepals 5, joined together into an obconical striated tube, with the free parts rather unequal and obtuse. Petals 5, inserted in the throat of the calyx, unequal. Stamens 10, exerted, with the filaments villous at the base, the 3 shortest ones erect. Ovary somewhat stipitate. Style filiform, acute. Legume compressed, flat, membranous, indehiscent, 1-seeded, oblong, nearly as in *Dalbergia*. —Trees, with abruptly pinnate leaves, with the petioles as well as the peduncles trigonal, and panicles of yellow flowers, which are bractless, and crowded in a spicate manner along the branches of the panicle.

1 *T. PANICULATA* (Aubl. l. c. t. 143. f. 1.) leaves with 6 pairs of opposite, ovate-oblong, acuminate leaflets. *h. S.* Native of Guiana, on the banks of rivers, where it is called *Tassi* or *Tachigali*.

*Panicle-flowered Tachigalia.* Tree 60 feet.

2 *T. TRIGONA* (Aubl. l. c. f. 2.) leaves with 6 alternate leaflets.

*h. S.* Native along with the preceding, of which it is perhaps only a variety. *Cubæa trigona*, Willd.

*Trigonal-peduncled Tachigalia.* Tree 60 feet.

3 *T. BIJUGA* (D. C. prod. 2. p. 487.) leaves with 2 pairs of opposite, coriaceous, shining leaflets, which are glaucous beneath. *h. S.* Native of Brazil. *Cubæa bijuga*, Spreng. neue entd. 1. p. 290. *Cassia tetraphylla*, Desv.

*Two-paired-leafletted Tachigalia.* Clt. 1822. Tr. 20 to 30 ft.

4 *T. EMARGINATA*; leaves with usually 4 pairs of elliptic, emarginate, coriaceous leaflets, which are discoloured beneath; racemes compound, pubescent. *h. S.* Native of Brazil. Sello. *Cubæa emarginata*, Spreng. syst. 2. p. 345.

*Emarginate-leafletted Tachigalia.* Tree.

*Cult.* For culture and propagation see *Hardwickia*, p. 436.

CCLXVI. BARYXYLUM (from βαρυς, *barys*, heavy, and ξυλον, *xylon*, wood; the wood of the tree is very heavy). Lour. coch. p. 266. D. C. prod. 2. p. 487.

LIN. SYST. *Decandria, Monogynia.* Calyx of 5, ovate-oblong, reflexed, equal, deciduous sepals, which are hardly concrete at the base. Petals 5, roundish, nearly equal, on short claws. Stamens 10, free, unequal, hypogynous? Anthers 4-celled. Style filiform. Legume thick, obtuse, nearly terete, a little curved, many-seeded. Seeds roundish, angular. —A tree, with brownish-red, heavy wood, abruptly pinnate, glabrous leaves, with few pairs of leaflets, and loose racemes of yellow flowers.

1 *B. RUPEM* (Lour. l. c.) leaflets oblong, obtuse. *h. G.* Native of Cochinchina, on the mountains. Wood iron-coloured, very heavy and very hard.

*Brown-wooded Baryxylum.* Tree 50 feet.

*Cult.* For culture and propagation, see *Ceratonia*, p. 435.

CCLXVII. MOLDENHAWERA (in honour of John James Moldenhawer, author of Tentamen in historiam plantarum Theophrasti, 1 vol. 8vo. Hamburg, 1791.). Schrad. in Gött. anz. 1821. p. 718. D. C. prod. 2. p. 488. —Dolichonema, Neuw. reis. vol. 2. with a figure ex flora, 1821. p. 303. and 329.

LIN. SYST. *Decandria, Monogynia.* Calyx of 5 sepals, which are concrete at the base. Petals 5, nearly equal. Stamens 10, free, glabrous, 9 of which are fertile and shorter than the claws of the petals, the other one 3-times longer than the rest, sterile, and bearing a pilose anther, which is dissimilar to those on the 9 fertile filaments. Style 1. Legume linear-oblong. —A tree, with simply or doubly pinnate leaves and yellow flowers. This genus is allied to *Cassia* and *Tachigalia*, according to the author.

1 *M. FLORIBUNDA* (Schrad. l. c.). *h. S.* Native of Brazil. *Cubæa speciosa*, Spreng. syst. append. 170.

*Bundle-flowered Moldenhawera.* Tree.

*Cult.* For culture and propagation see *Hardwickia*, p. 436.

CCLXVIII. HUMBOOLDTIA (in honour of Alexander Baron de Humboldt, the celebrated American traveller and naturalist). Vahl. symb. 3. p. 106. but not of Ruiz, et Pav. D. C. prod. 2. p. 488. —Batschia, Vahl. symb. 3. p. 39. t. 56. but not of Walt. Moench. nor Thunb.

LIN. SYST. *Pentandria, Monogynia.* Calyx with a short tube, 4-cleft; segments oblong, nearly equal. Petals 5, nearly equal, inserted in the mouth of the calyx. Stamens 5, glabrous. Ovary pedicellate. Style filiform. Legume oblong, compressed. —An unarmed tree, with flexuous branches, abruptly pinnate leaves, bearing about 4-6 pairs of ovate-oblong, acuminate leaflets, the lower pair situated at the very base of the petioles and appearing like stipulas. Stipulas truly transversely linear-oblong. Racemes axillary, with a solitary bractea under each pedicel, but with 2 bracteoles at the top of each pedicel.

1 *H. LAURIFOLIA* (Vahl. l. c.) leaflets 3-5 pairs; hind lobes of stipulas drawn out, acute; branches thickened at the internodes.

h. S. Native of Java. *Bátschia laurifolia*, Vahl. l. c.

*Laurel-leaved Humboldtia*. Tree 30 to 40 feet.

*Cult.* For culture and propagation see *Hardwickia*, p. 436.

**CCLXIX. HETEROSTEMON** (*ἑτερος*, *heteros*, variable, and *στήμων*, *stemon*, a stamen, in reference to the variable length of the stamens, as well as in some being fertile and others sterile). Desf. mem. mus. 4. p. 248. D. C. prod. 2. p. 488.

*Lin. syst.* *Monadelphica*, *Océndria*. Calyx tubular, 4-cleft, girded at the base by 2 connate, calyculate bracteas, the segments oblong and acute. Petals 3, obovate, inserted in the throat of the calyx. Stamens 8, unequal, long, declinate, monadelphous below and pilose above, the 3 lower ones are longer and fertile, and 5 bearing barren 2-lobed anthers. Stipe of the ovary concrete with the calyx. Style filiform. Legume flat, tapering to both ends, many seeded. A tree, with abruptly pinnate leaves and winged petioles, bearing linear, obtuse, emarginate, glabrous leaflets. Flowers large, few, somewhat corymbose. This genus is allied to *Tamarindus*.

1 *H. MIMOSOIDES* (Desf. l. c. t. 12.) h. S. Native of Brazil. *Mimosa-like Heterostemon*. Tree.

*Cult.* See *Tamarindus* for culture and propagation, p. 438.

**CCLXX. AMHERSTIA** (named by Dr. Wallich after the Right Honourable Countess Amherst and her daughter Lady Sarah Amherst, the zealous friends and constant promoters of all branches of natural history, especially botany, who, during their residence in India performed an arduous and extensive journey to the northern regions of Northern and Western Hindoostan, spending many weeks among the mountains near the Himalaya, where they obtained a very interesting collection of preserved specimens of plants). Wall. pl. rar. asiat. 1. p. 1. t. 1.

*Lin. syst.* *Diadelphica*, *Décándria*. Sepals 4, connate into a tube at the base, which is permanent and bears the stamiferous column at the apex, girded by 2 large opposite bracteas at the base, which are valvate in æstivation. Petals 5, unequal, 2 lower ones very minute and curved, lateral ones euneiform, divaricate, upper one large, spreading, obcordate, and unguiculate. Stamens 10, 9 of the filaments joined together into a long tube, but free at the apex, alternate ones shortest, the tenth free, but adnate to the pedicel of the ovary at the base. Anthers versatile, all fertile. Ovary stipitate, falcate, 4-6-ovulate, with the stipe adhering to the calycine tube. Style filiform, crowned by a small convex stigma. Legume pedicellate, flat, oblong, few-seeded.—A tree, with large, impari-pinnate leaves, bearing 6-8 pairs of leaflets, and long pendulous axillary racemes of showy scarlet flowers.

1 *A. NÓBILIS* (Wall. l. c.) h. S. Native of the Burman Empire, in the garden of a decayed kion, a sort of monastery, 2 miles from the right bank of the Saluen River, and 27 miles from the town of Martaban, but its native place of growth is still unknown, as the trees found in the garden have undoubtedly been planted there. The flowers are large, of a fine vermilion colour, diversified with yellow spots. This tree, when in foliage and blossom is the most superb object that can possibly be imagined, and not surpassed by any plant in the world. The Burmese name of the tree is *Thoka*. Handfuls of flowers were presented as offerings in the cave before the images of Buddha. Along with this tree were found some trees of *Mesia férrea* and *Jonèsia Asoca*. It is not a little remarkable that the priests of these parts should have manifested so good a taste as to select three sorts of trees as ornaments to their objects of worship which can hardly be surpassed in beauty.

*Noble Amherstia*. Tree 30 to 40 feet.

*Cult.* For culture and propagation see *Hardwickia*, p. 436.

**CCLXXI. TAMARINDUS** (*Tamar*, in Arabic is the name of the date, *Indus*, Indian; Indian date). *Lin. gen.* no. 46. *Lam. ill.* t. 25. *D. C. prod.* 2. p. 488.

*Lin. syst.* *Monadelphia*, *Ennéandria*, and *Décándria*. Calyx tubular at the base, cleft; the 3 upper lobes are reflexed and oblong, 2 lower ones also reflexed and joined together into one broad, 2-nerved lobe, which is usually bidentate at the apex. Petals 3, alternating with the 3 upper lobes of the calyx, the 2 lateral ones ovate, and the middle one cucullate. Stamens 9-10, 2 or 3 of which are longer than the others, monadelphous at the base and antheriferous, the other 7 very short and sterile. Style subulate. Legume pedicellate, acinaciform, compressed, 1-celled, 3-6-seeded, the valves filled with pulp between the epicarp and endocarp. Seeds ovate-quadrate, obliquely truncate at the hilum. Cotyledons unequal at the base.—Trees with abruptly pinnate leaves, bearing many pairs of small leaflets, and racemes of flowers.

1 *T. INDICA* (*Lin. spec.* 48. exclusive of the synonyme of Lafl.) legumes elongated, 8-12-seeded, 6-times or more longer than broad. h. S. Native of the East Indies and the tropical parts of Africa. *Woody. med. bot.* t. 166.—*Rheed. mal.* 1. t. 23.—*Rumph. amb.* 2. t. 23.—*Blackw. herb.* t. 221. *D. C. legum. mem.* xi. t. 24. f. 113. *germ.* A large spreading tree, with the leaves of a pale colour. Flowers with a straw-coloured calyx and yellow petals, beautifully streaked with red, and purple filaments and brown anthers. The timber of the *Tamarind-tree* is heavy, firm, and hard; sawed into boards it is converted to many useful purposes in building. The pulp contained in the pods is used both in food and medicine. The tamarinds which are brought from the East Indies are darker and drier, but contain more pulp; being preserved without sugar they are fitter to be put into medicines than those from the West Indies, which are much redder, but being preserved with sugar are more pleasant to the palate. The use of *tamarinds* was first learned from the Arabians; they contain a larger proportion of acid with the saccharine matter than is usually found in acid fruits. The epicarp of the pod is thin, and the acid pulp for which they are esteemed is the sarcocarp. *Tamarinds* are preserved in two ways; commonly by throwing hot sugar from the boilers on the ripe pulp; but a better method is to put alternate layers of *tamarinds* and powdered sugar in a stone jar. By this means the *tamarinds* preserve their colour, and taste more agreeably. Preserved *tamarinds* should be fresh and juicy, and should have an agreeable acid taste. They should not have a musty smell; the seeds should not be soft and swollen; and the blade of a knife should not get a coating of copper by being immersed among them. *Tamarinds* contain sugar, mucilage, citric acid, supertartrate of potass, tartaric acid, and malic acid. In medicine the pulp of *tamarinds*, taken in the quantity of from 2 to 3 drachms to an ounce or more, proves gently laxative and purgative, and at the same time by its acidity quenches thirst and allays immoderate heat. It increases the action of the sweet purgatives *cassia* and *mannia*, and weakens that of the resinous cathartics. Salts, whose base is potass, form an improper addition to *tamarinds*, for they are decomposed, and the tartaric acid of the fruit is precipitated in the form of supertartrate of potass.

*East Indian Tamarind.* Fl. June, July. Clt. 1633. Tree 40 to 60 feet.

2 *T. OCCIDENTALIS* (Gærtn. fruct. 2. p. 310. t. 146.) legumes short, 1-4-seeded, hardly 3-times longer than broad. h. S. Native of South America and the West India Islands. *Jacq. amer.* p. 10. t. 179. f. 98. *Blackw. herb.* t. 201. Flowers with a straw-coloured calyx and yellowish petals streaked with red, and purplish stamens. A large spreading tree. The pods of the West Indian *tamarind* are shorter and redder than those of

the East Indian *tamarind*, and are not so good. In many parts of America, particularly in Curaçoa, the natives eat abundance of the pulp raw without any inconvenience, except that of gently relaxing the body. In Martinico they eat even the unripe fruit. In the West Indies it is frequently made an ingredient in punch.

*West Indian Tamarind.* Fl. Feb. Clt. 1633. Tr. 30 to 50 ft.

*Cult.* Loam and peat is a good mixture to grow the species of *tamarind* in. Cuttings will root if planted in a pot of sand, with a hand-glass placed over them, in heat; but as seeds are annually received both from the East and West Indies, this is an unnecessary mode of increasing the plants. The seeds should be raised on a hot-bed, and the plants put into separate pots, as soon as they are about 2 or 3 inches high.

**CCLXXII. CA'SSIA** (κασσία, *cassia*, of Dioscorides. According to Olaus Celsus, this name is to be traced to the Hebrew *ketziath*, rendered by *κασίαν* in the Septuagint, and Latinized by *cassia*). Lin. gen. 514. Lam. ill. t. 332. Collad. mon. 1816. in 4to. D. C. prod. 2. p. 489.

*Lin. syst.* *Decandria, Monogynia.* Calyx of 5 sepals, which are hardly connected together at the base (f. 57. a.) and more or less unequal. Petals 5, unequal. Stamens 10, free, unequal (f. 57. c. d.), 3 lower ones the longest, the 4 middle ones short and straight, the 3 superior ones (f. 57. d.), bearing abortive difform anthers. Fertile anthers opening by 2 pores at the apex (f. 57. f.). Ovary stipitate, usually arched. Legume dehiscent, compressed, transversely many-celled inside; cells 1-seeded.—Shrubs or herbs, with abruptly pinnate leaves and opposite leaflets. The petioles are usually glandular. The flowers of all are yellow.

**SECT. I. HERPÉTICA** (Amboyna name of *C. alata*, var. β.). D. C. in Collad. mon. p. 91. prod. 2. p. 492. Calyx of 5 bluntish sepals. Anthers opening by 2 pores at the apex. Legumes flat, membranous, dehiscent, furnished with an acute foliaceous wing on the back, and divided internally into many cells by transverse dissepiments; cells rather pulpy inside. Seeds horizontal, compressed, nearly obcordate.—Perennial herbs, furnished with a large concave bractea under each flower.

1 *C. ALATA* (Lin. spec. 541.) leaves with 8-12 pairs of obovate-oblong, glabrous leaflets, outer ones the largest, lower ones approximating to the axils; petioles glandless. 2. S. Native of South America and the West India Islands. Sloan. hist. t. 175. f. 1. *C. Herpética*, Jacq. obs. 2. t. 45. f. 2. Flowers large, yellow. The leaves are finely pubescent on the under surface, according to H. B. et Kunth, nov. gen. amer. 6. p. 347. This is therefore a different plant.

*Var. β, Rumphiana* (D. C. prod. 2. p. 492.) racemes short, few-flowered. 2. S. Native of Java. *Herpética*, Rumph. amb. 7. t. 18. *C. alata*, Burm. fl. ind. 96. Perhaps a proper species.

*Winged-podded Cassia.* Clt. 1731. Pl. 6 feet.

2 *C. BRACTEATA* (Lin. fil. suppl. 232.) leaves with 10 pairs of oblong, obtuse leaflets, which are soft and hoary beneath; petioles glandless. 2. S. Native of Surinam. Flowers yellow. Leaves more than a foot long.

*Bracteate-flowered Cassia.* Fl. April, Dec. Cl. 1822. Pl. 6 ft.

**SECT. II. SÉNNA** (*Sienna* or *Sæna mechi*, the Arabic name for *senna*). Tourn. inst. t. 390. Gærtn. fruct. 146. D. C. in Collad. mon. 92. prod. 2. p. 492. Sepals obtuse. Anthers opening by 2 pores at the apex. Legumes membranous, broad, flat, and compressed, hardly dehiscent, torose at the seeds, divided internally into many cells by transverse dissepiments; cells hardly pulpy inside. Seeds vertical, compressed, nearly obcordate, shorter than the breadth of the legume, but the length of the funicle.

3 *C. OBOVATA* (Collad. mon. p. 92.) leaves with 6-7 pairs of obovate, obtuse leaflets; petioles glandless; legumes flat, compressed, arched, tumid, and a little crested in the middle. 2. S. but ☉. in the gardens. Native of Egypt, Sénégal, and Rome; cultivated in the south of Europe and the West Indies for its leaves, which are one kind of *Senna*. *C. Sénna*, Lam. ill. t. 332. f. 2. a. b. d. and f. 3. b. f. g. Jacq. fil. ecl. 1. t. 87. Flowers yellow. This is the Italian official *senna*.

*Obovate-leafletted or Italian Senna.* Fl. July, Aug. Clt. 1640. Pl. 1 to 2 feet.

4 *C. LANCEOLATA* (Forsk. ægypt. p. 85.) leaves with 4-5 pairs of oval-lanceolate, acute leaflets; petiole glandular; legumes flat, compressed, straightish, tumid in the middle. 2. S. Native of Upper Egypt. Lam. ill. t. 332. f. 2. c. and f. 3. a. *Cassia orientalis*, Pers. ench. 1. p. 457. *C. acutifolia*, Delil. ill. ægypt. 75. t. 27. f. 1. Flowers yellow. This is the official Alexandrian *senna*.

*Senna* is the leaves of *C. lanceolata* and *C. obovata*, both natives of Egypt; they are mixed with the pods. Those of the former are most esteemed; they are of a lively yellowish green colour, while those of the latter are green without any yellowish cast. With the true *senna* are mixed the leaves of another plant, *Cynanchium Arquel*. Rouillion says that at Cairo the traders mix these in the proportion of 500 of *C. lanceolata* and 300 of *C. obovata* and 200 of *Cynanchium Arquel*. But the greater part of the *senna* now used in this country is of a different kind. It is called East Indian. In America they now use the leaves of *C. Marylandica*. In medicine *senna* is a very useful cathartic, operating mildly and yet effectually; and if judiciously dosed and managed, rarely occasioning the bad consequences which too frequently follow the exhibition of the stronger purges. Its nauseous flavour, and its being apt to gripe, are the only inconveniences complained of in this drug. These are best obviated by adding some aromatic substance to the *senna*, as cardamon, ginger, cinnamon, &c., and by facilitating its operating by drinking plentifully of any mild diluent. *Senna* may be given in substance to the extent of half a drachm night and morning. It is more conveniently given in the form of infusion, which is generally made by pouring 6 ounces of boiling water upon from 2 to 6 drachms of *senna* leaves in a teapot, and letting it stand about an hour. *Senna* ought never to be used in decoction, Green says, because it becomes perfectly inert by the total dissipation of the nauseous and volatile principle, on which its purgative effects depend. The tincture, on account of the menstruum, cannot be given in doses large enough to have any effect.

*Lanceolate-leafletted or Alexandrian Senna.* Fl. July, Aug. Clt. ? Shrub 2 to 3 feet.

5 *C. LIGUSTRINOIDES* (Schranck, in akad. munch. 6. p. 179.) leaves with 5 pairs of glabrous, lanceolate leaflets, the lower ones the smallest; petioles glandless?; flowers racemose; legumes much compressed, glabrous, rounded at the apex. 2. S. Native of Arabia. Flowers yellow. This kind of *senna* is confused with the Alexandrian *senna* in the shops.

*Privet-like or Arabian Senna.* Fl. July, Aug. Clt. 1800. Shrub 1 foot.

6 *C. PISTACIÆFOLIA* (H. B. et Kunth, nov. gen. amer. 6. p. 349.) leaves with 6 pairs of oblong leaflets, which are retuse at the apex and glabrous above but pubescent beneath; petioles glandless; flowers racemose; legumes transversely veined. 2. S. Native of South America, between Popayan and Menezes. Flowers yellow.

*Pistachio-leaved Senna.* Tree 24 feet.

7 *C. STROBILACEA* (H. B. et Kunth, nov. gen. amer. 6. p. 347.) leaves with 11-12 pairs of oblong, emarginate leaflets, which are rather pilose above, but pubescent beneath; petioles glandless; racemes axillary; bractees large; legumes com-

pressed, torulose.  $\frac{1}{2}$ . S. Native of South America, on the banks of the river Magdalena, near the Bocca of St. Bartholomew. Flowers yellow.

*Strobile-like-racemed Senna.* Tree 12 to 20 feet.

8 C. TARA'NTAN (H. B. et Kunth, nov. gen. amer. 6. p. 348.) leaves with 11 pairs of oblong, acute leaflets, which are pilose above but pubescent beneath; petioles glandless; flowers racemose?; legumes compressed, torulose.  $\frac{1}{2}$ . S. Native of South America, near Cumana, where it is called *Tarantan*.

*Tarantan Senna.* Fl. July, Aug. Clt. 1817. Tree.

9 C. FRAXINFOLIA (H. B. et Kunth, nov. gen. amer. 6. p. 349.) leaves with 9-11 pairs of oblong, obtuse, glabrous leaflets; petioles glandless; racemes axillary, corymbose; legumes compressed, short.  $\frac{1}{2}$ . S. Native of South America, between the river Amazon and the town of Jaen de Bracamoros. C. cuspidata, Willd. enum. p. 445. Flowers yellow.

*Ash-leaved Senna.* Shrub 3 to 6 feet.

10 C. BROWNIANA (Kunth, mim. p. 135. t. 41.) leaves with 8-13 pairs of oblong, obtuse, mucronate, rather ciliated, glabrous leaflets; racemes axillary, length of leaves; legumes oblong-linear, mucronate, furnished with a narrow wing on both sutures.  $\frac{1}{2}$ . S. Native of Mexico, near Guanajuato. H. B. et Kunth, nov. gen. amer. 6. p. 350. Flowers yellow.

*Brown's Senna.* Shrub 12 feet.

11 C. RICHARDIANA (Kunth, mim. p. 139. t. 42.) leaves with 18-20 pairs of oblong leaflets, which are puberulous beneath, with a small gland on the petiole, between the lower pair; panicle terminal; legumes compressed, membranous, transversely veined, glabrous.  $\frac{1}{2}$ . S. Native of South America, on the banks of the river Atabapo, near the head of the Orinoco. H. B. et Kunth, nov. gen. amer. 6. p. 351. Flowers yellow.

*Richard's Senna.* Fl. July, Aug. Clt. 1823. Shrub.

SECT. III. CHAMÆSÆNNA ( $\chi\alpha\mu\alpha\iota$ , *chamai*, on the ground, and *senna*; dwarf senna). D. C. in Collad. mon. p. 95. prod. 2. p. 493. Sepals obtuse. Anthers oblong, opening by 2 pores at the apex. Legumes compressed, dehiscent, rather tumid at the sutures, divided internally into many cells, by complete or incomplete transverse dissepiments. Cells not pulpy inside. Seeds vertical, compressed, ovate, or somewhat square, about equal to the breadth of the legume, but longer than the funicle.

§ 1. *Trigonelloideæ* (*Trigonella*, and *idea*, like; plants with the habit of *Trigonella*). Annual plants, having the leaves furnished with but few pairs of leaflets.

12 C. SERICEA (Swartz, fl. ind. occ. 2. p. 724.) leaves with 4 pairs of oval leaflets, which are clothed with silky hairs, with subulate glands on the petiole, one between each pair of leaflets; legumes hairy, somewhat tetragonal, transversely somewhat articulated. ☉. S. Native of the West Indies and Brazil. C. sensitiva, Jacq. icon. rar. t. 459. C. ornithopoides, Lam. dict. 1. p. 644.

*Silky Wild-senna.* Fl. May, Aug. Clt. 1731. Pl. 1 foot.

13 C. CILIATA (Hoffm. verz. 1824. p. 208.) leaves with 3-4 pairs of obovate, acutish, pubescent leaflets, which are ciliated with silky down, and furnished with stipitate glands on the petiole, one between each of the pairs of leaflets, except the outer pair; spikes axillary, somewhat capitate; legumes terete, beaked, impressed. ☉. S. Native of Cuba. Perhaps sufficiently distinct from *C. sericea*.

*Ciliated-leafletted Wild-senna.* Fl. Ju. Jul. Clt. 1820. Pl. 1 ft.

14 C. OBTUSIFOLIA (Lin. spec. 539. exclusive of the synonyme of Rumph.) leaves with 3 pairs of obovate, obtuse leaflets, which are pubescent beneath, with an oblong, cylindrical, acute gland on the petiole, between the lower pair of leaflets; stipulas linear-subulate; legumes long, slender, recurved. ☉. S. Na-

tive of Cuba and Jamaica among rubbish. C. Tora, H. B. et Kunth, nov. gen. amer. 6. p. 35. which was gathered in the fields of Popayan.—Dill. hort. elth. 71. t. 62. f. 72. Sloane, jam. t. 180. f. 5.

*Obtuse-leaved Wild-senna.* Fl. July, Aug. Clt. 1732. Pl. 1 to 2 feet.

15 C. HUMILIS (Collad. mon. p. 96.) leaves with 3 pairs of obovate, obtuse leaflets, with an oblong gland on the petiole between the lower pair; petiole without an awn at the apex; legumes arched, compressed, with callous margins. ☉. S. Native of South America, Caribbee Islands, and Carolina. C. Tora  $\beta$ , Lin. spec. 538. C. Tala, Desv. journ. bot. 1814. p. 73. ?—Plum. ed. Burm. t. 76. f. 2.

*Humble Wild-senna.* Fl. Ju. Jul. Clt. 1810. Pl. 1 to 2 ft.

16 C. TORA (Lin. spec. 538. exclusive of var.  $\beta$  and the synonyme of Mill.) leaves with 3 pairs of obovate, obtuse leaflets, with an oblong gland between each of the 2 lower pairs on the petiole; petiole ending in a bristle; legumes straight, compressed, with callous margins. ☉. S. Native of the East Indies, Arabia, Japan, and Cochin-china. Dill. elth. 72. t. 63. f. 73. C. foetida, Sal. prod. 326. C. gallinaria, Collad. mon. p. 96. C. toroides, Hortul. C. obtusifolia and C. Tora, Burm. ind. p. 95. exclusive of the synonymes. —Rumph. amb. 5. t. 97. f. 2.

*Tora Wild-senna.* Fl. Aug. Clt. 1693. Pl. 2 to 5 feet.

17 C. LIMENSIS (Lam. dict. 1. p. 643.) leaves with 3-4 pairs of obovate, very blunt, glabrous leaflets; racemes axillary, many flowered, about equal in length to the leaves. ☉. S. Native of Peru. Perhaps the same as *C. pentagonia*, of Mill. fig. t. 82. from Campeachy.

*Lima Wild-senna.* Pl. 1 to 2 feet.

18 C. CILIARIS (Collad. mon. p. 98.) leaves with 2-3 pairs of semi-orbicular, veiny leaflets, the 2 outer ones the largest; stipulas cordate, lanceolate, with ciliated margins. ☉. S. Native of the East Indies. C. Tagera, Lin. spec. 538. exclusive of the synonyme of Rheed. Plant filiform, procumbent.

*Ciliary-stipuled Wild-senna.* Pl. procumbent.

19 C. TAGERA (Lam. dict. 1. p. 643. but not of Lin.) leaves with 3 pairs of obovate leaflets; peduncles very short, 1-flowered; legumes straight, linear. ☉. ? S. Native of Malabar, where it is called *Ponnam-Tagera*. Rheed. mal. 2. p. 103. t. 53.

*Tagera Wild-senna.* Fl. July. Clt. 1803. Pl. 2 to 3 feet.

§ 2. *Coluteoideæ* (from *Colutea*, and *idea*, like; plants with the habit of *Colutea*). Plants shrubby. Leaves with few or many pairs of leaflets.

\* *Inter glandulosæ* (from *inter*, between, and *glandula*, a gland). Glands situated on the petioles, between the pairs of leaflets.

20 C. VENUSTULA (H. B. et Kunth, nov. gen. amer. 6. p. 352.) leaves with 3-4 pairs of obovate-elliptic, puberulous leaflets, which are rounded at the apex, with a gland on the petiole above the lower pair; panicle terminal, with 2-flowered branches; legumes linear, beaked, puberulous.  $\frac{1}{2}$ . S. Native of South America, near Cumana, in arid places.

*Pretty Wild-senna.* Shrub.

\* \* *Jugiglandulosæ* (from *jugum*, a yoke, and *glandula*, a gland). Glands one or more on the petiole between the pairs of leaflets.

21 C. VIMINEA (Lin. amœn. 5. p. 397.) leaves with 2 pairs of ovate-oblong, acuminate, glabrous leaflets, with an oblong acute gland on the petiole between the lower pair; petiole ending in an awn; spines tridentate, on the old branches.  $\frac{1}{2}$ . S. Native of Jamaica, on the Blue Mountains, and of Porto Rico.—Sloane, jam. 2. t. 180. f. 6, 7. A rambling or climbing shrub.

*Twiggy Wild-senna.* Clt. 1786. Shrub cl.

22 *C. CHRYSOTRICHIA* (Collad. mon. p. 99. t. 13.) leaves with 2 pairs of rather pubescent ovate leaflets, lower pair the shortest and rounded on the outside, with an oblong gland on the petiole between the lower pair; spines tridentate on the old branches. *h. S.* Native of Guiana. *C. chrysocarpa*, Desv. journ. bot. 1814. p. 72. *C. virgata*, Rich. act. soc. hist. nat. par. p. 108. but not of Swartz. A rambling shrub. Ovary clothed with silky, adpressed, yellow hairs, whence the specific name.

*Golden-haired Wild-senna.* Shrub rambling.

23 *C. RUGOSA*; branches and peduncles pubescent; leaves with 2 pairs of elliptic, obtuse leaflets, which are oblique at the base and somewhat emarginate and mucronate at the apex, pubescent beneath, with the veins and nerves very prominent; racemes forming a terminal panicle; petiole bearing glands, one between each pair of leaflets; stipulas subulate. *h. S.* Native of Brazil. Sello (v. s. in herb. Lamb.).

*Wrinkled-leaved Wild-senna.* Shrub.

24 *C. MACRANTHERA* (D. C. in Collad. mon. p. 99. t. 8.) leaves with 2 pairs of oval-oblong, glabrous, acuminate leaflets, with an oblong-ovate gland on the petiole between the lower pair; petiole ending in a thick caducous bristle. *h. S.* Native of Brazil. Ovary linear, a little arched, clothed with adpressed pubescence.

*Long-anthered Wild-senna.* Fl. June, July. Clt. 1824. Sh.

25 *C. SCANDENS* (Ruiz, et Pav. in herb. Lamb.) branches angular, pubescent; leaves smooth, membranous, with 2 pairs of elliptic-oblong, acute, cuspidate leaflets, lower pair one half smaller than the upper; petiole bearing a large obtuse gland between the lower pair of leaflets; stipulas and bracteas lanceolate-subulate; racemes long, puberulous, shorter than the leaves. *h. C. S.* Native of Guayaquil.

*Climbing Wild-senna.* Shrub cl.

26 *C. QUINQUANGULATA* (Rich. act. soc. hist. nat. par. p. 108.) leaves with 2 pairs of ovate coriaceous, acuminate leaflets, which are glabrous above but pubescent beneath, and unequal at the base, with an ovate thick gland between each of the pairs on the petiole; panicle terminal. *h. S.* Native of Cayenne, in woods. Branches pentagonal, smoothish. Ovary hoary, a little arched. Stigma large, ovate, petaloid. The legume being unknown, the section to which the present plant belongs is doubtful.

*Five-angled-branched Wild-senna.* Fl. Ju. Jul. Clt. 1818. Shrub 2 to 4 feet.

27 *C. APOUCOÛTA* (Aubl. guian. 1. p. 379. t. 146.) leaves with 2-3 pairs of ovate-oblong, acuminate, glabrous leaflets, which are shining above, with an ovate sessile gland between each of the pairs on the petiole; racemes axillary. *h. S.* Native of Guiana, along the banks of the river Sinemari. *C. acuminata*, Willd. spec. 2. p. 517. but not of Mönch. *C. nitida*, Rich. act. soc. hist. nat. par. p. 108. *Apoucouita* is the name of the shrub in Guiana.

*Apoucouita Wild-senna.* Shrub 4 to 8 feet.

28 *C. SENNIOIDES* (Jacq. icon. rar. t. 70.) leaves with 2-3 pairs of obovate glabrous leaflets, the lower ones the roundest, with an oblong sessile gland on the petiole between the lower pair; stipulas linear-subulate, spreading. *h. S.* Native of the East Indies. Racemes axillary.

*Senna-like Cassia.* Fl. July, Aug. Clt. 1808. Sh. 3 to 4 ft.

29 *C. ALCAPARILLO* (H. B. et Kunth, nov. gen. amer. 6. p. 355.) leaves with 2-3 pairs of oblong glabrous leaflets, which are rounded at the apex, with a gland on the petiole between the lower pair; racemes axillary and terminal, loose. *h. S.* Native of Peru, in hot places near Olleros, where it is called *Alcaparillo*. The legume, according to Bonpland, is terete; it is therefore probably a species of *Chamaefistula*.

*Alcaparillo Wild-senna.* Shrub.

30 *C. RICAPSULARIS* (Lin. spec. 538.) leaves with 3 pairs of obovate, rather marginate, glabrous leaflets, lower ones the roundest, with a somewhat globose gland on the petiole between the lower pair, which is attenuated at the base; stipulas linear-subulate, spreading. *h. S.* Native of the West Indies, Surinam, and St. Martha. Plum. ed. Burm. t. 76. f. 1. Jacq. fragm. t. 58. Merian, sur. t. 32. *C. inflata*, Spreng. in herb. Balb.

*Var. β, aristata* (D. C. prod. 2. p. 495.) leaflets mucronate at the apex. *h. S.* Native of Guadaloupe. *C. Bertiæ*, Coll. hort. rip. p. 30. t. 34.

*Var. γ, quadrijuga* (D. C. l. c.) leaves with 4 pairs of obtuse leaflets.

*Ricapsular Wild-senna.* Fl. May, June. Clt. 1739. Shrub 4 to 6 feet.

31 *C. ARGENTEA* (H. B. et Kunth, nov. gen. amer. 6. p. 358.) leaves with 3 pairs of sub-elliptic leaflets, which are rounded at the apex, and clothed with silky pubescence, but silvery beneath, with a gland on the petiole between the lower pair; flowers axillary, solitary, and disposed in racemes at the tops of the branches; legumes slender, clothed with adpressed pubescence. *h. S.* Native of Mexico, on the banks of the river Mescal.

*Silvery Wild-senna.* Shrub 3 to 4 feet.

32 *C. GENUICULATA*; clothed with scurfy stellate tomentum; leaves with 3 pairs of ovate oblique leaflets, tapering to the apex, with a hairy gland on the petiole between the lower pair; racemes short, corymbose, axillary; legumes articulated. *h. S.* Native of Peru. (v. s. in herb. Lamb.)

*Jointed-podded Wild-senna.* Shrub.

33 *C. MOLLISSIMA* (Humb. et Bonpl. in Willd. enum. 440.) leaves with 3 pairs of ovate acuminate leaflets, which are clothed with soft pubescence beneath; petiole pilose, bearing a hairy gland between each pair of leaflets. *h. S.* Native of South America. Legumes unknown.

*Fery-soft Wild-senna.* Clt. 1816. Shrub.

34 *C. RENIFORMIS*; branches pubescent; leaves with 3 pairs of elliptic, acuminate, glabrous leaflets, tapering to both ends, lower ones the smallest, with an elongated gland between each pair; stipulas large, reniform, acuminate on one side. *h. S.* Native of Brazil, Sello. Perhaps a species of *Chamaefistula*.

*Kidney-shaped-stipuled Wild-senna.* Shrub.

35 *C. ARTEMISIOIDES* (Gaud. in D. C. prod. 2. p. 495.) clothed in every part with velvety canescent down; leaves with 3-4 pairs of linear-filiform leaflets, with a small gland on the petiole between the lower pair; racemes axillary, 5-8-flowered, a little shorter than the leaves. *h. G.* Native of New Holland, in the interior of the country.

*Wormwood-like Wild-senna.* Fl. June, July. Clt. 1820. Sh. 2 to 3 feet.

36 *C. GLUTINOSA* (D. C. prod. 2. p. 495.) leaves with 3-4 pairs of oblong, acuminate, glabrous leaflets, which are clammy as well as the branches, with a small sessile gland on the petiole between the lower pair; racemes axillary, usually 4-flowered. *h. G.* Native of New Holland, on the eastern coast. Legume broad, linear, on a short stipe, mucronate by the style.

*Clammy Wild-senna.* Shrub.

37 *C. OXYADENA* (D. C. prod. 2. p. 475.) leaves with 4-5 pairs of obovate glabrous leaflets, outer ones the longest, all glaucous beneath; petioles glabrous, furnished with a subulate acute gland, which is situated between the lower pair of leaflets. *h. S.* Native of Jamaica. *C. discolor*, Desv. journ. bot. 1814. p. 73? *C. frutescens*, Mill. dict. no. 2.

*Sharp-glanded Wild-senna.* Shrub 5 to 6 feet.

38 *C. DISPAR* (Willd. enum. 441.) leaves with 4-5 pairs of oblong usually obtuse leaflets, outer ones the largest, with a gland between each pair on the petiole. *h. S.* Native of South America. Compare it with *C. floribunda*.

*Unequal-leafletted Wild-senna.* Fl. Ju. July. Clt. 1824. Sh.  
39 *C. ACAPULCENSIS* (H. B. et Kunth, nov. gen. amer. 6. p. 353.) leaves with 4 pairs of obovate-elliptic leaflets, which are rounded at the apex, glabrous above, but puberulous beneath, and dotted, with a gland on the petiole between the lower pair; peduncles axillary, 2-flowered.  $\frac{1}{2}$ . S. Native of Mexico, near Acapulco.

*Acapulco Wild-senna.* Fl. June, July. Clt. 1823. Shrub 3 to 4 feet.

40 *C. GLAUCA* (Lam. dict. 1. p. 647.) leaves with 4-6 pairs of oval, acutish, glaucous leaflets, with a sessile oblong gland on the petiole between each of the 3 lower pairs; stipulas linear, subulate, spreading.  $\frac{1}{2}$ . S. Native of the East Indies. *C. Surratensis*, Burm. ind. 97.

*Glaucous Wild-senna.* Fl. June, July. Clt. 1818. Shrub 4 to 6 feet.

41 *C. FETIDISSIMA* (Ruiz et Pav. in herb. Lamb.) pubescent; leaves with 5 pairs of elliptic-lanceolate cuspidate leaflets, which are glaucous beneath, with a gland on the petiole between the lower pair; racemes axillary, shorter than the leaves.  $\frac{1}{2}$ . S. Native of Mexico. Flowers pale, with purple veins.

*Fery-fetid Wild-senna.* Shrub.

42 *C. SULPHUREA* (D. C. in Collad. mon. p. 84.) leaves with 5-6 pairs of oval-oblong leaflets, which are glaucous beneath, in the adult state they are glabrous, but when young they are puberulous, as well as the branches and petioles; petioles furnished with glands, one between each of the 3 or 4 lower pairs of leaflets; stipulas linear-subulate, rather falcate; racemes axillary, erect, shorter than the leaves.  $\frac{1}{2}$ . S. Native of the East Indies and the Mauritius, where it is probably cultivated. Rheed. mal. 6. t. 9. and t. 10. *C. arborescens*, Vahl. symb. 3. p. 56. but not of Mill. *Robinia Javanica*, Burm. fl. ind. 163. Legume flat, compressed, 4-5 inches long, erect. Flowers sulphur-coloured.

*Sulphur-coloured-flowered Wild-senna.* Fl. June, July. Clt. 1800. Shrub 5 to 10 feet.

43 *C. COLUTEOIDES* (Collad. mon. p. 102. t. 12.) leaves with 5-6 pairs of ovate, retuse, glabrous leaflets, outer ones the longest, with an oblong gland on the petiole between the lower pair; corymb terminal; 2 of the stamens are very long.  $\frac{1}{2}$ . S. Native country and legumes unknown.

*Colutea-like Wild-senna.* Shrub 4 to 6 feet.

44 *C. NEMOROSA* (H. B. et Kunth, nov. gen. amer. 6. p. 358.) leaves with 5-7 pairs of elliptic, emarginate, glabrous leaflets, with a gland on the petiole between the lower pair; peduncles axillary and terminal, 2-flowered.  $\frac{1}{2}$ . S. Native of South America, in the province of Jaen de Bracamoros in groves. Said to be allied to *C. polyphylla*.

*Grove Wild-senna.* Shrub 1 to 2 feet.

45 *C. RIFLORA* (Lin. amœn. 5. p. 397.) leaves with 6-8 pairs of oval-oblong or obovate, rather glabrous leaflets, with a subulate gland on the petiole between the lower pair; peduncles 2-4-flowered, much shorter than the leaves.  $\frac{1}{2}$ . S. Native of South America and the West India Islands. Sims, bot. mag. t. 810.—Plum. ed. Burm. t. 78. f. 1.

*Var.  $\beta$ , sempervirens* (D. C. cat. hort. monsp. p. 90. no. 56.) leaflets emarginate, glabrous; flowers smaller.

*Two-flowered Wild-senna.* Fl. April, Dec. Clt. 1766. Shrub 4 to 6 feet.

46 *C. GEMINIFLORA* (Moc. et Sesse, in Collad. mon. p. 103. t. 3.) leaves with 6 pairs of oval equal leaflets; petioles glandless? peduncles axillary, bifid, 2-flowered.  $\frac{1}{2}$ . S. Native of Mexico. Very like the preceding species.

*Twin-flowered Wild-senna.* Fl. June, July. Clt. 1824. Shrub 4 to 6 feet.

47 *C. OBCORDATA* (Swartz, herb. Wicks. obs. fl. St. Barth. VOL. II.

p. 411.) stems angular, glabrous; branches terete, pubescent; leaves with 3-7 pairs of obcordate, cuspidate, glabrous leaflets, with a pedicellate gland on the petiole between the lower pair; legumes compressed, pubescent; peduncles sub-terminal, filiform, 1-flowered, bibracteolate both at the base and in the middle.  $\frac{1}{2}$ . S. Native of the Island of St. Bartholomew. Flowers large, yellow.

*Obcordate-leafletted Wild-senna.* Shrub.

48 *C. PALLEIDA* (Vahl. ecl. amer. 3. p. 12.) leaves with 5-6 pairs of oval glabrous leaflets, outer ones somewhat cuneated and mucronate, with a clavate gland on the petiole between the lower pair; peduncles axillary, usually 4-flowered.  $\frac{1}{2}$ . S. Native of St. Martha. Legume linear, straight.

*Pale-flowered Wild-senna.* Fl. June, July. Clt. 1818. Shrub 4 to 6 feet.

49 *C. TOMENTOSA* (Lam. dict. 1. p. 647.) leaves with 6-8 pairs of oval-oblong obtuse leaflets, which are nearly glabrous above, but clothed with hoary tomentum beneath; petiole furnished with glands, usually with one between each pair of leaflets; legumes compressed, pubescent.  $\frac{1}{2}$ . S. Native of South America, near Santa-Fe-de-Bogota. H. B. et Kunth, nov. gen. amer. 6. p. 345. *C. multiglandulosa*, Jacq. icon. rar. 1. t. 72.

*Var.  $\beta$ , albida* (Ort. dec. 8. p. 92.) leaves with 2-5 pairs of oblique oval leaflets; glands subulate.  $\frac{1}{2}$ . S. Native of New Spain. Flowers pale yellow.

*Tomentose Wild-senna.* Fl. July, Sept. Clt. 1822. Shrub 5 to 7 feet.

50 *C. CANA* (Nees et Mart. nov. act. bonn. 12. p. 33.) leaves with 6-8 pairs of oblong, oblique, acutish leaflets, which are tomentose beneath, with a large subulate gland between each pair except the lower one; stipulas reniform, one of them furnished with a cuspidate lobe on one side; racemes axillary.  $\frac{1}{2}$ . S. Native of Brazil, at Barra-das-Veredas. The whole shrub is clothed with canescent tomentum. The legume is unknown, but the plant itself is said to be nearly allied to *C. tomentosa*.

*Hoary Wild-senna.* Shrub 4 to 6 feet.

51 *C. MEXICANA* (Jacq. hort. schœnbr. t. 203.) leaves with 5-7 pairs of oval-oblong, bluntish pubescent, ciliated leaflets, which are unequal at the base, with an ovate-cylindrical gland on the petiole between the lower pair; petioles and branches velvety.  $\frac{1}{2}$ . S. Native of Mexico and St. Domingo.

*Mexican Wild-senna.* Fl. June, July. Clt. 1824. Shrub 6 to 10 feet.

52 *C. BARCLAYANA* (Sweet, fl. austr. t. 32.) leaves with 6-8 pairs of linear-lanceolate, acute, glabrous leaflets, with a fascicle of glands between each of the pairs of pinnae, and one large depressed one at the base of the petiole; peduncles axillary and terminal, many-flowered, shorter than the leaves; 4 of the stamens sterile.  $\frac{1}{2}$ . G. Native of New Holland. (f. 57.)

*Barclay's Wild-senna.* Fl. June, Aug. Clt. 1824. Shrub 2 to 4 feet.

53 *C. AUSTRALIS* (Hook. bot. mag. 2676.) leaves with 12 pairs of oblong-lanceolate leaflets, with a subulate pedicellate gland between each of the pairs; petals and sepals nearly equal; peduncles usually 4-flowered.  $\frac{1}{2}$ . G. Native of New Holland. Flowers large, yellow.

*Southern Wild-senna.* Fl. June, Aug. Clt. 1824. Shrub 3 to 4 feet.

3 L

FIG. 57.

89 *C. NI'GRICANS* (Balb. herb. ex D. C. prod. 2. p. 496.) of linear-oblong, pairs of elliptic mucronate leaflets, which are gland on the petiole, with a thick obtuse gland on the petiole, Arabia Felix. *C. base*, and sometimes between the lower pair; haps belonging to a *aves*, as well as the petioles and branches peduncles axillary, short, few-flowered. *h. S. Domingo*. It is allied to *C. frondosa*, but being very obtuse, not acutely ovate, as in

\*\*\* *Eglandulæ* there are no glands

*Petioles without glandula*. Shrub 5 to 6 feet.

90 *C. APHY'LLA* (leaves with 3 pairs of ovate, glabrous, mucronate are margined with white, with a pedicellate stipulas wanting; situated between the lower pair; stipulas linear, lanceolate at the apex. racemes axillary, racemose. *h. S. Native of Buenos Ayres*. Bertèrii, Coll. hort. rip. p. 30. t. 24.

*Leaflets* *Wild-senna*. Fl. May, July. Clt. 1824. Sh. 8 to 10 ft.

56 *C. STIPULACEA* (Ait. hort. kew. 2. p. 52.) leaves with 8 pairs of ovate-lanceolate glabrous leaflets, with a gland on the petiole between the lower pair; stipulas ovate, large. *h. S. Native of Chili*. Feuill. per. 2. p. 56. t. 42.

*Large-stipuled Wild-senna*. Fl. June, Aug. Clt. 1786. Shrub.

57 *C. AURICULATA* (Lin. spec. 542.) leaves with 8-12 pairs of oval, obtuse, rather mucronate leaflets, which are puberulous when young, but at length become nearly glabrous, with numerous subulate glands on the petiole; stipulas reniform; racemes axillary; bractæas oval-oblong, mucronate. *h. S. Native of the East Indies*.—Pluk. alm. t. 314. f. 4. Glands on the petioles sometimes wanting.

*Auricled Wild-senna*. Fl. June, July. Clt. 1777. Sh. 4 to 6 ft.

58 *C. GAUDICHAUDII* (Hook. in Beech. voy. append. p. 81.) leaves with 4 pairs of elliptic-oblong, rather emarginate, glabrous leaflets, which are pale beneath, with a linear obtuse gland on the petiole between the lower pair; stipulas subulate, racemes axillary, shorter than the leaves; legumes pendulous, linear, compressed, membranous, usually 8-seeded. *h. G. Native of the Sandwich Islands*.

*Gaudichaud's Wild-senna*. Shrub.

59 *C. CHATELAINIANA* (Gaud. in Freyenet, voy. part. bot. p. 485. t. 111.) leaves with 4-5 pairs of lanceolate-linear, thickish, glabrous leaflets, with stipitate glands on the petiole, one below each pair of leaflets; umbels axillary, stalked, few-flowered; sepals obtuse; legumes membranous, flat, smooth. *h. G. Native of New Holland, on the western coast*.

*Chatelain's Wild-senna*. Shrub.

60 *C. SUFFRUTICOSA* (Roth, nov. spec. 213.) leaves with 9 pairs of oval, obtuse, rather pilose leaflets, which are glaucous beneath, with a pedicellate gland between each of the 2 lower pairs on the petiole; stipulas linear, rather falcate; corymbs fastigiate. *h. S. Native of the East Indies*.

*Suffruticose Wild-senna*. Shrub.

61 *C. FASTIGIATA* (Vahl. symb. 3. p. 57.) leaves with 9 pairs of oblong, obtuse, glabrous leaflets, with a pedicellate gland between each of the pairs of pinne on the petiole; calyx clothed with canescent villi. *h. S. Native of the East Indies*.

*Fastigiate Wild-senna*. Fl. June, July. Clt. 1810. Shrub 4 to 6 feet.

62 *C. FRONDOSA* (Ait. hort. kew. 2. p. 35.) leaves with 9 pairs of oval-oblong, smoothish, bluntish leaflets, with a cylindrical gland on the petiole between the lower pair; racemes axillary, shorter than the leaves. *h. S. Native of South America*.

*Var. a, tenuissima* (Zucc. obs. no. 70.) branches and petioles rather pubescent; leaflets smaller. *h. S. Native of Cuba, about the Havannah*.

*Var. β, crista* (Jacq. icon. rar. 1. t. 74.) branches and petioles smoothish; leaflets larger. *h. S. Native of Florida and St. Domingo*.

*Var. γ, pubescens* (Collad. mon. p. 106.) branches clothed with velvety down, as well as the under surface of the leaves. *h. S. Native of St. Domingo*.

*Var. δ, galegifolia* (Collad. l. c.) glabrous; leaflets larger, deep green; flowers sublateral.

*Frondose Wild-senna*. Fl. March, April. Clt. 1769. Shrub 3 to 6 feet.

63 *C. POLYPHYLLA* (Jacq. icon. rar. t. 460.) leaves with 10-12 pairs of elliptic-obtuse, somewhat mucronate, ciliated leaflets, with an oblong gland on the petiole between the lower pair; peduncles 2-flowered, shorter than the leaves. *h. S. Native of Porto-Rico*. There is sometimes a gland between more of the pairs of leaflets than the lower one.

*Many-leafletted Wild-senna*. Fl. June, July. Clt. 1816. Sh. 4 to 6 feet.

64 *C. LUTE'SCENS*; stems clothed with yellowish tomentum, as well as the petioles and under surface of the leaves, peduncles, and calyxes; upper surface of the leaflets hardly pubescent; leaves with 7-8 pairs of lanceolate, mucronate leaflets, which are oblique at the base; petiole bearing glands, one between each pair of leaflets; racemes shorter than the leaves, somewhat corymbose at the apex. *h. S. Native of Peru*. *C. pubescens*, Ruiz et Pav. in herb. Lamb. Stem simple.

*Yellowish Wild-senna*. Shrub.

65 *C. AURANTIA* (Ruiz et Pav. in herb. Lamb.) pubescent; leaves with 6 pairs of elliptic, oblique, obtuse, mucronate leaflets, with an acute gland on the petiole between the lower pair; racemes axillary, longer than the leaves. *h. S. Native of Peru*. Flowers orange-coloured.

*Orange-flowered Wild-senna*. Shrub.

66 *C. ANGUSTISILIQUA* (Lam. dict. 1. p. 649.) leaves with 10 pairs of oblong, acute, awned leaflets, with a pedicellate gland on the petiole between the lower pair of leaflets; legumes linear, compressed. *h. S. Native of St. Domingo*. Plum. ed. Burn. t. 78. f. 2. Flowers large.

*Narrow-podded Wild-senna*. Shrub 6 to 8 feet.

67 *C. MARGINATA* (Willd. enum. 444. but not of Roxb.) leaves with usually 15 pairs of linear-elliptic leaflets, with a subulate gland on the petiole between each of the pairs. *h. S. Native of Surinam; the rest unknown*.

*Margined Wild-senna*. Shrub.

68 *C. SELLOI*; branches and petioles pubescent; leaves with numerous pairs of lanceolate-linear mucronate leaflets, which are glaucous beneath, with a gland between the lower pair; racemes forming terminal panicles. *h. S. Native of Brazil, Sello*.

*Sello's Wild-senna*. Shrub.

69 *C. CALLANTHA* (Meyer, prim. esseq. 169.) leaves with 24 pairs of oblong-linear, glabrous leaflets, with a subulate gland on the petiole between the lower pair; racemes terminal; legumes glabrous. *h. S. Native of Guiana, near Essequibo*. Flowers large. According to Meyer this species is allied to *Ponciana*.

*Beautiful-flowered Wild-senna*. Shrub.

70 *C. MUTISIANA* (Kunth, mim. p. 142. t. 43. nov. gen. amer. 6. p. 359.) leaves with 40-50 pairs of oblong-linear leaflets, which are rounded at the apex, puberulous above, but hairy-pubescent beneath, as well as the petioles; branches very hispid; glands on the petiole, one between each pair of leaflets; racemes axillary, solitary, and twin. *h. S. Native of New Granada*. Legume linear, membranous, glabrous. Seeds 20-26.

*Mutis's Wild-senna*. Shrub.

\*\*\* *Basiglandulose* (from *basis*, the base, and *glandula*, a gland; leaves furnished with a gland at the base of the petiole). *Leaves with a sessile gland at the base of the petiole*.

71 *C. LONGISILIQUA* (Lin. fil. suppl. 230.) leaves with 4-5 pairs of ovate-oblong, acute, glabrous leaflets, outer ones the

longest, with acute glands on the petiole, one beneath or between the lower pair of leaflets, and another between the outer pair. *h. S.* Native of St. Domingo. From the situation of the glands this species appears to be intermediate between the present and the preceding division of the genus.

*Long-siliqued Wild-senna.* Fl. June, July. Clt. 1800. Shrub 3 to 6 feet.

72 *C. FALCATA* (Lin. spec. 539.) leaves with 4 pairs of ovate-lanceolate, retro-falcate leaflets, outer ones the largest, and with the outer side broadest, with a gland at the base of the petiole. *○. S.* Native of South America.

*Falcate-leafletted Wild-senna.* Pl. 1 to 2 feet.

73 *C. VENENIFERA* (Meyer, prim. esseq. 167.) leaves with 4 pairs of oval hairy leaflets, with a gland at the base of the petiole; racemes axillary, few-flowered; legumes pubescent. *h. S.* Native of Guiana, near Essequibo, in bushy sandy places, where it is called *Piami*, and where the roots are used by the inhabitants to intoxicate fish by throwing them in the water.

*Poison-bearing Wild-senna.* Shrub 3 to 6 feet.

74 *C. ÆGYPTIACA* (Willd. enum. 442.) leaves with 6 pairs of lanceolate, acute, glabrous leaflets, outer ones the largest, with a lanceolate gland at the base of the petiole; racemes terminal; peduncles 2-flowered. *h. S.* Native of Egypt.

*Egyptian Wild-senna.* Fl. May. Clt. 1822. Sh. 3 to 4 ft.

75 *C. OCCIDENTALIS* (Lin. spec. 539.) leaves with 4-6 pairs of ovate-lanceolate leaflets, with pubescent margins, and with a thick gland at the base of the petiole; peduncles short, 2-4-flowered, lower ones axillary, the rest disposed in a terminal raceme; legumes flat, compressed, with the sutures tumid. *○. S.* Native of South America and the West India Islands. Sloane, hist. 2. p. 175. f. 3, 4. Ker, bot. reg. t. 83. *C. planisiliqua*, Lin. spec. 510. *C. Caroliniana*, Walt. car. 135? ex Ell. sketch. 471. *C. occidentalis*, Burm. ind. 96. This is a very common species about Kingston in Jamaica, where it is called *stinking-weed*. The tops of the plant are commonly employed in all resolutive baths, and it is accounted a very powerful ingredient on such occasions.

*Var. β, glabra* (D. C. prod. 2. p. 497.) leaflets nearly elliptic, glabrous. *C. geminiflora*, Schrank, hort. mon. t. 26.

*Var. γ, aristata* (D. C. l. c.) leaflets ovate-lanceolate, with pubescent margins, awnedly-mucronate at the apex. Collad. mon. p. 108.

*Occidental Wild-senna.* Fl. May, Aug. Clt. 1759. Sh. 1 to 2 ft.

76 *C. PURPUREA* (Roxb. et Jacq. fil. ex Schrad. in litt. D. C. prod. l. c.) leaves with 5 pairs of ovate-lanceolate glabrous leaflets, with a small obtuse gland at the base of the petiole; peduncles 3 times shorter than the leaves, 4-6-flowered. *h. S.* Native of the East Indies. Lindl. bot. reg. 856. Stems purple at the base. Flowers yellow, as in the rest of the species. Legume unknown. Very like *C. occidentalis*.

*Purple-stemmed Wild-senna.* Fl. June, Aug. Clt. 1821. Sh. 3 to 4 feet.

77 *C. TÆTIDA* (Ruiz et Pav. in herb. Lamb.) hairy; leaves with 5 pairs of ovate acute leaflets; racemes axillary, about the length of the leaves; legumes ovate, membranous, cuspidate. *h. S.* Native of Chili. Stipulas ovate, oblique at the base. Petiole bearing a gland below some of the pairs of leaflets.

*Fetid Wild-senna.* Shrub.

78 *C. HIRSU'TA* (Lin. fil. suppl. p. 231.) leaves with 4-6 pairs of hairy, broadly-ovate, acuminate leaflets, with a depressed gland at the base of the petiole; racemes axillary, short, crowded; calyx very villous. *h. S.* Native of South America. *C. Caraccasana*, Jacq. hort. schœnbr. t. 270.

*Hairy Wild-senna.* Fl. July. Clt. 1778. Shrub 3 to 6 feet.

79 *C. LINEARIS* (Michx. fl. bor. amer. 1. p. 261.) leaves with

5-6 pairs of oval-lanceolate, acute, glabrous leaves with 2 at the base of the petiole; peduncles usual leaflets; petioles lary, and terminal; legumes linear, straight. id and clammy; Carolina. Said to be nearly allied to *C. occ. es disposed in a narrow and very acute, ex Michx., ovate C. viscosa*, Vahl. Legume compressed, ex Michx., terete, ex -coloured, drying

*Linear-leafletted Wild-senna.* Fl. June, 1 to 2 feet.

80 *C. ang's Cassia.* hort. kew. 2. p. 51. 1824. Pl. 1½ ft. of oblong viscosa (H. B. K. hort. kew. 2. p. 51.) leaves with 2 pairs of oblong leaflets, with ciliated leaflets, and of the well as the petioles short. *h. S.* many, and pilose; India, pedicels, and a. Fl. July, Aug. Clt. clammy pili; racemes terminal and late. Jacq. fragm. 46. t. 4. *h. S.* Native of Flowers yellow.

*Clammy Cassia.* Shrub. The margins branches and petioles an *C. C. PAYSONII* thick gland at the base of the petiole; racemes terminal; peduncles short, 2-4-flowered. *h. S.* Native country unknown.

*Pubescent Wild-senna.* Fl. June, July. Clt. 1818. Sh. 6 ft.

82 *C. CANEA* (Cav. descrip. pl. 131.) leaves with 6 pairs of ovate-lanceolate, somewhat ciliated leaflets, with a sessile gland at the base of the petiole; flowers sub-umbellate; legumes almost quadrangular. *h. S.* Native of Cumana. Lag. ex Rod. in ann. scienc. nat. 1802. vol. 5. p. 70. Perhaps sufficiently distinct from *C. occidentalis*.

*Canea Wild-senna.* Shrub 2 to 3 feet.

83 *C. SULCATA* (D. C. cat. hort. monsp. p. 90. no. 58.) leaves with 6-9 pairs of oval-oblong bluntish leaflets, which are pubescent beneath and on the margins, with an ovate thick gland at the base of the petiole; branches glabrous, furrowed. *h. S.* Native of South America. Collad. mon. p. 110. t. 6. *C. cœrnua*, Balb. cat. hort. taur. 1813. p. 22.

*Furrowed Wild-senna.* Fl. Jun. July. Clt. 1820. Sh. 2 to 3 ft.

84 *C. RUSCIFOLIA* (Jacq. icon. rar. 1. p. 71.) leaves with 6 pairs of ovate-lanceolate, almost glabrous leaflets, with a terete gland at the base of the petiole; legumes compressed, oblong-linear, tapering at both ends, with the sutures prominent. *h. S.* Native of Caraccas. H. B. et Kunth, nov. gen. amer. 6. p. 355.

*Ruscus-leaved Wild-senna.* Clt. 1816. Shrub 4 to 6 feet.

85 *C. LIGUSTRINA* (Lin. spec. 541.) leaves with 7 pairs of lanceolate, acuminate, rather ciliated leaflets, with a terete erect gland, which is rather distant from the base of the petiole. *h. S.* Native of America, from Cayenne to Virginia.—Dill. hort. elth. 350. t. 250. f. 328.

*Privet-like Wild-senna.* Fl. July. Clt. 1726. Sh. 5 to 6 feet.

86 *C. ROBINIOIDES* (Willd. enum. 443.) leaves with 6-9 pairs of lanceolate, acuminate, glabrous leaflets, with a sessile gland at the base of the petiole. *h. S.* Native of South America.

*Robinia-like Wild-senna.* Clt. 1823. Tree 10 to 20 feet.

87 *C. MARYLANDICA* (Lin. spec. 541.) leaves with 8-9 pairs of ovate-oblong, equal, mucronate leaflets, with an ovate gland at the base of the petiole; racemes axillary, many-flowered, shorter than the leaves; legumes compressed, linear, hispid, at length glabrous. *h. S.* Native of North America, in temperate places. Schkuhr, handb. 1. t. 113. —Dill. hort. elth. t. 260. f. 339. Root with black fibres. The leaves are used in North America as a substitute for senna.

*Maryland Wild-senna.* Fl. Aug. Oct. Clt. 1723. Pl. 2 to 3 ft.

88 *C. POLYANTHA* (Moc. et Sesse, in Collad. mon. p. 112. t. 2.) leaves with 12 pairs of oval mucronate leaflets, with an ovate thick gland at the base of the petiole; flowers panicle, corymbous; legumes compressed, and furnished with a narrow wing on both sutures. *h. S.* Native of New Spain.

*Many-flowered Wild-senna.* Shrub.

*Contrary-flowered Wild-senna.* Fl. June, Sept. Clt. 1820. Shrub 6 feet.

109 *C. SETIGERA* (D. C. prod. 2. p. 499.) leaves with 10-12 pairs of leaflets, which are glabrous, as well as the branches; leaflets oval-oblong, obtuse at both ends, each ending in a deciduous bristle, glaucous beneath; petioles glandless; racemes axillary and terminal, disposed in panicles; legumes flat. *h. S.* Native of the East Indies.

*Bristle-bearing Wild-senna.* Shrub.

110 *C. MONTANA* (Roth. nov. spec. 214.) leaves with about 12 pairs of oblong-oval, somewhat emarginate leaflets, which are glabrous on both surfaces; petioles glandless; racemes axillary; flowers heptandrous. *h. S.* Native of the East Indies.

*Mountain Wild-senna.* Shrub.

111 *C. TIMORINENSIS* (D. C. prod. 2. p. 499.) leaves with 12-15 pairs of oval-oblong leaflets, which are obtuse at both ends, mucated with awns, and clothed with hairy pubescence beneath; petioles glandless, and are as well as the branches puberulous; racemes many-flowered, shorter than the leaves; legumes flat, immarginate. *h. S.* Native of the Island of Timor.

*Timor Wild-senna.* Shrub.

SECT. IV. *BASEOPHYLLUM* (from *βασις*, *basis*, and *φυλλον*, *phyllon*, a leaf; in reference to the lower pair of leaflets being at the base of the petiole). D. C. in Collad. mon. p. 115. Sepals obtuse. Stamens nearly equal. Anthers oblong, all fertile, opening by 2 chinks at the apex. Legume flat, compressed, 1-celled, destitute of pulp. Seeds vertical, compressed, oval, longer than the funicle, but hardly shorter than the breadth of the valves.

112 *C. CYTISODES* (D. C. in Collad. mon. p. 116. t. 14.) leaves with 3 pairs of obovate-orbicular, glabrous leaflets, the lower pair approximating the axil, with a sessile gland on the petiole, between the 2 lower pairs of leaflets. *h. S.* Native of Brazil.

*Cytisus-like Cassia.* Shrub.

SECT. V. *ABSUS* (a name which Prosper Alpinus gave to *C. Absus*, from the name of a river in Palestine). D. C. in Collad. mon. p. 116. prod. 500. Sepals bluntish or acutish. Petals nearly equal. Stamens 5-10, nearly equal, all fertile. Anthers opening by 2 chinks at the apex. Legumes flat, compressed, destitute of pulp, 1-celled, or many-celled from obsolete dissepiments. Seeds vertical, or parallel to the valves, ovate, compressed, with the funicle short and scale-formed.—Annual herbs or subshrubs. Leaves with 2 pairs of leaflets. Bracteoles small, along the pedicels.

113 *C. ABSUS* (Lin. spec. 537.) leaves with 2 pairs of obovate, glabrous, ciliated, dotted leaflets, with small glands on the petiole between the lower pair of leaflets; branches and petioles pubescent; lower flowers solitary in the axils of the leaves, upper ones disposed in a naked terminal raceme. *h. S.* Native of Ceylon (Burm. zeyl. t. 97.) and Egypt, also of Jamaica, where it has probably been introduced. Collad. mon. p. 77. and 117. Jacq. ecl. 1. t. 53. Flowers copper-coloured or yellow, pentandrous. The seeds are used in ophthalmia, when reduced to powder.

*Absus Cassia.* Fl. June, July. Clt. 1777. Pl. 2 to 3 feet.

114 *C. HISPIDA* (Collad. mon. p. 118.) leaves with 2 pairs of ovate-roundish, glabrous, dotless leaflets; petioles glandless; branches and legumes hispid; racemes terminal, naked, elongated. *h. S.* Native of Cayenne. *C. Absus*, Aubl. guian. 1. p. 381. exclusive of the synonymes. *C. hispidula*, Vahl. ecl. amer. 3. p. 10. Sepals acuminate.

*Hispid Cassia.* Pl. 1 to 2 feet.

115 *C. THONNINGII* (D. C. prod. 2. p. 500.) leaves with 2 pairs of ovate, acute, ciliated, viscid, pilose leaflets; petioles glandless; stems peduncles, and calyxes hispid and clammy; lower flowers axillary and solitary, upper ones disposed in a terminal raceme. *h. S.* Native of Guinea. *C. viscosa*, Vahl. herb. but not of Kunth. Flowers copper-coloured, drying brown.

*Thonning's Cassia.* Fl. June, July. Clt. 1824. Pl. 1½ ft.

116 *C. VISCOSA* (H. B. et Kunth, nov. gen. amer. 6. p. 360.) leaves with 2 pairs of obovate, emarginate, ciliated leaflets, and are as well as the petioles glandular, clammy, and pilose; branches, pedicels, and calyxes clothed with clammy pili; racemes terminal and lateral, many-flowered. *h. S.* Native of New Granada, near Contreras and Ibagne. Flowers yellow.

*Clammy Cassia.* Shrub 5 to 6 feet.

117 *C. PAUCIFLORA* (H. B. et Kunth, l. c.) leaves with 2 pairs of elliptic, obtuse, clammy leaflets; petiole glandless; branches and pedicels clammy; racemes terminal, few-flowered. *h. S.* Native of Mexico, near La Venta del Peregrino. *C. brachystachya*, Moc. et Sesse, fl. mex. icon. ined. Very like the preceding species.

*Few-flowered Cassia.* Shrub 2 to 3 feet.

118 *C. LOTODES* (H. B. et Kunth, l. c.) leaves with 2 pairs of obovate, glabrous leaflets, which are rounded at the apex; petioles glandless; branches and pedicels clothed with clammy hairs; racemes terminal. *h. S.* Native of Cumana, near Caripe, and in sand on the banks of the Orinoco. Procumbent. Flowers yellow, large.

*Lotus-like Cassia.* Fl. June, July. Clt. 1820. Sh. procumb.

SECT. VI. *CHAMÆCRISTA* (a name given by Breynius to this section). Breyn. prod. 2. p. 29. D. C. in Collad. mon. p. 118. prod. 2. p. 500.—*Grimaldia*, Schrank, ex Biroli, cat hort. bot. taur. 1815. p. 36. Sepals acuminate, nearly equal. Stamens 10, or only 5-7 from abortion. Anthers oblong, glabrous, opening by 2 pores at the apex. Legumes flat, compressed, dehiscent, destitute of pulp. Seeds vertical, compressed, ovate, or nearly square.—Herbs or subshrubs. Stipulas many-nerved at the base. Pedicels bearing 2 acute bracteoles each, axillary, sometimes joined with the branches at the base, and therefore may be said to be supra-axillary. Flowers and fruit erect. Leaflets lapping over each other, when in sleep or at night.

§ 1. *Bauhiniaæ* (plants whose leaves appear like those of *Bauhinia*). D. C. prod. 2. p. 501. Leaves usually with 1 or 2 pairs of leaflets, rarely with 3-4 pairs.

119 *C. BAUHINIFOLIA* (Kunth, mim. p. 123. t. 37.) leaves with 1 pair of obovate, emarginate, obliquely cordate leaflets, with the margins undulately repand, and puberulous on both surfaces; petioles glandless, and are as well as the branches clothed with soft pubescence; stipulas cordate, acuminate; peduncles 1-3, axillary, 1-flowered, bibracteate, pilose at the apex as well as the calyxes. *h. S.* Native on the sandy banks of the Orinoco. H. B. et Kunth, nov. gen. amer. 6. p. 364.

*Bauhinia-leaved Cassia.* Shrub 2 to 3 feet.

120 *C. COTINIFOLIA*; glabrous; leaves with 1 pair of roundish, retuse, coriaceous, repand leaflets; racemes bristly, simple, and panicled. *h. S.* Native of Brazil. Sello. (v. s. herb. Lamb.)

*Cotinus-leaved Cassia.* Shrub 6 to 10 feet.

121 *C. DIPHYLLA* (Lam. dict. 1. p. 642.) leaves with 1 pair of obovate, 5-7-nerved leaflets, which are unequal at the base, and quite glabrous, as well as the branches; stipulas lanceolate, cordate, ciliated at the base, permanent; petiole ending in an awn. *h. S.* Native of Porto Rico, Cayenne, and about Acapulco. Cav. icon. 6. t. 600.

*Two-leaved Cassia.* Fl. May, July. Clt. 1781. Shrub 1 to 2 feet.

122 *C. BIFOLIATA* (D. C. in Collad. mon. 120. t. 9. f. B.) leaves with 1 pair of leaflets, which are as well as the branches and petioles pilose; leaflets obovate, 3-5-nerved at the base; stipulas cordate, lanceolate, ciliated; petiole without any awn. *h. S.* Native of Brazil, very common about Rio Janeiro. *C. pentandra*, Raddi, pl. bras. add. p. 20. Flowers pentandrous, ex Raddi. *C. nummulària*, Vahl. med. *C. rotundifolia*, Pers. is perhaps the same, ex Juss. Legume puberulous.

*Bifoliate Cassia.* Fl. June, July. Clt. 1820. Sh. 1 to 2 ft.

123 *C. FABAGINIFOLIA* (H. B. et Kunth, nov. gen. amer. 6. p. 363.) leaves with 1 pair of obovate, rather retuse, obliquely cordate, ciliated, glabrous leaflets; petioles glandless, and are as well as the branches beset with soft hairs; pedicels 1-2-together, axillary, 1-flowered, bibracteate, glabrous. *h. S.* Native of Mexico, on the burning mount Jorullo.

*Pabago-leaved Cassia.* Shrub 1 to 2 feet.

124 *C. CULTRIFOLIA* (H. B. et Kunth, nov. gen. amer. 6. p. 363.) leaves with 1 pair of oblong-lanceolate, falcately-ensiform, glabrous leaflets, which are denticulately ciliated at the apex; petioles furnished with 1 gland beneath the leaflets; branches marked by a pilose line; pedicels axillary, solitary, 1-flowered, hairy, bibracteate. *h. S.* Native on the banks of the river Orinoco.

*Knife-leaved Cassia.* Shrub 1 to 2 feet.

125 *C. LINEARIFOLIA*; leaves with 1 pair of long, linear, coriaceous, glabrous, acuminate leaflets; sepals acute. *h. S.* Native of Brazil. Sello. (v. s. herb. Lamb.)

*Linear-leafletted Cassia.* Shrub 2 to 3 feet.

126 *C. PULCHRA* (H. B. et Kunth, nov. gen. 6. p. 362.) leaves with 2 pairs of obovate-oblong, glabrous leaflets, which are rounded at the apex; petiole furnished with 1 gland beneath the leaflets; branches marked with 2 rows of stiff hairs; pedicels axillary, solitary, 1-flowered, bibracteate, hispid. *h. S.* Native of South America, near San Carlos del Rio Negro.

*Fair Cassia.* Shrub 1 to 2 feet.

127 *C. GRAVILIS* (Kunth, mim. p. 130. t. 36.) leaves with 2 pairs of obovate-oblong, obtuse, glabrous leaflets; branches also glabrous; petiole bearing 1 gland beneath the leaflets; pedicels solitary, axillary, 1-flowered, bibracteate, glabrous, twice the length of the leaves. *h. S.* Native on the banks of the river Orinoco. H. B. et Kunth, nov. gen. amer. 6. p. 360. Legume glabrous, rather twisted.

*Slender Cassia.* Fl. June, July. Clt. 1817. Sh. 1 to 2 ft.

128 *C. ROTUNDIFOLIA* (Pers. ench. 1. p. 156.) leaves with 2 pairs of roundish leaflets; branches rather villous; stipulas small, ovate, acuminate, about equal in length to the petioles; pedicels axillary, 1-flowered, elongated. *h. S.* Native of Brazil. Legume pubescent, flat, 10-12-seeded, length of pedicel.

*Round-leafletted Cassia.* Shrub 1 to 2 feet.

129 *C. PERSOONII* (Collad. mon. p. 119.) leaves and branches glabrous; leaves with 2 pairs of obovate veiny leaflets; stipulas lanceolate, adpressed, about equal in size to the leaflets. *h. S.* Native of Cayenne. *C. lanceolata*, Pers. ench. 1. p. 456. but not of Forsk.

*Persoon's Cassia.* Shrub 1 to 2 feet.

130 *C. UNIFLORA* (Spreng. neue entd. 1. p. 291.) leaves with 2 pairs of glabrous, obovate-lanceolate, veiny leaflets; branchlets pubescent; petioles glandular in the middle; stipulas cordate-lanceolate; pedicels axillary, 1-flowered, 10-times longer than the petioles. *h. S.* Native of Brazil. Flowers reddish. According to Neuw. reis. bras. vol. 2. the leaflets are shining and silky beneath, with a gland on the petiole between the lower pair. The flowers corymbose, and the legumes covered with

yellow hairs. This is perhaps the same or perhaps a different species.

*One-flowered Cassia.* Shrub 1 to 2 feet.

131 *C. BREVIPES* (D. C. in Collad. mon. p. 119. t. 9. f. A.) leaves with 2 pairs of glabrous leaflets; young branches and petioles tomentose; leaflets oblong; stipulas cordate-lanceolate, many-nerved at the base; petioles glandless; pedicels axillary, 1-flowered, rather shorter than the petioles. *h. S.* Native of Panama.

*Short-pedicelled Cassia.* Shrub 1 to 2 feet.

132 *C. KUNTHIANA* (Schlecht. et Cham. in Linnæa. 5. p. 599.) stems trailing, filiform, puberulous; leaves distich, with 3 pairs of approximate leaflets; rachis ending in a bristle-like mucrone; leaflets obliquely-obovate, mucronulate, 3-nerved, and reticulately veined, glabrous, obsolete ciliated; petiole pubescent, bearing a gland between the lower pair of leaflets; stipulas cordate, ovate, acuminate, pungent, many-nerved, ciliated; peduncles axillary, solitary, bibracteate, pubescent on the inner side, exceeding the leaves. *h. S.* Native of Mexico, on hills near Hacienda de la Laguna.

*Kunth's Cassia.* Shrub procumbent.

133 *C. TOLIOSA*; branches pubescent; leaves with 3-4 pairs of elliptic, obtuse, mucronate, glabrous leaflets; pedicels 2-3, axillary; sepals acute; legumes flat, lanceolate; stipulas linear-subulate. *h. S.* Native of Peru. (v. s. in herb. Lamb.)

*Leafy Cassia.* Shrub.

134 *C. TENELLA* (H. B. et Kunth, nov. gen. amer. 6. p. 365.) leaves with 2-4 pairs of oblong, glabrous leaflets; stems procumbent, puberulous; petioles bearing 1 gland, puberulous; pedicels puberulous, axillary, solitary, 1-flowered, bibracteate. *h. S.* Native on the banks of the river Orinoco, near San Borja.

*Weak Cassia.* Fl. June, July. Clt. 1820. Sh. procumbent.

135 *C. MICRONATA* (Spreng. syst. 2. p. 341.) leaves with 3 pairs of oblong-elliptic, mucronate, glabrous leaflets, with an urceolate gland between the lower pair; peduncles axillary, 1-flowered. *h. S.* Native of Brazil.

*Mucronate-leaved Cassia.* Shrub 1 to 2 feet.

§ 2. *Mimosæ-idea* (from *Mimosa*, and *idea*, like; plants with the habit of *Mimosa*). D. C. prod. 2. p. 502. *Leaves with from 5 to 50 pairs of leaflets.*

136 *C. LINEATA* (Swartz, fl. ind. occ. p. 726.) erect; leaves with 5 pairs of oblong, obtuse, mucronulate leaflets, which are pubescent beneath, but glabrous above as well as the petioles and branches, with a sessile gland at the base of the petiole; pedicels 1-flowered, axillary, and lateral; legumes hairy. *h. S.* Native of Jamaica, among rubbish.

*Lined-leaved Cassia.* Fl. Ju. Jul. Clt. 1818. Sh. 1 to 3 ft.

137 *C. CUNEATA* (D. C. in Collad. mon. p. 121.) erect; leaves with 5 pairs of obovate-cuneate, very blunt, mucronate leaflets, which are pubescent beneath as well as the branches and petioles, with a sessile gland at the base of the petiole; pedicels axillary, aggregate; legumes pubescent, spirally twisted. *h. S.* Native of South America.

*Cuneate-leafletted Cassia.* Shrub 1 to 2 feet.

138 *C. PROSTRATA* (Humb. et Bonpl. in Willd. enum. 441.) prostrate; leaves with 5-7 pairs of oblong-linear, cultriform, obtuse, mucronate leaflets; petiole pilose, bearing a pedicellate gland at the base; pedicels axillary, solitary, 1-flowered, glabrous; legumes pubescent. *h. S.* Native of South America, near the Orinoco. Stipulas and petioles ciliated at the base. H. B. et Kunth, nov. gen. amer. 6. p. 365.

*Prostrate Cassia.* Fl. May, Aug. Clt. 1819. Pl. prostrate.

139 *C. PYGMEA* (D. C. mon. sec. nat. gen. 2. p. 2. t. 131.) prostrate; leaves with 4-6 pairs of linear, mucronate leaflets,

which are pubescent as well as the branches and petioles; petiole bearing a pedicellate gland at the base; pedicels solitary, axillary, 1-flowered, longer than the leaves, bibracteate above the middle; legumes rather pubescent. ♀. S. Native of St. Domingo.

*Pygmy Cassia.* Pl. prostrate.

140 *C. PILOSA* (Lin. spec. 540.) erect; leaves with 5 pairs of oblong, ciliated leaflets, ending in a bristle; petioles glandless; stems straight, and are as well as the petioles beset with long, spreading, stiff hairs; pedicels axillary, 1-flowered, solitary, bibracteate at the base, longer than the leaves. ♀. S. Native of Jamaica. Swartz, obs. 160.

*Pilose Cassia.* Fl. June, July. Clt. 1818. Pl. 1 to 2 feet.

141 *C. GRAMMICA* (Spreng. neue entd. 3. p. 55.) erect; leaves with 6-7 pairs of canescent, pubescent leaflets; branches and petioles clothed with velvety hairs; leaflets oblong, mucronate, veiny beneath, with a pedicellate gland on the petiole below the lower pair of leaflets; pedicels axillary, solitary, 1-flowered, length of petiole; legumes pubescent. ♀. S. Native of Cuba and St. Domingo.

*Written-veined Cassia.* Pl. 1 to 2 feet.

142 *C. SERPENS* (Lin. spec. 541.) plant rather procumbent; leaves with 7 pairs of oblong-linear, mucronate leaflets; petioles and branches glabrous, with a sessile gland on the petiole beneath the leaflets; pedicels 2-3-together in a fascicle, supra-axillary, 1-flowered, shorter than the petioles; legumes smoothish, apiculated by the style. ♂. S. Native of Jamaica. Swartz, obs. 161. Collad. mon. 128. Flowers small.

*Creeping Cassia.* Pl. procumbent at the base.

143 *C. FASCICULATA* (Michx. fl. bor. amer. 1. p. 262.) leaves with 8-9 pairs of oblong-linear, mucronate leaflets, with a sessile gland on the petiole; pedicels in lateral fascicles; legumes smooth, rather arched. ♀. G. Native of Pennsylvania, Virginia, and Carolina. Ell. sketch. 473.

*Fascicled-flowered Cassia.* Pl. 1 to 2 feet.

144 *C. TRIFLORA* (Jacq. hort. schœnbr. t. 480.) erect; leaves with 6-10 pairs of oblong, obtuse, mucronulate, glabrous, rather ciliated leaflets, with a sessile gland on the petiole beneath the lower pair; petioles and branches puberulous; pedicels 3 in a fascicle supra-axillary, bibracteolate above the middle, shorter than the petioles; bracteoles and stipulas linear-lanceolate, many-nerved. ♂. ? S. Native country unknown. *C. venosa*, Castagn. ex Zucc. cent. 1. p. 68. Flowers large.

*Three-flowered Cassia.* Fl. June, July. Clt. 1816. Pl. 1 ft.

145 *C. POLYADE'NA* (D. C. mem. soc. hist. nat. gen. 2. p. 2. t. 132.) erect; leaves with 6-8 pairs of oblong, obtuse, glabrous leaflets, which are cuneated at the base; branches and petioles glabrous; glands 2-4 on the petiole, sessile, placed beneath and among the pairs of leaflets; pedicels 2-3-together, in a fascicle, supra-axillary, bibracteolate above the middle, shorter than the petioles; bracteoles and stipulas acute and small. ♂. ? S. Native of Guadaloupe. Nearly allied to *C. glandulosa*, but differs in the glands being sessile.

*Many-glanded Cassia.* Pl. 1½ foot.

146 *C. BURMA'NNI* (D. C. prod. 2. p. 502.) erectish? leaves with 7-9 pairs of oblong, awnedly mucronate, glabrous, rather ciliated leaflets, with a sessile gland at the base of the petiole; pedicels axillary, bracteolate, in fascicles; legumes glabrous, but puberulous at the sutures. ♀. G. Native of the Cape of Good Hope. *C. flexuosa*, Burm. prod. fl. cap. p. 12. exclusive of the synonymes.

*Burmans' Cassia.* Fl. June, July. Clt. 1810. Pl. 1 foot.

147 *C. VIRGATA* (Swartz, fl. ind. occ. p. 728.) erect; leaves with 10 pairs of ovate-lanceolate, mucronate leaflets, which are rather villous beneath, with a pedicellate gland on the petiole

beneath the lower pair; pedicels hairy, 1-flowered, axillary, longer than the petioles. ♀. S. Native of Jamaica and St. Domingo.

*Twiggy Cassia.* Fl. June, Jul. Clt. 1810. Sh. 2 to 3 feet.

148 *C. SWARTZII* (Wicks. obs. fl. st. Barth, p. 411.) branches pubescent; leaves with 9-12 pairs of obliquely linear, glabrous leaflets, which are obtuse and mucronate at the apex; petiole furnished with a gland at the base; stipulas lanceolate, acuminate, pubescent on the outside; sepals acuminate. ♀. S. Native of the island of St. Bartholomew. Flowers large. Legume compressed, marginated, a little curved, glabrous, 8-10-seeded. Allied to *C. virgata*.

*Swartz's Cassia.* Shrub 1 foot.

149 *C. BREVI'FOLIA* (Lam. dict. 1. p. 651.) plant diffuse; leaves with 10-12 pairs of oblong, glabrous, obtuse, somewhat 3-nerved leaflets; petiole glandless; stipulas lanceolate-linear, acuminate; pedicels 1-flowered, axillary, twice the length of the leaves, bibracteolate above the middle. ♀. S. Native of Madagascar. Leaflets a line long.

*Short-leafletted Cassia.* Shrub 1 foot.

150 *C. NICTITANS* (Lin. spec. 549. exclusive of the synonyme of Rumph.) erectish; leaves with 8-12 pairs of oblong-linear, obtuse, mucronate leaflets; petioles villous, bearing a somewhat pedicellate gland beneath the lower pair of leaflets; pedicels supra-axillary, very short; legumes pubescent. ♂. G. Native of the West Indies, Carolina, and Pennsylvania. Lin. hort. cliff. t. 36. Pluk. t. 314. f. 5. *Grimaldia assurgens*, Schrank. Flowers pentandrous.

*Trinkling Cassia.* Fl. July. Clt. 1800. Pl. 1 foot.

151 *C. CHAMÆCRISTA* (Lin. spec. 542. exclusive of the synonyme of Comm.) erect; leaves with 10-12 pairs of oblong-linear, mucronate leaflets, with a sessile gland on the petiole, beneath the lower pair; pedicels 2-3-together, in a fascicle, supra-axillary, shorter than the petioles; legumes rather hispid. ♀. S. Native of the West Indies, Carolina, and Virginia. Abbot. insect. Georg. t. 94. Curt. bot. mag. 107. *C. pulchella*, Salisb. prod. p. 326. Flowers small. The leaves are a good substitute for senna.

*Var. β, stricta* (Schrank, hort. mon. t. 34.) leaves with 10 pairs of leaflets; flowers nearly axillary. ♂. S. Native of Jamaica.

*Ground-crista or Dwarf Cassia.* Fl. June, Sept. Clt. 1699. Pl. 1 foot.

152 *C. GLANDULOSA* (Lin. spec. 542.) erect; leaves with 10-12 pairs of oblong, mucronate, glabrous leaflets, with a pedicellate gland on the petiole beneath the lower pair, and some between the leaflets; pedicels aggregate, supra-axillary; legume smoothish. ♂. S. Native of the West Indies. Collad. mon. p. 129.

*Glandular Cassia.* Fl. July, Aug. Clt. 1822. Pl. 1 foot.

153 *C. CINEREA* (Schlecht. et Cham. in Linnaea. 5. p. 599.) a much-branched procumbent shrub, clothed with grey adpressed down; leaves with 12-15 pairs of linear, rather cultriform, obliquely semi-cordate leaflets, with a marginal mucrone each; petiole furnished with a gland beneath the lower pair of leaflets; stipulas ovate-lanceolate, acuminate, 5-nerved; pedicels solitary or twin, axillary, or supra-axillary, bibracteate; stamens all fertile. ♀. S. Native of Mexico, on the sea-shore between Tecolula and Villa Rica. Legume 4-12-seeded, black.

*Cinereous Cassia.* Shrub procumbent.

154 *C. PAVONIA'NA*; stem pubescent, simple; leaves with 10-20 pairs of linear, cuspidate, nerved leaflets; stipulas subulate, nerved; peduncles 1-2-flowered, bracteate; petiole bearing a gland beneath the lower pair of leaflets. ♀. S. Native of Peru. (v. s. in herb. Lamb.)

*Pavon's Cassia.* Pl. 2 feet.

155 *C. MIMOROIDES* (Lin. spec. 543.) erect; leaves with 10-12 pairs of linear, mucronate leaflets, with a pedicellate gland on the petiole between the lower pair; pedicels axillary, 1-2-together, 1-flowered, much shorter than the petioles; branches pubescent; legumes glabrous. ☉. S. Native of Java and Ceylon.

*Mimosa-like Cassia.* Fl. Sept. Clt. 1806. Pl. 2 feet.

156 *C. CALYCIOIDES* (D. C. in Collad. mon. 125. t. 20. f. B.) erect; leaves with 10-13 pairs of linear, mucronate leaflets, which are lined with nerves beneath, with a pedicellate gland on the petiole beneath the lower pair; branches, petioles, and legumes pilose; peduncles axillary, divided nearly to the base into 2 or 3 1-flowered pedicels. ☉. S. Native of Cayenne.

*Calycium-like Cassia.* Pl. 1 foot.

157 *C. FLAVICOMA* (H. B. et Kunth, nov. gen. amer. 6. p. 366.) branches clothed with soft, yellow villi; leaves with 12-13 pairs of linear-oblong, pubescent leaflets, with a stipitate gland immediately under the lower pair; pedicels 1-2, rather supra-axillary, beset with villi. ♀. S. Native of South America, on the banks of the Orinoco.

*Yellow-haired Cassia.* Shrub 1 to 2 feet.

158 *C. RAMOSISSIMA* (H. B. et Kunth, nov. gen. amer. 6. p. 367.) branches tomentose; leaves with 12-15 pairs of linear-oblong glabrous leaflets, with rather scabrous margins, and with the nerve pilose beneath; petiole bearing a stipitate gland beneath the lower pair of leaflets; pedicels usually solitary, supra-axillary, villously pubescent. ♀. S. Native of Mexico, on the mount Jorullo. Legume unknown.

*Much-branched Cassia.* Shrub 1 to 2 feet.

159 *C. TRISTICULA* (H. B. et Kunth, nov. gen. amer. 6. p. 367.) branches hairy; leaves with 14-16 pairs of oblong-linear, cultriform, pilose leaflets, with a stipitate gland on the petiole beneath the lower pair; pedicels solitary or twin, pilose, hardly supra-axillary; legumes pilose. ♀. S. Native of New Granada, near Fusagasuga, and of Mexico, near Jalapa. C. hirta, H. W. no. 7988.

*Darkish Cassia.* Shrub 1 to 2 feet.

160 *C. FELIPENSIS* (H. B. et Kunth, nov. gen. amer. 6. p. 368.) branches hairy, tomentose; leaves with usually 12 pairs of linear-oblong, acutely piliferous, glabrous, rather ciliated leaflets, with a small sessile gland on the petiole beneath the lower pair, and some also between the pairs; pedicels 1-2-together, pubescent, hardly supra-axillary. ♀. S. Native of South America, in the province of Jaen de Bracamoros, near San-Felipe.

*San-Felipe Cassia.* Shrub 1 to 2 feet.

161 *C. PROPINQUA* (H. B. et Kunth, nov. gen. amer. 6. p. 369.) branches densely clothed with yellow pubescence; leaves with 10-14 pairs of oblong-linear glabrous leaflets, which are a little ciliated on the margins; petiole bearing a stipitate gland immediately under the ultimate pair of leaflets; pedicels 3-4-together, pubescent, supra-axillary; legumes pubescent, 8-10-seeded. ♀. S. Native of Cumana, near Caripe, and on mount Cocollar, and of Mexico. Very like *C. Eschynomene*.

*Related Cassia.* Shrub 3 to 4 feet.

162 *C. CAPE'NSIS* (Thunb. prod. 79. fl. cap. ed. Schultes, 1. p. 388.) erect; leaves with 12-18 pairs of linear leaflets, ending each in a somewhat hooked point, and with a sessile gland at the base of the petiole; branchlets villous; pedicels axillary, solitary, 1-flowered, bibracteolate in the middle. ♀. G. Native of the Cape of Good Hope, among grass. Collad. mon. p. 124. t. 19. B. Lodd. bot. cab. 511.

*Cape Cassia.* Fl. June. Clt. 1810. Shrub 1 foot.

163 *C. PUMILA* (Lam. dict. 1. p. 651.) plant diffusely procumbent; leaves with 12-15 pairs of linear, rather mucronate, ciliated leaflets, with a pedicellate gland on the petiole beneath

the lower pair; pedicels nearly axillary, 1-flowered, solitary, bibracteate above, the middle, much shorter than the petioles; branches and legumes pubescent. ☉. S. Native of the East Indies. *C. procumbens*, Lin. spec. ed. 1. p. 380. but not. ed. 2. Collad. mon. p. 127.—Pluk. alm. t. 120. f. 1.

*Demar's Cassia.* Fl. June, July. Clt. 1816. Pl. proc.

164 *C. PROCUMBENS* (Willd. spec. 2. p. 530.) procumbent; leaves with many pairs of leaflets; petioles glandless. ☉. H. Native of Virginia and Carolina. Lin. spec. ed. 2. p. 543.

*Procumbent Cassia.* Fl. June, July. Clt. 1806. Pl. proc.

165 *C. DIFFUSA* (D. C. mem. soc. hist. nat. gen. 2. p. 130.) plant diffusely procumbent, smoothish; leaves with 8-15 pairs of linear mucronate leaflets, with a pedicellate gland on the petiole beneath the lower pair; pedicels supra-axillary, solitary, bibracteate in the middle, much shorter than the petioles; legumes glabrous. ☉. S. Native of Porto-Rico.

*Diffuse Cassia.* Shrub proc.

166 *C. PEDICELLARIS* (D. C. prod. 2. p. 504.) branches pubescent; leaves with 15-20 pairs of glabrous, linear, mucronate leaflets, with a pedicellate gland on the petiole beneath the lower pair; pedicels 1-flowered, solitary, length of the leaves; legumes glabrous. ♀. S. Native of St. Domingo. Nearly allied to *C. diffusa*, but the flowers are 3 times the size.

*Pedicellate Cassia.* Shrub diffuse.

167 *C. RIPARIA* (H. B. et Kunth, nov. gen. amer. 6. p. 269.) branches pubescent; leaves with 16-19 pairs of linear glabrous leaflets, which are adpressedly ciliated on the margins; petiole bearing a stipitate gland beneath the ultimate pair of leaflets; pedicels 1-2, pilose, supra-axillary; legumes pilose. ♀. S. Native on the banks of the river Magdalena, near Mompex.

*River-side Cassia.* Shrub 1 to 2 feet.

168 *C. ASCHYNOMENE* (D. C. in Collad. mon. p. 127. t. 17.) plant rather diffuse; leaves with 18-20 pairs of linear, mucronate, glabrous leaflets; petiole smoothish, bearing a sub-sessile gland beneath the lower pair of leaflets; pedicels supra-axillary, aggregate, short; flowers heptandrous. ☉. S. Native of St. Domingo. Breyn. cent. t. 24. Legume rather puberulous.

*Aschynomene-like Cassia.* Fl. June, July. Clt. 1810. Sh. 1 ft.

169 *C. STIPULATA*; stem, petioles, and peduncles thickly beset with horizontal, stiff, yellowish hairs; leaves with 18-20 pairs of lanceolate, cuspidate, hairy, nerved leaflets; sepals ovate, cuspidate, nerved, oblique at the base, tapering much to the apex. ♀. S. Native of Peru. (v. s. in herb. Lamb.)

*Stipulate Cassia.* Shrub 1 to 2 feet.

170 *C. PATELLARIA* (D. C. in Collad. mon. p. 125. t. 16.) erect, clothed with villous pubescence; leaves with 18-20 pairs of linear cuspidate leaflets, with 1 or 2 sessile glands along the petiole; pedicels supra-axillary, short, in fascicles; calyx and legumes hairy. ☉. S. Native of Cayenne and Panama.

*Little-Dish Cassia.* Pl. 1 to 2 feet.

171 *C. PARKERIANA* (D. C. prod. 2. p. 565.) erect, puberulous; leaves with 20 pairs of oblong, mucronate, glabrous leaflets, with a pedicellate turbinate gland on the petiole beneath the lower pair; peduncles supra-axillary, branched, many-flowered; legumes shining, rather pilose. ♀. S. Native about Demerara. Habit of *G. Leschenaultiana*, but differs in the glands being pedicellate.

*Parker's Cassia.* Fl. Aug. Sept. Clt. 1817. Sh. 1 to 2 feet.

172 *C. OTTERBEINII* (Mey. prim. esseq. 169.) leaves with 20 pairs of oblong-linear glabrous leaflets, with a pedicellate gland on the petiole between the lower pair; petioles, pedicels, and branches clothed with canescent pili; pedicels 2-3-together, extra-foliaceous; legumes shining, rather pilose. ♀. S. Native of Guiana, in bushy places near Essequibo.

*Otterbein's Cassia.* Shrub 1 to 2 feet.

173 *C. ASPERA* (Muhl. cat. ex Ell. sketch. p. 474.) erect, hispid; leaves with 24 pairs of linear-lanceolate ciliated leaflets; petiole bearing a turbinate gland beneath the lower pair of leaflets; peduncles few-flowered, supra-axillary; flowers either heptandrous or enneandrous, with 3 of the stamens longer than the rest. ☉. H. Native of Georgia, in the Island of Eding. Habit of *C. nictitans*.

*Rough Cassia.* Fl. July, Aug. Clt. 1818. Pl. 1 to 2 feet.

174 *C. LESCHENAUTIA* NA (D. C. mem. soc. hist. nat. gen. 2. p. 132.) erect; leaves with 20-25 pairs of oblong-linear cuspidate leaflets, which are blunt at both ends; petiole bearing a sessile gland beneath the lower pair of leaflets, and ending in an awn at the apex, and is, as well as the branches, pubescent; pedicels in fascicles; supra-axillary; flowers heptandrous. ☉. H. Native of Bengal. Stamens very unequal. Pedicels when in fruit about 3-4 lines long. Stipulas ending in long taper points, many-nerved at the base, 8 lines long. Calyx smoothish.

*Leschenault's Cassia.* Shrub 1 to 2 feet.

175 *C. WALLICHIA* NA (D. C. l. c.) erect; leaves with 20-25 pairs of oblong-linear mucronate leaflets, which are obtuse at both ends; petioles bearing a sessile gland beneath the lower pair of leaflets, and ending in a bristle at the apex, and is, as well as the branches and calyxes, pubescent; pedicels in fascicles, supra-axillary; flowers decandrous. ☉. H. Native of Nipaul. *C. dimidiata*, Roxb. hort. beng. p. 32. D. Don, prod. fl. nep. 247. Stamens nearly equal. Stipulas 4-6 lines long. Sometimes there are 2 glands on the petiole, one between each of the 2 lower pairs of leaflets.

*Wallich's Cassia.* Fl. June, July. Clt. 1817. Pl. 1 foot.

176 *C. ANGUSTISSIMA* (Lam. dict. 1. p. 650.) erect; leaves with about 30 pairs of very small, linear, mucronate leaflets; stipulas lanceolate-setaceous; peduncles twin or 2-parted, and are hairy as well as the branches. ☉. S. Native of Java and Amboyna, ex Rumph. amb. 6. t. 67. f. 1.

*Very-narrow-leafletted Cassia.* Fl. July, Aug. Clt. 1820. Pl. 1 foot.

177 *C. FLEXUOSA* (Lin. spec. 543. but not of Burm.) erect; leaves with 25-35 pairs of oblong-linear 3-nerved leaflets; stipulas obliquely cordate, acuminate; pedicels axillary, usually solitary. ☉. S. Native of Brazil. Breyn. cent. 65. t. 23.

*Flexuous-stemmed Cassia.* Fl. July, Aug. Clt. 1810. Pl. 1 foot.

178 *C. GUINEENSIS*; stem erect, simple, flexuous; leaves with 4 pairs of oval-lanceolate, entire, acute, glabrous leaflets; pedicels 1-flowered, axillary, and terminal. ♀. S. Native of Guinea, in the Island of St. Thomas.

*Guinea-stemmed Cassia.* Shrub 1 foot.

179 *C. MICROPHYLLA* (Willd. spec. 2. p. 529.) erect; leaves with about 50 pairs of oblong-linear leaflets; petioles narrowly margined between the pairs of leaflets, and bearing a sessile gland beneath the lower pair of leaflets; pedicels solitary, supra-axillary; legumes villous. ♀. S. Native of the Island of Santa-Cruz. Stem branched, pubescent. Stipulas lanceolate, acuminate. Perhaps many species are confused under this name.

*Var. β, Guineensis* (D. C. prod. 2. p. 505.) leaves with about 40 pairs of leaflets; petiole not margined; pedicels solitary. ☉. S. Native of Guinea. *C. geminata*, Vahl. ex herb. Puer.

*Var. γ, hecatophylla* (D. C. in Collad. mon. p. 124. t. 18.) glands usually twin beneath the leaflets; pedicels 2-3, aggregate; legumes at length smoothish. ☉. S. Native of Tobago.

*Var. δ, Senegalensis* (D. C. l. c.) leaves with about 40 pairs of leaflets; petiole a little margined; legumes smoothish. ☉. S. Native of Senegal, at Richard-Tôle.

*Small-leafletted Cassia.* Fl. June, Sept. Clt. 1810. Pl. 1 ft.

180 *C. ARENARIA* (H. B. et Kunth, nov. gen. amer. 6. p.

370.) branches flexuous, tetragonal, puberulous; leaves with 45-50 pairs of linear glabrous leaflets, with rather hispid scabrous margins, lower ones and stipulas ciliated; petiole bearing 2 glands beneath the lower pair of leaflets; peduncles 1-2, pilose, axillary. ♀. S. Native on the banks of the Orinoco, near Maypures, in sandy shady places.

*Sand Cassia.* Fl. June, May. Clt. 1819. Shrub 1 to 2 ft.

† *Species not sufficiently known.*

181 *C. TETRAPHYLLA* (Coll. mon. 130.) leaves with 2 pairs of ovate leaflets; stems procumbent; flowers solitary, axillary; legumes hairy. ☉. S. Native of Mexico, about Vera Cruz. *C. procumbens*, Mill. dict. no. 20. but not of Lin. Perhaps the same as *C. hispida*.

*Four-leafletted Cassia.* Pl. proc.

182 *C. DESVAUXII* (Coll. mon. 131.) leaves with 2 pairs of glabrous, veiny, ovate-lanceolate leaflets; stem shrubby; legumes villous. ♀. S. Native of South America. *C. tetraphylla*, Desv. journ. bot. 1814. p. 72. but not of Mill.

*Desvaux's Cassia.* Shrub.

183 *C. LATIFOLIA* (Meyer, prim. esseq. 166.) leaves with 2 pairs of oblong glabrous leaflets, with a large gland between the lower pair, and a small one between the superior pair. ♀. S. Native of Guiana. Flowers large, yellow.

*Broad-leafletted Cassia.* Shrub 6 to 8 feet.

184 *C. GLABRA* (Coll. mon. 131.) leaves with 2 pairs of obliquely ovate-roundish, obtuse, quite glabrous, veiny leaflets; branches angular, glabrous. ♀. S. Native of Brazil. *C. venosa*, Desv. journ. bot. 1814. p. 72. but not of Zucc.

*Glabrous Cassia.* Shrub.

185 *C. ARBORESCENS* (Mill. dict. no. 15. but not of Vahl.) leaves with 2 pairs of oblong-ovate leaflets, which are villous beneath; flowers corymbose; stem erect, arboreous; legumes compressed. ♀. S. Native of Mexico, about Vera Cruz.

*Arborescent Cassia.* Tree 20 to 30 feet.

186 *C. AURITA* (Coll. mon. p. 131.) leaves with 2 pairs of oblong-lanceolate, eared leaflets, with a large ovate gland between the lower pair. ♀. S. Native of Brazil. Vand. fl. lus. et bras. in Rœm. script. p. 104.

*Eared-leafletted Cassia.* Shrub or tree.

187 *C. CUBEENSIS* (Hoffmans. verz. 1824. p. 209.) leaves with 2-3 pairs of ovate, acuminate, ciliated, rather pilose leaflets, which are unequal at the base, outer ones the largest, with a gland on the petiole between the lower pair; legumes slender, terete, obtuse, somewhat incurved. ♀. S. Native of Cuba.

*Cuba Cassia.* Shrub 6 to 8 feet.

188 *C. MONANTHA* (D. C. prod. 2. p. 506.) leaves with 3 pairs of ovate, acuminate, villous leaflets; flowers solitary, axillary; legumes erect, terete; stem erect, herbaceous. ☉. S. Native of Mexico, about Campeachy. *C. uniflora*, Mill. dict. no. 5.

*One-flowered Cassia.* Pl. 1 foot.

189 *C. MILLERI* (Coll. mon. p. 132.) leaves with 3 pairs of obtuse emarginate leaflets; stems pilose; flowers solitary, axillary, longer than the petioles; legumes flat. ♀. S. Native of Jamaica. *C. emarginata*, Mill. dict. no. 13. but not of Lin.

*Miller's Cassia.* Shrub.

190 *C. VILLOSA* (Mill. dict. no. 14.) leaves with 3 pairs of oblong-oval, equal, villous leaflets; legumes articulated, stem erect, arborescent. ♀. S. Native of Mexico, about Campeachy. Flowers small, straw-coloured.

*Villous-leaved Cassia.* Tree 14 to 16 feet.

191 *C. HOMOPHYLLA* (Hoffmans. verz. 1824. p. 209.) leaves with 3-4 pairs of elliptic-oblong, obtuse, glabrous leaflets, outer ones hardly larger than the others; petiole furnished with 1 or 2 subulate sessile glands between 1 or 2 of the lower pairs of

leaflets. *h. S.* Native country, flowers, and fruit unknown. Said to be allied to *C. occidentalis*.

*Equal-leafletted Cassia.* Shrub.

192 *C. HOUSTONIA'NA* (Coll. mon. p. 132.) leaves with 4 pairs of oblong-ovate leaflets; stems procumbent; peduncles axillary, 2-flowered. *h. S.* Native of Jamaica. *C. biflora*, Mill. dict. no. 14. but not of Lin.

*Houston's Cassia.* Pl. proc.

193 *C. MACRADE'NA* (Collad. mon. p. 132.) leaves with 4 pairs of oblong, eared, mucronate leaflets, bearing a large orbicular gland at the base of the petiole. *h. S.* Native of Brazil. Vand. in Rom. script. p. 104.

*Long-glanded Cassia.* Shrub.

194 *C. PUBIGERA* (Lag. gen. et spec. p. 14. no. 184.) leaves with 4 pairs of rather hairy, ovate, acuminate leaflets, outer ones lanceolate, with a conical, somewhat pedicellate gland at the base of the petiole.—Native of Guayaquil.

*Pubigerous Cassia.* Shrub.

195 *C. ARACHOIDES* (Burch. cat. no. 1680. ex trav. 1. p. 341.) leaves with 4-5 pairs of obovate leaflets, which are rounded or obcordate at the apex; stems herbaceous, trailing; racemes simple, axillary; legumes oval-orbicular, membranous, flat.—Native of the Cape of Good Hope.

*Arachis-like Cassia.* Pl. trailing.

196 *C. SINGUE'NA* (Gailliaud, fl. a meroe, 1826.) branches tomentose at the apex; leaves with 7 pairs of obtuse interglandular leaflets, pubescent on the back and margins. *h. G.* Native of Egypt, about Singue.

*Singue Wild-senna.* Shrub.

197 *C. ASCHRE'K* (Forsk. descrip. p. 86.) leaves with 4-5 pairs of oval-oblong, glabrous, obtuse, acuminate leaflets, with a subulate gland between each pair; legumes flat. *h. G.* Native of Arabia at Mor, where it is called *Aschreck*.

*Aschreck Cassia.* Pl. 1 foot?

198 *C. PLUMIER'II* (D. C. prod. 2. p. 506.) leaves with 5 pairs of ovate-lanceolate glabrous leaflets; legumes compressed, long, straight, pendulous, torose at the seeds. *h. G.* Native of Guadeloupe. Plum. ed. Burm. t. 77. *C. planisiliqua*, Lam. dict. 1. p. 645. but not of Lin.

*Plumier's Cassia.* Tree.

199 *C. FRUTESCENS* (Mill. dict. no. 2.) leaves with 5 pairs of ovate glabrous leaflets, outer ones the longest; stem shrubby; legumes long, terete. *h. S.* Native of Jamaica.

*Shrubby Cassia.* Shrub 5 to 6 feet.

200 *C. HIRTA* (Willd. enum. suppl. 23.) leaves with 5 pairs of oblong hairy leaflets, with an oblong gland on the petiole between the lower pair; stipulas subulate; branches hairy. *h. S.* Native country unknown.

*Hairy Cassia.* Shrub.

201 *C. SA'BAK* (Gailliaud, fl. a meroe, 1826.) branches smooth, ferruginous; corolla an inch and a half; flowers numerous. *h. S.* Native of Egypt, on mount Aqaro, where it is called *Sabak*, and where the inhabitants use the husks of the pods to tan leather.

*Sabak Cassia.* Shrub.

202 *C. SUMATRA'NA* (Roxb. ex Horn. hort. hafn. suppl. p. 135.) leaves with 4-8 pairs of elliptic coriaceous leaflets, which are retuse and mucronate at the apex. *h. S.* Native of Sumatra.

*Sumatra Cassia.* Shrub.

203 *A. EGLANDULOSA* (Dum. Cours. bot. cult. ed. 2. vol. 6. p. 34.) leaves with 7 pairs of ovate-orbicular, mucronate, glabrous leaflets, which are palest beneath; petioles glandless. *h. S.* Native country unknown.

*Glandless Cassia.* Shrub 4 to 6 feet.

204 *C. TUBERCULATA* (Collad. mon. p. 133.) leaves with 7-8

pairs of oblong acuminate leaflets, lower ones the smallest; petiole glandless; stem angular, tubercled. *h. S.* Native of Brazil. Vand. in Rom. script. p. 104.

*Tubercled-stemmed Cassia.* Shrub.

205 *C. DECIPiens* (Desv. journ. bot. 1814. p. 73.) leaves with usually 8 pairs of linear-lanceolate, acute, quite glabrous leaflets; legumes compressed, elongated, somewhat reniform. *h. S.* Native of America.

*Deceiving Cassia.* Shrub.

206 *C. SOPHEROIDES* (Collad. mon. p. 134.) leaves with 8-10 pairs of lanceolate, acute, glabrous leaflets, with rather villous margins; petiole bearing an oblong gland at the base; legumes compressed. *h. S.* Native of the East Indies. *C. Sophera*, Lam. dict. 1. p. 649. but not of Lin.

*Sophera-like Cassia.* Shrub 6 to 8 feet.

207 *C. CHAMÆCRISTOIDES* (Collad. mon. p. 134.) leaves with many pairs of linear leaflets; stems procumbent, frutescent; flowers large, solitary, axillary; legumes glabrous. *h. S.* Native of Mexico, about Vera Cruz. *C. chamæcrista*, Mill. dict. no. 17. but not of Lin.

*Chamæcrista-like Cassia.* Shrub proc.

208 *C. HORNEMA'NNI* (D. C. prod. 2. p. 507.) erect; leaves with many pairs of elliptic, ciliated, mucronate leaflets, bearing one sessile gland on the petiole. *h. S.* Native country unknown. *C. venosa*, Horn. hort. hafn. suppl. p. 46. but not of Zucc.

*Hornemann's Cassia.* Pl. 1 to 2 feet.

209 *C. MULTIJUGA* (Rich. in act. soc. hist. nat. par. 108.) arboreous, quite glabrous; leaves with 20-25 pairs of oblong elliptic leaflets, which are white beneath; panicle terminal, multiple. *h. S.* Native of Cayenne.

*Many-paired-leafletted Cassia.* Tree 20 to 30 feet.

210 *C. DISCOLOR* (Herb. Desv. Hamilt. prod. p. 38.) stem shrubby; leaves with usually 6 pairs of obovate, oblong, rather emarginate, glabrous leaflets, cinereous beneath; flowers terminal, sub-racemose; legumes broad, oblong, compressed. *h. S.* Native of Jamaica.

*Discoloured-leaved Cassia.* Shrub.

211 *C. HIRSU'TA* (Herb. Desv. Hamilt. prod. p. 38.) stem shrubby; leaves with usually 6 pairs of ovate, oblong, mucronulate leaflets, which are tomentose beneath; flowers axillary, spicate; legume glabrous, compressed, very long, and linear. *h. S.* Native of Jamaica.

*Hairy Cassia.* Shrub.

*Cult.* All the species of *Cassia* are of easy culture; they thrive best in a mixture of loam and peat, and cuttings of the shrubby kinds root readily in sand under a hand-glass; those of the stove species in heat. The *C. Marylandica* being the only hardy perennial species, should be grown in a sheltered situation in peat soil, and it may either be increased by seeds or by dividing the plant at the root in spring.

CCLXXIII. DELARIA (Delar, evidently the name of some botanist). Desv. obs. legum. ex in Schlecht. Linnæa. 2. p. 510.

LIN. SYST. *Decándria, Monogýnia.* Calyx spathaceous, 5-toothed, marcescent. Vexillum large, spreading. Stamens 10, fertile. Ovary sessile or stipitate. Stigma acute. Legume elongated, few-seeded.—Shrubs, with alternate simple leaves.

1 *D. OVALIFOLIA* (Desv. l. c.) leaves oval-elliptic, canescent beneath; flowers axillary; legumes hairy, usually twin. *h. S.* Native of Brazil. *Cassia simplicifolia*, Desv. journ. bot. 1814. p. 72. D. C. prod. 2. p. 505.

*Oval-leaved Delaria.* Shrub.

2 *D. PYRIFOLIA* (Desv. l. c.) *h. S.* Native of Guinea. Nothing further is known to us of this plant.

*Pear-leaved Delaria.* Shrub.

*Cult.* A mixture of loam and peat is the soil best suited to the

species of *Delària*, and cuttings will root readily if planted in a pot of sand, with a hand-glass placed over them in heat.

**CCLXXIV. CHAMÆFISTULA** (*chamæ*, a word usually applied in botany to signify false, and *fistula*, a pipe; in reference to the cylindrical pods; but it has nothing to do with the true *Fistula*, which is the *Cathartocarpus Fistula*). *Cássia*, section II. *Chamæfistula*, D. C. in Collad. mon. p. 87. D. C. prod. 2. p. 490.—*Chamæcássia*, Breyn. prod. 2. p. 28.

**Lin. syst.** *Decándria, Monogýnia*. Sepals 5, very obtuse, hardly joined at the base, more or less unequal. Petals 5, unequal. Stamens 10, free, unequal, the 3 lower ones longest, the 4 middle ones short and straight, and the 3 superior ones bearing difformed abortive anthers. Anthers opening by 2 pores at the apex. Ovary stipitate. Legumes terete, hardly dehiscent, slender, membranous, divided by transverse dissepiments into 1-seeded divisions internally, and filled with pulp. Seeds elliptic, compressed, horizontal.—Trees or shrubs, with abruptly pinnate leaves, bearing glands on the petioles. Flowers of all yellow.

\* *Leaves with 2 pairs of leaflets. Petiole bearing a gland between the lower pair of leaflets.*

1 *C. BACILLARIS*; leaves with 2 pairs of ovate, obtuse, oblique leaflets, with a gland on the petiole between the lower pair; racemes axillary, pedunculate; legumes cylindrical, acute. *h. S.* Native of Surinam. *Cássia bacillaris*, Lin. fil. suppl. p. 231. *Houst. rel. t. 17. Jacq. fragm. t. 85. f. 4. ? Cathartocarpus Bacillus*, Lindl. bot. reg. t. 881. Legume a foot long, terete.

*Rod Bastard-cassia.* Fl. Ju. Jul. Clt. 1782. Tr. 12 to 14 ft.

2 *C. SPECIOSA*; leaves with 2 pairs of rather coriaceous unequal-sided leaflets, which are shining above and glabrous, but densely clothed with tomentose pubescence beneath, ultimate pair twice the size of the other, obovate-oblong, with a cylindrical gland on the petiole between the lower pair; corymbs terminal. *h. S.* Native of Brazil. *Cássia micans*, Nees. in fl. 1821. p. 329. *C. speciosa*, Ehrh. in Gött. anz. 1821. p. 718. Ovary nearly terete, on a short stipe, thickly clothed with yellow hairs. Style short, glabrous, uncinat, thick. Anthers large.

*Showy Chamæfistula.* Fl. June, July. Clt. 1816. Tree.

3 *C. INÆQUILÁTERA*; leaves with 2 pairs of ovate, rather acuminate, glabrous leaflets, which are unequal-sided at the base, with a sessile gland on the petiole between the lower pair; racemes axillary, pedunculate; legumes incurved. *h. S.* Native of St. Martha. *C. inæquilátera*, Bert. ined. ex. D. C. prod. 2. p. 490. Very like the following species, but differs in being glabrous.

*Unequal-sided-leafletted Chamæfistula.* Tree 20 feet.

4 *C. MACROPHÝLLA*; leaves with 2 pairs of elliptic-oblong, bluntish leaflets, which are glabrous above, but clothed with soft hairs beneath as well as the branchlets and petioles, with an obtuse gland on the petiole between the lower pair of leaflets; racemes axillary, pedunculate; legumes incurved. *h. S.* Native of New Granada, at the mouth of the river Sinu near Cartagena. *Cássia macrophýlla*, Kunth, mim. p. 126. t. 38. nov. gen. amer. 6. p. 340. Lateral leaflets nearly equal at the base.

*Long-leaved Chamæfistula.* Tree.

5 *C. PUBÉRULA*; leaves with 2 pairs of unequal-sided, elliptic-oblong, acute leaflets, which are glabrous above, but clothed with adpressed pubescence beneath, as well as on the branches and petioles, lower pair smaller, ovate-roundish, with an oblong-conical gland on the petiole between the lower pair; racemes axillary, pedunculate. *h. S.* Native of New Granada. *Cássia pubérula*, H. B. et Kunth, nov. gen. amer. 6. p. 341.

*Puberulous Chamæfistula.* Tree.

6 *C. OXYPHYLLA*; leaves with 2 pairs of unequal-sided, acuminate-mucronate leaflets, which are pubescent above, but clothed with soft tomentose pubescence beneath, superior pair

oblong, lower small and ovate, bearing an oblong, clavate gland on the petiole between the lower pair; racemes few-flowered. *h. S.* Native of New Andalusia, on Mount Cocollar. *Cássia oxyphýlla*, Kunth, mim. p. 129. t. 39. H. B. et Kunth, nov. gen. amer. 6. p. 342.

*Sharp-leafletted Chamæfistula.* Tree 50 feet.

7 *C. MELANOCA'RPA*; leaves with 2 pairs of ovate-lanceolate, acuminate leaflets, which are shining above and quite glabrous beneath, as well as the branches and petioles, lower pair one half smaller than the outer pair; gland cylindrical, acute, situated on the petiole between the lower pair of leaflets; racemes pedunculate, axillary; legumes straight, terete. *h. S.* Native of Jamaica. *Cássia melanocarpa*, Bert. ined. ex. D. C. prod. 2. p. 491. Legume smooth, black, on a short stipe within the calyx, obtuse, mucronulate by the style, rather torulose.

*Black-fruited Chamæfistula.* Tree 20 to 30 feet.

8 *C. PRÓMINENS*; leaves with 2 pairs of ovate-elliptic, acuminate, glabrous leaflets, lower pair the smallest, with a prominent gland between; branches and peduncles pubescent; racemes forming a large, terminal, corymbose panicle. *h. S.* Native of Brazil. Sello. Legume unknown. (v. s. herb. Lamb.)

*Prominent-glanded Chamæfistula.* Tree.

9 *C. RUIZIANA*; leaves with 2 pairs of broad, elliptic, obtuse, glabrous leaflets, which are oblique at the base, with a large obtuse gland between the lower pair on the petiole; racemes twin, short, corymbose, axillary. *h. S.* Native of Guayaquil. *Cássia macrophýlla*, Ruiz et Pav. in herb. Lamb.

*Ruiz's Chamæfistula.* Tree 20 to 30 feet.

10 *C. OBLIQUA*; leaves with 2 pairs of elliptic, acuminate, glabrous leaflets, with a prominent gland on the petiole between the lower pair; peduncles about the length of the leaves; flowers corymbosely umbellate. *h. S.* Native of Peru. *Cássia obliqua*, Ruiz et Pav. in herb. Lamb. Legume unknown. Lower pair of leaflets the smallest.

*Oblique-leafletted Chamæfistula.* Tree.

11 *C. ELEGANS*; glabrous; leaves with 2 pairs of oblique, elliptic, acuminate, coriaceous leaflets, lower pair the smallest, with a prominent ovate-conical gland on the petiole between each pair. *h. S.* Native of Peru. Legumes unknown. Perhaps a species of *Cássia*.

*Elegant Chamæfistula.* Tree.

\* \* *Leaves with 3 or more pairs of leaflets.*

12 *C. ASTROITES*; clothed in every part with stellate, flocky tomentum; leaves with 3-4 pairs of leaflets, floral ones with only 2 pairs; leaflets obliquely ovate-lanceolate, acuminate, ultimate ones the largest, with a clavate gland on the petiole, between the lower pair, or one between each of the two lower pairs; stipulas setaceous; racemes axillary, pedunculate, corymbose; bractæas filiform. *h. S.* Native of Mexico, in Plan del Rio. *Cássia astroites*, Schlecht. et Cham. in Linnæa. 5. p. 597. Legume elongated, somewhat moniliform.

*Starry-haired Chamæfistula.* Tree.

13 *C. CORYMBOSA*; leaves with 3 pairs of oblong-lanceolate, rather falcate leaflets, which are glabrous as well as the branches, with an oblong gland on the petiole between the lower pair; peduncles 3-5-flowered; legumes cylindrical, 4-times longer than the pedicel. *h. G.* Native of Buenos Ayres. *Cássia corymbosa*, Lam. dict. 1. p. 644. *Jacq. fragm. t. 101. f. 1. Curt. bot. mag. 633. C. crassifolia*, Ort. dec. 10. p. 122. *Cássia falcata*, Dum. Cours. bot. cult. ed. 2. vol. 6. p. 35.

*Corymbse-flowered Chamæfistula.* Shrub 6 to 10 feet.

14 *C. INFLATA*; leaves with usually 3 pairs of obovate-roundish, glabrous leaflets, which are glaucous beneath, with a clavate gland on the petiole between the lower pair; racemes panicked; legumes inflated. *h. S.* Native of South America,

on the banks of the river Magdalena. *Cássia inflata*, Spreng. syst. 2, p. 336.

*Inflated-podded Chamæfistula*. Shrub.

15 *C. CONTORTA*; erect, branched; leaves with 3 pairs of obovate, pubescent, mucronate leaflets; pedicels axillary, solitary, 1-flowered; legume linear, subterete, twisted. *h. S.* Native of Guinea, in the island of St. Thomas. Flowers large, yellow.

*Twisted-podded Chamæfistula*. Shrub.

16 *C. CROTALARIOIDES*; leaves with 3-4 pairs of oval, rather mucronate, pubescent leaflets, with a sessile elongated gland on the petiole, between each of the pairs of leaflets, except the upper one; branches pubescent; legumes ovate-oblong, puberulous, mucronate. *h. S.* Native of South America. *Cássia crotalarioides*, Kunth, *min.* t. 40. Sepals oblong, bluntish, 3-nerved. Stipulas linear, subulate, elongated. Perhaps a species of *Cássia*.

*Crotalaria-like Chamæfistula*. Shrub 1 to 2 feet.

17 *C. FLORIBUNDA*; leaves with 3-5 pairs of oblong-lanceolate, glabrous leaflets, with an oblong gland on the petiole between the lower pair; branches glabrous; peduncles many-flowered; legumes nearly cylindrical, 3-times the length of the pedicel. *h. S.* Native of New Spain. *Cássia floribunda*, Cav. ex. Collad. *mon.* p. 88. *Cássia corymbosa*, Ort. *dec.* p. 124. but not of Lam.

*Bundle-flowered Chamæfistula*. Fl. June, July. Clt. 1818. Tree or shrub.

18 *C. HERBERTIANA*; leaves with 5 pairs of lanceolate, acuminate leaflets, which are smoothish above but pubescent beneath as well as the branches and petioles; petiole bearing small, sessile glands, one between each pair of leaflets, except the 2 extreme pairs; racemes axillary and terminal, sub-corymbose. *h. S.* Native of Barbadoes. *Cássia Herbertiana*, Lindl. *bot. reg.* 1422. Flowers large, straw-coloured.

*Herbert's Chamæfistula*. Fl. Aug. Sept. Clt. 1828. Shrub 9 to 10 feet.

19 *C. LEVIGATA*; leaves with 3-5 pairs of ovate-lanceolate, acuminate, glabrous leaflets, with an oblong, acutish gland between each of the pairs on the petiole; branches glabrous. *h. S.* Native of New Spain. *Cássia levigata*, Willd. *enum.* 441. *Cássia septentrionalis*, Zucc. *cent.* no. 69. *Cássia grandiflora*, Desf. *cent. hort. par.* but not of Pers. *Cássia elegans*, H. B. et Kunth, *nov. gen. amer.* 6, p. 342. *Hern. mex.* p. 376. f. 1?

*Smooth Chamæfistula*. Shrub 6 to 12 feet.

20 *C. PENDULA*; leaves with 4 pairs of oblong, rounded leaflets, which are glaucous beneath, and glabrous on both surfaces as well as the branches; petiole bearing a clavate gland between the lower pair of leaflets; racemes axillary, many-flowered; legumes terete, rather torulose, glabrous. *h. S.* Native of New Granada, near Guadua. *Cássia pendula*, Willd. *enum.* 1, p. 440. H. B. et Kunth, *nov. gen. amer.* 6, p. 343.

*Pendulous-racemed Chamæfistula*. Fl. July, Aug. Clt. 1820. Shrub 10 to 12 feet.

21 *C. INDECORA*; leaves with 4 pairs of obovate-oblong leaflets, which are rounded at the apex, glabrous above, but clothed with soft pubescence beneath as well as the branches and petioles; petiole bearing a gland between the lower pair of leaflets; peduncles axillary, many-flowered; legumes compressed, puberulous. *h. S.* Native of Caraccas. *Cássia indecora*, H. B. et Kunth, *nov. gen. amer.* 6, p. 343. Legume 5-6 inches long, divided internally into about 75 cells.

*Indecorous Chamæfistula*. Tree.

22 *C. TOROSA*; leaves with 4-7 pairs of ovate-lanceolate, glabrous leaflets, with a gland at the base of the petiole; branches glabrous; legumes cylindrical, torulose. *h. G.* Native of China. *Cássia torosa*, Cav. *descrip. pl.* p. 131. *Cássia Chi-*

*nensis*, Jacq. *icon. rar.* t. 73. but not of Lam. *Cássia torulosa* and *Cássia Indica*, Poir. *suppl.* 2, p. 126. and p. 127.

*Torose-podded Chamæfistula*. Fl. June, July. Clt. 1816. Shrub 6 feet.

23 *C. CHINENSIS*; leaves with 3-5 pairs of oval, acutish leaflets, which are smoothish as well as the branches; petiole bearing a solitary gland; peduncles very short, 3-4-flowered. *h. G.* Native of China. *Cássia Chinensis*, Lam. *dict.* 1, p. 644. but not of Jacq. *Cássia grandiflora*, Pers. *ench.* 1, p. 457. but not of Desf.

*China Chamæfistula*. Fl. June. Clt. 1807. Sh. 4 to 6 ft.

24 *C. GIGANTEA*; leaves with 4-5 pairs of oval leaflets, which are attenuated at the base, and obtusely, somewhat emarginate and mucronate at the apex, glabrous as well as the branches; petiole glandless; racemes axillary, rather velvety, the upper ones disposed in a kind of panicle. *h. S.* Native of Jamaica, where it is cultivated under the name of *Cássia arborescens*. *Cássia gigantea*, Bert. *ined. ex. D. C. prod.* 2, p. 492. Sepals roundish. Pedicels crowded, an inch long. Bractees subulate. Legumes unknown.

*Giant Chamæfistula*. Tree 20 to 30 feet.

25 *C. EXCELSA*; leaves with 10-20 pairs of elliptic-oblong leaflets, which are unequal at the base, mucronate at the apex, smoothish above and shining, but pubescent beneath as well as the petioles and peduncles; corymbs of flowers panicle. *h. S.* Native of Brazil. *Cássia excelsa*, Schrad. in *goett. anz.* p. 717. *Cássia fastigiata*, Nees. et Neuw. *reis. bras. ex. flora*, 1821, p. 308. and p. 329.

*Tall Chamæfistula*. Tree.

26 *C. COROMANDELIANA*; leaves with 6-10 pairs of lanceolate acute leaflets, which are glabrous as well as the branches; petiole bearing an ovate thick gland near its base; legumes terete, smooth. *h. S.* Native of the East Indies. *Cássia Coromandeliana*, Jacq. *fragm.* 67, t. 100. ~~How like *C. torosa*.~~

*Coromandel Chamæfistula*. Fl. June, July. Clt. 1823. Tr.

27 *C. SOPHERA*; leaves with 8-10 pairs of lanceolate, acute, nearly equal leaflets, which are glabrous as well as the branches; petiole bearing an oblong gland at the base. *h. S.* Native of India in shady woods, as well as of Egypt and China. *Cássia Sophera*, Lin. *spec.* 542.—Rumph. *amb.* 5, t. 97, f. 12.—Rheed. *mal.* 2, t. 52.—Burm. *zeyl.* t. 98. Racemes corymbose. Flowers large, pale yellow. Perhaps numerous species are conf. under the name of *C. Sophera*.

*Sophera Chamæfistula*. Fl. Jul. Sept. Clt. 1658. Sh. 4 to 10 ft.

*Cult.* See *Cássia* for culture and propagation, p. 450.

CCLXXV. CATHARTOCARPUS (*καθαίρω*, *cathairo*, to purge, and *καρπος*, *karpos*, the fruit; in reference to the pulp contained in the pods being cathartic). Pers. *ench.* 1, p. 459. —Bactrylobium, Willd. *enum.* 440.—*Cássia*, Gært. *fruct.* 2, t. 147. *Cássia*, sect. 1. *Fistula*, D. C. in Collad. *mon.* p. 83. *prod.* 2, p. 489.

*LAN. SYST.* *Decandria*, *Monogynia*. Sepals very blunt, hardly joined at the base, more or less unequal. Petals 5, unequal. Stamens 10, free, unequal, the 3 lower ones longest, the 4 middle ones short and straight, 3 upper ones bearing abortive, diffracted anthers. Anthers ovate, opening by 2 chinks at the apex. Ovary stipitate. Legumes terete, or a little compressed, indehiscent, woody, with elevated sutures, transversely many-celled inside, the cells 1-seeded, and filled with cathartic pulp. Seeds elliptic, rather compressed, horizontal. Trees with abruptly pinnate leaves and pendulous or erect racemes of large yellow flowers. The trees much resemble the *Laburnum* when in full flower in their native countries.

1 *C. GRAVENSIS* (Pers. *ench.* 1, p. 459.) leaves with 10-20

pairs of oval-oblong leaflets, which are equal at the base, mucronate at the apex, puberulous above, but clothed with soft tomentum beneath, when young tomentose; petiole glandless; racemes axillary, shorter than the leaves; legumes compressed, wrinkled, very long. *h. S.* Native of the Caribbee islands, Guiana, Brazil, and between Turbaco and Carthagena, &c. *Cássia grândis*, Lin. fil. suppl. 230. *Cássia mollis*, Vahl. symb. 3. p. 57. Jacq. fragm. t. 85. f. 3. in fruit. *Cássia Brasiliana*, Lam. dict. 1. p. 649.—Breyn. cent. t. 21. but not t. 14. Legumes a little compressed, a foot and a half long.

*Great Purging-cassia.* Clt. 1820. Tree 30 to 40 feet.

2 *C. FERRUGINEUS*; leaves with 13-20 pairs of oblong-linear, short-acuminate leaflets, which are cuneate on the upper side at the base, and clothed with tomentose pubescence beneath; petiole glandless; racemes about equal in length to the leaves, erect; branches angularly furrowed. *h. S.* Native of Brazil. *Bactrylobium ferrugineum*, Schrad. in Gœtt. anz. 1821. p. 713. *Cássia ferruginea*, Schrad. in litt. 1825. Hardly distinct from the preceding species, according to Nees. in flor. 1821. p. 328.

*Rusty Purging-cassia.* Tree 30 to 40 feet.

3 *C. MOSCHATUS*; leaves with 14-18 pairs of oblong leaflets, which are rounded at the apex, and clothed with soft pubescence on both surfaces; petiole glandless; legumes cylindrical. *h. S.* Native of South America, near Mompox, on the banks of the river Magdalena. *Cássia moschata*, H. B. et Kunth, nov. gen. amer. 6. p. 358. The pulp in the fruit has a musky scent according to Bonpland.

*Musky Purging-cassia.* Tree 40 feet.

4 *C. SPECIOSUS*; leaves with 14 pairs of oblong acutish leaflets, which are smoothish above but clothed with soft pubescence beneath; petiole glandless; racemes many-flowered; legumes terete, rather compressed, undulately annulated. *h. S.* Native of South America, on the banks of the river Magdalena, near the town of Teneriffe. *Cássia speciosa*, H. B. et Kunth, nov. gen. amer. 6. p. 358. *Cássia Humboldtiana*, D. C. prod. 2. p. 489.

*Showy Purging-cassia.* Clt. 1826. Tree 40 feet.

5 *C. MARGINATUS*; leaves with 12-15 pairs of oval-oblong, unequal leaflets, which are obtuse, emarginate, and mucronate at the apex, clothed with velvety down beneath, as well as the bracts and petioles; racemes axillary, much shorter than the leaves. *h. S.* Native of Coromandel. *Cássia marginata*, Roxb. hort. beng. p. 31. *Cássia Roxburghii*, D. C. prod. 2. p. 489.

*Marginate-leaved Purging-cassia.* Clt. 1810. Tree 20 ft.

6 *C. TRINITATIS*; leaves with 8-10 pairs of ovate-oblong, acuminate leaflets, which are rather puberulous, and shining a little above, but paler, and clothed with rather villous down beneath; petioles glandless, and are as well as the branches and peduncles clothed with fine velvety down; panicle terminal. *h. S.* Native of the island of Trinidad. *Cássia Trinitatis*, Reichb. in Sieb. pl. exsic. trin. no. 57.

*Trinidad Purging-cassia.* Clt. 1820. Tree 20 to 30 feet.

7 *C. SIEBERIANUS*; leaves with 8-10 pairs of ovate-oblong shining leaflets, which are pale and beset with very minute pubescence beneath; petioles glandless; branches, peduncles, and calyxes clothed with fine velvety down; racemes loose, bracteate. *h. S.* Native of Senegal. *C. Javánica affinis*, Sieb. pl. exsic. seneg. no. 48. *Cássia Sieberiana*, D. C. prod. 2. p. 489.

*Sieber's Purging-cassia.* Tree 20 to 30 feet.

8 *C. CONSPICUUS* (G. Don, in edin. phil. journ. 1824.) leaflets ovate-lanceolate, acuminate, and emarginate, 3-nerved at the base, white beneath, stipulas subulate; racemes pendulous, loose; legumes terete, with elevated sutures. *h. S.* Native of Sierra Leone, where the pods are called *Monkey drum-*

*sticks.* The tree has much the appearance of *Laburnum* when in flower.

*Conspicuous Purging-cassia.* Fl. Feb. Clt. 1793. Tree 20 to 30 feet.

9 *C. JAVA'NICUS* (Pers. ench. 1. p. 459.) leaves with 12-15 pairs of ovate, obtuse, glabrous leaflets; petioles glandless; racemes axillary; legumes nearly cylindrical, very long, and transversely torose. *h. S.* Native of Java and the Moluccas, &c. *Cássia Javánica*, Lin. spec. 542. exclusive of the synonyms.—Rumph. amb. 2. t. 22. *Cássia Bacillus*, Gærtn. fruct. 1. p. 318. Flowers flesh-coloured. Legumes 2 feet long, rather thick, containing a black cathartic pulp as the rest of the species, which is given to horses, hence its name, *Horse-cassia*, in the East Indies.

*Java Purging-cassia.* Clt. 1779. Tree 30 to 40 feet.

10 *C. EXCELSUS*; leaves with 7 pairs of ovate-oblong, acutish leaflets, beset with minute scattered hairs on both surfaces; petioles glandless. *h. G.* Native of South America, near Porto-Cabello, and in the valleys of Aragua. *Cássia excelsa*, H. B. et Kunth, nov. gen. amer. 6. p. 339. but not of Schrad. *Cássia Bonplandiana*, D. C. prod. 2. p. 490. Flowers and fruit unknown. Nearly allied to *C. Fistula*.

*Tall Purging-cassia.* Tree 30 to 40 feet.

11 *C. ATTELEH*; leaves bipinnate, glandless, glabrous; leaflets ovate-oblong, glaucous-green; legumes long, cylindrical; seeds covered with green pulp when mature. *h. G.* Native of Egypt, at Abo Qoulgui, in the province of Qamanay, where it is called *Atteleh*. *Cássia Attèleh*, Gailliaud, in fl. meroc, 1826. Nearly related to *C. Fistula*.

*Atteleh Purging-cassia.* Tree 20 feet.

12 *C. FISTULA* (Pers. ench. 1. p. 459.) leaves with 4-6 pairs of ovate, rather acuminate, glabrous leaflets; petioles glandless; racemes loose, bractless; legumes cylindrical, rather obtuse, smooth. *h. S.* Native of the East Indies, from whence it has been introduced to South America and the West Indies. *Cássia Fistula*, Lin. spec. 540. Gærtn. fruct. 2. t. 147. f. 1. Woodv. med. bot. t. 164. Regn. bot. with a figure, Lam. ill. t. 332. Mack. voy. ægypt. p. 21. t. 4.—Rumph. amb. 2. t. 21. Plench. icon. t. 327. Pods cylindrical, with elevated sutures, 1-2 feet long, containing a black sweet pulp. This pulp is an easy and gentle laxative. There are two sorts of this drug in the shops, one brought from the East Indies, the other from the West. The pods of the latter are generally large, rough, thick, rounded, and the pulp nauseous; those of the former are smaller, smoother, the pulp blacker, and of a sweeter taste, and are preferred to the other. Such pods should be chosen as are heavy and new, and do not make any rattling noise, from the seeds being loose within, when shaken, indicating that the pulp is dried up. The pulp should be of a bright shining black colour, and have a sweet taste. The greatest part of the pulp dissolves both in water and alcohol, and may be extracted from the pod by either. In the shops they boil the bruised pods in water, and evaporate the solution to a due consistence. Vauquelin has analyzed the pulp, and found it to consist of parenchyma, gluten, gelatine, gum, extractive, and crystallizable sugar. In medicine, the pulp from its saccharine and extractive constituents is a gentle laxative, and is recommended in a dose of some drachms in costive habits. In larger quantities it generally excites nausea, although some recommend it.

*Fistula-podded Purging-cassia or Pudding Pipe-tree.* Fl. June, July. Clt. 1731. Tree 30 to 50 feet.

13 *C. RHOMBIFOLIUS*; leaves with 3-4 pairs of ovate-roundish, very blunt, glabrous leaflets; petioles glandless; racemes loose. *h. S.* Native of the Island of Timor. *Cássia rhombifolia*, Roxb. hort. beng. p. 31. *Cássia Fistula*, var. *β.* ovata, D. C. prod. 2. p. 490.

*Rhomb-leafletted Purging-cassia.* Tree 20 to 30 feet.

14 *C. LÆTA*; leaves with 4 pairs of thin elliptic-oblong leaflets, which are rather hairy above, and clothed with soft hairy pubescence beneath; petioles glandless; peduncles 4-8-flowered. *h. S.* Native near Guayaquil, on the sea shore. *Cássia læta*, *H. B. et Kunth*, nov. gen. amer. 6. p. 340. Legume unknown.

*Mild Purging-cassia.* Tree 30 to 40 feet.

15 *C. FISTULOIDES*; leaves bipinnate, with 2 pairs of pinnæ, each pinna bearing 6 pairs of leaflets; racemes erect; legumes terete, obtuse. *h. S.* Native of Mexico. *C. fistula*, *Moc. et Sesse*, fl. mex. icon. ined. *Cássia fistuloides*, *Collad. mon.* p. 87. t. 1. This is a very doubtful species of *Cathartocárpus* from the form of the leaves.

*Fistula-like Purging-cassia.* Tree 20 feet.

*Cult.* See *Cássia* for culture and propagation, p. 450.

**CCLXXVI. EXOSTYLIS** (from *εξω*, *exo*, without, and *στυλος*, *stylos*, a style; in allusion to the style being much exerted beyond the other parts of the flower). *Schott.* in *Spreng.* syst. append. 406.

*Lin. syst. Decándria, Monogýnia.* Calyx clavate, 5-cleft, 3 of the segments revolute. Petals 5, nearly equal, conniving imbricately, inserted in the middle of the throat of the calyx. Stamens 10, nearly equal, dilated at the base; anthers sagittate, cuspidate. Style elongated, simple. Legume thick, many-seeded.—A tree, with impari-pinnate leaves, and racemes of rose-coloured flowers.

1 *E. VENUSTA* (*Schott*, l. c.) A tree, with villous branches, impari-pinnate leaves, ovate, rather pilose leaflets, and subracemose bracteate peduncles. *h. S.* Native of Brazil.

*Beautiful Exostylis.* Tree.

*Cult.* See *Copaífera* for culture and propagation, p. 456.

**CCLXXVII. METROCYNIA** (an anagram of *Cynometra*, to which genus the present is nearly allied). *Pet. Th. gen. mad.* no. 76. *D. C. prod.* 2. p. 507.

*Lin. syst. Decándria, Monogýnia.* Sepals 5, joined together into a campanulate tube at the base, with the lobes long and coloured. Petals 5. Stamens 10; filaments hairy, with the anthers inserted on their tops. Ovary pedicellate, hairy. Style length of stamens. Legume short, somewhat reniform, 1-seeded, warted or plaited.—A shrub from Madagascar, with abruptly-pinnate leaves, bearing few pairs of leaflets. Flowers disposed in dense spikes. This genus is very nearly allied to *Schôtia* and *Cynometra* according to *M. Du Petit Thouars*.

1 *M. COMMERSÖNI* (*D. C. prod.* 2. p. 507.) *h. S.* Native of Madagascar. Shrub smooth. Leaves with 2 pairs of leaflets, the lower pair at the base of the petiole, the upper pair at the apex. Leaflets coriaceous, elliptic-obovate, emarginate.

*Commerson's Metrocynia.* Shrub 4 to 6 feet.

*Cult.* See *Copaífera* for culture and propagation, p. 456.

**CCLXXVIII. AFZELIA** (in honour of Adam Afzelius, M.D. professor of botany in the university of Upsal in Sweden, who in his younger days resided many years at Sierra Leone, where he collected a large herbarium of the vegetables of that country, very few of which he published). *Smith*, in *Lin. trans.* 4. p. 221. *D. C. prod.* 2. p. 507.

*Lin. syst. Decándria, Monogýnia.* Calyx tubular, with a 4-cleft deciduous limb. Petals 4, unguiculate, upper one largest. Stamens 10, 8 of which are fertile, and the 2 superior ones sterile. Style subulate. Stigma acute. Legume ligneous, many-celled. Seeds arillate at the base; aril cup-shaped, one-half the length of the seed. Embryo straight, at the base of the seed, with a somewhat inclosed radicle and fleshy cotyledons.

Flowers disposed in racemes, blood-coloured. This genus is not well known.

1 *A. AFRICA'NA* (*Smith*, l. c.) 8 of the stamens fertile. *h. S.* Native of Sierra Leone. Seeds black, with scarlet aril, which becomes yellow on drying. Leaves abruptly pinnate.

*African Afzelia.* Tree.

2 *A. PANCØVIA* (*D. C. prod.* 2. p. 507.) 7 of the stamens fertile. *h. S.* Native of Guinea. *Pancøvnia bijuga*, *Willd. spec.* 2. p. 285. *Smith* in *Rees' cycl.* vol. 26. *Afzèlia bijuga*, *Spreng.* syst. append. 170. Leaves with 2 pairs of leaflets.

*Pancovius's Afzelia.* Tree.

*Cult.* See *Copaífera* for culture and propagation, p. 456.

**CCLXXIX. MELANOXYLON** (from *μελας μελανος*, *melas melanos*, black, and *ξύλον*, *xylon*, wood; wood black). *Schott*, in *Spreng.* syst. append. p. 406.

*Lin. syst. Decándria, Monogýnia.* Calyx deeply 5-cleft. Petals 5, nearly equal. Stamens 10, hairy. Legume compressed, falcate. Seeds furnished with a winged arillus each.

1 *M. BRA'UNA* (*Schott*, l. c.) *h. S.* Native of Brazil. A tree, with reddish brown wood, impari-pinnate leaves, oblong-lanceolate leaflets, which are hairy beneath, and paniced racemes of flowers. Flowers clothed with rusty tomentum.

*Brauna Melanoxylon.* Tree.

*Cult.* For culture and propagation see *Copaífera*, p. 456.

**CCLXXX. ACO'SMIUM** (from *ακοσμία*, *acosmia*, want of ornament; a tree without beauty). *Schott*, in *Spreng.* syst. append. 406.

*Lin. syst. Decándria, Monogýnia.* Calyx campanulate, 4-5-cleft. Petals 5, spreading. Stamens 10, inserted in the bottom of the calyx. Ovary elongated, perhaps a legume.

1 *A. LENTISCIFOLIUM* (*Schott*, l. c.) *h. S.* Native of Brazil. A shrub, with impari-pinnate leaves, elliptic-lanceolate shining leaflets, and yellow flowers. Racemose, branches leafless.

*Acetia tamarindifolia*, *Spreng.* syst. 2. p. 21.

*Lentiscus-leaved Acosmium.* Shrub.

*Cult.* For culture and propagation see *Copaífera*, p. 456.

**CCLXXXI. SCHOTIA** (so named by Jacquin in honour of Richard Van der Schot, his companion in his travels). *Jacq. coll.* 1. p. 93. *Lam. ill.* t. 331. *D. C. prod.* 2. p. 507.—*Schott*, *Thunb.*

*Lin. syst. Decándria, Monogýnia.* Sepals 5, coloured, joined together at the base. Petals 5, lateral ones incumbent. Stamens 10; filaments glabrous; anthers glandless. Ovary pedicellate. Style filiform. Legume unknown.—Trees, with rigid branches, abruptly-pinnate leaves, few-flowered racemes, and vermilion-coloured flowers.

**SECT. I. SCHOTIA** (see genus for derivation). Calyx tubular at the base, with 5 erect lobes. Fruit unknown. Leaves abruptly pinnate.

1 *S. SPECIOSA* (*Jacq. icon. rar.* 1. t. 75. *Andr. bot. rep.* t. 348.) leaves with 7-10 pairs of oval-lanceolate, acuminate leaflets, ending each in a spine-like mucrone; stipulas subulate, *h. S.* Native of Senegal and the Cape of Good Hope. *Guayacum Afrum*, *Lin. spec.* 547. *S. Afr.*, *Thunb. prod.* 79. *Theodora speciosa*, *Med. mon.* p. 16. t. 1. Flowers scarlet.

*Sherry Schotia.* Fl. July, Dec. Clt. 1759. Sh. 5 to 6 feet.

2 *S. TAMARINDIFOLIA* (*Afz. ex bot. mag.* t. 1153.) leaves with 8-10 pairs of ovate, bluntish, mucronate or awnless leaflets, rather gibbous in front at the base. *h. S.* Native of the Cape of Good Hope. *Ait. hort. kew.* ed. 2. vol. 3. p. 33. Flowers crimson. Legume broad, large, arched, reticulately veiny, and with the sutures thickened.

*Tamarind-leaved Schotia.* Fl. May, Sept. Clt. 1795. Shrub 5 to 6 feet.

3 *S. STIPULA'TA* (Ait. hort. kew. ed. 2. vol. 3. p. 33.) leaves with 5 pairs of oval, acute, mucronate leaflets; stipulas dimidiately ovate, falcate, mucronate.  $\frac{1}{2}$ . G. Native of the Cape of Good Hope. Flowers crimson.

*Stipulaceous Schotia.* Fl. May, Sept. Clt. 1794. Sh. 5 to 6 ft.

4 *S. ALA'TA* (Thunb. fl. cap. ed. Schult. 1. p. 389.) leaves with usually 4 pairs of cuneiform cut, usually convolute leaflets, which are reflexed at the apex.  $\frac{1}{2}$ . G. Native of the Cape of Good Hope. Flowers axillary, pedunculate. Petiole furnished with a narrow wing.

*Winged Schotia.* Fl. June, July. Clt. 1816. Sh. 4 to 6 feet.

SECT. II. SCHOTIA'RIA (an alteration from the generic name). D. C. prod. 2. p. 508. Legume turgid. Leaves simple.

5 *S. SIMPLICIFOLIA* (Vahl. ined. D. C. prod. 2. p. 508.) leaves oval, emarginate, obtuse, quite smooth, shining, quite entire, 3-nerved, and reticulately veined; racemes terminal; rachis, calyxes, and pedicels clothed with short velvety down; stamens exceeding the petals, and the petals exceeding the calyx.  $\frac{1}{2}$ . S. Native country unknown. Legume turgid according to Vahl.

*Simple-leaved Schotia.* Shrub 4 to 6 feet.

SECT. III. OMPHALOBIOIDES (from *Omphalobium*, a genus in Connaraceæ, and *idea*, like; resembles that genus in habit). D. C. prod. 2. p. 508. Sepals only connected a very little at the base. Filaments somewhat monadelphous at the very base. Legume on a short pedicel, oval, compressed, almost indehiscent, 1-celled, and 2-seeded. Seed girded by an ample aril at the base.

6 *S. LATIFOLIA* (Jacq. fragm. 23. t. 15. f. 4.) leaves with 2-4 pairs of obovate, very blunt, mucronate leaflets; sepals 4; petals oblong, hardly attenuated; calyx 4-lobed, mucronate, 4 times longer than the calyx; legume 2-seeded.  $\frac{1}{2}$ . G. Native of the Cape of Good Hope. *Omphalobium Schotia*, Jacq. ecl. icon. in f. Petals and stamens purple and white. Seeds orbicular, brown, furnished with a yellow arillus.

*Broad-leaved Schotia.* Fl. May, July. Clt. 1810. Sh. 6 ft.

*Cult.* The species of this genus are very elegant when in flower. They succeed best in a cool part of a stove, as the green-house is rather too cold for them in winter, although they are natives of the Cape of Good Hope. The soil best suited for them is a mixture of loam, peat, and sand, and ripened cuttings will root readily if planted in a pot of sand, with a hand-glass placed over them in a moderate heat.

CCLXXXII. COPAIFERA (from *Copaiba*, the Brazilian name for the balsam of Capevi, and *fero*, to bear; trees producing the balsam of Capevi). Lin. gen. no. 542. Desf. mem. mus. p. 375. H. B. et Kunth, nov. gen. amer. 7. p. 265. D. C. prod. 2. p. 509. Hayne, pl. offic. ex Schlecht. Linnæa. vol. 1. p. 425. —Copaiba, Jacq. amer. 133.

LIN. SYST. *Decandria, Monogynia.* Calyx bractless. Sepals 4, connected at the very base, spreading, small, and equal. Petals wanting. Stamens 10, distinct, nearly equal; anthers oblong. Style filiform. Legume stipitate, obliquely elliptic, coriaceous, somewhat compressed, 2-valved, 2-ovulate, 1-seeded. Seed elliptic, wrapped in a fleshy arillus. Embryo straight, with a sublateral radicle.—Trees, natives of the tropical parts of America, with impari-pinnate leaves, and coriaceous, somewhat unequal, ovate leaflets. Flowers white, disposed in panicles.

\* *Leaves impari-pinnate; leaflets reticulated with ribs.*

1 *C. BEYRICHI* (Hayne in Schlecht. Linnæa. 1. p. 425.)

leaves with 2-3 pairs of equal-sided leaflets, each ending in a long emarginate acumen, lower ones oblong, upper ones lanceolate, hardly with pellucid dots.  $\frac{1}{2}$ . S. Native of Brazil. Hayne, pl. offic. t. 12.

*Beyrich's Balsam of Capevi tree.* Tree 20 to 30 feet.

2 *C. GUIANE'NSIS* (Desf. mem. mus. 7. p. 376.) leaves with 2-4 pairs of equal-sided leaflets, each ending in a long apiculated point, lower ones ovate, upper ones oblong, full of pellucid dots.  $\frac{1}{2}$ . S. Native of Guiana, near the Rio Negro. Hayne, pl. offic. t. 13.

*Guiana Balsam of Capevi tree.* Clt. 1817. Tree 30 to 40 ft.

3 *A. MA'RTII* (Hayne, l. c.) leaves with 2-3 pairs of ovate, equal-sided, dotless leaflets, ending each in a short emarginate acumen.  $\frac{1}{2}$ . S. Native of Brazil. Hayne, pl. offic. t. 15.

*Martius's Balsam of Capevi tree.* Tree 30 to 40 feet.

4 *C. JACQUINIA'NA* (Hayne, l. c.) leaves with 2-5 pairs of ovate, incurved, unequal-sided, bluntly acuminate leaflets, full of pellucid dots.  $\frac{1}{2}$ . S. Native of Martinique, Trinidad, &c. Hayne, t. 14. C. officinalis, Lin. spec. 557. Jacq. amer. t. 86. Lam. ill. t. 342. Woodv. med. bot. 3. t. 137. H. B. et Kunth, nov. gen. 7. t. 659. The trees which produce the *balsam of Capevi*, or *Copaiva*, are natives of the Spanish West India Islands, and of some parts of South America, and the resinous juice flows in considerable quantities from incisions made in the trunk. The juice is clear and transparent, of a whitish or pale yellow colour, an agreeable smell, and a bitterish pungent taste. It is usually about the consistence of oil, or a little thicker; when long kept it becomes nearly as thick as honey, retaining its clearness; but it has never been observed to grow dry or solid, as other resinous juices do. The best resin of Copaiva comes from Brazil. Pure resin of Copaiva dissolves entirely in alcohol; the solution has a very fragrant smell. Distilled with water it yields a large quantity of a limpid essential oil, but no benzoic acid; it is therefore not a balsam, but a turpentine, a combination of resin and volatile oil. In medicine the resin of Copaiva is a useful tonic, but in some degree irritating. In large doses it proves purgative, and promotes urine, and is supposed to clean and heal excoriations in the urinary passages more effectually than any of the other resinous fluids. The resin has been principally celebrated in chronic catarrh, gleet, and the fluor albus, and externally as a vulnerary. The dose of this medicine rarely exceeds 20 or 30 drops, though some authors direct 60 or upwards. It may be conveniently taken in the form of an emulsion, into which it may be reduced by triturating it with oil of almonds, with a thick mucilage of gum-arabic, or with the yolk of eggs, till they are well incorporated, and then gradually adding a proper quantity of water.

*Jacquin's Balsam of Capevi tree.* Tree 30 to 40 feet.

5 *C. NIVUGA* (Hayne, l. c.) leaves with 2 pairs of incurved, oval, bluntly-acuminate, unequal-sided leaflets, which are full of pellucid dots.  $\frac{1}{2}$ . S. Native of Brazil. Hayne, pl. offic. t. 16.

*Two-paired-leafletted Balsam of Capevi-tree.* Tree 30 to 40 feet.

6 *C. MULTIJUGA* (Hayne, l. c.) leaves with 6-10 pairs of somewhat incurved, unequal-sided leaflets, ending each in a long apiculated acumen, lower ones ovate-oblong, upper ones lanceolate, all full of pellucid dots.  $\frac{1}{2}$ . S. Native of Brazil. Hayne, pl. offic. t. 17. f. c.

*Many-paired-leafletted Balsam of Capevi tree.* Tree 30 to 40 feet.

\*\* *Leaves impari-pinnate; leaflets reticulately veined.*

7 *C. JUSSI'EI* (Hayne, l. c.) leaves with 5-6 pairs of incurved, nearly equal-sided leaflets, each ending in a long mucronate acumen, lower ones ovate-lanceolate, upper ones oval-oblong, all full

of pellucid dots; petioles glabrous.  $\frac{1}{2}$ . S. Native of Peru. Hayne, pl. offic. t. 17. f.

*Jussieu's Balsam of Capevi tree.* Tree 30 to 40 feet.

8 C. NITIDA (Mart. miss. Hayne, l. c.) leaves with 2-4 pairs of incurved, unequal-sided, obtusely-acuminated leaflets, with hardly any pellucid dots, lower ones broad-ovate, upper ones oblong-ovate; petioles and peduncles glabrous.  $\frac{1}{2}$ . S. Native of Brazil. Hayne, pl. offic. t. 17. a.

*Shining-leaved Balsam of Capevi tree.* Tree 30 to 40 feet.

9 C. LA'XA (Hayne, l. c.) leaves with 3-4 pairs of equal-sided, somewhat incurved, emarginate leaflets, lower ones ovate-cordate, upper ones ovate-oblong, all full of pellucid dots; petioles pubescent; peduncles villously tomentose.  $\frac{1}{2}$ . S. Native of Brazil. Hayne, pl. offic. t. 18.

*Loose Balsam of Capevi tree.* Tree 40 feet.

10 C. LANGSDORFII (Desf. mem. mus. 7. p. 376. Hayne, l. c.) leaves with 3-5 pairs of equal-sided, obtuse leaflets, lower ones ovate, upper ones ovate-elliptic, all full of pellucid dots; petioles and peduncles pubescent.  $\frac{1}{2}$ . S. Native of Brazil. Hayne, pl. offic. t. 19.

*Langsdorf's Balsam of Capevi tree.* Tree 30 to 40 feet.

11 C. CORIACEA (Mart. miss. Hayne, l. c. p. 427.) leaves with 2-3 pairs of elliptic, equal-sided, emarginate dotless leaflets; petioles and peduncles nearly glabrous.  $\frac{1}{2}$ . S. Native of Brazil. Hayne, pl. offic. t. 20.

*Coriaceous-leaved Balsam of Capevi tree.* Tree 40 feet.

12 C. CORDIFOLIA (Hayne, l. c.) leaves with usually 5 pairs of nearly equal-sided, emarginate, dotless leaflets, lower ones ovate-cordate, upper ones elliptic-obovate; petioles and peduncles clothed with pubescent tomentum.  $\frac{1}{2}$ . S. Native of Brazil. Hayne, pl. offic. t. 21.

*Heart-leafletted Balsam of Capevi tree.* Tree 30 to 40 feet.

13 C. SELLONI (Hayne, l. c.) leaves with 3-4 pairs of somewhat unequal-sided, hardly dotted leaflets, lower ones ovate, upper ones lanceolate; petioles and peduncles tomentose.  $\frac{1}{2}$ . S. Native of Brazil. Hayne, pl. offic. t. 22.

*Sello's Balsam of Capevi tree.* Tree 30 to 40 feet.

14 C. OBLONGIFOLIA (Hayne, l. c.) leaves with 6-8 pairs of elliptic-oblong, nearly equal-sided, emarginate leaflets, full of pellucid dots; petioles and peduncles pubescent.  $\frac{1}{2}$ . S. Native of Brazil. Hayne, pl. offic. t. 23. a.

*Oblong-leafletted Balsam of Capevi tree.* Tree 30 to 40 feet.

15 C. TRAPEZIFOLIA (Hayne, l. c.) leaves with 4-7 pairs of ovate-trapeziform leaflets, which are for the most part emarginate, full of pellucid dots; petioles pubescent.  $\frac{1}{2}$ . S. Native of Brazil.

*Var. a, crassiuscula* (Hayne, l. c.) leaflets for the most part alternate, thicker, full of pellucid dots. Hayne, l. c. t. 23. b.

*Var. β, tenella* (Hayne, l. c.) leaflets for the most part opposite, thinner, and very full of pellucid dots. Hayne, l. c. t. 23.

*Trapezium-leaved Balsam of Capevi tree.* Tree 30 to 40 ft.

† *A species not sufficiently known.*

16 C. DISPERMA (Willem. herb. maur. p. 34.) fruit 2-seeded.  $\frac{1}{2}$ . S. Native of the Mauritius.

*Two-seeded Balsam of Capevi tree.* Tree.

*Cult.* Sandy loam is the best soil for the species of *Copaifera*. Ripened cuttings will root if planted in a pot of sand plunged in heat, under a hand-glass.

CCLXXXIII. CYNOMETRA (from *κυνος*, *kyon*, a dog, and *μετρα*, *metra*, a matrix; shape and consistence of pods). Lin. gen. 519. Lam. ill. t. 331. D. C. prod. 2. p. 509.—*Cynomorium*. Rumph. amb. 1. p. 163. but not of Lin.

LIN. SYST. *Decandria, Monogynia*. Calyx bractless, deciduous, with a very short tube, and a 4-parted limb; the lobes

reflexed and pencilled at the apex. Petals 5, oblong, equal. Stamens 10, distinct; anthers bifid at the apex. Legumes half round, fleshy, indehiscent, 1-celled, 1-seeded, tubercled on the outside. Seed filling the cell, and fixed to the middle of the suture. Embryo straight, with thickish, roundish cordate cotyledons.—Trees, with bifoliate leaves and red flowers rising from the main trunk of the trees. Legumes brown, edible.

§ 1. *Genuinæ* (*genuinus*, genuine; this division contains the genuine species). *Leaves with one pair of leaflets.*

1 C. CAULIFLORA (Lin. spec. 547.) trunk floriferous; leaflets emarginate at the apex.  $\frac{1}{2}$ . S. Native of the East Indies. Lam. ill. t. 331. f. 1.—Rumph. amb. 1. t. 62. Peduncles rising in fascicles from the trunk, bracteolate, with many pedicels rising in racemes from the roundish bracteas, sometimes short and few-flowered, sometimes elongated and many-flowered. Perhaps two species are confused under *C. cauliflora*. Flowers white.

*Stem-flowered Cynometra.* Clt. 1804. Tree 30 to 40 feet.

2 C. RAMIFLORA (Lin. spec. 547.) branches floriferous; leaflets acuminate at the apex.  $\frac{1}{2}$ . S. Native of the East Indies. Lam. ill. t. 331. f. 2.—Rumph. amb. 1. t. 63.—Rheed. mal. 4. t. 31. Flowers white. Seed compact, whitish, covered with a thin pellicle, having an astringent taste, but without any smell.

*Branch-flowered Cynometra.* Tree 60 feet.

§ 2. *Dubie* (from *dubius*, doubtful, this division contains doubtful species of the genus). *Leaves with many pairs of leaflets.*

3 C. POLYANDRA (Roxb. cor. 3. t. 286.) branches floriferous; peduncles axillary, short, many-flowered; leaves abruptly pinnate, with 2-3 pairs of leaflets.  $\frac{1}{2}$ . S. Native of the East Indies, on the mountains of Silhet. Flowers white, polyandrous. Legume flat, not tubercled on the outside. This tree is perhaps generically distinct from *Cynometra*, from the stamens being 40-50 in number in each flower, and probably hypogynous, and therefore it comes near to *Swartzia*.

*Polyandrous Cynometra.* Tree 40 feet.

4 C. PINNATA (Lour. coch. p. 268.) racemes terminal; leaves impari-pinnate.  $\frac{1}{2}$ . G. Native of Cochin-china. Leaves lanceolate, glabrous. Calyx 5-parted. Stamens 10. Petals very thick, yellow, not tubercled on the outside. Perhaps a distinct genus.

*Pinnate-leaved Cynometra.* Tree 60 feet.

*Cult.* For culture and propagation see *Copaifera*.

CCLXXXIV. INTSIA (*Intsi* is the name of *I. Madagascarensis* in Madagascar). Pet. Th. gen. nov. mad. p. 22. no. 75. D. C. prod. 2. p. 509.

LIN. SYST. *Enneandria, Monogynia*. Calyx campanulate at the base, 5-parted. Petal one, unguiculate, opposite the ovary. Stamens 9, 3 of which are fertile, longer, and declinate. Legume oblong, compressed, 3-4-seeded. Seeds oblong, with the intervals between the seeds filled with medulla.—Tall trees, with pinnate leaves.

1 I. MADAGASCARIENSIS (D. C. prod. 2. p. 509.) leaves with 2 pairs of leaflets, and an odd one; flowers corymbose; stamens 9, 6 of which are sterile.  $\frac{1}{2}$ . S. Native of Madagascar, where it is called *Intsi*.

*Madagascar Intsia.* Tree 60 feet.

2 I.? AMBOINE'NSIS (D. C. prod. 2. p. 509.) leaves abruptly pinnate, with 2 pairs of leaflets; flowers somewhat panicked; sterile filaments 3.  $\frac{1}{2}$ . S. Native of the Moluccas. *Caju-Bessi* or *Metrosideros Amboinensis*, Rumph. amb. 3. p. 21. t. 10. This tree is placed in the present genus by M. Du Petit

Thuars, but not without some doubt, and Loureiro refers it to *Barjxylum*.

*Ambuyna* Intsia. Tree 60 feet.

*Cult.* For culture and propagation see *Copaifera*, p. 456.

**CCLXXXV. EPERUA** (the tree is called in Guiana *Vorapa-Tabaca*, and the fruit *eperu*, signifying a sabre, from the shape of the pods). Aubl. guian. 1. p. 369. t. 142. D. C. prod. 2. p. 510.—Rotnámia, Neck. elem. no. 1284.—Panzèra, Willd. spec. 2. p. 540.

**LIN. SYST.** *Monadelphina*, *Decándria*. Sepals 4, thick, and concave, connected together into a permanent urceolate tube at the base, with the sides incumbent, upper one the broadest. Petal 1, roundish, fringed, inserted in the middle of the calyx. Stamens 10, long; filaments thickened, and rather villous at the base, and joined into a short monadelphous ring. Ovary stipitate. Style long, filiform. Legume compressed, dry, coriaceous, falciform, 2-valved, 1-4-seeded, when young it is tomentose.—A tree, with abruptly-pinnate leaves, bearing 2-3 pairs of ovate, acuminate, shining leaflets. Panicle pendulous, on a long peduncle, constantly composed of numerous distant racemes. Flowers red.

1 *E. FALCATA* (Aubl. l. c.)  $\frac{1}{2}$ . S. Native of Guiana, in woods, where it is called *Vouapa*, according to Lessert's herbarium. Dimórpha falcata, Smith in Rees's cycl. no. 3. The inhabitants of Guiana make handles to their hatchets of the wood of this tree.

*Falcate-podded Eperua*. Tree 40 to 50 feet.

*Cult.* For culture and propagation see *Copaifera*, p. 456.

**CCLXXXVI. PARIVOA** (the Guiana name of *hupia* tree). Aubl. guian. 2. p. 756. t. 303. D. C. prod. 2. p. 510.—*Adlèria*, Neck. elem. no. 1286.—Dimórpha, Willd. spec. 3. p. 971.

**LIN. SYST.** *Diadelphina*, *Monogýnia*. Calyx 2-bracteoles on the outside, 3-5-cleft; tube urceolate; segments thick and blunt. Petal 1, large, roundish, convolute, inserted in the calyx. Stamens 10; filaments long, 9 of which are joined together at the base, and the tenth loose. Ovary stipitate. Style long, filiform. Legume thick, compressed, oval, 2-valved, 1-seeded.—A tree, with abruptly-pinnate leaves, bearing 3-4 pairs of ovate, acuminate, shining leaflets. Flowers purple, in short racemes. Perhaps sufficiently distinct from *Eperua*.

1 *P. GRANDIFLORA* (Aubl. l. c.)  $\frac{1}{2}$ . S. Native of Cayenne, along the banks of rivers. Dimórpha grandiflora, Willd. l. c. Rudge in Lin. trans. 9. p. 180. t. 20. Petal almost 2 inches long, purple. The trunk of the tree is more than 2 feet in diameter, and the wood is reddish, solid, and compact; and is used in Cayenne for various important purposes.

*Great-flowered Parivoa*. Clt. 1821. Tree 30 feet.

*Cult.* For culture and propagation see *Copaifera*, p. 456.

**CCLXXXVII. ANTHONOTA** (from *ανθος*, *anthos*, a flower, and *νωτος*, *notos*, the back; in reference to the flower being only furnished with one petal, which is behind). Beauv. fl. d'ow. 1. p. 70. t. 42. D. C. prod. 2. p. 510.

**LIN. SYST.** *Decándria*, *Monogýnia*. Bractea 2-lobed, situated under the calyx. Calyx petaloid, 4-cleft, 3 of the lobes are lanceolate and acute, the fourth broader and emarginate. Petal one, standing on a long claw, with a spoon-shaped emarginate limb. Stamens 10, free, 3 of which are very long, and 7 shorter than the calyx. Ovary sessile, compressed, ovate. Style filiform, crowned by a somewhat bifid stigma. Legume compressed, flat, hardly dehiscent, 1-celled, many-seeded, somewhat reticulated from transverse wrinkles. Seeds orbicular, flat.—A glabrous shrub, without stipulas. Leaves abruptly-pinnate, with 2-3 pairs of coriaceous, elliptic-oblong, acuminate leaflets;

petiole terete. Racemes axillary, very short. This genus is allied to *Oútea*, *Vouapa* and *Parivòta*.

1 *A. MACROPHYLLA* (Beauv. l. c.)  $\frac{1}{2}$ . S. Native of Western Africa, between Warce and Buonopozo, along the banks of rivulets. Leaflets 8-10 inches long.

*Long-leafletted Anthonota*. Shrub 6 to 8 feet.

*Cult.* For culture and propagation see *Copaifera*, p. 456.

**CCLXXXVIII. OUTEA** (*Joutay* is the name of *O. paniculata* in Guiana). Aubl. guian. 1. p. 28. Juss. gen. 347. Vahl. enum. 2. p. 38.—*Macrolòbium*, spec. Schreb. et Willd.

**LIN. SYST.** *Triándria*, *Monogýnia*. Calyx 5-cleft, furnished with 2 opposite bracteas at the base. Petals 5, 4 of which are very minute or almost wanting, the fifth large, and undulately plicate. Stamens 3-4, long, free, when 4 the fourth is sterile. Ovary pedicellate, terminated by a long style. Legume compressed, 1-celled (1-seeded? ex ovarium).—Trees, natives of Guiana, with abruptly-pinnate leaves, and racemes of flowers.

1 *O. MULTIJUGA* (D. C. prod. 2. p. 510.) leaves with 3-5 pairs of obovate-emarginate, oblong, very blunt, retusely emarginate leaflets.  $\frac{1}{2}$ . S. Native of French Guiana. Stamens 3. Perhaps sufficiently distinct from the following species.

*Many-paired-leafletted Outea*. Tree.

2 *O. GUIANENSIS* (Aubl. guian. 1. p. 28. t. 9.) leaves with 2 pairs of elliptic-oblong obtuse leaflets.  $\frac{1}{2}$ . S. Native of French Guiana. Stamens 4, of which one is sterile and villous. Lam. ill. t. 26. *Macrolòbium pinnatum*, Willd. spec. 1. p. 186. *Macrolòbium Utea*, Gmel. syst. 93.

*Guiana Outea*. Clt. 1825. Tree 50 feet?

3 *O. BIJUGA* (D. C. prod. 2. p. 511.) leaves with 2 pairs of leaflets; flowers triandrous, and with 6 sterile filaments.  $\frac{1}{2}$ . S. Native of the East Indies. *Macrolòbium bijugum* Coleb. Lin. trans. vol. 12. p. 359. t. 17.

*Two-paired-leafletted Outea*. Clt. 1823. Shrub 10 feet.

*Cult.* For culture and propagation see *Copaifera*, p. 456.

**CCLXXXIX. VOUAPA** (the name of the first species in Guiana). Aubl. guian. 1. p. 25. Juss. gen. p. 350. D. C. prod. 2. p. 511.—*Macrolòbium* species, Schreb. et Willd. *Macrolòbium*, Vahl. enum. 2. p. 37.—*Krugèria*, Neck. elem. no. 1389.

**LIN. SYST.** *Triándria*, *Monogýnia*. Calyx 4-cleft, furnished with 2 opposite bracteoles at the base. Petal one, flat. Stamens 3. Legume pedicellate, coriaceous, 1-seeded.—Trees, natives of Guiana, bearing only one pair of leaflets. Flowers disposed in racemes. This genus is perhaps not sufficiently distinct from *Oútea*.

1 *V. BIFOLIA* (Aubl. guian. 1. p. 25. t. 7.) leaflets sessile, ovate, acuminate, oblique; bracteas with one elevated nerve each; lobes of calyx spreading, about equal in length to the corolla; legumes winged on one side.  $\frac{1}{2}$ . S. Native of Guiana and of Maranhão in Brazil, where we have seen it in great plenty. *Macrolòbium hymenoides*, Willd. spec. 1. p. 186. *Macrolòbium Vouapa*, Gmel. syst. 1. p. 93. *M. bifolium*, Pers. ench. 1. p. 39. Petals violaceous.

*Two-leafletted Vouapa*. Clt. 1823. Tree 60 feet.

2 *V. SIMIRA* (Aubl. guian. 1. p. 26. t. 8.) leaflets petiolulate, somewhat obovate-lanceolate, equal at the base; legumes oval, with smooth margins.  $\frac{1}{2}$ . S. Native of Guiana, where it is called *Simira*. *Macrolòbium sphaerocarpum*, Willd. spec. 1. p. 186. *Macrolòbium Simira*, Gmel. syst. 1. p. 93. *Vouapa violacea*, Lam. ill. no. 420. Petals violaceous.

*Simira Vouapa*. Tree 40 to 50 feet.

3 *V. STAMINEA* (D. C. prod. 2. p. 510.) leaflets sessile, lanceolate-oblong, bluntish; segments of calyx reflexed; stamens 3 times the length of the corolla; legumes obsoletely margined

on one side. *h. S.* Native of Guiana, in the Island of Arowabisch. *Macrolobium stamineum*, Meyer. *esseq.* 18.

*Stamineous* Voupa. Tree 30 to 40 feet.

4 *V. PHASELOCARPA* (Hayne, *gat. darst. vesch. ex Schlecht. Linnæa*. vol. 5. p. 20.) leaflets sessile, obovate-oblong, rounded, and emarginate at the apex, and unequal at the base; legumes channelled on both margins. *h. S.* Native of Brazil?

*Phaselus-fruited* Voupa. Tree.

*Cult.* For culture and propagation see *Copaifera*, p. 456.

CCXC. HYMENÆA (from *Hymen*, the god of marriage; in reference to the twin leaflets). *Lin. gen. no.* 512. *Gartn. fruct.* 2. p. 305. t. 144. *Lam. ill. t.* 330. *D. C. prod.* 2. p. 511.—*Courbaril*, *Plum. gen. t.* 36.

*LIN. SYST. Decandria, Monogynia.* Calyx furnished with 2 bracteoles at the base, tubular, coriaceous; tube urceolate; limb 5-parted, the 2 lower segments for the most part joined, all deciduous. Petals 5, unequal, sessile, lower one usually boat-shaped. Stamens 10, distinct, inflated in the middle. Ovary pedicellate, beardless. Style filiform. Legume woody, ovate-oblong, indehiscent, 1-celled, many-seeded, filled with dry farinaceous, filamentose pulp. Embryo straight, with fleshy cotyledons, and a globose radicle.—Trees, with bifoliate leaves, and corymbs of white or yellowish flowers.

\* *Leaflets glabrous.*

1 *H. VENOSA* (Vahl. *eclog.* 2. p. 31.) leaflets oblong, unequal-sided, but equal at the base, ending each in a long obtuse acumen. *h. S.* Native of Cayenne. Flowers of panicle sessile. Calyx silky, shining.

*Veiny-leaved* Locust-tree. Tree 40 feet.

2 *H. LATIFOLIA* (Hayne, *gat. dars. vesch. ex Schlecht. Linnæa*. 5. p. 18.) leaflets roundish-ovate, nearly equal-sided, equal at the base, but emarginate at the apex. *h. S.* Native of South America. *H. obtusifolia*, Willd. *herb.*

*Broad-leafletted* Locust-tree. Tree.

3 *H. CONFERTIFLORA* (Mart. *mss.* Hayne, l. c.) leaflets ovate, unequal-sided, but equal at the base, ending in a long obtuse acumen. *h. S.* Native of Brazil.

*Crowded-flowered* Locust-tree. Tree.

4 *H. CONFERTIFOLIA* (Hayne, l. c.) leaflets oblong, unequal-sided, and unequal at the base, ending in a short acumen. *h. S.* Native of Brazil.

*Crowded-leaved* Locust-tree. Tree.

5 *H. COURBARIL* (*Lin. spec.* 537.) leaflets oblong-ovate, unequal-sided, and unequal at the base, ending in a long acumen; legume oblong, compressed, yellowish, shining. *h. S.* Native of South America. Vahl. *eclog.* 2. p. 30. *Lam. ill. t.* 330. f. 1. *D. C. legum. mem.* xii. t. 26. f. 120. *germ. Jacq. amer. pict.* p. 63. t. 264. f. 65. Flowers of panicle pedicellate. Petals yellow, striped with purple. Stamens purple. The filamentose white substance contained in the pods is as sweet as honey, and is eaten by the Indians with great avidity. It is purgative when fresh gathered, but loses this quality as it grows old. Between the principal roots of the tree exudes a fine transparent resin, white, yellowish or red, which is collected in large lumps, and is called gum-anime. It makes the finest varnish that is known, superior even to the Chinese lac; for this latter use it is dissolved in the highest rectified spirits of wine. It burns readily, and with a clear flame, emitting a grateful and fragrant smell, for which reason it is sometimes ordered by way of fumigation in the chambers of persons labouring with asthmas or suffocative catarrhs. Its vapours not only strengthen the head, but all parts of the body affected with cold. Some apply it outwardly, dissolved in oil or spirits of wine, to strengthen the nerves. An oil may be distilled from it, useful in palsies, in cramps, and con-

tractions of the sinews. The solution in spirits has been thought not inferior to guaiacum in venereal cases. The inner bark is an excellent vermifuge in spirit or decoction. The wild bees are fond of building their nests in this tree. The timber of old trees is reckoned excellent, and is in great request for wheel-work in sugar-mills, particularly for cogs to the wheels, being extremely hard and tough; it is so heavy that a cubic foot weighs a hundred pounds; it also takes a fine polish. *Courbaril* is the name of the tree in some parts of South America.

*Courbaril* Locust-tree or Gum-anime-tree. Tree 40 to 60 ft.

6 *H. STILBOCARPA* (Hayne, l. c.) leaflets oblong, unequal-sided, and unequal at the base, ending in a short acumen; legume nearly cylindrical, smooth, and shining. *h. S.* Native of South America.

*Shining-fruited* Locust-tree. Tree.

7 *H. CANDOLLEANA* (H. B. et Kunth, *nov. gen. amer.* 6. p. 323. t. 566.) leaflets oblong, unequal-sided, but equal at the base, and emarginate at the apex. *h. S.* Native of Mexico, about Acapulco. Peduncles terminal, many-flowered. Flowers pedicellate. Calyx 4-parted, clothed with fine canescent down.

*De Candolle's* Locust-tree. Tree 30 feet.

8 *H. STIGMATA* (Mart. *mss.* Hayne, l. c.) leaflets somewhat cordate, shining, unequal-sided, and unequal at the base, obtuse at the apex; legume oblong, compressed, beset with white dots. *h. S.* Native of Brazil.

*Dotted-fruited* Locust-tree. Tree.

\*\* *Leaflets clothed with villous tomentum.*

9 *H. ROTUNDATA* (Hayne, l. c.) leaflets semicordate, ovate, unequal-sided, and unequal at the base, rounded at the apex. *h. S.* Native of South America.

*Round-leafletted* Locust-tree. Tree.

10 *H. CEFERSIANA* (Hayne, l. c.) leaflets oblong, unequal-sided, obtuse, unequal at the base; lower leaflets somewhat semi-cordate; corymbs axillary, and terminal. *h. S.* Native of South America.

*Olfers's* Locust-tree. Tree.

11 *H. MARTIANA* (Hayne, l. c.) leaflets nearly elliptic, unequal-sided, retuse, and very unequal at the base; corymbs terminal. *h. S.* Native of Brazil.

*Martius's* Locust-tree. Tree.

12 *H. SELLOIANA* (Hayne, l. c.) leaflets oblong-oval, unequal-sided, very blunt, unequal at the base; corymbs terminal. *h. S.* Native of Brazil.

*Sello's* Locust-tree. Tree.

*Cult.* For culture and propagation see *Copaifera*, p. 456.

CCXC. (a) TRACHYLOBIUM (from *τραχυς*, *trachys*, rough, and *λοβος*, *lobos*, a pod; pods rough on the outside). Hayne, *gat. dars. vesch. ex Schlecht. Linnæa*. vol. 5. p. 19.

*LIN. SYST. Decandria, Monogynia.* Calyx bibracteolate at the base, tubular, coriaceous; tube urceolate; limb 5-parted, with the segments deciduous, 2 upper ones usually connected. Petals 3, nearly equal, on long claws. Stamens 10, free. Ovary pedicellate, bearded. Legume coriaceous, suberose, indehiscent, 1 or few-seeded, filled with solid pulp.—Trees, with bifoliate leaves, and panicles of white flowers.

1 *T. MARTIANUM* (Hayne, l. c.) leaflets sessile, coriaceous, nearly veinless, ovate-lanceolate, unequal-sided, and unequal at the base, ending in an emarginate acumen. *h. S.* Native of Brazil. *Hymenaea verrucosa*, *Lam. dict.* p. 306. *T. Tanroijou*, *Juss. gen. in a note*, p. 351. Panicle divaricate; peduncles many-flowered. Legume warted. Ovary stipitate, 5-ovulate. *Martius's* *Trachylobium*. *Ch.* 808. Tree.

2 *T. HORNEMANNIUM* (Hayne, l. c.) leaflets on very short petiolules, coriaceous, oblong, unequal-sided, and unequal at

the base, ending in a long obtuse acumen. *h. S.* Native of South America.

*Hornemann's Trachylobium.* Tree.

3 *T. GÆRTNERIA'NUM* (Hayne, l. c.) leaflets on short petioles, very coriaceous, nearly veinless, oval-ovate, unequal-sided, abruptly acuminate, and unequal at the base. *h. S.* Native of Madagascar. *Hymenæ'a verrucosa*, Gært. fruct. 2. p. 306. t. 139. f. 7.

*Gærtner's Trachylobium.* Tree.

4 *T. LAMARCKIA'NUM* (Hayne, l. c.) leaflets on short petioles, rather coriaceous, reticulately veined, oval-ovate, unequal-sided, and unequal at the base, ending in a short acumen. *h. S.* Native of Madagascar? *Hymenæ'a verrucosa*, Lam. ill. t. 330. f. 2.

*Lamarck's Trachylobium.* Tree.

5 *T. FLORIBUNDUM*; leaflets oblong, unequal at the base, coriaceous, ending in a blunt acumen; panicles axillary, branched; flowers pedicellate; legumes ovate, hairy, 1-2-seeded. *h. S.* Native of South America, near Angostura. *Hymenæ'a floribunda*, H. B. et Kunth, nov. gen. amer. 6. p. 323. t. 567.

*Bundle-flowered Trachylobium.* Tree 60 feet.

*Cult.* For culture and propagation see *Copaifera*, p. 456.

CCXCI. SCHNELLA (meaning unknown). Raddi, mem. pl. bras. add. p. 32. D. C. prod. 2. p. 512.

*Lin. syst. Decandria, Monogynia.* Calyx coriaceous, campanulate, 5-toothed. Petals 5, unguiculate, nearly equal. Stamens 10. Style wanting. Legume truncate. Leaves 2-lobed, like those of *Bauhinia*. It is said by the author to be a genus intermediate between *Hymenæ'a* and *Bauhinia*.

1 *S. MICROSTA'CHYA* (Raddi, l. c.) lobes or leaves ovate, obtuse; branches cirriferous. *h. S.* Native of Brazil, near Rio Janeiro, in hedges. Young branches, calyxes, peduncles, and petioles clothed with rusty tomentum.

*Small-spiked Schnella.* Shrub cl.

2 *S. MACROSTA'CHYA* (Raddi, l. c. f. 4.) lobes or leaves roundish; flowers in spikes; spikes axillary and terminal, very long. *h. S.* Native of Brazil, about Rio Janeiro, on the high mountains.

*Long-spiked Schnella.* Shrub cl.

3 *S. SMILACINA*; climbing; branches cirriferous; leaves undulate, ovate, acuminate, 5-nerved, glabrous; racemes spike-like, elongated. *h. S.* Native of Brazil. *Caulótrepus smilacinus*, Schott, in Spreng. syst. append. p. 406.

*Smilax-like Schnella.* Shrub cl.

*Cult.* For culture and propagation see *Bauhinia*.

CCXCII. BAUHINIA (named by Plumier in memory of the two famous botanists of the 16th century, John and Caspar Bauhin, brothers; the leaves being simple but 2-lobed, which circumstance, it is said, gave occasion to Plumier to name this genus from the two brothers). Plum. gen. st. 13. Lin. gen. no. 511. Lam. ill. t. 329. D. C. legum. mem. xiii. prod. 2. p. 512.

*Lin. syst. Decandria, Monogynia.* Sepals 5, irregularly connected together into a 5-cleft calyx, or cleft laterally, membranous. Petals 5, spreading, oblong, rather unequal, upper one usually distant from the rest. Stamens 10, sometimes 9 of which are sterile and monadelphous (f. 58. c.), and the tenth loose and fertile (f. 58. c.), sometimes all are monadelphous at the base, with all or only 5 or 3 of them fertile; the rest sterile. Ovary long, pedicellate. Legume 1-celled, 2-valved, many-seeded. Seeds compressed, oval, with the endopleura tumid. Embryo straight, with an ovate radicle, and flat cotyledons.—Shrubs, with 2-lobed leaves, constantly composed of 2-joined leaflets at the top of the petiole, sometimes nearly altogether free, sometimes nearly joined together to the apex, but usually joined together more or less, and with an awn in the recess. Flowers disposed in racemes.

SECT. I. CASPA'RIA (in memory of Caspar Bauhin, see genus). Kunth, ann. sc. nat. 1. p. 85. nov. gen. amer. 6. p. 317. D. C. prod. 2. p. 512.—*Bauhinia*, Cav. but not of Kunth. Stamens 10, of which 9 are monadelphous, short, and sterile (f. 58. c.), the tenth one long and antheriferous, and almost free from the rest. Ovary stipitate. Racemes terminal, simple, leafless.

1 *B. DIVARICATA* (Lin. spec. 535.) leaves obtuse at the base; leaflets hardly connected to the middle; free parts oblong, acute, 2-nerved, diverging; petals lanceolate. *h. S.* Native of South America. Lin. hort. cliff. p. 156. t. 15. Flowers white.

*Divaricate-lobed-leaved Mountain-ebony.* Fl. June, Sept. Clt. 1742. Shrub 5 to 6 feet.

2 *B. LAMARCKIANA* (D. C. prod. 2. p. 512.) leaves cordate at the base, glabrous above, pubescent on the nerves beneath; leaflets joined together to the middle, 2-nerved, free parts bluntish, and rather diverging; petals lanceolate. *h. S.* Native of South America. *B. divaricata*, Lam. dict. 1. p. 389. exclusive of the synonyme, ex Desf. cat. hort. par. p. 211. *B. retusa*, Poir. suppl. 1. p. 699. but not of Roxb. Flowers white.

*Lamarck's Mountain-ebony.* Clt. 1818. Shrub 6 feet.

3 *B. SPATHACEA* (Moc. et Sesse, fl. mex. icon. ined. ex D. C. prod. 2. p. 512.) leaves glabrous, emarginately cordate both at the base and apex; leaflets connected beyond the middle, 2-nerved, free parts oval, obtuse; petals lanceolate. *h. S.* Native of New Spain. Flowers white, 3-petalled according to the figure. Calyx spathaceous.

*Spathaceous-calyxed Mountain-ebony.* Clt. 1823. Sh. 6 ft.

4 *B. SUBROTUNDIFOLIA* (Cav. icon. 5. t. 406.) leaves hardly cordate at the base, clothed with hairy tomentum beneath; leaflets connected to the middle, ovate, obtuse, almost semi-orbicular; petals long, on long claws (f. 58. b.). *h. S.* Native of Calava, near Manila, and in the vicinity of Acapulco. The plant from the Philippine Islands much more tomentose than that found in the vicinity of Acapulco. Petals red.

*Roundish-leaved Mountain-ebony.* Shrub 6 feet.

5 *B. LUNARIA* (Cav. icon. t. 407.) leaves glabrous; leaflets free, or joined to the middle, 3-nerved, ovate-roundish; racemes simple, tomentose; claws of petals very long and pilose. *h. S.* Native of the vicinity of Acapulco and Calava. Petals red.

*Moon-leaved Mountain-ebony.* Clt. 1820. Shrub 6 feet.

6 *B. PES-CA'PRAE* (Cav. icon. t. 404.) leaves glabrous, glaucous beneath, coriaceous, cordate at the base; leaflets connected beneath the middle, oblong, 3-nerved, the free parts nearly parallel when young, but at length diverging at the apex; petals oblong, on long claws, and are hairy as well as the sterile stamens. *h. S.* Native of Mexico, about Acapulco, on the sea-shore. *Caspària pe-caprae*. H. B. et Kunth, nov. gen. amer. 6. p. 318. Petals reddish.

*Goat's-foot-leaved Mountain-ebony.* Shrub 6 feet.

7 *B. AURITA* (Ait. hort. kew. 2. p. 48.) leaves glabrous, cordate at the base; leaflets connected the fourth part of their length, oblong-lanceolate, nearly parallel, 6-8-nerved; petals ovate, on short stipes. *h. S.* Native of Jamaica. Mill. fig. t. 61. *B. divaricata*  $\beta$ , Lin. spec. 535. Flowers white.

*Eared Mountain-ebony.* Fl. Aug. Sept. Clt. 1756. Shrub 4 to 6 feet.

8 *B. PORRECTA* (Swartz, prod. p. 66.) leaves cordate at the

base, with the nerves on the under side as well as the petioles and branches puberulous; leaflets connected to about the middle, ovate, acuminate, 3-4-nerved, nearly parallel; petals lanceolate. *h. S.* Native of Jamaica and St. Domingo. Sims, bot. mag. 1708. Jacq. schœnbr. t. 100. Plum. ed. Burm. t. 44. f. 2. Petals white.

*Stretched-out Mountain-ebony.* Clt. 1737. Sh. 10 to 12 ft.

9 *B. LATIFOLIA* (Cav. icon. t. 405.) leaves ovate or cordate at the base, young ones, petioles, and branchlets puberulous; leaflets connected beyond the middle, broadly ovate, 3-nerved, acute, and rather diverging at the apex; petals lanceolate, stipitate, a little undulated. *h. S.* Native of New Spain. In a specimen sent from the Botanic Garden at Madrid to De Candoille, the pedicels, calyxes, and ovaries were downy. Flowers white.

*Broad-leaved Mountain-ebony.* Clt. 1818. Shrub 5 to 6 ft.

10 *B. CAUDATA* (Ait. hort. kew. 2. p. 49.) leaves cordate at the base, pale and pubescent beneath; leaflets connected a little beyond the middle, ovate-oblong, bluntish; sepals smooth, ending in a long taper point. *h. S.* Native of Java and other parts of the East Indies. Flowers white.

*White-flowered Mountain-ebony.* Fl. May, June. Clt. 1777. Shrub 4 to 6 feet.

11 *B. ACUMINATA* (Lin. spec. 536.) leaves rather cordate at the base, smoothish; leaflets connected beyond the middle, ovate, acuminate, parallel, 4-nerved; sepals attenuated; petals broadly ovate, hardly stipitate. *h. S.* Native of Malabar.—Rheed. mal. t. 24. *B. acuminata*, Burm. ind. 94. exclusive of the synonymes of R. Brown and Sloane. Bauhinia, Burm. zeyl. 45. Flowers pure white, void of scent.

*Acuminate-leaved Mountain-ebony.* Clt. 1808. Sh. 5 to 6 ft.

SECT. II. *PAULETIA* (in honour of John James Paulet, M.D. who published a work at Paris in 1791, entitled *Tabula plantarum fungosarum*). Cav. icon. 5. p. 5. D. C. prod. 2. p. 513. Stamens 10, somewhat monadelphous at the very base, all fertile, or the 5 alternate ones are sterile, and the other 5 fertile. Ovary stipitate.

\* *Prickly or spiny shrubs.*

12 *B. PAULETIA* (Pers. ench. 1. p. 455.) spines stipular; leaves glabrous, ovate at the base; leaflets ovate, obtuse, parallel, 4-nerved, connected beyond the middle; peduncles axillary, 2-flowered, constituting a leafy raceme; petals and sepals linear, acute; the 5 fertile stamens very long. *h. S.* Native of the vicinity of Panama. *Paulëtia aculeata*, Cav. icon. t. 410. *P. spinosa*, Poir. suppl. 1. p. 599. *B. Panamensis*, Spreng. syst. 2. p. 384. Petals yellowish red.

*Paulet's Mountain-ebony.* Clt. 1820. Shrub 6 to 8 feet.

13 *B. GLANDULOSA* (D. C. prod. 2. p. 513.) spines stipular; leaves nearly orbicular, rather cordate, membranous, pubescent beneath, and full of glandular dots; leaflets connected, semi-ovate, 4-nerved, obtuse, divaricate; flowers 1-3, opposite the leaves; calyx hairy on the outside; petals oblong-lanceolate. *h. S.* Native of New Barcelona. *Paulëtia glandulosa*, H. B. et Kunth, nov. gen. amer. 6. p. 314. Flowers white. Fruit unknown. Allied to *B. Paulëtia*.

*Glandular Mountain-ebony.* Shrub.

14 *B. GRANDIFLORA* (Juss. in Poir. suppl. 1. p. 600.) spines stipular; leaves roundish, cordate at the base, tomentose beneath; leaflets connected to the middle, ovate, obtuse, 3-4-nerved; branchlets and calyxes pubescent; peduncles axillary, 1-3-flowered, constituting a raceme; bracteoles ending in a setaceous acumen; stamens shorter than the petals. *h. S.* Native of Peru. Hook, bot. misc. 1. p. 218. t. 91. Flowers white.

*Great-flowered Mountain-ebony.* Clt. 1820. Shrub.

15 *B. LEPTOPHYLLA* (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 513.) spines stipular; leaves cordate at the base, glabrous; leaflets ovate, acuminate, 3-nerved, parallel, connected beyond the middle; peduncles axillary, 2-flowered, constituting a leafy raceme; petals linear, acute; 5 fertile stamens very long. *h. S.* Native of New Spain. Flowers greenish. Very nearly allied to *B. Paulëtia*.

*Slender-petalled Mountain-ebony.* Clt. 1818. Sh. 4 to 6 ft.

16 *B. ACULEATA* (Lin. spec. 535.) spines stipular; leaves rather cordate at the base, glabrous; leaflets ovate, obtuse, 3-nerved, connected nearly to the apex; petals lanceolate, deeply crenated; stamens 9-10, incurved. *h. S.* Native of South America. Plum. ed. Burm. t. 44. f. 1. Jacq. amer. p. 119. t. 177. ed. pict. p. 60. t. 260. f. 31. Flowers large, white, with a somewhat unpleasant scent, like *Savin*.

*Prickly Mountain-ebony.* Fl. June, Aug. Clt. 1737. Sh. 4 to 6 feet, climbing.

17 *B. ROTUNDATA* (Mill. dict. no. 7.) spines stipular; leaves somewhat cordate at the base; lobes rounded; petals 3 inches long, about the length of the stamens; flowers lateral. *h. S.* Native of Carthagena, in New Spain. Flowers large, white.

*Rounded-leaved Mountain-ebony.* Tree 20 feet.

18 *B. FORFICATA* (Link. enum. 1. p. 404.) stem prickly; leaves cordate at the base, glabrous; leaflets connected to the middle, stretched out, 4-nerved; petals lanceolate. *h. S.* Native of Brazil. Flowers white. Stamens not described.

*Pincer-leaved Mountain-ebony.* Clt. 1823. Sh. 4 to 6 feet.

19 *B. EMARGINATA* (Mill. dict. no. 5.) stem prickly; leaves cordate at the base, tomentose beneath; leaflets orbicular, connected almost to the apex. *h. S.* Native of New Spain, at Carthagena. Flowers large, terminal, of a dirty white colour.

*Emarginate-leaved Mountain-ebony.* Shrub 4 to 6 feet.

\* \* *Unarmed shrubs.*

20 *B. INERMIS* (Pers. ench. 1. p. 455.) but not of Forsk.) leaves ovate at the base, ferruginous beneath; leaflets oblong, acute, 4-nerved, parallel, connected a little beyond the middle; racemes terminal, leafless, simple; petals linear; stamens 10, fertile; anthers glabrous. *h. S.* Native of Mexico, about Acapulco. *Paulëtia inermis*, Cav. icon. t. 409. H. B. et Kunth, nov. gen. amer. 6. p. 316. Flowers white.

*Unarmed Mountain-ebony.* Clt. 1810. Shrub 6 to 8

21 *B. RUFESCENS* (Lam. dict. 1. p. 391. ill. 321. f. 2.) leaflets distinct, semiorbicular, 3-nerved, glabrous; petals lanceolate; stamens 10, fertile; anthers hairy. *h. S.* Native of Senegal and Gambia and the Cape of Good Hope, as well as of the Mauritius. *B. rubescens*, Pers. ench. 1. p. 455. Flowers pale red.

*Rufescent Mountain-ebony.* Clt. 1810. Shrub 5 to 6 feet.

22 *B. PARVIFLORA* (Vahl. symb. 3. p. 55.) leaves roundish, glabrous above and shining, but glaucous beneath and pilose on the nerves; leaflets distinct, roundish, 3-nerved; racemes leafless, longer than the leaves; petals linear; stamens 10, villous at the base. *h. S.* Native of the East Indies. Calyx spathaceous, villous before expansion. Perhaps a climbing shrub.

*Small-flowered Mountain-ebony.* Clt. 1808. Shrub 5 to 6 ft.

23 *B. MADAGASCARIENSIS* (Desv. journ. bot. 1814. 1. p. 74.) leaves cordate at the base, quite smooth; leaflets obtuse, 3-nerved, rather ascending; stamens 10, the 5 alternate ones very short; petals on long claws, oval, acute. *h. S.* Native of Madagascar. Leaves about an inch long. Flowers white.

*Madagascar Mountain-ebony.* Clt. 1826. Sh. 5 to 6 feet.

24 *B. UNGULA* (Jacq. fragm. 22. t. 15. f. 1.) leaves ovate at the base, clothed with soft villi; leaflets connected beyond the middle, ovate, obtuse, parallel, 3-nerved; flowers axillary; petals elliptic, unguiculate; stamens 10? fertile. *h. S.* Na-

tive of Caraccas. *B. aculeata*, Jacq. amer. 119. t. 177. f. 2. Flowers white.

*Clawed-petalled Mountain-ebony.* Clt. 1817. Sh. 5 to 6 ft.

25 *B. UNGULATA* (Lin. spec. 535.) leaves ovate at the base; leaflets connected to the middle, oval-oblong, parallel, with the inner side straight; petals subulate; stamens 10, alternate 5 short. *h. S.* Native of South America. Flowers white.

*Ungulated-petalled Mountain-ebony.* Clt. ? Tr. 18 to 20 ft.

26 *B. VARIEGATA* (Lin. spec. 535.) leaves cordate at the base, glabrous; leaflets broadly-ovate, obtuse, 5-nerved, connected beyond the middle; petals ovate, nearly sessile; stamens 10, the 5 longest fertile. *h. S.* Native of Malabar. Rheed. mal. 1. t. 34. Calyx bursting lengthwise. Flowers in loose, terminal racemes. Petals red marked with white, and yellow at the base.

*Var. β, Chinensis* (D. C. prod. 2. p. 514.) leaves rounded at the base; petals acute, lilac, with 1 purple spot at the base of each. *h. S.* Native of China. Braam. icon. chin. t. 26.

*Variegated-flowered Mountain-ebony.* Fl. June, July. Clt. 1690. Tree 20 feet.

27 *B. CUCULLATA* (Desv. journ. bot. 1814. 1. p. 74.) leaves roundish, pubescent on the nerves; leaflets ovate, obtuse, 1-nerved, rather ascending; flowers axillary. *h. S.* Native of the East Indies. Nearly allied to *B. variegata*, but the flowers are said to be smaller. Calyx bursting lengthwise.

*Cucullate-leaved Mountain-ebony.* Shrub.

28 *B. TOMENTOSA* (Lin. spec. 536.) leaves ovate or roundish at the base, under surface villous as well as the petioles, branches, stipulas, peduncles, bracteas, and calyxes; leaflets connected beyond the middle, oval, obtuse, 3-4-nerved; peduncles 1-3-flowered; petals obovate, obtuse; stamens 10, fertile, unequal. *h. S.* Native of Ceylon. Burm. zeyl. p. 44. t. 18. Petals pale yellow, with a red spot at the claw. The native practitioners of India prescribe it for dysenteric affections.

*Tomentose Mountain-ebony.* Clt. 1808. Shrub 6 to 12 ft.

29 *B. PUBESCENS* (D. C. legum. mem. xiii.) leaves rather cordate at the base, pubescent beneath and on the petioles; leaflets connected beyond the middle, oval, obtuse, 4-nerved, nearly parallel; peduncles 3-4-flowered; calyx glabrous, spatulate; petals obovate; stamens 10, fertile. *h. S.* Native of Jamaica. Flowers large, white, much crowded.

*Pubescent Mountain-ebony.* Clt. 1823. Shrub 4 to 6 feet.

30 *B. PICTA* (D. C. prod. 2. p. 515.) leaves roundish-elliptic, membranous, glabrous; leaflets connected, semi-ovate, acutish, spreading, 5-nerved; racemes terminal, solitary; calyx clothed with rusty tomentum; petals oblong. *h. S.* Native of South America, on the banks of the river Magdalena. Paulëtia picta, H. B. et Kunth, nov. gen. amer. 6. p. 316. Flowers white, spotted with red.

*Painted-leaved Mountain-ebony.* Shrub.

31 *B. MULTINERVIA* (D. C. prod. 2. p. 515.) leaves elliptic, rounded at the base, membranous, shining above, but rather pilose beneath, the nerves ferruginous; leaflets semi-ovate, obtuse, approximate, 5-nerved; flowers racemose; calyx clothed with rusty tomentum; petals linear. *h. S.* Native of Caraccas and on Montana de Capaya. Paulëtia multinervia, H. B. et Kunth, nov. gen. amer. 6. p. 316. Flowers snow white. Legume 8-12 inches long. Perhaps the stem is unarmed.

*Many-nerved-leaved Mountain-ebony.* Clt. 1817. Tr. 20 ft.

32 *B. GLAUDESCENS* (D. C. l. c.) leaves reniform, profoundly cordate, membranous, glaucescent beneath, scattered with minute hairs; leaflets roundish, spreading, 4-nerved. *h. S.* Native of Cumana, on mountains near Caripe. Paulëtia glaucescens, H. B. et Kunth, nov. gen. amer. 6. p. 316. Perhaps a separate section, and unarmed. Flowers and fruit unknown.

*Glaucescent Mountain-ebony.* Clt. 1817. Tr. 20 to 30 ft.

33 *B. RETICULATA* (D. C. legum. mem. xiii.) leaves coriaceous, cordate at the base, glabrous, minutely reticulated between the nerves; leaflets broadly ovate, obtuse, connected beyond the middle, diverging at the apex; flowers disposed in nearly sessile fascicles in the axils of the leaves; calyxes and ovaries tomentose; legumes broad, linear, glabrous. *h. S.* Native of Senegal and of Arabia, if *B. inermis* of Forsk. descrip. p. 85. be the same as *B. platisiliqua*, Perr. in litt. Stamens 10, free, 8 of which are antheriferous. Petals nearly equal. Ovary stipitate. Legume twice the breadth of that of *B. purpurea*.

*Reticulated-leaved Mountain-ebony.* Shrub.

34 *B. ODORATISSIMA* (Newm. mss. in herb. Lamb.) leaves broad, cordate; leaflets connected to the middle, 4-nerved, acuminate, coriaceous; racemes long, terminal. *h. S.* Native of Maranham. Flowers large, very sweet-scented.

*Very-sweet-scented Mountain-ebony.* Shrub.

SECT. III. SYMPHYDODA (from *συμφυω*, *symphyo*, to glue together, and *πους ποδος*, *pous podos*, a foot; in reference to the foot or stipe of the ovary). D. C. legum. mem. xiii. prod. 2. p. 515. Stamens monadelphous at the base, 3 fertile ones very long, the rest small, sterile, or almost abortive. Ovary stipitate, the stipe adhering to the tube of the calyx. Branches terete.

35 *B. RACEMOSA* (Vahl. symb. 3. p. 56. t. 62.) branches terete; leaves cordate at the base, clothed with silky villi beneath as well as on the peduncles, petioles, branches, calyxes, and petals; leaflets broadly ovate, obtuse, connected to the middle, 5-nerved, rather diverging at the apex; racemes somewhat corymbose; petals obovate, obtuse; flowers triandrous. *h. S.* Native of the East Indies.

*Racemose-flowered Mountain-ebony.* Clt. 1790. Shrub cl.

36 *B. TRIANDRA* (Roxb. hort. beng. p. 31.) leaves roundish, glabrous; leaflets joined to the middle, 4-nerved; racemes axillary and terminal; legume stipitate, pubescent. *h. S.* Native of the East Indies. Flowers white. Stamens 3, antheriferous. (v. s. herb. Lamb.)

*Triandrous Mountain-ebony.* Clt. 1823. Shrub.

37 *B. PURPUREA* (Lin. spec. 536.) branches terete; leaves cordate at the base, coriaceous, when young they are clothed with rusty tomentum, but at length becoming glabrous; leaflets connected much above the middle, broadly ovate, obtuse, 4-nerved; petals lanceolate, acute. *h. S.* Native of the East Indies and the island of Timor.—Rheed. mal. 1. t. 33. Petals red, one of them streaked with white on the claw. Legume linear, straight, a foot long, apiculated at one end by the style and at the other by the stipe.

*Purple-flowered Mountain-ebony.* Clt. 1778. Tree.

38 *B. RETUSA* (Roxb. hort. beng. p. 31. but not of Poir.) branches terete; leaves cordate at the base, and emarginately retuse at the apex, coriaceous, glabrous; leaflets connected nearly to the apex, 5-nerved, broadly semi-ovate; panicle loose, terminal; stamens 3, antheriferous, the rest wanting. *h. S.* Native of Bengal. Flowers white. Petals ovate, unguiculate, 3-4 lines long.

*Retuse-leaved Mountain-ebony.* Clt. 1820. Shrub.

39 *B. COROMANDELIA'NA* (D. C. prod. 2. p. 515.) branches terete; leaves glabrous, cordate at the base; leaflets semi-oval, obtuse, parallel, connected to the middle, 4-nerved; raceme pubescent; petals ovate-lanceolate, acute; stamens 3, very long and antheriferous, the rest short and bristle-formed. *h. S.* Native of India, near Pondicherry.

*Coromandel Mountain-ebony.* Tree.

40 *B. CORYMBOSA* (Roxb. hort. beng. p. 31.) branches terete, cirrhiferous; leaflets cordate at the base, the nerves on the under surface as well as the petioles, branches, and calyxes clothed

with rufous villi; leaflets semi-oval, obtuse, parallel, connected to the middle, 3-nerved; stamens 3; petals ovate, stipitate. *h. S.* Native of China and the East Indies. D. C. legum. mem. xiii. t. 70. B. scandens, Burm. fl. ind. 94. Flowers white.

*Corymbose-flowered Mountain-ebony.* Clt. 1818. Shrub cl.

41 B. *PO'TTII*; leaves glabrous, roundish, cordate, 11-nerved; lobes obtuse; racemes terminal, corymbose; legumes clothed with rusty silky hairs, ending in a long tail; calyx cleft longitudinally above. *h. S.* Native of Pulo Penang. Potts. (v. s. herb. Lamb.)

*Potts's Mountain-ebony.* Shrub.

SECT. IV. *PHA'NERA* (from *φανερως*, *phaneros*, manifest; from the corolla and calyx spreading much). Lour. coch. p. 37. D. C. prod. 2. p. 516. Stamens 10, somewhat monadelphous at the base, 3 of which are very long and fertile, and 7 small and sterile. Ovary on a short stipe. Branches and stems compressed, climbing.

42 B. *ANGU'NA* (Roxb. cor. 3. p. 82. t. 285.) stem climbing, regularly flexuous, compressed, cirriferous; leaves glabrous, cordate; leaflets 3-nerved, in the younger plants they are connected to the middle and very much acuminate, in the adult plants they are connected almost to the apex, and ending in a short acumen; panicle terminal. *h. S.* Native of Malabar, Silhet, and Chittagong.—Rheed. mal. 8. t. 30 and 31. B. scandens, Lin. spec. ed. 1. p. 374. exclusive of the synonyme of Rumph. Flowers small, white. Legume 1-2-seeded. Calyx urceolate, bluntly 5-cleft, girding the alabastrum of corolla like a cup before expansion.

*Snake Mountain-ebony.* Clt. 1790. Shrub cl.

43 B. *LINGUA* (D. C. prod. 2. p. 516.) stems climbing, angular; branches compressed, cirriferous; leaves clothed with rufous villi beneath, cordate; leaflets 3-nerved, semi-ovate, acuminate, connected almost to the middle; racemes few-flowered, erect. *h. S.* Native of Amboyna and the Moluccas, in woods by the sea-side. *Folium lingua*, Rumph. amb. 5. p. 1. t. 1. B. scandens, Lin. spec. ed. 1. p. 374. exclusive of the synonyme of Rheed. Flowers at first whitish, but at length change to a yellowish colour. Petals lanceolate, acute.

*Tongue-leaved Mountain-ebony.* Shrub cl.

44 B. *COC'INEA* (D. C. prod. 2. p. 516.) stem compressed, unequal; branches climbing, cirriferous; leaves shining and rufous beneath, cordate; leaflets 4-nerved, semi-ovate, acuminate, connected to the middle; racemes on long peduncles, pendulous, large. *h. S. G.* Native of Cochinchina, in woods. *Phanera coccinea*, Lour. coch. p. 37. Petals ovate, scarlet. Legume many-seeded.

*Scarlet-flowered Mountain-ebony.* Shrub cl.

SECT. V. *CAULOTRE'TUS* (from *καυλος*, *kaulos*, a stem, and *τρεω*, *treo*, to fly; in reference to the stems twining to a great height on trees). Rich. herb. ex D. C. prod. 2. p. 516. —Bauhinia, Kunth, ann. sc. nat. p. 84. H. B. et Kunth, nov. gen. amer. 6. p. 319. but not of Cav. Stamens 10, all fertile and free, usually shorter than the petals. Calyx ventricose, 5-toothed, and somewhat 2-lobed. Ovary sessile. Stems usually climbing and compressed. Flowers white or yellowish.

\* *Leaflets free to the base.*

45 B. *SPL'ENDENS* (H. B. et Kunth, nov. gen. amer. 6. p. 319.) stem climbing, cirriferous?; branches compressed, glabrous; leaflets free to the base, dimidiately ovate-oblong, 3-nerved, membranous, rather shining above, but clothed with fine, golden, shining down beneath. *h. S.* Native of South America, on the banks of the Orinoco. Flowers and fruit unknown.

*Splendid-leaved Mountain-ebony.* Shrub cl.

46 B. *OUTI'MOUTA* (Aubl. guian. 1. p. 375. t. 144.) stem sarmentose, compressed, cirriferous; leaflets free to the base, semi-ovate, acuminate, parallel, 4-nerved, clothed with adpressed silky down beneath; stipulas orbicular, oblique at the base, upper ones permanent; racemes dense, short. *h. S.* Native of French Guiana. B. Guianensis, var. Lam. dict. 1. p. 391. Flowers white. The plant is called *Ya-Outimouta* in Guiana.

*Outimouta Mountain-ebony.* Shrub cl.

47 B. *GUIANE'NSIS* (Aubl. guian. 1. p. 377. t. 145.) stem sarmentose, compressed, cirriferous; leaflets free to the base, semi-ovate, acuminate, 4-nerved, parallel, smoothish beneath, and green on both surfaces; stipulas wanting, very small or deciduous. *h. S.* Native of Guiana, in woods. Flowers white?

*Guiana Mountain-ebony.* Clt. 1820. Shrub cl.

48 B. *HETEROPHY'LLA* (Kunth, mim. t. 46. H. B. et Kunth, nov. gen. amer. 6. p. 319.) stem erect, cirriferous; branches terete, and are as well as the calyxes clothed with rusty hairs; leaflets shining, membranous, clothed with adpressed pubescence beneath, obliquely-oblong, rather obtuse, rounded at the base, 4-nerved, lower ones connected to the middle, upper ones free; racemes terminal, solitary, leafless. *h. S.* Native of South America, in the valleys of Aragua and near Porto Cabello of Caracas. Flowers white.

*Variable-leaved Mountain-ebony.* Clt. 1824. Shrub cl.

49 B. *INTEGRIFOLIA* (Roxb. hort. beng. p. 90.) leaflets free, 4-nerved; racemes terminal, corymbose; stamens free; tendrils hooked; legumes flat, smooth. *h. S.* Native of the East Indies. (v. s. in herb. Lamb.)

*Entire-leaved Mountain-ebony.* Shrub cl.

\* \* *Leaflets connected to the middle.*

50 B. *EMARGINATA* (Roxb. in herb. Lamb.) leaves large, roundish, ~~emarginate, with a pinnate in the recess, nerved, glabrous, or the leaflets are connected only to the apex, 4-nerved; panicles divaricate, terminal; stamens free.~~ *h. S.* Native of the East Indies. (v. s. herb. Lamb.)

*Emarginate-leaved Mountain-ebony.* Shrub cl.

51 B. *GLA'BRA* (Jacq. amer. 119. t. 173. f. 5.) climbing; branches terete; leaves glabrous, cordate at the base, leaflets oval, obtuse, parallel, 4-nerved, connected to the middle. *h. S.* Native of Carthage, in woods and among bushes. Petals oval, attenuated at the base, yellowish-green, spotted with purple inside. Ovary hairy.

*Glabrous Mountain-ebony.* Clt. 1810. Shrub cl.

52 B. *SUAVE'OLENS* (H. B. et Kunth, nov. gen. amer. 6. p. 320.) stem compressed, cirriferous; leaves membranous, cordate, pubescent beneath; leaflets semi-ovate, rounded at the apex, connected to the middle, 4-5-nerved; racemes terminal and axillary; calyx clothed with silky pubescence. *h. S.* Native of New Spain, on the banks of the river Guancabamba near Cavico. Petals white.

*Sweet-scented-flowered Mountain-ebony.* Shrub cl.

53 B. *CUMAN'E'NSIS* (H. B. et Kunth, nov. gen. amer. 6. p. 321.) stem sarmentose; branches glabrous; leaves cordate at the base, pubescent beneath; leaflets membranous, ovate, acutish, 4-nerved, hardly connected to the middle; racemes terminal, solitary, sometimes bifid or cirriferous. *h. S.* Native of Cumana, near Bordonos. Lindl. bot. reg. 1133. Læfl. itin. p. 218. ? Moc. et Sesse, fl. mex. icon. ined. ex. D. C. prod. 2. p. 517. B. scandens Americana, Lin. spec. ed. 2. p. 535. Flowers white.

*Cumana Mountain-ebony.* Shrub cl.

† *Species not sufficiently known.*

\* *Leaflets connected together to the very apex, and therefore the leaves are simple and entire.*

54 *B. RICHARDIA'NA* (D. C. prod. 2. p. 517.) leaves cordate, 5-7-nerved, acute, quite smooth.  $\frac{1}{2}$ . S. Native of Guiana. *Caulotrētus cordifolia*, Rich. ined. Perhaps this species belongs to Section IV. but differs from Section *Caulotrētus* in the ovary being stipitate. Flowers white.

*Richard's Mountain-ebony.* Shrub.

55 *B. CINNAMOMEA* (D. C. prod. 2. p. 517.) leaves elliptic, obtuse at the base, quite glabrous, acuminate at the apex, 7-nerved, undivided; legume stipitate, compressed, linear, glabrous, straight.  $\frac{1}{2}$ . S. Native of Cayenne. Leaves 3 inches long and 2 broad. The middle nerve is usually double at the base, in consequence of the 2 joined leaflets. Petals 6-9 lines long. Legume 8-9 inches long, standing on a stipe an inch long.

*Cinnamon Mountain-ebony.* Shrub.

56 *B. ? DU'BIA*; stems simple; leaves alternate, cordate, acuminate, glabrous, obsoletely 3-nerved; racemes terminal; petals very long, linear, reflexed; stamens numerous, very long, but shorter than the style.  $\frac{1}{2}$ . S. Native of Maranh. Flowers white.

*Doubtful Mountain-ebony.* Shrub 1 to 2 feet.

\* \* Leaflets connected to the middle into a 2-lobed limb.

57 *B. LATISILIQUA* (Cav. icon. t. 408.) leaves subcordate at the base, glabrous; leaflets semioval-oblong, acuminate, 5-nerved, connected a third part of their length, approximate at the upper part.  $\frac{1}{2}$ . S. Native of the Philippine Islands. Flowers racemose. Legume half a foot long, and an inch and a half broad, broadly winged at the seminiferous suture. Perhaps a proper genus.

*Broad-podded Mountain-ebony.* Shrub 6 to 8 feet.

58 *B. MACROPHYLLA* (Poir. suppl. 1. p. 600.) leaves shining and glabrous above, ~~in a hooked peak~~ beneath; leaflets large, hardly connected at the base, semi-ovate, 5-nerved, ending in a long acumen; legume oblong-elliptic, tumid at the sutures.  $\frac{1}{2}$ . S. Native of South America? *B. chrysophylla* Vahl. ined. Leaflets 6-8 inches long, and 3-4 broad. Perhaps sufficiently distinct from *B. Outimouta*. Flowers unknown.

*Large-leaved Mountain-ebony.* Shrub.

59 *B. RACEMIFERA* (Desv. journ. bot. 1814. 1. p. 74.) stem erect; leaves cordate, cuneate, or the lobes are short, obtuse, divaricate, and acuminate at the apex, 6-nerved; flowers disposed in racemose panicles; calyx villous, somewhat tripartite.  $\frac{1}{2}$ . S. Native of South America.

*Raceme-bearing Mountain-ebony.* Shrub.

60 *B. ARMATA* (Otto, pl. bras. no. 25. in flora, 1821. p. 602.) stem prickly, climbing; leaves 2-lobed; lobes ovate, acute.  $\frac{1}{2}$ . S. Native of Brazil.

*Armed Mountain-ebony.* Shrub cl.

61 *B. FAREK* (Desv. journ. bot. 1814. 1. p. 74.) leaves cordate at the base; leaflets hardly connected a fourth part of their length, oblong, acutish, 4-nerved, nearly parallel; petals ovate-lanceolate, stipitate.  $\frac{1}{2}$ . S. Native of Abyssinia. *Farek*. Bruce, trav. 5. t. 18. exclusive of the synonyme. The stamens, according to the figure, are monadelphous and all fertile, but according to Desvaux they are diadelphous.

*Farek Mountain-ebony.* Shrub.

62 *B. TAMARINDACEA* (Gaillaud, voy. meroc. 1826.) leaves cordate, 2-lobed, nearly orbicular; nerves running through the whole upper surface of the leaves from a spiculate gland in the recess, with glands on the under surface at the origin of the confluent nerves; fruit thick, nerved, pulpy inside; seeds egg-shaped, in many series?—Native of Egypt, on mount Aqaro.

*Tamarind-like Mountain-ebony.* Shrub.

\*\*\* Leaflets free to the base.

63 *B. DIPHYLLA* (Symes, trav. ava. 1808. t. 7.) leaflets distinct to the base, unequal, obtuse, 5-nerved; tendrils simple, lateral.  $\frac{1}{2}$ . S. Native of the East Indies.

*Two-leafletted Mountain-ebony.* Shrub.

64 *B. AMERICANA* (Delaun. herb. amat. t. 315.) leaves ovate at the base; leaflets parallel at the apex.  $\frac{1}{2}$ . S. Native of South America. It differs from *B. unguiculata*, Lin. in the stamens being diadelphous, only one of which is fertile.

*American Mountain-ebony.* Clt. 1800. Shrub 6 feet.

†† The names of undescribed species, some of which are probably identical with some of those described above.

1 *B. semibifida*, Roxb. hort. beng. p. 31. 2 *B. Malabárica*, Roxb. l. c. 3 *B. ferruginea*, Roxb. l. c. 4 *B. cordifolia*, Roxb. l. c. p. 90. 5 *B. anatónica*, Link. enum. 1. p. 405. 6 *B. Indica*, Lodd. cat. 7 *B. microphylla*, Hortul. 8 *B. speciosa*, Hortul.

*Cult.* Some of the species of *Bauhinia* are very shewy when in bloom, and some are elegant climbers, well fitted for covering the rafters in stoves or stove conservatories. They all thrive well in a mixture of loam, peat, and sand. Cuttings should be taken off at a joint when the plants are in a growing state, neither too ripe nor too young, and planted in sand, with a hand-glass placed over them in a moist heat. The leaves of the cuttings should be allowed to remain on.

CCXCIII. CERCIS (from *κερκίς*, *kerkis*, a shuttlecock; a name given by Theophrastus to this tree). Lin. gen. no. 510. Lam. ill. t. 328. Geertn. fruct. t. 144. D. C. prod. 2. p. 518. —*Siliquastrum*, Tourn. inst. t. 114. Mœnch. meth.

*LIN. SYST. Decandria, Monogynia.* Calyx urceolate at the base and gibbous, bluntly 5-toothed at the apex. Petals 5, unguiculate, all distinct, disposed in a papilionaceous manner; the wings or side petals the largest. Stamens 10, free, unequal. Ovary on a short stipe. Legume oblong, slender, compressed, 1-bellied, many-seeded, somewhat winged on the seminiferous suture, and opening on the other suture. Seeds obovate, with tumid, somewhat albuminous endopleura. Embryo straight, with a short radicle, flat cotyledons, and an inconspicuous plumule.—Trees, with simple, many-nerved, cordate leaves, rising after the flowers have decayed. Pedicels 1-flowered, rising from the trunk and branches in fascicles.—This genus is allied to *Bauhinia*. The leaves are probably composed of 2 joined leaflets, forming an entire limb.

1 *C. SILIQUASTRUM* (Lin. spec. 534.) leaves very blunt, emarginate, and quite glabrous.  $\frac{1}{2}$ . S. Native of the south of Europe, Levant, Spain, south of France, Italy near Rome, and on the Appenines. Duh. arb. ed. nov. t. 7. Sims, bot. mag. 1138. Mill. fig. 253. *Siliquastrum orbiculatum*, Mœnch. meth. Flowers of a bright purple colour. There are also varieties with flesh-coloured and white flowers; they are frequently used in salads from their agreeable poignancy. The wood is very beautiful and veined with black, takes an excellent polish, and may be converted to many useful purposes.

*Var. β, parviflora* (D. C. prod. 2. p. 518.) A shrub, with white spotted branches, and the flowers only about one-half the size of those of the species.  $\frac{1}{2}$ . S. Native of Bucharia. Perhaps a proper species.

*Siliquastrum*, Common Judas-tree, Red-bud or Love-tree. Fl. May, June. Clt. 1596. Tree 20 to 30 feet.

2 *C. CANADENSIS* (Lin. spec. 534.) leaves cordate, acuminate, villous in the axils of the veins beneath.  $\frac{1}{2}$ . S. Native from Canada to Virginia, along the banks of rivers. Mill. fig. t. 2. *Siliquastrum cordatum*, Mœnch. meth. Flowers red, and are frequently put into salads by the inhabitants of North Ame-

rica, and the French in Canada pickle them. The wood is of the same colour and texture as that of the first species. The legumes stand on a long pedicel, and are apiculated at the apex by a longer style. The young branches dye wool of a very fine colour. The tree is called *red-bud* in America.

*Var. β, pubescens* (Pursh, fl. amer. sept. p. 308.) leaves pubescent beneath.

*Canadian Judas-tree.* Fl. May, June. Clt. 1730. Tree 12 to 20 feet.

*Cult.* These trees are usually planted with other flowering trees and shrubs as ornaments to pleasure grounds, and for their singular beauty deserve a place in every garden and shrubbery; for when the trees have arrived at a pretty good size the branches are so thickly beset with flowers as scarcely to be seen, and the singular shape of their leaves makes a very agreeable variety in summer. They are generally raised from seeds, which should be sown about the end of March on a bed of light earth; they may also be propagated by layers, but plants raised from seeds thrive best.

**CCXCIV. PALOVEA** (an alteration from the Guiana name of the shrub). Aubl. guian. 1. p. 365. t. 141. Lam. ill. t. 323. D. C. prod. 2. p. 518. — *Gimania*, Scop. ex Schreb. gen. no. 691. Neck. elem. no. 1285.

*LIN. SYST. Encandria, Monogynia.* Bracteoles 2 under the calyx, joined into a 2-lobed involucre; tube of calyx obconical, exerted from the involucre, with a 4-5-lobed limb; lobes spreading. Petals 3-4, deciduous, the inner one bearing something like a sterile anther. Stamens 9, exerted beyond the tube of the calyx; filaments free, very long, subulate, replicate before the expansion of the flowers, as in the order *Melastomaceæ*. Anthers when young linear, 2-celled, straight, fixed by the middle. Ovary stipitate, linear, compressed. Style filiform, glabrous, biplicate when young, crowned by a roundish stigma. Legume (ex Aubl.) oblong, compressed, 2-valved, 1-celled, 6-7-seeded. — A shrub, with alternate, elliptic, quite entire, glabrous leaflets, which are acuminate at both ends, and pedicellate flowers, which are disposed in umbels at the tops of the branches. Pedicels bracteate.

1 *P. GUIANENSIS* (Aubl. l. c.)  $\frac{1}{2}$  S. Native of Guiana, in woods. Corolla red.

*Guiana Palovea.* Shrub 5 to 6 feet.

*Cult.* For culture and propagation see *Bauhinia*, p. 463.

**CCXCV. ALOEXYLON** (from *αλον*, *aloc*, of Dioscorides, the Aloe, and *ξύλον*, *xyton*, wood; this tree produces the aloes-wood of the shops). Lour. cochin. p. 267. D. C. prod. 2. p. 518.

*LIN. SYST. Decandria, Monogynia.* Calyx of 1 sepals or 4-parted; sepals acute, deciduous, lower one falcate, incurved, nearly twice the length of the rest. Petals 5, unequal, longer than the calyx. Stamens 10, distinct. Ovary compressed, curved. Style filiform. Legume woody, smooth, falcate, 1-seeded. Seed oblong, curved, arillate. — A tree, with erect branches, simple, alternate, lanceolate, quite entire, petiolate leaves, and terminal flowers. This genus is hardly known.

1 *A. AGALLOCHUM* (Lour. l. c.)  $\frac{1}{2}$  G. Native of Cochinchina, on the highest mountains, and the Molucca Islands. — Rumph. amb. 2. p. 29. t. 9. ex Lour. *Cynomœtra Agallocha*, Spreng. syst. 2. p. 327. The wood is white and scentless, and has long been used as a perfume. Aloes-wood is held in high estimation in the East on account of its fragrant odour as a perfume, for which purpose it is applied to clothes and apartments, and as a cordial medicine in fainting fits, and in cases of paralytic affection. By the Chinese and Heathen Moors it was used as incense in their sacrifices; and employed for setting the most

precious jewels that are wrought in the East Indies. It was formerly deemed in that part of the world of greater value than gold, and various fables have been invented as to the origin of the tree that yields it. Some have feigned that it grew in Paradise, and that it was conveyed from thence by the rivers, which overflowed their banks, and swept off the trees in their way. Others pretend that it grows on inaccessible mountains, where it is guarded by wild beasts. The calambac or eagle-wood should not be confounded with the aloes-wood. See *Aquilaria*.

*Agallocha* or Aloes-wood. Tree 60 feet.

*Cult.* For culture and propagation see *Bauhinia*, p. 463.

**CCXCVI. AMARIA** (meaning unknown). Seb. Mutis in sem. nuy. gran. 1810. p. 25. D. C. prod. 2. p. 519.

*LIN. SYST. Monadelphina, Decandria.* Calyx cylindrical, rounded at the base, permanent, 5-cleft; lobes linear, cohering at the apex, and dehiscent on the sides. Petals 5, equal, obovate, spreading, keeled from the base to the apex. Stamens 10, subulate, erect, monadelphous at the base. Ovary oblong, stipitate; stipe adnate to the calyx. Style filiform, crowned by a capitate stigma. Legume very long, compressed, pedicellate, torose at the seeds, 1-celled, 2-valved, dehiscent. Seeds many, roundish, compressed. — American shrubs, with simple cordate leaves. This genus is unknown to European botanists, but it appears to be allied to *Jonësia*, from the stipitate ovary, and in the stipe adhering to the calyx.

1 *A. PETIOLATA* (Seb. Mutis. l. c.) leaves petiolate; flowers terminal.  $\frac{1}{2}$  S. Native of New Granada, in the temperate parts.

*Petiolate-leaved Amaria.* Shrub 4 to 6 feet.

2 *A. SESSILIFOLIA* (Seb. Mutis. l. c.) leaves sessile, almost stem-clasping; flowers axillary; peduncles many-flowered.  $\frac{1}{2}$  S. Native of New Granada, in temperate places.

*Leaflets are connected to the stipe.*

*Cult.* For culture and propagation see *Bauhinia*, p. 463.

**CCXCVII. BOWDICHIA** (in honour of T. E. Bowdich, who was sent on a mission to Ashantee in Western Africa). H. B. et Kunth, nov. gen. amer. 6. p. 376. D. C. prod. 2. p. 519.

*LIN. SYST. Decandria, Monogynia.* Calyx turbinate, 5-impunctate, 5-toothed; teeth acute, erect, 2 superior ones approximate. Petals 5, free, disposed in a kind of papilionaceous manner, lateral ones the longest. Stamens 10? free. Legume stipitate, 10-ovulate, compressed, membranous, winged on the seminiferous suture, 1-celled, indehiscent. Embryo straight. — An unarmed tree, with impari-pinnate leaves, clothed with rusty tomentum beneath, as also the branches. Flowers violaceous.

1 *B. VIRGILIOIDES* (H. B. et Kunth, l. c.)  $\frac{1}{2}$  S. Native of South America, near Barbula, Lavilla del Pao, and at the mouth of the Orinoco, where it is commonly called *Alcornoco*. Leaflets 13, lanceolate-oblong, obtuse at both ends.

*Virgilia-like Bowdichia.* Tree.

*Cult.* For culture and propagation see *Bauhinia*, p. 463.

**CCXCVIII. CRUDYA** (— Crudy, the name of a person who communicated the first specimen of the tree to Schreber). Willd. spec. 2. p. 539. D. C. prod. 2. p. 519. — *Crudya* et *Cýclas*, Schreb. gen. no. 711. and 712. — *Apalatôa*, *Touchirôa*, *Vourâna*, and *Parivôa* species, Aubl. guian. *Touchirôa*, Rich. mss. — *Waldschmidtia*, Neck. elem. no. 1445.

*LIN. SYST. Octo-Decandria, Monogynia.* Calyx bibracteate at the base, with the tube short and obconical, and the limb 4-cleft and spreading. Petals wanting. Stamens 8-10, exerted from the tube of the calyx, long, free, rather dilated at the base. Ovary ovate, hairy, rather stipitate. Style filiform. Legume coria-

ceous, thick, 1-2-seeded.—Guiana trees, with impari-pinnate glabrous leaves, alternate entire leaflets, and axillary simple racemes of flowers. The genus has the habit of *Swartzia*, but is not well known.

1 *C. SPICATA* (Willd. spec. 2. p. 539.) leaflets 9-13, oblong-lanceolate, equal at the base, acuminate at the apex. *h. S.* Native of Guiana, in woods. *Apalatoa spicata*, Aubl. guian. 1. p. 383. t. 147. exclusive of fig. 5 and 6. ex Koen. in ann. bot. 1. p. 358. t. 8. f. 5.

*Spicate-flowered Crudya.* Tree 30 feet.

2 *C. AROMATICA* (Willd. spec. 2. p. 540.) leaflets 3, elliptic, obtuse at the base and equal, but acuminate at the apex. *h. S.* Native of Guiana, in woods. *Touchiròa aromatica*, Aubl. guian. 1. p. 385. t. 148. Lam. ill. t. 339. Racemes 4 times shorter than the leaves, hardly pedunculate. Flowers greenish. Legume 1-seeded, girded by a wing, ex Aubl. but his description is doubtful according to Richard. Wood aromatic.

*Aromatic Crudya.* Tree 40 to 50 feet.

3 *C. PARIVOA* (D. C. prod. 2. p. 520.) leaflets 3, ovate, very unequal at the base, acuminate at the apex; racemes equal in length to the leaves, on long peduncles. *h. S.* Native of Guiana, in woods. *Parivòà tomentosa*, Aubl. guian. 2. p. 759. and 304. *Touchiròa Parivòà*, Rich. herb. Flowers purple. The stamens are 10 and distinct, and the ovary is hairy.

*Parivòà Crudya.* Tree 20 feet.

4 *C. VOVARANA* (D. C. prod. 2. p. 520.) leaflets 6, ovate, acute; petiole angular. *h. S.* Native of Guiana, in woods. *Vouaràna Guianensis*, Aubl. guian. suppl. p. 12. t. 374. *Touchiròa Vouaràna*, Rich. mss. Flowers unknown. *Vouaràna* is the name of the tree in Guiana.

*Vouaràna Crudya.* Tree 10 feet.

*Cult.* For culture and propagation see *Copaifera*, p. 456.

CCXCIX. DIALIUM (*Cassia*, a name employed for the Heliotropium by some Greek writers; it comes from *διαλον*, but the plant of the Greeks has nothing to do with the present). Burm. fl. ind. 2. Lin. mant. 24. D. C. prod. 2. p. 520.—*Dialium et Arina*, Schreb.—*Arina*, Aublet. guian. 1. p. 15.—*Cléryia*, Nak. elem. no. 897.

*Lin. syst. Diandria, Monogynia.* Calyx 5-parted or of 5 sepals; sepals oval, obtuse, concave, equal in length, 2 outer ones rather the broadest. Petals none. Stamens 2, inserted in the receptacle on the superior side of the flower; anthers thick, erect, 2-celled. Ovary ovate, sessile. Style subulate, bluntish. Legume pulpy inside, 1-2-seeded. Seeds compressed.—Trees, with impari-pinnate glabrous leaves, and paniced racemes of small flowers. This genus is nearly allied to *Codarium*.

1 *D. INDUM* (Lin. mant. 24.) panicle simple, drooping; leaflets elliptic-oblong, acute; anthers 3 times the length of the filaments. *h. S.* Native of Java. *D. Javanicum*, Burm. ind. p. 12. exclusive of the synonyme of Rumph. *D. Indum*, Smith in Rees' cycl. vol. 11. no. 11. Calyx clothed with white velvety down on the outside.

*Indian Dialium.* Tree 20 to 30 feet.

2 *D. DIVARICATUM* (Vahl. enum. 1. p. 303.) panicle compound, erect; leaflets ovate, acuminate; anthers shorter than the filaments. *h. S.* Native of Guiana, in woods. *Arouna Guianensis*, Aubl. guian. 1. p. 16. t. 5. *Arina divaricata*, Willd. spec. 1. p. 49. Legume oval, compressed, indehiscent, dry. Leaflets exstipellate, the ultimate one longer and narrower than the others.

*Divaricate Dialium.* Tree 30 to 40 feet.

*Cult.* For culture and propagation see *Copaifera*, p. 456.

CCC. CODARIUM (from *κοδιον*, *kodion*, the hide of a beast; in reference to the consistence and hairiness of the pods).

VOL. II.

*Sol.* in Vahl. enum. 1. p. 302. ed. 2. p. 400. *Afz.* in Schrad. new. journ. 2. p. 233.

*Lin. syst. Diandria, Monogynia.* Calyx 5-parted; lobes equal, spreading; the tube permanent. Petal one, linear-lanceolate, flatish. Stamens 2, inserted in the calyx, free, erect; filaments longer than the anthers; anthers ovate, 2-celled. Legume clothed with black or brown velvety down, 2-valved, 1-seeded. Seeds surrounded by mealy pulp. Albumen, ex *Afz.* (perhaps endopleura) large, and shell-formed. Cotyledons elliptic. Radicle hemispherical. Plumule ligulate, acute.—Trees, native of Guinea, with impari-pinnate leaves, bearing 2-3 pairs of coriaceous leaflets. Flowers small, reddish, disposed in terminal branched panicles.

1 *C. ACUTIFOLIUM* (*Afz.* l. c.) leaflets unequal, bluntly somewhat acuminate, the same colour on both surfaces, glabrous. *h. S.* Native of Guinea, particularly of Sierra Leone. *C. nitidum*, Vahl. enum. 1. p. 303. *Dialium Guineense*, Willd. in Rœm. arch. 1. p. 31. t. 6. *Codarium Solandri*, Vahl. enum. p. 302. Hort. trans. 5. p. 160. The pulp in the pods is dry and mealy; it is eaten by the natives of Sierra Leone under the name of tamarinds, as well as that of the next species.

*Acute-leaved Velvet-tamarind.* Fl. Feb. Clt. 1793. Tree 12 to 20 feet.

2 *C. OBTUSIFOLIUM* (*Afz.* l. c. Vahl. enum. 2. p. 401.) leaflets equal, rounded at the apex, the same colour on both surfaces, glabrous. *h. S.* Native of Sierra Leone, and other parts of Guinea.

*Obtuse-leafletted Velvet-tamarind.* Fl. Feb. Clt. 1824. Tree 12 to 20 feet.

3 *C. DISCOLOR* (D. C. prod. 2. p. 520.) leaflets elliptic-oblong, attenuated at both ends, glabrous above, but clothed with very minute velvety pubescence beneath. *h. S.* Native of Sierra Leone, and other parts of Guinea.

*Discoloured-leaved Velvet-tamarind.* Tree 14 to 20 feet.

*Cult.* For culture and propagation see *Copaifera*, p. 456.

CCCI. VATAIREA (meaning not explained). Aubl. guian. 2. p. 755. t. 302. D. C. prod. 2. p. 521.

*Lin. syst.* unknown. Flowers unknown. Legume coriaceous, roundish, compressed, ferruginous, wrinkled on one side, with membranous margins, 1-celled, indehiscent. Seed large, roundish, flattened. Embryo straight. A tree, with impari-pinnate leaves, alternate, oval, glabrous, stiff leaflets, which are cinereous on the under surface. This genus is analogous to *Pterocarpus* from its fruit, but differs in the embryo being straight.

1 *V. GUIANENSIS* (Aubl. l. c.) *h. S.* Native of Guiana, on the banks of rivers. The tree is called *Graine à d'artre*.

*Guiana Vatairea.* Tree 50 feet.

*Cult.* See *Copaifera* for culture and propagation, p. 456.

## Tribe XI.

DETARIEÆ (plants agreeing with *Detarium* in important characters). D. C. legum. mem. xiii. prod. 2. p. 521. Calyx 4-lobed, globose before expansion; lobes valvate. Petals wanting. Stamens 10-25, perigynous, nearly free. Legume fleshy. Cotyledons thick.—African trees, with impari-pinnate leaves. This tribe agrees with *Swartzia* in the calyx, but with *Cassia* in the rest of the characters. It comes very near to the order *Amygdalaceæ* in the drupaceous fruit, and the icosandrous flowers.

CCCH. DETARIUM (*Detar* is the name of the tree in Senegal). Juss. gen. 365. D. C. prod. 2. p. 521.

*Lin. syst. Decandria, Monogynia.* Calyx 4-cleft; lobes valvate before expansion. Alabastrum globose. Petals wanting. Stamens 10; filaments distinct, alternate ones shortest. Ovary

globose, hispid. Style and stigma one. Drupe orbicular, thick, soft, farinaceous, containing a large, hard, orbicular, compressed, nut, smooth on the sutures, reticulated with interwoven fibres in the valves, 1-celled, 1-seeded. Seed large, smooth, compressed, blackish, exalbuminous. Embryo straight, with thick, transversely oval cotyledons, a short radicle, and an ovate plumule.— A tree, with alternate and impari-pinnate leaves, ovate obtuse glabrous leaflets, which are velvety beneath. Racemes axillary, branched, shorter than the leaves.

1 D. SENEGAL'NSE (Gmel. syst. 3. p. 700.)  $\frac{1}{2}$  S. Native of Senegal and Gambia.

Senegal Detarium. Tree 40 feet.

Cult. See *Copaifera* for culture and propagation, p. 456.

CCCIII. CORDYLA (from *κορδύλη*, *kordyle*, a club; shape of calyx before expansion). Lour. coch. p. 500. D. C. prod. 2. p. 521. — Cordylia, Pers. ench. 2. p. 260.

LIN. SYST. *Icosandria*, *Monogynia*. Calyx campanulate, 4-cleft, pear-shaped before expansion; lobes acute, valvate in aestivation. Corolla none. Stamens 30-35, subulate, rather monadelphous at the very base. Ovary stipitate, ovate, acute. Style short. Legume stipitate, 1-celled, many-seeded. Seeds 6, ovate. — A tree, with impari-pinnate leaves, bearing 19-21 oblong, emarginate, glabrous leaflets, and axillary racemes of flowers, which are much shorter than the leaves. Stamens long, copper-coloured. Berry edible. This genus comes very near *Detarium*.

1 C. AFRICA'NA (Lour. l. c.)  $\frac{1}{2}$  S. Native of the eastern coast of Africa.

African Cordyla. Tree 40 to 50 feet.

Cult. For culture and propagation see *Copaifera*, p. 456.

{ Genera belonging to Leguminosæ, but are not sufficiently known, and are therefore not received among the tribes.

CCCIV. CRUMINIUM (meaning not explained). Desv. obs. legum. in Schlecht. Linnaea. 2. p. 512.

LIN. SYST. unknown. Calyx cup-shaped, truncate. Petals and stamens unknown. Legume compressed, flat, many-seeded, margined on both sides.

1 C. GIANT'NUM (Desv. l. c.)  $\frac{1}{2}$  S.

Giant Cruminium. Tree?

Cult. See *Copaifera* for culture and propagation, p. 456.

CCCV. PHYLLOLOBIMUM (from *φύλλον*, *phyllon*, a leaf, and *λοβος*, *lobos*, a pod; in reference to the flat membranous pods). Fisch. in Spreng. nov. prov. 33. D. C. prod. 2. p. 521.

LIN. SYST. unknown. Calyx campanulate, 5-cleft; teeth equal, subulate. Corolla papilionaceous; the vexillum a little larger than the rest of the petals. Legume turgid, compressed at the sutures, falcate, 6-10-seeded, 2-valved, opening only at one of the sutures. A flexuous herb, beset with adpressed pubescence, with impari-pinnate leaves, bearing 6 pairs of oval glabrous leaflets. Racemes axillary, usually 6-flowered. Bractees linear, shorter than the pedicels. Flowers greyish white. According to Sprengel this genus is allied to *Cajanus* and *Rudolphia*, but according to Link it is allied to *Indigofera* and *Tephrosia*.

1 P. CHINE'NSE (Fisch. l. c.)  $\frac{1}{2}$  S. Native of China.

China Phyllobium. Pl.

2 C. ZANZIBAR'NSE (Boger. mss.)  $\frac{1}{2}$  S. Native of Zanzibar.

Zanzibar Phyllobium. Clt. 1826. Pl.?

Cult. A mixture of peat and sand will suit the species of this genus, and cuttings will root in the same kind of earth, with a hand-glass placed over them in heat.

CCCVI. AMPHINOMIA (from *αμφι*, *amphi*, around, and *νομος*, *nomos*, order; flowers regular?). D. C. legum. mem. xiv. prod. 2. p. 522.—Hermannia spec. Lin.—Connaris species. Thunb.

LIN. SYST. *Monadelphina*, *Decandria*. Calyx ovate, ventricose, permanent, 5-cleft; segments lanceolate, spreading. Petals 5, unguiculate, spatulate. Filaments 10, monadelphous at the base; anthers minute. Ovary ovate, rugose. Style one, lateral, filiform, simple, obtuse. Legume roundish, crowned by the style, muricated, 1-celled, 2-valved; valves concave. Seeds numerous, fixed to the superior suture, many of which are abortive, and one of them roundish-reniform.— A decumbent hairy herb, with ovate stipulas, trifoliate leaves, obovate leaflets, and axillary and terminal peduncles, each bearing 3-4 bracteate flowers at the top. The description is taken from the figure of Thunb.

1 A. DECU'MBENS (D. C. l. c.)  $\frac{1}{2}$  G. Native of the Cape of Good Hope. Hermannia triphylla, Lin. amen. 6. p. 91. but not of Cav. Connaris decumbens, Thunb. in Roem. arch. 1. p. 1. t. 1.

Decumbent Amphinomia. Pl. decumbent.

Cult. A mixture of loam and peat will suit this plant, and cuttings will root in sand under a hand-glass.

CCCVII. SARCODUM (from *σαρκώης*, *sarcodes*, fleshy; legume). Lour. coch. p. 462. D. C. prod. 2. p. 522. Sarcodium. Pers. ench. no. 1752.

LIN. SYST. *Diadelphina*, *Decandria*. Calyx cup-shaped, truncate at the apex above, but acutely 3-toothed on the lower side. Vexillum ovate, ascending; wings oblong, short, flat; keel falcate. Stamens diadelphous. Legume fleshy, terete, equal, many-seeded. A climbing unarmed shrub, with pinnate leaves, bearing many pairs of woolly leaflets. Spikes terminal. Flowers rose-coloured.

1 S. SINGAP'ORENSE (Lour. l. c.)  $\frac{1}{2}$  S. Native of Cochin-china, in woods. Leaves perhaps abruptly of  $\frac{1}{2}$  S. impari-pinnate; leaflets ovate-oblong, acuminate.

Climbing Sarcodium. Shrub cl.

Cult. A mixture of loam, peat, and sand will suit this shrub, and ripened cuttings will root if planted in sand, with a hand-glass placed over them.

CCCVIII. VARENNEA (named by De Candolle to recan- useful works of M. Varenne de Fénille on agriculture, and vegetable physiology). D. C. legum. mem. xiv. prod. 2. p. 522.—Viborquia, Orteg. dec. 5. p. 66. t. 9. but not of Thunb. nor Mœnch, nor Roth.

LIN. SYST. *Monadelphia*, *Decandria*. Calyx tubularly campanulate, permanent, 5-toothed, the 2 superior teeth the broadest. Petals 5, disposed in a sub-papilionaceous manner, having the vexillum cuneiform and emarginate; wings spatulate and falcate, and the carina of 2 spatulate petals, which are concave above. Stamens 10, monadelphous, with the sheath cleft in front (ex Orteg.), diadelphous, the tenth one free (ex icon. fl. mex. ined.) Ovary oblong. Style filiform, subulate. Stigma capitate. Legume oblong, compressed, flat, rather falcate, 1-seeded. Seed fixed to the top of the legume, oblong-reniform.— A shrub, with impari-pinnate leaves, bearing many pairs of ovate, entire, stipellate leaflets, the odd or terminal one obcordate, but often deficient. Racemes numerous, spicate, disposed in a panicle. Flowers small, white. The place which this genus should occupy in the order is uncertain. It is said to be allied to *Nissolia* and *Pterocarpus*.

1 V. POLYSTACHYA (D. C. prod. 2. p. 522.)  $\frac{1}{2}$  S. Native of Mexico. Viborquia polystachya, Orteg. l. c. Moc. et Sesse, fl. mex. icon. ined. Leaves with about 20 pairs of leaflets. Flowers about 30, in a raceme.

*Many-spiked Varennea*. Shrub 1 to 2 feet.

*Cult.* See *Sarcodum* for culture and propagation, p. 466.

CCCIX. CRAFTORIA (named apparently after some botanist or horticulturist of the name of Craford). Rafin. speech. 1. p. 159. D. C. prod. 2. p. 522.

LIN. SYST. *Diadelphia*, *Decandria*. Calyx campanulate, 5-cleft; segments nearly equal. Corolla papilionaceous, with a large reflexed vexillum, adpressed wings, which are auricled at the base, and an obtuse keel, which is longer than the wings. Stamens 10, diadelphous. Ovary linear. Style filiform; stigma dot-formed, glabrous. Legume usually 2-seeded, linear, torulose, striated. Seed oblong-reniform.—A twining plant, with impari-pinnate leaves; leaflets oblong, mucronate, sessile. Peduncles longer than the leaves, somewhat spicate; bractes scarious, subulate, permanent, ciliated. Flowers white. This genus is allied to *Galiga* and *Colutea* according to the author, but from both and from *Tephrosia* it differs in the 2-seeded legume.

1 C. BRACTEATA (Rafin. l. c.) ♀. F. Native of Pennsylvania, on the banks of the river Susquehannah.

*Bracteate Crafordia*. Pl. tw.

*Cult.* Peat or vegetable earth is a good soil for this plant, and cuttings will be easily rooted.

CCCX. AMMODENDRON (from *appoc*, *amos*, sand, and *deindron*, *dendron*, a tree; habitation of the shrub). Fisch. in D. C. legum. mem. xvi. prod. 2. p. 528. Led. fl. alt. 2. p. 110.

LIN. SYST. *Decandria*, *Monogynia*. Calyx 5-cleft, sub-bilabiate, permanent, at length reflexed. Corolla papilionaceous; wings and dipetalous keel equal and connivent. Stamens 10, distinct. Legume flat, membranous, 1-seeded from abortion, margined by a wing, samaroid. Seed reniform, compressed.

A small, neat, silky shrub, having the petioles hardening into spines. Leaves bilobed; leaflets lanceolate. Flowers white, disposed in racemes. This genus is closely allied to *Halimodendron*, which it ought to have followed in the body of the order.

1 A. SIBIRICA (Fisch. l. c.) ♀. H. Native of Siberia, in salt fields in the desert of Soongaria, and at the river Bekim. Leaflets lanceolate, silky white on both surfaces. *Sophora argentea*, Pall. act. petrop. 1792. p. 373. t. 8. *Podalyria argentea*, Willd. spec. 2. p. 502. *Sophora bifolia*, Pall. astr. p. 124. t. 91. *Robinia argentea*, Sievers.

*Sievers's Sand-tree*. Shrub 2 to 4 feet.

*Cult.* For culture and propagation see *Halimodendron*, p. 244.

CCCXI. LACARA (meaning unknown). Spreng. neue end. 3. p. 56. D. C. prod. 2. p. 528.

LIN. SYST. *Decandria*, *Monogynia*. Calyx campanulate, 5-toothed. Petals 5, unequal, unguiculate, nerved, concave. Stamens 10, free, inserted in the bottom of the calyx, pilose at the base, longer than the petals. Anthers versatile. Capsule? pilose.—A shrub, with alternate, simple, quite entire, petiolate, coriaceous, unequal, triple-nerved leaves, and axillary racemes of flowers. The fruit of this genus is unknown.

1 L. TRIPLINERVIA (Spreng. l. c.) ♀. S. Native of Brazil. Leaves a span long, and a hand in breadth.

*Triple-nerved Lacara*. Shrub.

*Cult.* For culture and propagation see *Copaifera*, p. 456.

CCCXII. HARPALYCE (from *Harpalyce* in mythology, the daughter of Clymenus, remarkable for her beauty; in reference to the beauty of the plant). Moc. et Sesse, fl. mex. icon. ined. ex D. C. prod. 2. p. 528.

LIN. SYST. *Monadelphina*, *Decandria*. Calyx bilabiate, deciduous, bibracteolate at the base, both lips lanceolate, acuminate,

and entire. Corolla papilionaceous, with an obovate vexillum, auricled wings, and a 2-edged, elongated, acuminate, rather twisted keel. Stamens 10, monadelphous. Style filiform, incurved with the carina. Legume compressed, flat, narrow at the base, ovate-oblong at the apex, 4-5-seeded, mucronate by the style.—An erect herb, suffrutescent at the base, with impari-pinnate leaves, and axillary peduncles, which are longer than the leaves, bearing racemes of large red flowers. This genus appears to be allied to *Phaseolus* from the bibracteolate calyx, and the incurved carina, but differs particularly from that genus in the leaves being impari-pinnate, but in consequence of the legume being 2-seeded, and the leaves being impari-pinnate, the genus is probably allied to *Astragalus*, but the calyx is very distinct.

1 H. FORMOSA (D. C. prod. 2. p. 523.) ♀. S. Native of New Spain, in the hot regions. *Astragalus carnosus*, Moc. et Sesse, fl. mex. ined.

*Sherry Harpalyce*. Pl. 1 foot.

*Cult.* For culture and propagation see *Hoffmanseggia*, p. 133.

CCCXIII. DIPLOPRION (from *διπλος*, *diploos*, double, and *πριον*, *prion*, a saw; in reference to the legume being serrated on all sides). Viv. fl. hb. p. 18. t. 19. f. 2. D. C. prod. 2. p. 523.

LIN. SYST. *Monadelphina*, *Decandria*. Calyx tubular, 5-toothed. Corolla papilionaceous. Filaments 10, connected. Legume 1-celled, flat, many-seeded, spirally involute, serrated on both margins.—An annual hairy herb, 2-3 inches long, with petiolate trifoliate leaves, ovate lanceolate stipulas, and axillary peduncles, bearing each a head of yellow flowers. This genus is allied to *Medicago* according to the habit, but from the legume it appears to be more nearly allied to *Biserrula*, but it is not sufficiently known.

1 D. MEDICAGINOIDES (Viv. l. c.) ♂. H. Native of Libya, in the great Syrtis, in fields.

*Medick-like Diploprion*. Pl. 2 to 3 inches.

*Cult.* The seeds of this plant only require to be sown in the open border in a dry warm situation.

CCCXIV. RIVERIA (in honour of Mariano de Rivero, director of the government mines of Columbia; native of Arequipa, in Peru). B. et Kunth, nov. gen. amer. 7. p. 266. D. C. prod. 2. p. 524.

LIN. SYST. unknown. Flowers unknown. Legume stipitate, obliquely-elliptic, compressed, mucronate, chartaceous, 2-valved, 1-seeded. Seed oblong-reniform, fixed to the lower part of the pod, covered with friable white substance. Cotyledons thick. Radicle small, situated beneath the apex of the embryo, pointing to the bottom.—An unarmed tree, with impari-pinnate leaves, bearing 1-3 pairs of coriaceous leaflets, having the petiole winged. Peduncles usually terminal. Perhaps this genus belongs to tribe *Geoffrieæ*, near *Audina*, or perhaps to tribe *Cassieæ*, near *Copaifera*.

1 R. NIRENS (H. B. et Kunth, nov. gen. amer. 7. p. 266. t. 659.) ♀. S. Native of South America, near Jacn de Bracamoros.

*Shining Riveria*. Tree.

*Cult.* See *Copaifera* for culture and propagation, p. 456.

†† Additional genera.

CCCXV. DONIA (to the memory of the late Mr. George Don, of Forfar, whose numerous discoveries have so eminently enriched the Flora of his native land). G. and D. Don, mss. in herb. Lamb. but not of R. Brown nor Pursh.

LIN. SYST. *Diadelphina*, *Decandria*. Calyx campanulate, 5-toothed or 5-cleft. Corolla papilionaceous. Vexillum ovate-lanceolate, acuminate, rather shorter than the keel, reflexed;

wings lanceolate, acuminate, spreading, half the length of the keel, which is cymbiform, and composed of one petal. Stamens 10, diadelphous, one of which is separate from the rest; anthers incumbent. Style long, filiform; stigma truncate. Legume oblong, swollen, coriaceous, 1-celled. Seeds many, reniform, disposed in 2 rows, attached by a funicle to the lower suture—Procumbent, herbaceous, perennial herbs or subshrubs, with impari-pinnate leaves, and foliaceous, adnate permanent stipulas. Flowers large, crimson, about 2 inches long, disposed in umbels or racemes.

1 *D. FUSCÆA*; suffruticose, minutely pubescent; leaflets alternate, oblong, retuse, coriaceous; flowers racemose; calyx 5-toothed; legumes smooth.  $\mathfrak{L}$ . G. Native of New Zealand, where it was first discovered by Sir Joseph Banks and Dr. Solander, who gave it the name of *Clianthus puniceus*. Flowers large, crimson.

*Scarlet flowered Donia*. Shrub 1 to 2 feet.

2 *D. SPECIOSA*; herbaceous, very villous; leaflets opposite, lanceolate, acute; flowers umbellate; calyx 5-cleft; legume silky.  $\mathfrak{L}$ . G. Native of New Holland, at Regent's Lake. Flowers large, crimson.

*Sherry Donia*. Pl. procumbent.

3 *D. FORMOSA*; plant herbaceous, very villous; leaflets opposite, obovate; flowers racemose; calyx 5-cleft; legume silky.  $\mathfrak{L}$ . G. Native of the North-west coast of New Holland, at the Curlew river. Capt. King.

*Beautiful Donia*. Pl. procumbent.

*Cult.* Elegant plants, resembling the *Sutherlandia frutescens*, when in bloom, their flowers being large, and of a crimson colour. Should ever any of the species be introduced to our gardens, we would recommend their being grown in an equal mixture of loam, peat, and sand, and cuttings will no doubt strike root in the same kind of soil, under a bell-glass.

CCCXVI. MEGASTEGLIA (from *μεγας*, *megas*, large, and *στεγος*, *stegos*, a covering; in reference to the large bracteas, which enclose the flower before expansion).

LIN. SYST. *Monadelphica*, *Dicandria*. Bracteas 2, large, inclosing the flower before expansion. Calyx bilabiate, upper lip bifid, lower one trifid. Corolla papilionaceous, not much longer than the calyx. Stamens 10, monadelphous? Legume unknown.—A herbaceous plant, densely clothed in every part with fuscous hairs. Leaves with 10-12 pairs of ovate acuminate leaflets. Pedicels elongated, 1-flowered, solitary or twin, axillary. Flowers large, red or purple.

1 *M. SPECIOSA*.  $\mathfrak{L}$ . G. Native of Mexico. Pavon, Astragalus ammodytes, Ruiz et Pav. in herb. Lamb. Perhaps the same genus as *Harpalyce*.

*Sherry Megastegia*. Pl. 1 to 2 feet.

*Cult.* For culture and propagation see *Hoffmanséggia*, p. 433.

CCCXVII. SEBIPIRA (meaning unknown.) Mart. reis. bras. ex Schlecht. *Linnaea*. 5. p. 44.

LIN. SYST. *Dicandria*, *Monogynia*. Calyx tubular, cylindrical, somewhat equally 5-toothed. Corolla of 5 petals, disposed in a somewhat papilionaceous manner; petals erect, unguiculate, flat, crenulated, having the vexillum almost quadrate, shorter than the wings and petals of the keel. Stamens 10, free; anthers globose. Stigma capitate. Legume compressed, linear, membranous, 1-celled, many-seeded, winged on one side. Seeds obovate. Embryo straight. This genus belongs to Tribe *Cassia*, and ought perhaps to follow *Copaifera*, p. 455. of the present volume.

1 *S. MAJOR* (Mart. l. c.) leaves pinnate, with many pairs of alternate, oblong-lanceolate, obtuse leaflets, which are glaucous

beneath and hoary; panicle of flowers spreading.  $\mathfrak{L}$ . S. Native of Brazil.

*Larger Sebipira*. Shrub or tree.

*Cult.* See *Copaifera* for culture and propagation, p. 456.

#### † Additional Leguminous plants.

##### Tribe I. *Sophorææ*, p. 108.

1 *BAPTISIA MINOR* (Lehm. in nov. act. bonn. 14. p. 803. and p. 113. no. 8. of the present volume,) stem erect, solid; leaflets rhomboid-lanceolate; stipulas lanceolate, longer than the petioles; racemes axillary, bracteate; bracteas cordate, lanceolate, lower ones permanent; vexillum entire.  $\mathfrak{L}$ . II. Native of North America. *Baptisia australis*, Hortul. Plant glaucous and pruinose. Flowers blue. This plant differs from the true *B. australis* in the stem being solid and always smaller, in the lower bracteas being permanent, and lastly in the vexillum being entire, which in *B. australis* is appendiculate at the base.

*Smaller Baptisia*. Fl. June, July. Pl. 1 to 2 feet.

2 *GOMPHOLOBIUM KNIGHTEA'NUM* (Lindl. bot. reg. 1468.) leaves ternate and pinnate; leaflets roundish-obovate, ovate, and linear, mucronate, and glabrous; cymes terminal, pedunculate, length of the leaves.  $\mathfrak{L}$ . G. Native of New Holland. Flowers rose-coloured. Leaflets variable in shape.

*Knight's Gompholobium*. Fl. July, Aug. Clt. 1831. Sh. 1 ft.

##### Tribe II. *Loteæ*. Subtribe I. *Genisteæ*, p. 126.

3 *CROTALARIA EUPLEURITOLIA* (Schlecht. et Cham. in *Linnaea*. 5. p. 575.) pubescent; stem angularly winged, dichotomously branched; leaves on short petioles, ovate-elliptic, obtuse at both ends, and mucronate; flowers usually twin, pedunculate, near the base of the branches; bracteas rather joined, opposite, stipula-form, ~~very small, and situated at the apex.~~  $\odot$ . S. Native of Mexico, near Hacienda de la Laguna. Flowers blue, rather smaller than those of *C. verrucosa*. Lin. 134. no. 12. of the present volume, and to which it is nearly allied.

*Bupleurum-leaved Crotalaria*. Pl. 1 to 2 feet.  $\mathfrak{L}$ .

4 *CROTALARIA BRACTEATA* (Schlecht. et Cham. in *Linnaea*. 5. p. 575.) plant exstipulate; leaves sessile, oblong, obtuse, mucronate, attenuated at the base, clothed with yellowish tomentum beneath, as well as on the branches and calyxes; branches terete; racemes elongated, opposite the leaves, or somewhat terminal on long peduncles; peduncles bracteate; corolla equal in length to the calyx; calycine segments linear, elongated, acuminate, and very acute; legumes glabrous, rather clavate, many-seeded.  $\odot$ . S. Native of Mexico, at Hacienda de la Laguna. Flowers propped by bracteas on short pedicels. Corolla flesh-coloured. This species comes nearly to *C. Paulinia*, p. 136. no. 35. of the present volume.

*Bracteate-flowered Crotalaria*. Pl. 1½ foot.

5 *GENISTA TENOREI*; stems diffusely prostrate; branches angular, striated, and villous; leaves oval-oblong, acute, pilose on both surfaces; flowers axillary, solitary, on short peduncles; calyx somewhat cylindrical, pilose; the teeth setaceous; corolla glabrous; vexillum of a copper-yellow colour, about equal in length to the keel.  $\mathfrak{L}$ . II. Native of Lucania, on the mountains. *G. depressa*, Tenore, fl. neap. prod. append. 5. but not of Bieb. This species differs from *G. prostrata*, Lam. p. 153. no. 72. of the present volume, in the leaves being pilose on both surfaces, in the calyx being hairy, and lastly in the calycine teeth being setaceous.

*Tenore's Genista*. Shrub prostrate.

6 *OSORIS PEDUNCULARIS* (Lindl. bot. reg. 1446.) herbaceous, diffuse, beset with glandular pubescence; leaves obovate, toothed, simple; stipulas quite entire, shorter than the petiole; pe-

duncles long, 1-flowered, awned, arched, at length recurved.  $\gamma$ . G. Native of Teneriffe. Flowers variegated with white and rose colour. Leaves all simple.

*Pedunculate*-flowered Rest-harrow. Fl. April. Clt. 1830. Shrub 1 foot.

7 *ONONIS CONJUGATA* (herb. Lamb.) leaves bifoliate, nerved, glabrous, oblique, obtuse; stipulas large, adnate to the stem at the base, ovate-cordate, acuminate and mucronate; petiole ending in a spine; legume hairy; sepals acute, lanceolate, longer than the corolla; pedicels 1-flowered, axillary, solitary.  $\gamma$ . G. Native of Mexico.

*Conjugate*-leaved Rest-harrow. Shrub 1 to 2 feet.

8 *ONONIS NICOLOR* (Moris. clench. Sard. fasc. iii.) plant clothed with clammy glandular villi; leaves trifoliate; leaflets oblong-ovate, serrately toothed at the apex; stipulas large, length of petioles; peduncles axillary, awned, 1-2-flowered, about equal in length to the leaves; corolla twice the length of the calyx, but the legumes are 3-times longer than it and drooping.  $\odot$ . H. Native of Sardinia, in fields, on the south side. Corolla pale yellow, having the keel tipped with purple. It comes very near to *O. viscosa*, Lin. no. 11. of the present volume, in habit, but differs in the leaflets being equal in size and shape, and in the corolla and legume being much longer than the calyx; it also differs from *O. geminiflora*, Lag. p. 160. no. 29. and *O. biflora* of Desf. p. 159. no. 121. of the present volume, in the hairs being tipped with red glands.

*Two-coloured*-flowered Rest-harrow. Fl. June, Jul. Pl. 1 ft.

*Subtribe II. Trifoliæ*, p. 167.

9 *TRIGONELLA AZUREA* (Meyer. verz. pfl. p. 136.) plant clothed with soft pubescence; stem branched, diffuse; stipulas ovate-cuspidate, toothed; leaflets obovate, toothed; heads dense-flowered, pedunculate; legumes villous, nearly linear, compressed, nerved, 4-6-seeded, ending in a hooked beak.  $\odot$ . H. Native of Persia, *ovoid* hills near Baku, Lenkeran, and Swant. *Trifolium cæruleum*, Bieb. fl. taur. 3. p. 509. Flowers blue. To follow *T. caerulea*, Ser. p. 174. no. 1. of the present volume.

*Azure*-flowered Trigonella. Pl. 1 foot.

10 *TRIGONELLA ARCUATA* (Meyer. verz. pfl. p. 136.) plant pubescent, diffuse; leaflets obovate, denticulated; stipulas semi-sagittate, toothed at the base; umbels sessile, 6-8-flowered; common peduncle awnless; legume pubescent, nearly terete, erect, arched, reticulately veined.  $\odot$ . H. Native of Persia, on the mountains of Talusah, near Swant. To follow *T. Mons-peliaca*, Lin. p. 175. no. 20. of the present volume.

*Arched*-podded Trigonella. Pl. diffuse.

11 *TRIGONELLA MONANTHA* (Meyer. verz. pfl. p. 137.) plant diffuse, puberulous; leaflets obovate, and are as well as the semi-sagittate stipulas toothed or cut; legumes axillary, solitary, sessile, elongated, terete, straightish, reticulately veined.  $\odot$ . H. Native of Persia, near Lenkeran and Swant. To follow *T. prostrata*, p. 174. no. 7. of the present volume.

*One-flowered* Fenu-Greck. Pl. diffuse.

12 *TRIGONELLA MEXICANA*; stem erect, leaflets obovate, cuneiform, orbiculate, sharply toothed at the apex; stipulas lanceolate, subulate, ciliated; racemes pedunculate; legumes reticulately, mucronate, rather falcate, many-seeded.  $\odot$ . H. Native of Mexico. Flowers white or yellow. To follow *T. striata*, Lin. p. 174. no. 11. of the present volume.

*Mexican* Trigonella. Pl.  $\frac{1}{2}$  to 1 foot.

13 *TRIFOLIUM SPINULOSUM* (Dougl. mss. Hook. fl. bor. amer. 133.) prostrate, glabrous; leaflets oblong, acute at both ends, spinulously denticulated, and terminating in a stiff spine; stipulas ovate, acuminate, shining, serrated; involucre 1-leaved, laciniately multifid; heads of flowers globose, longer than the involucre; calycine teeth narrow-subulate, pungent, straight,

a little shorter than the corolla.  $\gamma$ . H. Native of North-west America, very common near springs in the valleys between Spokane and Kettle Falls. This species is allied to *T. fimbriatum*, Lindl. p. 185. no. 53. of the present volume, but is sufficiently distinct. The vexillum and wings are shorter and more acute, the flowers smaller, white, the keel and wings tipped with a fine purple, and the whole plant more slender. This plant might prove perhaps very useful as a clover, the herbage forming a dense, short sward. It is extremely nutritive, and preferred to every thing else by deer and horses in its native country.

*Spinulose*-toothed Trefoil. Pl. prostrate.

14 *TRIFOLIUM POLYPHYLLUM* (Meyer. verz. pfl. p. 139.) quite glabrous; leaves radical, petiolate; leaflets 7-9, nearly linear, serrulated; stipulas subulate; scape naked; flowers umbellate, becoming at length reflexed; corolla twice the length of the calyx; calycine teeth nearly equal, subulate; ovary biovulate.  $\gamma$ . H. Native of the western region of Caucasus, at the height of 3600 or 4300 feet. Allied to *T. alpinum*, Lin. p. 192. no. 131. of the present volume.

*Many-leafletted* Trefoil. Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

15 *LOTUS AUSTRALIS* (Andr. bot. rep. 624.) stem pilose, herbaceous, and perhaps procumbent; leaflets and stipulas about equal in size, obovate-lanceolate; peduncles elongated; flowers 3-6, disposed in racemose heads at the tops of the peduncles; calycine segments longer than the tube; stamens diadelphous, the alternate filaments of the 9 connected ones very dissimilar to the others.  $\gamma$ . G. Native of New Holland. Flowers large, showy, pink, or rose-coloured. Sims, bot. mag. 1365. This plant should follow *L. Arabicus*, Lin. p. 197. no. 27. of the present volume.

*Southern* Bird's-foot Trefoil. Fl. July, Aug. Clt. 1800. Pl. ascending.

16 *HOSACKIA UNIFOLIATA* (Hook. fl. bor. amer. 135.) plant decumbent, hairy, much branched; leaves usually with 1 leaflet, rarely with 2 or 3, almost sessile; leaflets oval, acute at both ends; stipulas obsolete; peduncles 1-flowered, with 1 ovate bractea under the flower.  $\odot$ . H. Native of North America, on the shores of the Columbia. Corolla yellow. This species approaches *H. decumbens*, Benth. in the size and shape of the leaflets and in the hairiness, but in its flowers to *H. parviflora*, Benth. p. 200. no. 1. of the present volume.

*One-leafletted* Hosackia. Pl. decumbent.

*Subtribe III. Clitorea*, p. 201.

17 *PSORALEA PHYSODES* (Dougl. mss. Hook. fl. bor. amer. p. 136.) smoothish; leaves pinnately trifoliate, rarely with 5 leaflets; leaflets broadly rhomboid-ovate, acute, mucronate, obscurely glandular, terminal one on a long petiole; racemes pedunculate, loose, axillary, longer than the leaves; calyx much inflated, hairy, hardly shorter than the corolla, with the teeth nearly equal.  $\gamma$ . H. Native of North America, on the banks of streams, in open sandy, and gravelly soils, from the great falls of the Columbia to the Rocky Mountains. Legumes glandular, 1-seeded. It is easily distinguished from the other species by its broader leaflets, as well as by its large inflated calyx, which almost conceals the flower. The plant comes nearest to *P. incana*, Nutt. p. 203. no. 42. of the present volume.

*Bladder*-calyxed Psoralea. Pl.  $1\frac{1}{2}$  foot.

18 *PSORALEA BRACHYATA* (Dougl. mss. Hook. fl. bor. amer. p. 137. t. 53.) stem erect, flexuous, a little branched, very villous; leaves palmately 5-foliate, clothed with adpressed hairs; leaflets elliptic; peduncles axillary, elongated, longer than the leaves; racemes oblong, spicate, rather loose; bracteas and teeth of calyx leafy and lanceolate; flowers erect.  $\gamma$ . F. Native of North America, on the plains of the Saskatchewan, from Carlton House to Edmonton House. Root fusiform. Flowers

with a white vexillum and a blue keel, which is united to the wings. According to Mr. Douglas this is the *Naret de Prairie* of Canadian voyagers and not the *P. esculenta*, Pursh, p. 203. no. 40. of the present volume, to which the present plant comes nearest. The roots, though stringy, dry, and tough, and containing but little farinaceous matter, are gathered and eaten by the Cree Indians raw, or sometimes roasted.

*Brachiata* Psoralea. Pl. 1 to 1½ foot.

19 GLYCINE INVOLUCRATA (Wall. pl. rar. asiat. 3. p. 22. t. 241.) branches filiform, long, twining, pilose; leaflets oval, ciliated; racemes dense, axillary; peduncles usually with 2 whorles of 3 roundish bracteas at the base. L. C. G. Native of Nipaul, also in Sirmore and Kamaon. Flowers white, tipped with pink.

*Involucrated-racemed* Glycine. Shrub tw.

*Subtribe IV. Galégeæ*, p. 222.

20 PETALOSTEMON ORNATUM (Dougl. mss. Hook, fl. bor. amer. p. 138.) spikes of flowers oblong-cylindrical; bracteas longer than the calyx, which is very villous; leaves with 2-3 pairs of elliptic-oblong, glabrous leaflets. L. F. Native of North-west America, frequent in the arid prairies near the Blue Mountains, of Lewis's River. Bracteas subulate, hairy. Corolla rose-coloured. This species comes near to *P. carneum*, Michx. p. 222. no. 2. of the present volume.

*Ornamented* Petalostemon. Pl. 1 foot.

21 CARAGANA BU'NGII (Led. fl. ross. alt. ill. t. 464.) leaves with 2-3 pairs of broad-elliptic, distant leaflets, which are cuneated at the base, but rounded and truncate at the apex, ending in a spine-like mucrone, rather silky on both surfaces; stipulas spreadingly recurved, spinescent, permanent; petioles pungent, deciduous; peduncles usually solitary, and are well as the calyxes silky. L. H. Native of Altaia, in desert called *Koriae*, and near the river Tschuja. Led. alt. 3. p. 264. Corolla yellow. To follow *C. arborescens*, p. 243. no. 3. of the present volume.

*Bunge's* Caragana. Fl. June. Shrub 3 to 5 feet.

*Subtribe V. Astragaleæ*, p. 247.

22 PHA'CA ABBREVIATA (Led. fl. ross. alt. ill. t. 330. fl. alt. 3. p. 268.) plant pilose when young, but when in an adult state smooth; stems erect, simple; stipulas lanceolate-linear, reflexed, marcescent; leaves with 21-23 oblong, mucronate leaflets, which are rounded at both ends; peduncles longer than the leaves; flowers numerous, disposed in a short raceme; corolla hardly twice the length of the calyx; legumes stipitate, compressed, when young densely clothed with pili. L. H. Native of Altaia, in subalpine places at the mouth of the river Abai. Flowers deep yellow. To follow *P. alpina*, Lin. p. 247. no. 3. of the present volume.

*Short-spiked* Bastard-vetch. Fl. June, July. Pl. 2 feet.

23 PHA'CA ELONGATA (Hook, fl. bor. amer. p. 140.) stem erect, angular, pubescent, sparingly branched; leaves with 8-10 pairs of oblong-cuneated, retuse leaflets, which are hoary beneath; stipulas small, acuminate, broad at the base, lower ones connected; peduncles much longer than the leaves; racemes elongated, loose; calyxes silky; legumes coriaceous, cylindrical, curved, sessile, acute. L. H. Native of North-west America, on the plains of the Saskatchewan. Flowers small, white, or cream-coloured, having the carina tipped with purple. There is a smaller variety of this plant with flexuous stems. This species follows *P. arnaria*, Pall. p. 248. no. 7. of the present volume.

*Elongated* Bastard-vetch. Pl. 1 to 1½ foot.

24 PHA'CA FLEXUOSA (Hook, fl. bor. amer. p. 141.) stem

decumbent, flexuous, angular, sparingly branched; leaves with 6-9 pairs of linear-oblong, obtuse leaflets, which are glabrous above, but clothed with adpressed pili beneath; stipulas small, broad at the base, acuminate, lower ones connected; peduncles longer than the leaves; racemes elongated, loose; calyxes rather silky; legumes coriaceous, cylindrical, straight, sessile, acute. L. H. Native of North-west America, abundant on elevated and dry fertile soils of the Red River and Assinaboin. *Astragalus flexuosus*, Dougl. mss. p. 256. no. 33. of the present volume. Flowers purple, very fragrant. This species follows *P. Lappónica*, p. 248. no. 14. of the present volume.

*Flexuous-stemmed* Bastard-vetch. Pl. 1 foot.

25 PHA'CA COLLINA (Hook, fl. bor. amer. p. 141.). L. H. Native of North-west America, on the sub-alpine ranges of the Blue Mountains. *Astragalus collinus*, Dougl. mss. p. 256. no. 55. of the present volume. Corolla white, with a large purple spot on one of the petals. Stipulas oblong, leafy. The plant is remarkable for the linear leaflets.

*Hill* Bastard-vetch. Fl. June, July. Pl. 1 foot.

26 PHA'CA PECTINATA (Hook, fl. bor. amer. p. 141. t. 54.). L. H. Native of North-west America, in the pastures of the Saskatchewan, and on the Red Deer and Eagle hills, bordering on that river. Flowers large, white. *Astragalus pectinatus*, Dougl. mss. p. 257. no. 53. of the present volume.

*Pectinate-leaved* Bastard-vetch. Pl. decumbent.

27 PHA'CA PODOCARPA (Hook, fl. bor. amer. p. 142.) plant caespitose, much branched, diffuse; stems and branches striated; leaves with 6-9 pairs of broad-linear, obtuse leaflets; stipulas small, ovate, acuminate; peduncles longer than the leaves; racemes loose; legumes oblong, coriaceous, compressed, clothed with appressed hairs, acuminate, tapering into a long stipe at the base, with thickened sutures. L. H. Native of North America, on dry, sandy, and barren grounds, at the great falls of the Columbia. Flowers middle-sized, white. This plant should follow *P. arnaria*, p. 248. no. 7. of the present volume.

*Fool-fruited* Bastard-vetch. Fl. June, Aug. Pl. 1 foot.

28 PHA'CA NIGRESCENS (Hook, fl. bor. amer. p. 143.) clothed with obscure adpressed pili; stems erect and decumbent, branched, striated; leaves with 8-10 pairs of oblong, obtuse leaflets, which are cuneated at the base; racemes for the most part longer than the leaves; stipulas small, ovate, acutish, connate at the base; teeth of calyx a little shorter than the tube; legumes stipitate, oblong, membranous, compressed, glabrous. L. H. Native of North America, along the Saskatchewan to the Rocky Mountains, and as far north as Fort Franklin on the Mackenzie River. Corolla white or cream-coloured. The present species should follow *Phaca caespitosa*, Nutt. p. 248. no. 6. of the present volume. The stems are usually purplish.

*Blackish* Bastard-vetch. Pl. erect or decumbent.

29 PHA'CA ABORIGINORUM (Hook, fl. bor. amer. p. 144.). L. H. Native of North America, from Lake Winnipeg to the Rocky Mountains, and as far north as Bear Lake in lat. 66°. *Astragalus aboriginorum*, Richards, p. 258. no. 61. of the present volume.

*Aboriginal* Bastard-vetch. Pl. 1 foot.

30 PHA'CA GLABRISCU'LA (Hook, fl. bor. amer. p. 144.) plant glabrous or with a few scattered hairs; stem erect, nearly simple, striated; leaves with 5-6 pairs of linear-lanceolate, acutish leaflets; stipulas ovate, acute, lower ones connate and larger; legume on a rather long stipe, lanceolate, falcate, compressed, membranous, glabrous. L. H. Native of North America, in the valleys of the Rocky Mountains. General aspect very similar to the preceding species, of which it may only be a variety. Corolla white or bluish, with the keel dark blue.

*Smoothish Bastard-vetch.* Pl. 1 foot.

31 *PHA'CA E'LEGANS* (Hook, fl. bor. amer. p. 144.) plant nearly glabrous; stems branched, erect, or assurgent, angular; leaves with 5-7 pairs of oblong, obtuse leaflets, which are cuneated at the base, glabrous above, but clothed with minute adpressed pili beneath; stipulas ovate, acute, rather connate at the base; racemes compact, on long peduncles, exceeding the leaves, but when in fruit much more elongated; legumes sessile, elliptic, inflated, membranous, apiculated, clothed with black velvety down, 3-5-seeded. *U. H.* Native of North America, in the prairies of the Rocky Mountains. There is a smaller ascending variety with shorter racemes, which inhabits the summits of the higher mountains. Leaves glaucous beneath. Flowers of a bright and deep purple. This species should follow *P. Lappônica*, p. 248. no. 14. of the present volume.

*Elegant Bastard-vetch.* Pl. 1 foot.

32 *PHA'CA BISULCA'TA* (Hook, fl. bor. amer. p. 145.) stems rather decumbent, smoothish; leaves nearly sessile, with 11-13 pairs of elliptic leaflets, which are clothed with adpressed hairs beneath; stipulas ovate, acute, free; racemes pedunculate, very much elongated; flowers nodding; legumes pendulous, stipitate, linear-cylindrical, bisulcate, clothed with adpressed pubescence. *U. H.* Native of North America, on the plains of the Saskatchewan. Flowers of a rich purple colour. This species should follow *P. brachytropis*, Stev. p. 248. no. 16. of the present volume.

*Bisulcate-podded Bastard-vetch.* Pl. 1 to 2 feet.§ 1. *Acaules*, p. 249.

33 *OXY'TROPIS FOLIOLOSA* (Hook, fl. bor. amer. p. 146.) stemless, and clothed with hoary villi; leaves numerous; leaflets approximate, ovate or ovate-oblong, acutish; scapes pilose, longer than the leaves; heads of flowers broadly ovate, small; flowers crowded, spreading, lower ones reflexed; bracteas linear-subulate, shorter than the calyx, which is beset with black hairs; legumes remotish, deflexed, cylindrical, acute, beset with black hairs. *U. H.* Native of North America, from Carlton House to the Rocky Mountains. Petals bluish purple, their bases nearly white. This species is most nearly allied to *O. montana*, D. C. p. 249. no. 1. of the present volume.

*Leafy Mountain Milk-vetch.* Pl.  $\frac{1}{2}$  foot.

34 *OXY'TROPIS ARGYROPHY'LLA* (Led. fl. ross. atl. ill. t. 51.) is *O. argyrea*, D. C. p. 249. no. 4. of the present volume.

*Silver-leaved Mountain Milk-vetch.*

35 *OXY'TROPIS SULPHUREA* (Led. fl. ross. atl. ill. t. 55. fl. atl. 3. p. 285.) nearly stemless; leaflets numerous, lanceolate, when young silky; petioles and scapes beset with spreading pili; scapes a little longer than the leaves; flowers horizontal, in dense spikes; bracteas lanceolate-linear, about equal in length to the villous calyx; legumes erectly spreading, ovate-oblong, somewhat 2-celled, acuminate. *U. H.* Native of Altaia, near Riddersk. Corolla sulphur-coloured. To follow *O. capéstris*, D. C. p. 251. no. 26. of the present volume.

*Sulphur-coloured-flowered Mountain Milk-vetch.* Pl.  $\frac{1}{2}$  foot.

36 *OXY'TROPIS BREVICAT'LIS* (Ledeb. fl. ross. atl. ill. t. 288. fl. atl. 3. p. 284.) plant caulescent, erect, rather silky; stem short; leaflets crowded; stipulas adnate to the petioles, lanceolate, acuminate, ciliated; leaflets ovate-oblong; peduncles twice the length of the leaves; racemes at length elongated; bracteas about half the length of the calyx; legumes cylindrical, erect, pubescent, 1-celled. *U. H.* Native of Altaia, in the Soongarian desert, between mount Ku and Karkarala. Corolla violaceous. Plant tufted. To follow *O. Songarica*, D. C. p. 250. no. 17. of the present volume.

*Short-stemmed Mountain Milk-vetch.* Fl. Ju. Aug. Pl.  $\frac{1}{2}$  ft.§ 2. *Verticillares*, p. 251.

37 *OXY'TROPIS PHYSOCARPA* (Led. fl. ross. atl. ill. t. 381. fl. atl. 3. p. 272.) stem shrubby, branched; leaves imparipinnate; leaflets verticillate in fours, oblong or linear, minute, with ciliated margins, and bearded towards the apex; petioles usually permanent; peduncles axillary, usually 3-flowered, rather shorter than the leaves, but at length elongated; calyx rather villous; legumes inflated, muricate, ending in a curved beak. *U. H.* Native of Altaia, on the tops of the alps at the river Tschuja. Corolla violaceous. To follow *O. muricata*, p. 252. no. 41. of the present volume.

*Bladder-fruited Mountain Milk-vetch.* Fl. June. Sh. dense.

38 *OXY'TROPIS SUBVERTICILLATA* (Led. fl. ross. atl. ill. t. 292. fl. atl. 3. p. 275.) stem shrubby, branched, very short; leaves imparipinnate; leaflets somewhat verticillate by pairs of fours, elliptic, silky on both surfaces; petioles hardened, permanent; peduncles axillary, 3-flowered, shorter than the calyx, which is beset with spreading villi; legumes pubescent. *U. H.* Native of Altaia, in the Soongarian desert, between the mountains Kent and Ku. Corolla violaceous. To follow *O. muricata*, D. C. p. 252. no. 41. of the present volume.

*Subverticillate-leaved Mountain Milk-vetch.* Fl. July, Sept. Shrub dwarf.§ 3. *Tragacanthoides*, p. 252.

39 *OXY'TROPIS POLYPHYLLA* (Led. fl. ross. atl. ill. t. 277.) stem shrubby, much branched, short; leaves imparipinnate; leaflets 11-17, ovate-oblong, silky on both surfaces; petioles hardened, permanent; spikes of flowers sub-capitate, axillary; peduncles elongated, about equal in length to the leaves; calyx clothed with white villi. *U. H.* Native of Altaia, on mountains near the river Tschuja. Corolla violaceous. To follow *O. tragacanthoides*, Fisch. p. 252. no. 42. of the present volume.

*Many-leafletted Mountain Milk-vetch.* Fl. May, Ju. Sh.  $\frac{1}{2}$  ft.

40 *OXY'TROPIS LEUCOROBIA* (Led. fl. ross. atl. ill. t. 282. fl. atl. 3. p. 279.) stem shrubby, much branched, short; leaves imparipinnate; leaflets usually 13, oblong-linear, glabrous; petioles hardened, permanent; peduncles axillary, 2-flowered, very short; calyx covered with thick, elevated corpuscles; legumes rather inflated, glabrous, ending in an acuminate beak. *U. H.* Native of Altaia, on mountains near the river Tschuja. Vexillum and wings yellow. Keel bluish. To follow *O. tragacanthoides*, Fisch. p. 252. no. 42. of the present volume.

*White-petioled Mountain Milk-vetch.* Fl. Ju. Sh. 6 inches.

41 *OXY'TROPIS ACIPHYLLA* (Led. fl. ross. atl. ill. t. 281. fl. atl. 3. p. 279.) stem shrubby, much branched; leaves abruptly pinnate, with 2 or 3 pairs of oblong or oblong-linear, pungent leaflets, which are silky on both surfaces; petioles permanent, hardened into spines; peduncles axillary, 2-3-flowered, twice the length of the villous calyx; legumes oblong, acuminate, villous. *U. H.* Native of Altaia, on sandy hills at the river Irtysh. Corolla purplish violet. Shrub forming a dense tuft. To follow *O. tragacanthoides*, Fisch. p. 252. no. 42. of the present volume.

*Needle-leafletted Mountain Milk-vetch.* Pl. May. Sh. tufted.§ 4. *Caulescentes*.

42 *OXY'TROPIS DIFFUSA* (Led. fl. ross. atl. ill. t. 451. fl. atl. 3. p. 281.) many stemmed, diffuse, beset with adpressed pili; stipulas opposite the leaves, somewhat concrete, ciliated; leaflets ovate-oblong; peduncles at length nearly twice the length of the leaves; flowers racemose; bracteas rather exceeding the pedicels; legumes depressed, mucronate, deflexed, 1-celled.

clothed with adpressed pili. *U. H.* Native of Altaia, in humid places. *O. glabra*, D. C.? Corolla bluish violet. To follow *O. pilosa*, D. C. p. 252. no. 43. of the present volume.

*Var. α, elongata* (Led. l. c.) stem 1-2 feet high.

*Var. β, pumila* (Led. l. c.) stem 2-6 inches high.

*Diffuse Mountain Milk-vetch.* Pl.  $\frac{1}{2}$  to 2 feet.

43 *OXYTROPUS FLORIBUNDA* (D. C. prod. 2. p. 280.) According to Ledebour the following names belong to this species. *O. tères*, D. C. *O. longicuspis*, Ledeb. *O. Fischéri*, D. C. *O. vaginata*, D. C. *O. tenella*, D. C.

*Bundle-flowered Mountain Milk-vetch.* Pl.  $\frac{1}{2}$  to 1 foot.

### § 1. *Hypoglottidei*, p. 253.

44 *ASTRAGALUS PAUCIFLORUS* (Hook. fl. bor. amer. p. 149.) plant decumbent and hoary, beset with adpressed pili; stipulas concrete, opposite the leaves, lower ones entire; leaves with 3-5 pairs of oblong acute leaflets; peduncles rather shorter than the leaves, 2-4-flowered; flowers small, loosely racemose; bracteas length of pedicels; calyx beset with white pili, having the teeth about equal in length to the tube. *U. H.* Native of North America, among the rocks in the more elevated regions of the Rocky Mountains. Root long, descending, rather fusiform. Corolla blue. This species should follow *A. hypoglottis*, Linn. p. 253. no. 1. of the present volume.

*Few-flowered Milk-vetch.* Pl. decumbent.

45 *ASTRAGALUS MULTICAULIS* (Led. fl. ross. alt. ill. t. 316. fl. alt. 3. p. 295.) caulescent, prostrate, or ascending, pubescent; stipulas membranous, concrete, opposite the leaves; leaflets oblong or obovate, emarginate, 5-6 pairs; racemes short; peduncles much longer than the leaves; bracteas longer than the pedicels; calyx beset with black or white pili; legumes erect, racemose, glabrous, ovate, triquetrous, short, half 2-celled; cells 1-seeded. *U. H.* Native of Altaia, in muddy salt places near the river Tschuja. Corolla pale purple. To follow *A. hypoglottis*, p. 253. no. 1. of the present volume.

*Many-stemmed Milk-vetch.* Fl. May, June. Pl. prostrate.

### § 2. *Dissitiflōri*, p. 255.

46 *ASTRAGALUS PUBERULUS* (Led. fl. ross. alt. ill. t. 291. fl. alt. 3. p. 299.) plant erect, many-stemmed, hoary; stems terete, smooth; leaves stalked, with 6-11 pairs of oblong or oblong-linear retuse leaflets; flowers racemose, drooping; peduncles exceeding the leaves; bracteas lanceolate; tube of calyx twice the length of the teeth; vexillum retuse, longer than the emarginate wings; ovary glabrous. *U. H.* Native of Altaia, on hills at the rivers Ursal and Tschuja. Vexillum pale lilac. To follow *A. sulcatus*, Lin. p. 255. no. 29. of the present volume.

*Puberulous Milk-vetch.* Fl. May, June. Pl. 1 foot.

47 *ASTRAGALUS VICIODES* (Led. fl. ross. alt. ill. t. 286. fl. alt. 3. p. 301.) stems erect, glabrous, rather sulcate above; leaves petiolate, with 8 pairs of oblong, obtuse leaflets; flowers racemose, drooping; peduncles about twice the length of the leaves; bracteas lanceolate; teeth of calyx not half so long as the tube; vexillum emarginate; wings entire; legumes erect, ovate, triquetrous, coriaceous, 2-celled; cells few-seeded. *U. H.* Native of Altaia, in meadows on both sides of the river Irtysh and elsewhere. Flowers purplish. To follow *A. sulcatus*, Lin. p. 255. no. 29. of the present volume.

*Vetch-like Milk-vetch.* Pl. 1 foot.

48 *ASTRAGALUS LEPTOCAULIS* (Led. fl. ross. atl. ill. t. 284. fl. atl. 3. p. 296.) shrubby, much branched; stem silky; stipulas concrete, opposite the leaves; leaflets oblong, usually 4 pairs, nearly glabrous above, clothed with adpressed pili beneath and on the margins; racemes few-flowered; peduncles more than twice the length of the leaves; calyx beset with white and black hairs; legumes horizontal, oblong, triquetrous,

clothed with adpressed pili, 2-celled, more than twice the length of the calyx; cells many-seeded. *U. H.* Native of Altaia, on rocks near the rivulet called Urmuchaika, about Buchtor-minsk. Corolla bluish. To follow *A. Hyrcanus*, Pall. p. 256. no. 42. of the present volume.

*Slender-stemmed Milk-vetch.* Shrub dwarf.

### § 3. *Onobrychoidei*, p. 257.

49 *ASTRAGALUS DIAPHANUS* (Dougl. mss. Hook. fl. bor. amer. p. 151.) plant prostrate, diffuse, pilose; stipulas small, ovate, acuminate; leaves with 5-9 pairs of obovate leaflets; peduncles shorter than the leaves; flowers small, capitate, loose; bracteas ovate, acuminate, minute, rather shorter than the pedicels; legumes rather reflexed, linear, compressed, falcate, somewhat diaphanous, smoothish, 2-celled, many-seeded. *U. H.* Native of North America, abundant on sandy soils near the great falls of the Columbia. Flowers small, purple. This species should follow *A. lentiginosus*, Dougl. p. 257. no. 49. of the present volume.

*Diaphanous-podded Milk-vetch.* Pl. prostrate.

50 *ASTRAGALUS COMPRESSUS* (Led. fl. ross. alt. ill. t. 289. fl. alt. 3. p. 304.) plant prostrate, suffruticose, silky; leaflets oblong-linear, usually 3 pairs; flowers somewhat capitate; peduncles twice or thrice longer than the leaves; vexillum a little longer than the wings; legumes racemose, erect, linear, compressed, much longer than the calyx, and clothed with adpressed pili. *U. H.* Native of Altaia, at the river Irtysh. To follow *A. arbusculus*, Pall. p. 258. no. 59. of the present volume.

*Compressed-podded Milk-vetch.* Fl. April, May. Pl. prostr.

51 *ASTRAGALUS MELANOCARPUS* (Fras. cat. Richards. in Frankl. journ. ed. 2. append. p. 28. Hook. fl. bor. amer. p. 150.) plant clothed with silky hoary down; stems short, decumbent; stipulas ovate, acute; leaves with 8-10 pairs of ovate leaflets, which are acute at both ends, but sometimes obovate and obtuse; racemes capitate, loose, 6-8-flowered, longer than the leaves, on longish peduncles; flowers spreading; legumes spreading, elliptic-oblong, coriaceous, nearly 1-celled; wrinkled, blackish-brown. *U. H.* Native of North America, on the plains of the Saskatchewan, and on the Eagle and Red Deer Hills on the same river. Flowers dark purplish-blue, varied with white. Perhaps the same as the *A. Missouriensis* of Nutt. p. 258. no. 69. of the present volume. Root fusiform.

*Black-fruited Milk-vetch.* Pl. decumbent.

N. B. *Astragalus succumbens*, Dougl. p. 263. no. 139., *A. inflexus*, Dougl. p. 256. no. 34. and *A. glareosus*, Dougl. p. 271. no. 241. should follow *A. lentiginosus*, Dougl. p. 257. no. 49. of the present volume; and *A. Purshii* should follow *A. Carolinianus*, p. 263. no. 130.

52 *ASTRAGALUS LOTIFLORUS* (Hook. fl. bor. amer. p. 159.) plant hoary and clothed with adpressed pili; stems short, diffuse; stipulas ovate, acuminate; leaves on rather long petioles; leaflets rather remote, usually 6 pairs, oblong, obtuse; peduncles slender, shorter than the leaves; flowers 3-4, loose, capitate, usually yellow; bracteas subulate, longer than the pedicels; calyx campanulate, clothed with white pili, with the teeth subulate and longer than the tube; petals about equal in length; legumes erectly spreading, ovate, acuminate, compressed, very villous from white hairs, 1-celled, with the upper suture straight, and the lower one arched. *U. H.* Native of North America, about Carlton House on the Saskatchewan. Perhaps a species of *Phaca* very near *Phaca villosa*. *Astragalus villosus* of Michx.

*Lotus-flowered Milk-vetch.* Pl. diffuse.

### § 5. *Fesicari*, p. 259.

53 *ASTRAGALUS CANDIDISSIMUS* (Led. fl. ross. alt. t. 287. fl.

alt. 3. p. 309.) root creeping; stems herbaceous, erect, clothed with white tomentum; stipulas ovate-lanceolate, acuminate, free, glabrous inside; leaves with 7-10 pairs of nearly orbicular, mucronate leaflets; peduncles about equal in length to the leaves; calyxes woolly, at length bladdery; legumes inflated, ovate, ending in a long reflexed acumen, glabrous, 2-celled, much larger than the calyx.  $\mathcal{U}$ . II. Native of Altaia, in sand at the river Irtysh. Corolla purplish-violet. To follow *A. megalanthus*, D. C. p. 259. no. 80. of the present volume.

*Very-white Milk-vetch.* Fl. June. Pl. 1 foot.

§ 7. *Annulæres*, p. 259.

54 *ASTRAGALUS ORBICULATUS* (Led. fl. ross. alt. t. 290. fl. alt. 3. p. 311.) plant villous and procumbent, or erectish; leaves with 6-11 pairs of nearly orbicular mucronate leaflets; stipulas ovate, acute; racemes usually 3-flowered, pedunculate; peduncles one-half the length of the leaves; bracteas and teeth of calyx lanceolate-linear; ovary oblong, densely clothed with pili, on a glabrous stipe.  $\mathcal{U}$ . H. Native of Altaia, in the Soongarian desert. Corolla white. To follow *A. striatellus*, Bieb. p. 260. no. 86. of the present volume.

*Orbicular-leaftletted Milk-vetch.* Fl. May, June. Pl. proc.

§ 8. *Synochreæti*, p. 261.

55 *ASTRAGALUS RARIFLORUS* (Led. fl. ross. alt. ill. t. 298. fl. alt. 3. p. 313.) plant ascending, suffruticose, clothed with adpressed hoary pili; leaves with 5-11 oblong-linear leaflets; peduncles much longer than the leaves; flowers remote, on short pedicels, secund; legumes subulate, triquetrous, a little arched, horizontal, clothed with white villi, 3 or 4 times longer than the calyx.  $\mathcal{U}$ . II. Native of Altaia, in the Soongarian desert, in dry salt fields about the mountains of Tschingistan. Corolla cream-coloured. To follow *A. microphyllus*, Lin. p. 261. no. 108.

*Scarce-flowered Milk-Vetch.* Fl. July, Aug. Pl. ascending.

56 *ASTRAGALUS OREA'DES* (Meyer, verz. pfl. p. 141.) smoothish; stems diffuse; stipulas all concrete and sheath-formed; leaflets 8-12 pairs, all oblong-elliptic, rather retuse; peduncles shorter than the leaves; legumes crowded, erectish, inflated, nearly globose, mucronate, and pilose.  $\mathcal{U}$ . H. Native of Persia, on mount Kasbek, at the height of 3600 or 4200 feet. Nearly allied to *A. microphyllus*, Lin. p. 261. no. 108.

*Oreades Milk-vetch.* Pl. diffuse.

57 *ASTRAGALUS DEPAUPERATUS* (Led. fl. ross. atl. 3. p. 314.) plant erectish, suffruticose, rather silky; leaflets 5-9, oblong, acute at both ends; peduncles exceeding the leaves; flowers few, in umbellate heads; legumes oblong, a little arched, compressed, granular, villous, but at length almost glabrous, 2-celled.  $\mathcal{U}$ . II. Native of Altaia, in dry salt plains, near Loktewsk. Corolla cream-coloured. To follow *A. microphyllus*, Lin. p. 261. no. 108. of the present volume.

*Depauperated Milk-vetch.* Fl. Aug. Pl.  $\frac{1}{2}$  to 1 foot.

§ 9. *Ciccroidei*, p. 262.

58 *ASTRAGALUS RYTIDOCARPUS* (Led. fl. ross. alt. ill. t. 293. fl. alt. 3. p. 315.) plant ascending, rather hoary; stipulas ovate, mucronate or acuminate; leaves with 4 pairs of oblong-linear leaflets; peduncles about equal in length to the leaves; spikes capitate, few-flowered; legumes short, nearly globose, didymous, sessile, wrinkled, transversely 2-celled, rather villous, apiculated by the oblique style.  $\mathcal{U}$ . II. Native of Altaia, in islands in the river Tschuja. To follow *A. glycyphyllos*, Lin. p. 262. no. 116. of the present volume.

*Rugged-fruited Milk-vetch.* Fl. June. Pl. ascending.

§ 10. *Galegiformes*, p. 263.

59 *ASTRAGALUS CHLOROSTACHYS* (Lindl. hort. trans. vol. 7. VOL. II.

p. 249. and p. 263. no. 134. of the present volume) stems erect, pubescent; stipulas distinct, separate from the petioles; leaves with 11-12 pairs of oblong pubescent leaflets; racemes pedunculate, many-flowered, longer than the leaves; legumes inflated, a little arched; racemes axillary at the tops of the shoots.  $\mathcal{U}$ . II. Native of Nipaul. Flowers greenish yellow.

*Green-spiked Milk-vetch.* Fl. Sept. Oct. Clt. 1823. Pl. 2 to 4 feet.

60 *ASTRAGALUS PODOCARPUS* (Meyer, verz. pfl. p. 142.) plant clothed with adpressed, canescent down; stems branched, diffuse, or erect; stipulas free, lanceolate; leaflets 3-6 pairs, elongated, nearly linear, acute; peduncles very long; spikes dense-flowered, oblong; legumes stipitate, erect, oblong, clothed with pili, longer than the calyx.  $\mathcal{U}$ . II. Native of Persia, near Swant, on the mountains of Talusch, at the height of 2000 feet. Flowers yellowish. To follow *A. galegiformis*, Lin. p. 263. no. 137. of the present volume.

*Foot-fruited Milk-vetch.* Pl. 1 to 2 feet.

§ 13. *Tragacanthæ*, p. 265.

61 *ASTRAGALUS SIRINICUS* (Tenore, fl. neap. prod. 5. ex. Schlecht. Linnaea. 5. p. 102.) shrubby; petioles spinescent; leaves with 14 pairs of elliptic-oblong bluntish leaflets, beset with adpressed pili on both surfaces; peduncles rather shorter than the leaves, from 2-10, disposed in a racemose spike; calyx clothed with black and white hairs; the teeth setaceous; corolla yellow, 3-times the length of the calyx; bracteas linear, setaceous, 3-times the length of the pedicels; legumes villous.  $\mathcal{U}$ . H. Native of Naples, on Mount Sirini, near Lagonegro in rocky meadows. This species differs from *A. retusus*, Willd. p. 267. no. 185. of the present volume, in the flowers being disposed in racemose spikes, not capitate, in the setaceous teeth of the calyx, and in the linear bracteas. It differs from *A. Massiliensis*, in the calycine teeth being subulate, not obtuse, and obliquely truncate, in the bracteas being longer than the pedicels, and in the racemose flowers.

*Sirini Goat-thorn.* Shrub  $\frac{1}{2}$  to 1 foot.

§ 15. *Anthylloides*, p. 268.

62 *ASTRAGALUS ELLIPSOIDES* (Led. fl. ross. alt. ill. t. 297. fl. alt. 3. p. 319.) nearly stemless and silky white; leaflets 11-23, broad-elliptic, acute at both ends; stipulas ovate, acuminate, silky outside; peduncles a little shorter than the leaves; spikes oblong or globose; calyxes inflated, elliptic, clothed with white pili; legumes somewhat triquetrous, many-seeded, acute, very villous, shorter than the calyx.  $\mathcal{U}$ . II. Native of Altaia. Corolla sulphur-coloured. To follow *A. calycinus*, Bieb. p. 268. no. 197. of the present volume.

*Var. a, elongatus* (Led. l. c.) caulescent; leaflets 11-19, remote; spikes oblong-cylindrical; calyx clothed with spreading pili.  $\mathcal{U}$ . II. Native on the mountains of Arkaul and Dolenkara.

*Var. β, intermedius* (Led. l. c.) almost stemless; leaflets 11-23, large, crowded; spikes oblong, short; calyx clothed with adpressed pili.  $\mathcal{U}$ . II. Native on exposed hills, near Ustka-menogorsk.

*Var. γ, abbreviatus* (Led. l. c.) smaller, stemless; leaflets 11-13; spikes subglobose, few-flowered; calyx clothed with spreading pili.  $\mathcal{U}$ . II. Native of dry fields about the mountains of Tschingistan and Dschigilen.

*Ellipsoid-podded Milk-vetch.* Fl. May. Pl. dwarf.

63 *ASTRAGALUS SABULETORUM* (Led. fl. ross. alt. ill. t. 298. fl. alt. 3. p. 321.) nearly stemless, silky white; leaflets 11-19, oblong, acute at both ends; stipulas ovate, acuminate, silky; peduncles about equal in length to the leaves; spikes ovate-globose; calyxes inflated, ovate, clothed with white adpressed

pili, and densely ciliated at the apex; legumes rather triquetrous, many-seeded, acute, villous, longer than the calyx.  $\mathcal{U}$ . H. Native of Altaia, in sand at the rivers Irtysh and Bekun. Corolla rose-coloured. To follow *A. calycinus*, Bieb. p. 268. no. 197.

*Sand Milk-vetch.* Fl. May. Pl. dwarf.

64 *ASTRA'GALUS MELANÓTRICHOS* (Led. fl. ross. atl. ill. t. 294. fl. alt. 3. p. 323.) stem erect, shrubby, much branched; branches silky; leaflets 7-9, linear, acute at both ends, with a few scattered strigæ; stipulas ovate-lanceolate, rather adnate to the petiole; peduncles longer than the leaves; spikes short, nearly globose; calyxes inflated, ellipsoid, densely clothed with black hairs at the base, and in the throat; legumes ovate, triquetrous, many-seeded, acutish, pilose, exceeding the calyx.  $\mathcal{H}$ . H. Native of Altaia, on mount Kurtschum not far from Nabaty, at the river Irtysh. Corolla yellow. To follow *A. inflatus*, D. C. p. 268. no. 205. of the present volume.

*Black-haired Milk-vetch.* Fl. June. Pl.  $\frac{1}{2}$  foot.

65 *ASTRA'GALUS SCLEROPÓDIUS* (Led. fl. ross. atl. ill. t. 295.) stem erect, shrubby, much branched; young branches strigose, adult ones glabrous from the bark being deciduous; leaflets 11-21, oblong, rather mucronate, sparingly strigose; stipulas lanceolate, rather adnate to the petiole; peduncles longer than the leaves, hardened into spines; spikes cylindrical, secund; calyx inflated, ellipsoid, beset with spreading pili; legumes ovate, somewhat triquetrous, many-seeded, acute, pilose, shorter than the calyx.  $\mathcal{H}$ . H. Native of Altaia, on mountains of Kurtschum, at the river Irtysh. Corolla yellow. To follow *A. inflatus*, D. C. p. 268. no. 205. of the present volume.

*Hard-petioled Milk-vetch.* Fl. June. Shrub 3 feet.

66 *ASTRA'GALUS XANTHÓTRICHOS* (Led. fl. ross. atl. ill. t. 296. fl. alt. 3. p. 324.) stem erect, shrubby, much branched; young branches strigose, adult ones silky white; leaflets 7-9, elliptic, rather mucronulate, beset with a few strigæ; stipulas semiovate-lanceolate; peduncles longer than the leaves; spikes subglobose; calyxes inflated, ellipsoid, beset with spreading pili; legumes ovate, somewhat triquetrous, many-seeded, acute, very villous, exceeding the calyx.  $\mathcal{H}$ . H. Native of Altaia, on the mountains of Kurtschum on rocks. Corolla yellow. To follow *A. follicularis*, Pall. p. 268. no. 206. of the present volume.

*Yellow-haired Milk-vetch.* Fl. June. Shrub 2 to 3 feet.

67 *ASTRA'GALUS GLOMERATUS* (Led. fl. ross. atl. ill. t. 299. fl. alt. 3. p. 327.) almost stemless, tufted, glaucous, beset with a few pili; leaflets usually 9, obovate; racemes axillary, 4-8-flowered, almost sessile; calyx at length ruptured; the teeth lanceolate-linear, about half the length of the tube; legumes cylindrical, acuminate, beset with silky strigæ, 2-celled.  $\mathcal{U}$ . H. Native of Altaia, in exposed fields at the river Irtysh, between Woroninsk and Nabaty. Corolla with the vexillum rose-coloured, having a large white spot in the centre, and with the wings and keel whitish, the latter tipped with purple. To follow *A. ammodytes*, Pall. p. 269. no. 210. of the present volume.

*Glomerate Milk-vetch.* Fl. April, May. Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

68 *ASTRA'GALUS HYPOGÆUS* (Led. fl. ross. atl. ill. t. 95. fl. alt. 3. p. 329.) stemless, clothed with long white hairs; leaflets 5-13, rather remote, obovate; flowers aggregate at the roots, exactly sessile; calyx at length ruptured, with the teeth linear, subulate, equal in length to the tube; legumes subglobose, didymous, villous, 1-celled, few-seeded, under ground; vexillum elongated, emarginate, with the margins connate, and the middle tubular.  $\mathcal{U}$ . H. Native of hills and fields near to the river Tscharych and Buchtorm, and in the Soongarian desert. Corolla white. To follow *A. galactites*, p. 269. no. 209.

*Underground-podded Milk-vetch.* Fl. Aug. Pl.  $\frac{1}{2}$  foot.

§ 16. *Caprini*, p. 269.

69 *ASTRA'GALUS RÓSEUS* (Led. fl. ross. atl. ill. t. 300. fl. alt.

3. p. 330.) caulescent, erect or ascending; stem clothed with white villi; leaflets 17-23, obovate-elliptic, clothed with hoary-villi; spike capitate, nearly globose; peduncles short; calyx villous, with the teeth setaceous, exceeding the tube in length, but about equal in length to the corolla; legumes obovate, triquetrous, woolly, 1-celled, a little longer than the tube of the calyx.  $\mathcal{U}$ . H. Native of Altaia, in sandy fields at the river Irtysh. Corolla rose-coloured. To follow *A. longiflorus*, Pall. p. 269. no. 215. of the present volume.

*Rose-coloured-flowered Milk-vetch.* Fl. May, June. Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

70 *ASTRA'GALUS LACTIFLÓRUS* (Led. fl. ross. atl. ill. t. 103. fl. alt. 3. p. 333.) plant caulescent, hairy; leaflets 19-23, elliptic; racemes very short, axillary; bracteas lanceolate-linear; calyxine teeth lanceolate-linear, thrice the length of the tube, but shorter than the bracteas; corolla glabrous; legumes ovate, rather triquetrous, mucronate, 2-celled, many-seeded, densely clothed with wool.  $\mathcal{U}$ . H. Native of Altaia, in dry fields and on rocks. *A. testiculatus* Altaicus, Pall. Corolla milk-coloured. To follow *A. Schanginianus*, Pall. p. 270. no. 222.

*Milk-flowered Milk-vetch.* Fl. June. Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

71 *ASTRA'GALUS BREVIFÓLIUS* (Led. fl. ross. atl. ill. t. 307. fl. alt. 3. n. 334.) tufted, rather silky; leaflets 7, oblong, petiolulate, racemes axillary, very short, 1-2-flowered; flowers longer than the leaves; teeth of calyx much longer than the tube;  $\mathcal{H}$ . H. Native of Altaia, in sterile dry deserts, near the river Tschuja. Corolla sulphur-coloured. To follow *A. Buchtormensis*, Pall. p. 270. no. 228.

*Short-leaved Milk-vetch.* Fl. June. Pl.  $\frac{1}{4}$  foot.

§ 17. *Incáni*, p. 270.

72 *ASTRA'GALUS ROSTRATUS* (Meyer, verz. pfl. p. 144.) plant stemless, and densely clothed with hairs, which are fixed by their centre; scape rather shorter than the leaves; leaflets 13-17, nearly linear, acute; calyxine teeth shorter than the tube; setaceous; legumes erect, very long, subulate, nearly terete, erectish, ending in a beak.  $\mathcal{U}$ . H. Native of Persia, on the mountains of Tulusch near Swant, at the height of 2000 feet. Allied to *A. Monspessulanus*, Lin. p. 270. no. 233.

*Beaked-podded Milk-vetch.* Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

73 *A. REFRACTUS* (Meyer, verz. pfl. p. 144.) plant canescent from adpressed pili, which are fixed by their centre; scapes erect, longer than the leaves; leaflets 19-25, oblong-lanceolate, acute; racemes elongated, loose; calyxine teeth subulate, shorter than the tube; legumes deflexed, stipitate, rather trigonal, beaked, beset with black and white hairs.  $\mathcal{U}$ . H. Found along with *A. rostratus*. Flowers yellow. To follow *A. sanguinolentus*, Bieb. p. 270. no. 234 of the present volume.

*Refracted-podded Milk-vetch.* Pl.  $\frac{1}{4}$  foot.

§ 18. *Radiciflóri*, p. 271.

74 *ASTRA'GALUS PHYSOCARPUS* (Led. fl. alt. 3. p. 335.) almost stemless; leaflets 17-27, elliptic, rounded at the base or cuneated, mucronate, glaucous, glabrous on both surfaces, but with a few adpressed hairs on the margin, which are fixed by their centre; peduncles about equal in length to the leaves; flowers in dense spikes; legumes inflated, membranous, subglobose, glabrous.  $\mathcal{U}$ . H. Native of Altaia, about Loktewsk, &c. *A. physodes* Altaicus, Pall. astr. p. 72. t. 58. Flowers violaceous or dirty yellow. To follow *A. physodes*, Lin. p. 271. no. 247.

*Bladder-fruited Milk-vetch.* Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

Tribe III. *Hedysæreæ*. Subtribe II. *Euhedysæreæ*, p. 277.

75 *DESMÓDIUM PURPUREUM* (Hook. in Beech. voy. part. bot. p. 62.) stem erect, terete, nearly simple, clothed with adpressed

pubescence; leaflets 3, elliptic, obtuse, veiny, smoothish; stipulas subulate, acuminate; racemes axillary, on rather long peduncles; bracteas lanceolate, acuminate, ciliated; legume 5-6-jointed, joints quadrate, convex on one side, reticulated, scabrous from stiff hairs. *h. S.* Native of the East Indies and the Sandwich Islands. *Hedysarum purpureum*, Roxb. hort. beng. p. 57. *Hedysarum siliquosum*, Burm. zeyl. t. 53. f. 2. Burm. ind. t. 55. f. 2. Flowers purple. This species should follow *D. siliquosum*, D. C. p. 296. no. 126. of the present volume.

*Purple-flowered Desmodium.* Shrub.

76 *HEDYSARUM POLYMORPHUM* (Led. fl. alt. 3. p. 338.) stem ascending; leaves with many pairs of elliptic or oblong leaflets, which are rather silky beneath, or clothed with adpressed pili; spikes pedunculate, crowded; keel a little shorter than the vexillum, but longer than the wings; fruit erect, with the joints wrinkled, and clothed with hoary pubescence. *U. H.* Native of Altaia, in salt marshes at the river Tschuja, not far from the mouth of the river Aigulak. Flowers rose-coloured. To follow *H. roseum*, Steph. p. 301. no. 18. According to Ledebour, the following are varieties of this plant.

*Var. α, pumilium* (Led. fl. alt. 1. c.) prostrate; leaflets 5-6 pairs. *U. H.* Native of Altaia.

*Var. β, prostratum* (Sievers, Led. 1. c.) prostrate; leaflets 6-8 pairs. *H. roseum*, Steph. in D. C. prod. 2. p. 342.

*Var. γ, ascendens* (Led. fl. ross. alt. ill. t. 51.) ascending; leaflets 7-9 pairs. *U. H.* *H. rutidocarpum*, D. C. prod. 2. p. 341.

*Var. δ, suberectum* (Led. fl. alt. 3. p. 339.) erectish; leaflets 6-8 pairs. *U. H.* *H. Gmelini*, Ledeb. *H. Altaicum*, Fisch. in D. C. prod. 2. p. 339.

*Var. ε, elatum* (Led. 1. c.) stem erect; leaflets 8-9 pairs.

*Polymorphous Hedysarum.* Fl. June, July. Pl. prostrate and erect.

77 *HEDYSARUM NEGLECTUM* (Led. fl. ross. alt. t. 482. fl. alt. 3. p. 341.) plant caulescent, erect; leaflets ovate-lanceolate, pubescent beneath; racemes elongated, axillary; bracteas exceeding the pedicels; teeth of calyx lanceolate, about equal in length to the tube; vexillum equal in length to the wings, but shorter than the keel; pods pendulous, pilose, with elliptic joints. *U. H.* Native of Altaia, on shady alps at the river Koksun. *H. lasiocarpum*, Led. Flowers rose-coloured, but there is also a variety with white flowers.

*Neglected Hedysarum.* Fl. May, June. Pl.  $\frac{1}{2}$  foot.

78 *ONOBRYCHIS VAGINALIS* (Meyer, verz. pfl. 145.) stipulas large, concrete, opposite the leaves; leaves with 6-9 pairs of ovate or oblong, obtuse or acute leaflets, beset with soft pili beneath as well as on the stem; wings obtuse, unidentate at the base, shorter than the calyx; pods unknown. *U. H.* Native of Persia, on arid hills near Baku. This species comes near to *O. Pallasi*, Bieb. p. 306. no. 30. but is easily distinguished from it by the concrete stipulas.

*Sheathed-stipuled Saintfoin.* Pl. 1 foot.

79 *ONOBRYCHIS HETEROPHYLLA* (Meyer, verz. pfl. p. 146.) plant clothed with minute, adpressed, silky down; stems procumbent or assurgent; stipulas free, lanceolate; radical leaves simple and ternate, cauline ones with 2-3 pairs of ovate, or nearly orbicular, mucronulate leaflets; wings acuminate, unidentate at the base, longer than the calyx; legumes very villous, with prickly margins; prickles setaceous, elongated. *U. H.* Native of Persia, in stony dry places on the mountains of Talusch near Swant. Corolla yellowish, but sometimes finely streaked with brown veins. To follow *A. Pallasi*, Bieb. p. 306. no. 30.

*Variable-leaved Saintfoin.* Pl. procumbent.

*Tribe IV: Viciæ, p. 311.*

80 *VICIA COSTATA* (Led. fl. ross. alt. ill. t. 108. fl. alt. 3. p. 346.)

glabrous; stem compressed, somewhat quadrangular; leaves with usually 6 pairs of rather alternate, petiolulate, reflexed, ovate-oblong, mucronate, ribbed, rather glaucous, somewhat coriaceous leaflets; peduncles 3-8-flowered, about equal in length to the leaves; stipulas semi-sagittate or hastate; teeth of calyx nearly equal, lower one the longest, but one-half shorter than the tube; style bearded at the apex; legumes pendulous, glabrous, nearly cylindrical, 2-4-seeded. *U. H.* Native of Altaia, on rocks at the river Katunja and Tschuja, and on the mountains of Dolen-Kara. Flowers whitish; the keel tipped with purple. To follow *V. sylvatica*, p. 316. no. 8.

*Ribbed-leaved Vetch.* Fl. June, July. Pl. 2 feet.

81 *VICIA LILACINA* (Led. fl. ross. alt. ill. t. 366.) stem weak; leaflets 9-16, ovate-elliptic, alternate or opposite, mucronate, clothed with adpressed pili beneath, the veins anastomosing; stipulas oblong, acuminate, ciliated, entire or semi-sagittate; peduncles many-flowered, exceeding the leaves; vexillum exceeding the keel, but shorter than the wings; style pilose; legumes oblong, compressed, glabrous, usually 3-seeded. *U. H.* Native of Altaia, on mountains near Aleandrowsk, at the river Irtysch. Flowers lilac, smaller than those of *V. Cracca*. To follow *V. bicinnis*, Lin. p. 319. no. 49. of the present volume.

*Lilac-flowered Vetch.* Fl. June, July. Pl. cl.

82 *VICIA MEGALOTROPIS* (Led. fl. ross. alt. ill. t. 368.) stems and tendrils branched; leaflets numerous, lanceolate-linear, alternate or opposite, mucronate; stipulas very narrow, ciliated, linear, or semi-sagittate; peduncles many-flowered, about equal in length to the leaves, or rather shorter; flowers numerous, imbricate; vexillum and wings about equal in length to the keel; style puberulous at the apex; legumes horizontal, oblong, glabrous, 3-4-seeded, compressed. *U. H.* Native of Altaia, on mountains at the river Uba, Ulba, Koksun, Tschanytsch, &c. Flowers with an emarginate purple vexillum, and with the wings and keel white, tipped with bluish violet. To follow *V. tenuifolia*, Lin. p. 317. no. 28. of the present volume.

*Large-keel Vetch.* Pl. cl.

83 *VICIA MULTICAULIS* (Led. fl. ross. alt. ill. t. 50. fl. alt. 3. p. 345.) stems and tendrils nearly simple; leaves with 4-8 pairs of alternate, or opposite, oblong-elliptic, mucronate leaflets; stipulas sub-hastate; peduncles exceeding the leaves, 4-8-flowered; vexillum equal in length to the keel and wings; style puberulous at the apex; legumes horizontal, oblong, somewhat reticulated, 6-8-seeded, rather compressed. *U. H.* Native of Altaia, on mountains. *V. alpina*, Pall. itin. 2. p. 568. Flowers almost the colour of the last species.

*Many-stemmed Vetch.* Fl. May. Pl. cl.

84 *ERVUM AGRIGENTINUM* (Gussone, in litt. D. C. prod. 2. p. 367.) leaflets 8-10, elliptic, mucronate; tendrils trifid; stipulas semi-sagittate, deeply toothed; peduncles 2-5-flowered, shorter than the leaves; calycine segments linear, equal, longer than the tube; legumes ovate, compressed, puberulous, reticulately veined, 4-seeded. *U. H.* Native of Sicily, about Agrigentum. Allied to *E. tetraspermum*, but differs in the legumes being broader, puberulous, and in the stipulas being toothed.

*Agrigentum Lentil.* Pl. 1 foot.

85 *LATHYRUS ALTAICUS* (Led. fl. ross. alt. ill. t. 53. fl. alt. 3. p. 355.) stem weak, pubescent, tetragonal, but not winged; leaves with 3-5 pairs of oblong or ovate mucronate leaflets, which are pilose beneath; stipulas semi-sagittate, ovate, acuminate, a little toothed; peduncles 2-4-flowered, longer than the leaves; legumes cylindrical, villously pubescent. *U. H.* Native of Altaia, on the lower mountains. Root creeping. Corolla reddish-violet, changing to bluish. To follow *L. palustris*, Lin. p. 334. no. 30. of the present volume.

*Altai Lathyrus.* Fl. May, June. Pl. cl.

86 *ORBUS SUBVILLOsus* (Led. fl. ross. alt. ill. t. 483. fl. alt.

3. p. 359.) plant clothed with hoary pubescence; root fibrous; stem branched at the base; leaflets 5-9, oblong-linear, mucronate, somewhat attenuated at the base; stipulas lunately-sagittate, profoundly cut; peduncles axillary, 2-3-flowered, twice the length of the leaves; calycine teeth broad-lanceolate, upper one shortest. ♀. H. Native of Altaia, in salt fields at the river Kurtschum. Flowers with a reddish vexillum, yellowish wings, and the keel tipped with blue. To follow *O. lacteus*, Bieb. p. 339. no. 14.

*Rather-rillous Bitter-vetch.* Fl. April, May. Pl. 1 foot.

87 *O'ROBUS INTERMEDIUS* (Led. fl. ross. alt. ill. t. 484.) plant sparingly pilose; stem simple; leaves with 4 pairs of narrow, oblong, apiculated, nerved leaflets; stipulas semi-sagittate or hastate, toothed at the base or entire, much shorter than the leaflets; peduncles axillary, 4-8-flowered, longer than the leaves; calycine teeth equal in length to the tube, upper ones the shortest. ♀. H. Native of Altaia, about the metal mines of Nicolajewsk. Intermediate between *O. lacteus* and *O. luteus*. Flowers pale yellow or cream-coloured.

*Intermediate Bitter-vetch.* Fl. May, June. Pl. 1 to 1½ foot.

#### Tribe V. *Phacelice*, p. 341.

88 *CANAVALLIA PUBESCENS* (Gaud. ex Hook. in Beech. voy. part. bot. p. 81.) stem twining; branches and petioles pubescent; leaflets ovate, elliptic, ending in a very short acumen, rather oblique at the base, membranous, glabrous above, but pubescent beneath; peduncles axillary, 3-flowered. ♀. C. S. Native of the Sandwich Islands. Nearly allied to *Dolichos galeatus*, Gaud. p. 357. no. 4. of the present volume, which is also a species of *Canavalia*. To follow *C. rutilans*, p. 363. no. 7.

*Pubescent Canavalia.* Shrub tw.

89 *MUCUNA ANGUINA* (Wall. pl. rar. asiat. 3. p. 19. t. 236.) flowers cymose, dense; legumes roundish, transversely wrinkled, hispid, 1-seeded; leaflets glabrous above. ♀. C. S. Native of Chittagong. Flowers large, dark purple, fetid.

*Snake-stemmed Cow-itch.* Fl. Nov. Shrub tw.

90 *LUPINUS MINIMUS* (Dougl. mss. Hook, fl. bor. amer. p. 168.) plant small, herbaceous, and densely clothed with silky hairs; stem furnished with 1-2 leaves; leaflets 7-9, lanceolate, acute, tapering to the base; flowers alternate and verticillate; pedicels bractless; upper lip of calyx bifid at the apex, lower one entire; root small, rather fusiform. C. H. Native of North-west America, in mountain valleys near the Kettle Falls, and very abundant towards the Rocky Mountains along the Columbia. To follow *L. micranthus*, Dougl. p. 366. no. 15. of the present volume.

*Small Lupine.* Pl. ½ foot.

#### Tribe VI. *Dalbergiæ*, p. 373.

91 *PONGAMIA ELLIPTICA* (Wall. pl. rar. asiat. 3. p. 20. t. 237.) leaves impari-pinnate, with 3-5 pairs of cuneate-oblong, pubescent leaflets; branchlets, peduncles, and calyxes clothed with ferruginous villi; racemes in fascicles; legumes elliptic-lanceolate. ♀. C. S. Native of Amboyna. *Galedupa elliptica*, Roxb. hort. beng. p. 53. Flowers rose-coloured.

*Elliptic Pongamia.* Shrub tw.

#### Tribe VIII. *Mimoseæ*, p. 381.

92 *INGA SPINFOLIA* (Hamilt. prod. p. 61.) stem and branches prickly; leaves bipinnate, with 6 pairs of pinnae, each pinna bearing 3 pairs of ovate-oblique, reticulated, pubescent leaflets, ending each in a spine-like mucrone; legumes twisted, pubescent. ♀. S. Native of the West Indies. Desv. journ. bot. vol. 3. This species should follow *I. Marthæ*, Spreng. p. 395. no. 126.

*Spine-leaved Inga.* Tree.

93 *ACA'CIA STENOSTACHYA* (Desv. herb. Hamilt. prod. p. 59.) unarmed; branches angular, brownish, glabrous; leaves with

about 10 pairs of pinnae, each pinna bearing about 20 pairs of linear-rhomboid, rather coriaceous, shining leaflets; rachis complanate, sulcate, pubescent; spikes twin, axillary, filiform, on very long peduncles, cylindrical, loose-flowered; flowers minute. ♀. S. Native of Guiana. This species should follow *A. Guianensis*, Willd. p. 410. no. 135. of the present volume.

*Slender-spiked Acacia.* Tree.

94 *ACA'CIA HAMILTONII* (Desv. herb. Hamilt. prod. p. 59.) unarmed; young branches pubescent; leaves with 5 pairs of pinnae, each pinna bearing many pairs of rather remote, linear, obtuse, ciliated leaflets; peduncles elongated, and are as well as the rachis pilose; spikes subglobose. ♀. S. Native of Jamaica. To follow *A. formosa*, Kunth, p. 417. no. 223.

*Hamilton's Acacia.* Tree.

95 *ACA'CIA LINEARIS* (Desv. herb. Hamilt. prod. p. 59.) unarmed, shrubby; branches nodose, striated, pubescent at the apex; bractes rather hardened, permanent; leaves with usually 5 pairs of pinnae, each pinna bearing about 20 pairs of narrow, linear, crowded, rather ciliated leaflets; peduncles terminal, elongated, fastigate; spikes subglobose. ♀. S. Native of Jamaica. This plant should follow the last species.

*Linear-leafletted Acacia.* Shrub.

96 *ACA'CIA MICROCAN'THA* (Desv. herb. Hamilt. prod. p. 60.) stem armed, arborescent; branches pubescent; leaves with usually 10 pairs of pinnae, each pinna bearing many pairs of minute pubescent leaflets; spikes stipitate, globose, axillary, solitary, on short peduncles, nodding; bractes rather spinescent. ♀. S. Native of Guiana. This species should follow *A. albicans*, Kunth, p. 414. no. 185. of the present volume.

*Small-spined Acacia.* Tree.

97 *ACA'CIA ALBIDA* (Lindl. bot. reg. 1317.) spines twin, short; branches, petioles, and peduncles pubescent; leaves with 5-7 pairs of pinnae, each pinna bearing 8-10 pairs of linear, acute leaflets; heads of flowers pedunculate, twin, axillary. ♀. G. Native of Peru. Flowers yellow. This species should follow *A. albicans*, Kunth, p. 414. no. 185. of the present volume.

*Whitish Acacia.* Fl. Oct. Clt.? Shrub.

98 *ACA'CIA SELENOCARPA* (Desv. herb. Hamilt. prod. 2. p. 60.) stem armed; branches whitish, glabrous, spiny; spines scattered; leaves with usually 6 pairs of pinnae, each pinna bearing about 15 pairs of linear-rhomboid, quite glabrous, glaucescent leaflets; spikes globose, twin, loose-flowered, pedunculate; legumes short, lunate. ♀. S. Native of Guiana. This species should follow *A. macrocarpa*, Kunth, p. 415. no. 192.

*Moon-podded Acacia.* Tree.

#### Tribe X. *Cassiæ*, p. 427.

99 *HUMBOLDTIA BRUNONIS* (Wall. pl. rar. asiat. 3. p. 17. t. 233.) leaves with 2 pairs of leaflets; hind lobes of stipulas nearly equal-sided, rounded at both extremities; branches equal. ♀. C. S. Native of the mountains of Malabar and the peninsula of India. A climbing shrub, with deep orange-coloured flowers.

*Brown's Humboldtia.* Shrub cl.

ORDER LXXIX. CHRYSOBALANÆÆ (shrubs and trees agreeing with *Chrysobalanus* in important characters). R. Br. Congo. p. 14.—Rosaceæ, Tribe I. Chrysobalanææ, D. C. prod. 2. p. 525.

Flowers more or less irregular (f. 59. a. f. 60. a. f. 61. b.). Sepals 5, joined together into a 5-lobed calyx (f. 59. a. f. 60. a. f. 61. a.), permanent. Petals equal in number to the lobes of the calyx (f. 60. b. f. 61. b.), and inserted in it, imbricate in aestivation. Stamens inserted in the calyx (f. 60. c.) along with

the petals, few (f. 61. c.) or numerous (f. 59. c. f. 60. d.), having the filaments incurved when the flower is in æstivation. Anthers 2-celled, bursting by a double chink. Ovary 1 (f. 61. e.), free, having the style proceeding from its base (f. 61. d.), and containing 2 erect ovula (f. 61. e.). The pedicel of the ovary closely cohering to the calyx. Style simple, crowned by a more or less dilated stigma. Seed usually solitary from abortion, exalbuminous in all except *Hirtella*, in which it is fleshy and the cotyledons foliaceous; in the rest of the genera the cotyledons are fleshy and thick.—This order is composed of trees and shrubs, natives within the tropics, with simple, entire, feather-nerved, glandless, petiolate leaves, and axillary and terminal racemes or panicles of small flowers. The fruit of the greater part of the plants are eatable, though by no means very palatable, being extremely dry and farinaceous: they generally go under the name of plums in the places of their natural growth. The principal distinguishing characters in the fructification of *Chrysobalanæ* are the style proceeding from the base of the ovarium (f. 61. d.), the ovula (which in *Amygdalacæ* are 2 in number), as well as in the embryo being erect (f. 61. e.). The greater part of the *Chrysobalanæ* have their flowers more or less irregular, this irregularity consisting in the cohesion of the stipe of the ovary with one side of the calyx, and a greater number or greater perfection of stamina, on the same side of the flower.

*Synopsis of the genera.*

1 *CHRYSOBALANUS*. Calyx campanulate, 5-cleft (f. 59. a.). Petals 5, unguiculate. Stamens about 20 (f. 59. c.) inserted on one side. Drupe plum-formed (f. 59. d.), containing an ovate, 5-furrowed, 1-seeded patamen.

2 *MOQUELEA*. Calyx turbinate, acutely 5-toothed. Petals 5, orbicular. Stamens about 40, inserted in the calyx beneath the petals. Ovary hairy. Drupe woody.

3 *COUEPIA*. Calyx tubular, obtusely 5-lobed. Petals 5, nearly orbicular. Stamens about 20, inserted in the top of the calycine tube. Drupe egg-shaped, dry, covered with a thick, fibry, coriaceous rind. Seed 1, inclosed in a fragile testa.

4 *ACTOIA*. Calyx tubular, bluntly 5-lobed. Petals 5, oblong, unequal. Stamens 10-12, projecting on one side of the flower, with the filaments joined to the middle. Drupe ovate, coriaceous, containing a 1-celled, 1-seeded nut.

5 *PARINARIUM*. Calyx urceolate, 5-cleft. Petals 5. Stamens 15. Ovary villous. Drupe ovate, thick, farinaceous, containing a hard, wrinkled, rough, 2-celled, 2-seeded nut. Seeds clothed with wool.

6 *GRANGERIA*. Calyx bluntly 5-cleft (f. 60. a.). Petals 5 (f. 60. b.), soon falling off. Stamens 15 (f. 60. d.), unequal. Ovary woolly. Drupe olive-formed, rather triquetrous (f. 60. e.), containing a bony, triquetrous, 1-seeded nut.

7 *LINCANIA*. Calyx bibracteolate on the outside, 5-cleft. Petals wanting. Stamens 5-10, when 5 they are opposite the calycine lobes. Drupe olive-formed, fleshy, containing a 1-seeded nut.

8 *THELYRA*. Calyx campanulate, ending in a tube, which is adnate to the peduncle, as in *Pelargonium*. Petals 5. Stamens

10, the 6 on one side fertile, the 4 on the other side sterile and tooth-formed. Ovary 2-ovulate. Berry? wrinkled, villous inside, 1-seeded.

9 *HIRTELLA*. Calyx obtusely 5-lobed (f. 61. a.). Petals 5, small, deciduous (f. 61. b.). Stamens 3-15 (f. 61. c.). Drupe furrowed (f. 61. e.), containing a 1-celled nut. Albuvaen fleshy. Cotyledons foliaceous.

† *Genera apparently belonging to the present order.*

10 *LEUCOSTOMON*. Calyx 5-parted; lobes acute, coloured, deciduous, with the lower one permanent, glandular, and stamiferous above. Petals wanting. Stamens about 20, inserted in a calycine disk. Ovary free, ovate, pubescent, 5-furrowed, ending in a filiform style. Fruit unknown.

11 *TRILEPISUM*. Calyx 5-lobed, free from the ovary. Petals wanting. Stamens numerous, inserted in the tube of the calyx, and disposed in many series. Tube terminated by 3 ligular between the stamens and pistil. Ovary 1-seeded. Style bifid at the apex, crowned by a tomentose stigma.

I. *CHRYSOBALANUS* (from χρυσος, *chrysos*, gold, and βάλανος, *balanos*, an acorn; in reference to the yellow fruit of some of the species). Lin. gen. 621. Lam. ill. t. 428. D. C. prod. 2. p. 525.—Icaco, Plum. gen. 43. t. 5.

LIN. SYST. *Icosándria, Monogýnia*. Calyx campanulate, 5-cleft. Petals 5, unguiculate. Stamens about 20, nearly equal in length, disposed in one series. Drupe fleshy, plum-formed, containing an ovate, 5-furrowed, 1-seeded nut.—Trees with simple leaves, and racemes or panicles of insignificant flowers. Fruit of all edible.

1 *C. Icaco* (Lin. spec. 513.) leaves nearly orbicular, or obovate, emarginate; racemes axillary, dichotomous; stamens hairy. h. S. Native of South America and the West Indies, by the sea-side, as well as of the southern parts of North America. Jacq. amer. 154. t. 91. Plum. ed. Burm. t. 158.—Catesb. car. 1. t. 25. Panicles axillary, dichotomous. Flowers white. Fruit about the size of a plum, ovate-roundish, varying much in colour, white, yellow, red, but most commonly purple, and usually covered with a kind of bloom; the skin is thin, and the pulp white, adhering firmly to the stone, the taste sweet, with some austerity, but not unpleasant, and is eaten both raw and preserved. The fruit is called *Icaco* or *Cocoa plum*, and is sold in the markets in the West Indies, under these names.

*Var. β, pellocarpus* (Meyer, prin. esseq. 193.) leaves roundish-ovate or obovate; fruit oval, brown. h. S. Native of Guiana. C. purpureus, Mill. dict. no. 2. Brown. jam. 250. t. 17. f. 5. Perhaps a proper species.

*Icaco* or Common *Cocoa-plum*. Clt. 1752. Sh. 3 to 6 feet.

2 *C. ellipticus* (Smeath. herb. Hort. trans. 5. p. 453.) leaves elliptic, obtuse, or acute, never emarginate; racemes axillary, dichotomous; stamens hairy. h. S. Native of Sierra Leone, on the sea-side. Racemes sometimes disposed in a bracteolate panicle. Fruit the size of a damson plum, with a black thin skin, and the flesh like that of the last species. The fruit is eatable.

FIG. 59.

*Elliptic-leaved Cocoa-plum.* Fl. Feb. Mar. Sh. 8 to 10 ft.

3 *C. OBLONGIFOLIUS* (Mich. fl. bor. amer. 1. p. 285.) leaves oblong or oblanceolate, a little crenulated; panicles terminal; stamens glabrous.  $\frac{1}{2}$ . S. Native of Georgia, in sandy pine forests. Nutt. gen. amer. 1. p. 301. Fruit olive-formed, nearly dry. Leaves sometimes tomentose beneath.

*Oblong-leaved Cocoa-plum.* Fl. May, Ju. Clt. 1812. Sh. 1 ft.

4 *C. OVALIFOLIUS* (Schott, in Spreng. syst. append. p. 406.) leaves coriaceous, rather cordate, elliptic, obtusely pointed, clothed with silvery tomentum beneath; flowers hermaphrodite; stamens glabrous.  $\frac{1}{2}$ . S. Native of Brazil.

*Oval-leaved Cocoa-plum.* Shrub.

5 *C. MACROPHYLLUS* (Schott, l. c. p. 407.) leaves cordate, oblong, obtuse, elongated, coriaceous, shining above, but clothed with white tomentum beneath, having the veins parallel and prominent; flowers hermaphrodite.  $\frac{1}{2}$ . S. Native of Brazil. In this and the preceding species 7 of the stamens are wanting or sterile.

*Long-leaved Cocoa-plum.* Shrub.

*Cult.* Sandy loam is the best soil for the species of *Coccol-plum*. Large cuttings, taken off at a joint, without shortening any of their leaves, and planted thinly in a pot filled with sand, with a bell-glass placed over them, in a moist heat, will strike root readily. The best way of increasing the plants is by seeds, when they can be procured.

II. MOQUILEA (meaning not explained by the author). Aubl. guian. 1. p. 521. t. 208. D. C. prod. 2. p. 526.

LIN. SYST. *Icosándria, Monogýnia*. Calyx tubular or urceolate, acutely 5-parted or 5-toothed. Petals 5, rather unequal, roundish. Stamens about 40, longer than the petals, inserted in the tube of the calyx beneath the petals, distinct or polyadelphous at the base. Ovary hairy. Style lateral, filiform, hairy below. Stigma obtuse. Drupe woody, egg-shaped, with a chinky bark, 1-seeded. Seed amygdalaceous. Trees with simple leaves and axillary and terminal racemes of white flowers.

1 *M. GUIANE'NSIS* (Aubl. l. c.) leaves oval, acuminate, quite entire, glabrous; racemes loosely paniced.  $\frac{1}{2}$ . S. Native of Guiana, in woods. Stamens about 40, free.

*Guiana Moquilea.* Tree 30 feet.

2 *M. CANOM'ENSIS* (Mart. fl. bras. 2. p. 79. t. 166.) young branches, under side of the leaves, buds, and racemes beset with rusty hairs; leaves oblong, acute; berry globose; stamens in 5 bundles, rising from an incomplete orb in the top of the tube of the calyx.  $\frac{1}{2}$ . S. Native of Brazil. Hirtella Canomensis, Spreng. syst. append. p. 407. Flowers white.

*Canom Moquilea.* Tree 20 to 30 feet.

*Cult.* For culture and propagation see *Chrysobalanus*.

III. COUEPIA (*Coupi* is the name of the tree in Guiana). Aubl. guian. 1. p. 521. t. 207. D. C. prod. 2. p. 526.

LIN. SYST. *Icosándria, Monogýnia*. Calyx tubular, bluntly 5-lobed at the apex. Petals 5, nearly orbicular, length of calyx. Stamens about 20, nearly equal, inserted in the top of the calycine tube; filaments distinct. Ovary somewhat stipitate. Drupe egg-shaped, with a dry, thick, coriaceous, fibrous rind. Seed 1, large, inclosed in a thin testa. Trees with oval, entire, feather-nerved leaves. Flowers few, nearly terminal.

1 *C. GUIANE'NSIS* (Aubl. l. c.) leaves with undulated margins; tube of calyx obconical, with rounded lobes.  $\frac{1}{2}$ . S. Native of Guiana. *Acia amara*, Willd. spec. 3. p. 717. Petiole clothed with rufous hairs. Flowers small, white. Seed bitter. In Guiana the natives strip the bark from the tree and use it in baking their earthenware.

*Guiana Couepia.* Tree 60 feet.

2 *C. PARILLO* (D. C. prod. 2. p. 526.) leaves flat; tube of calyx cylindrical, with oval-oblong, acuminate lobes.  $\frac{1}{2}$ . S.

Native of Guiana, where it is called *Parillo*. Flowers small, white.

*Parillo Couepia.* Tree 20 to 30 feet.

*Cult.* For culture and propagation see *Chrysobalanus*.

IV. ACIOA (*Acioa* is the Guiana name of the tree). Aubl. guian. 2. p. 690. D. C. prod. 2. p. 526.—*Dulacia*, Neck. elem. no. 1236.

LIN. SYST. *Monadélphia, Decándria*. Calyx tubular, bluntly and unequally lobed at the apex. Petals 5, oblong, obtuse, unequal. Stamens 10-12, projecting only on one side of the flower; filaments joined to the middle into a flat ligula, but free at the apex. Ovary or stipe of ovary adnate to the calyx at the base. Drupe ovate, coriaceous, chinky at maturity, containing a 1-celled, 1-seeded nut. Seed large, with a brittle testa.—A tree, with oval, acute, entire leaves, caducous stipulas, and terminal corymbs of violaceous flowers.

1 *A. GUIANE'NSIS* (Aubl. l. c.)  $\frac{1}{2}$ . S. Native of Guiana, in woods. *Acia dulcis*, Willd. spec. 3. p. 717. Petioles glabrous. Seed eatable. Hardly distinct from *Couepia*. It is sometimes called *Coupi* by the inhabitants of Guiana. The fruit contains a sweet oil like that of the almond.

*Guiana Acioa.* Tree 60 feet.

*Cult.* For culture and propagation see *Chrysobalanus*.

V. PARINARIUM (*Parinari* is the name of *P. montanum* in Guiana). Juss. gen. 341. Lam. ill. t. 429. D. C. prod. 2. p. 526. *Parinari*, Aubl. guian. 1. p. 514.—*Dugortia*, Neck. elem. no. 797.—*Petrocarya*, Schreb. gen. no. 629.

LIN. SYST. *Icosándria, Monogýnia*. Calyx urceolate, 5-cleft. Petals 5. Stamens about 15, commonly 3 to each petal. Ovary villous, with the stipe adhering to the calyx. Style filiform, glabrous. Drupe ovate, thick, containing a 2-celled, 2-seeded, hard nut, which is rough on the outside. Seeds covered with wool.—Trees with villous branches, and with the leaves glabrous above, but white from pubescence beneath. Flowers small, white, disposed in panicles, corymbs, or racemes. Pulp of fruit eatable, and sometimes the kernel of the nut.

SECT. I. PETROCARYA (from *πετρα*, *petra*, a stone; and *καρυα*, *karya*, a nut; in reference to the hard nut contained in the fruit). D. C. prod. 2. p. 527. Flowers disposed in corymbose branched racemes. Stamens 7-8, sterile in one side, and 7 or 8 fertile at the opposite side.—Species native of Guinea.

1 *P. MONTANUM* (Aubl. guian. 1. p. 514. t. 204 and 205.) leaves ovate, acuminate, clothed with white down beneath.  $\frac{1}{2}$ . S. Native of French Guiana, in woods. *Petrocarya montana*, Willd. spec. 2. p. 287.—*Petrocarya Brasiliensis*, Schott. The drupe is large, ovate, smooth, and fulvous, has a thick acid rind, and the nut or kernel of the tubercular putamen is sweet and edible.

*Mountain Parinarium.* Tree 60 to 80 feet.

2 *P. CAMPESTRE* (Aubl. l. c. p. 516. t. 206.) leaves cordate, acuminate, clothed with white down beneath.  $\frac{1}{2}$ . S. Native of French Guiana, in woods. Drupe small, oval, yellow; putamen less echinated than in most of the species, and containing only one single, edible seed. Stipulas broad, many nerved.

*Field Parinarium.* Clt. 1824. Tree 30 to 40 feet.

SECT. II. NEOCARYA (*Neou*, the Senegal name of *P. Senegalensis*, and *καρυον*, *karyon*, a nut; which signifies *Neonut*). D. C. prod. 2. p. 527. Flowers disposed in axillary and terminal paniced racemes. Stamens all fertile, disposed in one series, some of them rather concrete at the base.—Species native of Guinea.

3 *P. SENEGALE'NSIS* (Perr. in litt. D. C. prod. 2. p. 527.) leaves oval, obtuse at both ends, clothed with white down be-

neath. *h. S.* Native of Senegal, where it is called *Ncou*. It is therefore referrible to the *Ncou Adansoni*, Juss. gen. p. 342. Racemes subspicate, hairy. Calyx ventricose on one side. Fruit unknown.

*Senegal Parinarium.* Tree 40 to 50 feet.

4 *P. EXCELSUM* (Hort. trans. 5. p. 451.) leaves oblong, coriaceous, deep green above, but clothed with white pubescence beneath; racemes panicle. *h. S.* Native of Sierra Leone, where the fruit is brought to the market at Freetown, under the name of *Rough-skinned* or *Grey plum*. They are eaten by the inhabitants. It is about the size of *Imperatrice plum*, with a coarse skin of a greyish colour; the pulp is dry and farinaceous, and owing to the size of the stone is small in bulk. The negroes are very fond of the fruit. Perhaps *Mampota Senegalensis* of Adanson mentioned by Jussieu, in gen. pl. 342. is referrible to this species.

*Tall Parinarium.* Fl. Feb. Clt. 1822. Tree 50 to 60 feet.

5 *P. MACROPHYLLUM* (Hort. trans. 5. p. 452.) leaves large, ovate, sessile, and cordate, green above and downy beneath; stems thickly beset with brown hairs; racemes terminal; fruit oblong, twice the size of those of the preceding species. *h. S.* Native of Sierra Leone, by the sea-side about Cape Shilling, where the fruit is called *Gingerbread-plum* by the natives, who eat its pulp; it has much the flavour and appearance of that of the preceding.

*Large-leaved Parinarium.* Fl. Feb. Mar. Clt. 1822. Shrub 2 to 3 feet.

*Cult.* For culture and propagation see *Chrysobalanus*, p. 478.

VI. GRANGERIA (in honour of N. Granger, a traveller in Egypt and Persia). Comm. in Juss. gen. 349. Lam. ill. t. 427. D. C. prod. 2. p. 527.

LIN. SYST. *Icosandria, Monogynia*. Calyx bluntly 5-cleft (f. 60. a.). Petals 5 (f. 60. b.), soon falling off. Stamens 15, rather unequal. Ovary woolly (f. 60. c.). Style lateral (f. 60. d.), filiform, glabrous. Drupe olive-formed, rather triquetrous (f. 60. e.), containing a triquetrous, 1-seeded, bony nut. Cotyledons thick and fleshy.—A tree, with stipulaceous, ovate, entire, glabrous leaves, and spicate racemes of white flowers.

1 *G. BORBONICA* (Lam. dict. 3. p. 21.) *h. S.* Native of the island of Bourbon. Drupe blood-coloured when young. *C. buxifolia*, Smith in Rees' cycl. 16. no. 1. (f. 60.)

*Bourbon Grangeria.* Clt. 1823. Tree 40 to 50 feet.

*Cult.* For culture and propagation see *Chrysobalanus*, p. 478.

VII. LINCANIA (an anagram of Caligni, the Guiana name of the first species). Aubl. guian. 1. p. 119. t. 45. Lam. ill. t. 122. D. C. prod. 2. p. 527.—Hedycrea, Schreb. gen. no. 409. Rœm. et Schult. syst. 1. p. 345. mant. 252.

LIN. SYST. *Pentandria, Monogynia*. Calyx bibracteolate on the outside, with a 5-cleft limb. Petals wanting. Stamens 5-10, opposite the calycine lobes, or only 3 from abortion. Ovary 1, in the bottom of the calyx. Style incurved, lateral? Drupe olive-formed, fleshy, containing a 1-seeded nut. Seed thick.—Small trees, with oblong acuminate leaves, which are hoary beneath, and terminal spicate racemes of small white flowers.

1 *L. INCA'NA* (Aubl. l. c.) stamens 5; style incurved; flowers

in terminal spikes. *h. S.* Native of Guiana. *Hedycrea incana*, Willd. spec. 1. p. 1210. Vahl. enun. 2. p. 37.

*Hairy Lincania.* Shrub 4 to 5 feet.

2 *L. HUMILIS* (Cham. in Linnæa. 2. p. 549.) stamens 10, exerted; style pilose; spikes nearly simple. *h. S.* Native of Brazil.

*Dwarf Lincania.* Shrub.

3 *L. TURIU'VA* (Cham. l. c. p. 550.) stamens 10, exerted; style smooth; spikes branched. *h. S.* Native of Para, in Brazil. *Hirtella Octandra*, Willd. rel. in Rœm. et Schultes, syst. 5. p. 274.

*Turiuva Lincania.* Shrub.

*Cult.* For culture and propagation see *Chrysobalanus*, p. 478.

VIII. THELYRA (meaning unknown). Pet. Th. gen. mad. no. 72. D. C. prod. 2. p. 527.

LIN. SYST. *Dicandria, Monogynia*. Calyx campanulate at the base, ending in a small tube, which is adnate to the peduncle, as in *Pelargonium*. Petals 5. Stamens 10; the 6 on one side fertile, but the 4 on the other side are sterile and tooth-formed. Anthers fixed by the back, and bursting at the sides. Style lateral. Ovary 2-ovulate. Drupe? wrinkled, villous inside. Seed one, thick, exalbuminous. Cotyledons thick, unequal, plicate, the one involving the other. Radicle inferior.—Trees, natives of Madagascar, furnished with glandular bracteas.

1 *T. MADAGASCARIENSIS*. *h. S.* Native of Madagascar. None of the species are described.

*Madagascar Thelyra.* Tree.

*Cult.* For culture and propagation see *Chrysobalanus*, p. 478.

IX. HIRTELLA (a diminutive of *hirtus*, having been so named from the hairiness of the branches). Lin. gen. no. 86. Lam. ill. t. 138. D. C. prod. 2. p. 528.—Caussea, Scop.—Cosmibuena, Ruiz et Pav. fl. per. prod.

LIN. SYST. *Tri-Icosandria, Monogynia*. Calyx bluntly 5-lobed (f. 61. a.), usually reflexed at length. Petals 5, small (f. 61. b.), deciduous. Stamens 3-15 (f. 61. c.), many of which are abortive; filaments long, circinnately twisted inwards before the flowers expand. Style rising from the base of the ovary (f. 61. d.), opposite the stamens. Drupe furrowed (f. 61. e.), 1-celled. Seed stipitate, erect, with fleshy albumen, and a straight embryo, and leafy cotyledons (Gaertn. fruct. 3. p. 40. t. 185.)—American shrubs, with entire stipulaceous leaves, and axillary and terminal simple or compound racemes of flowers.

1 *H. TRIANDRA* (Swartz, fl. ind. occid. 1. p. 508.) flowers triandrous; petals ovate; racemes compound, loose, terminal; rachis pubescent; leaves oblong, acuminate, glabrous. *h. S.* Native of the West Indies and New Spain, in woods. *H. Americana*, Jacq. amer. p. 8. t. 8. *H. paniculata*, Lam. dict. 3. p. 33. Flowers white.

*Triandrous Hirtella.* Clt. 1810. Tree 20 feet.

2 *H. COSMIBU'ENA* (Lam. ill. 2. p. 114.) flowers triandrous; petals emarginate; racemes compound, pubescent, axillary, and terminal; leaves oblong, acuminate, pubescent beneath. *h. S.* Native of Peru, in woods. *Cosmibuena*, Ruiz et Pav. fl. per. prod. p. 10. t. 2. *H. Peruviana*, Pers. ench. 1. p. 250. *H. racemosa*, Ruiz et Pav. fl. per. 3. t. 227. f. B. Petals lilac.

*Cosmibuena's Hirtella.* Shrub 5 to 6 feet.

3 *H. MOLLICOMA* (H. B. et Kunth, nov. gen. amer. 7. p. 263.) flowers triandrous; petals roundish-elliptic; panicles terminal and axillary, usually solitary, elongated, and pilose; leaves oblong, acuminate, somewhat coriaceous, acute at the base, glabrous above, and shining, but beset with soft fuscous pili beneath. *h. S.* Native of New Spain, near El Espinal at the river Magdalena. Flowers white.

*Soft-haired Hirtella.* Tree 20 feet.

4 *H. PENDULA* (Saj. ex Lam. dict. 3. p. 134.) flowers tetrandrous and pentandrous; racemes compound, loose, elongated, pubescent; leaves oblong-lanceolate, acuminate, cordate at the base, and rather scabrous beneath. *h. S.* Native of South America. Smith in Rees' cycl. 19. no. 3. Flowers white.

*Pendulous-branched Hirtella.* Shrub.

5 *H. CASTA'NEA* (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 528.) flowers triandrous; petals ovate, length of the calyx; racemes terminal, and are, as well as the branches, very hairy; leaves hairy, oblong-lanceolate, rather cordate at the base, acuminate at the apex. *h. S.* Native of New Spain. Petals of a dirty whitish red colour. Stamens hardly twice the length of the petals.

*Chestnut-coloured-flowered Hirtella.* Shrub or tree.

6 *H. RUGOSA* (Pers. ench. 1. p. 250.) flowers triandrous; petals oblong, longer than the calyx; racemes terminal, and are, as well as the branches, very hairy; leaves ovate-lanceolate, acuminate, shining above, reticulated beneath, and pilose on the nerves. *h. S.* Native of Porto-Rico and St. Thomas. *H. Portoricensis*, Willd. rel. in Rœm. et Schultes, syst. 5. p. 274. Flowers white.

*Wrinkled Hirtella.* Shrub.

7 *H. HIRTEA* (Lam. ill. no. 2754.) flowers tetrandrous or pentandrous; racemes aggregate, compound, axillary, and terminal, and are, as well as the branches, hairy; leaves oval, acute, pilose on the nerves beneath. *h. S.* Native of Cayenne. *H. paniculata*, Vahl. symb. 2. p. 43. t. 31. *H. aggregata*, Poir. suppl. 2. p. 53. Stamens constantly 6 according to Meyer, nov. act. bonn. 12. p. 802.

*Hairy Hirtella.* Shrub or tree.

8 *H. GLANDULOSA* (Spreng. anl. t. 7. f. 1-4. new. entd. 1. p. 303.) flowers pentandrous; calyx and pedicels beset with stipitate glands; racemes compound, terminal; leaves ovate-oblong, acutish; the nerves beset with yellow hairs. *h. S.* Native of Brazil.

*Glandular Hirtella.* Shrub or tree.

9 *H. CORYMBOSA* (Cham. in Linnaea. 9. p. 545.) flowers triandrous; corymbs compound, terminal, pubescent; leaves coriaceous, rather cordate, glabrous on both surfaces. *h. S.* Native of Brazil.

*Corymbose-flowered Hirtella.* Shrub.

10 *H. FLORIBUNDA* (Cham. in Linnaea. 2. p. 548.) flowers octandrous or enneandrous; racemes simple, terminal, and axillary, very hairy; leaves lanceolate-elliptic, coriaceous, glabrous above, except on the nerves, but hairy beneath. *h. S.* Native of Brazil.

*Bundle-flowered Hirtella.* Shrub or tree.

11 *H. RACINOSA* (Lam. dict. 3. p. 133.) flowers pentandrous; calyx glandless; racemes simple, axillary, solitary; rachis and branchlets villous; leaves oblong, acuminate, glabrous above, but rather pilose or glabrous on the nerves beneath. *h. S.* Native of Guiana and Cayenne. *H. Americana*, Aubl. guian. 1. p. 247. t. 98. Flowers purplish. (f. 61.)

*Racemose-flowered Hirtella.* Clt. 1782. Tree 20 to 30 feet.

12 *H. OBLONGIFOLIA* (D. C. prod. 2. p. 529.) flowers pentandrous and hexandrous; calyx glandless; racemes simple, axillary, solitary, glabrous; leaves ob-

long, acuminate, glabrous. *h. S.* Native of New Spain. *H. rosea*, Moc. et Sesse, fl. mex. icon. ined. Flowers red. Style glabrous.

*Oblong-leaved Hirtella.* Shrub or tree.

13 *H. HEXANDRA* (Willd. rel. in Rœm. et Schultes, syst. 5. p. 274.) flowers hexandrous; racemes tern, simple, hairy; leaves oblong, bluntish, glabrous but pubescent on the nerves beneath; petioles and peduncles pubescent. *h. S.* Native of South America, at the river Orinoco. *H. B. et Kunth*, nov. gen. amer. 6. p. 245. Flowers white.

*Hexandrous Hirtella.* Shrub.

14 *H. HEBECLADA* (Moric. ined. D. C. prod. 2. p. 529.) flowers hexandrous; racemes terminal, simple; branches, petioles, and nerves of leaves velvety; leaves oval, rather puberulous above, and rather hispid beneath. *h. S.* Native of Brazil. Raddi.

*Hairy-branched Hirtella.* Shrub.

15 *H. TOMENTE'LLA* (Schott, in Spreng. syst. append. p. 341.) flowers hexandrous and heptandrous; racemes terminal, clothed with ferruginous tomentum; leaves oblong, attenuated at both ends, glabrous above, but rather hairy beneath. *h. S.* Native of Brazil.

*Tomentose Hirtella.* Shrub.

16 *H. ANGUSTIFOLIA* (Schott, in Spreng. syst. append. p. 341.) flowers heptandrous and octandrous; racemes simple, nodding, hairy; leaves cordate, linear-lanceolate, hairy on both surfaces. *h. S.* Native of Brazil.

*Narrow-leaved Hirtella.* Shrub.

17 *H. APE'TALA* (Meyer, in nov. act. bonn. 12. p. 803.) flowers enneandrous, apetalous; calyx spreading; leaves ovate-oblong, acuminate, glabrous; racemes compound, terminal. *h. S.* Native of Surinam.

*Apetalous Hirtella.* Shrub.

18 *H. POLYANDRA* (H. B. et Kunth, nov. gen. amer. 6. p. 246. t. 565.) flowers with 18-20 stamens, 5-petalled; panicles terminal, much branched, clothed with hoary tomentum; leaves oblong or obovate-oblong, ending in a short acumens, acute at the base, shining and glabrous above, but clothed with white tomentum beneath. *h. S.* Native on the shores of the Pacific ocean, near Acapulco. Flowers white.

*Polyandrous Hirtella.* Shrub 10 to 12 feet.

† *Species not sufficiently known.*

19 *H. SCA'NDENS* (Willd. rel. in Rœm. et Schultes, syst. 5. p. 274.) flowers heptandrous; racemes axillary and terminal; leaves distinct, oblong, rounded at the base, acuminate at the apex, shining and glabrous; stems climbing. *h. S.* Native of Brazil.

*Climbing Hirtella.* Shrub cl.

20 *H. NEMOROSA* (Willd. rel. 1. c.) flowers heptandrous; racemes terminal; leaves distich, oblong, rounded at the base, acuminate at the apex, shining and glabrous; stem erect. *h. S.* Native of Brazil. Petals yellow. Stamens violaceous.

*Groce Hirtella.* Shrub.

21 *H. ACAYACENSIS* (Moc. et Sesse, fl. mex. icon. ined. and mss. D. C. prod. 2. p. 529.) flowers octandrous, 4-petalled; racemes simple, villous, axillary; leaves obovate, acuminate, glabrous. *h. S.* Native of Mexico, on the mountains of Acayaca. Flowers purple.

*Acayaca Hirtella.* Shrub or tree.

22 *H. DODECANDRA* (Moc. et Sesse, l. c.) flowers with 12-15 stamens; racemes terminal, panicle; leaves oval-oblong, acute. *h. S.* Native of Mexico. Petals rose-coloured. Perhaps sufficiently distinct from *H. polyandra*.

*Dodecandrous Hirtella.* Shrub or tree.

23 *H. NITIDA* (Willd. rel. 1. c.) flowers in terminal racemes,

FIG. 61.

pubescent; leaves oblong, acuminate, shining, narrow at the base.  $\frac{1}{2}$  S. Native of Cuba.

*Shining-leaved Hirtella.* Shrub or tree.

*Cult.* For culture and propagation see *Chrysobalanus*, p. 478.

† *Genera which are doubtful whether they belong to the present order.*

X. LEUCOSTOMON (from λευκος, *leucos*, white, and στομα, *stoma*, mouth). Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 639.

LIN. SYST. *Icosándria, Monogýnia*. Calyx 5-parted; lobes ovate-lanceolate, acute, spreading, coloured, deciduous, the lower part permanent, and bearing a circle of glands above, and stamens. Petals wanting. Stamens about 20, inserted in the calycine disk; filaments very short; anthers long, erect, fixed by the base. Ovary free, ovate, pubescent, 5-furrowed, ending in an acute filiform style. Fruit unknown.—A shrub, with oval, entire, feather-nerved leaves. Stipulas 2, subulate. Peduncles trifid, 3-flowered. Calyx brownish-purple.

1 L. TERNIFLORUM (Moc. et Sesse, l. c.)  $\frac{1}{2}$  S. Native of Mexico.

*Tern-flowered Leucostomon.* Shrub.

*Cult.* For culture and propagation see *Chrysobalanus*, p. 478.

XI. TRILEPSIUM (from τρεῖς, *treis*, three, and λεπίς, *lepis*, a scale; in reference to the 3 scales situated in the calycine tube between the stamens and pistil). Pet. Th. gen. mad. no. 74. D. C. prod. 2. p. 639.

LIN. SYST. *Icosándria, Monogýnia*. Calyx thick, 5-cleft, not adhering to the ovary. Petals wanting. Stamens numerous, inserted by several series in the calyx; filaments filiform. Calycine tube terminating in 3 scales between the stamens and pistil. Ovary in the bottom of the calyx, 1-seeded. Style longer than the tube, bifid at the apex. Stigmas tomentose. Fruit unknown.—A small tree, with alternate lanceolate leaves, when young wrapped round by the stipulas, which are caducous.

1 T. MADAGASCARIENSIS.  $\frac{1}{2}$  S. Native of Madagascar.

*Madagascar Trilepsium.* Tree.

*Cult.* For culture and propagation see *Chrysobalanus*, p. 478.

ORDER LXXX. AMYGDALACEÆ (plants agreeing in important characters with *Amygdalus*, the almond).—Amygdalææ, Juss. gen. 340. exclusive of some genera.—Drupacææ, D. C. fl. fr. 4. p. 479.—Rosacææ, tribe II. Amygdalææ, D. C. prod. 2. p. 529.

Calyx 5-toothed (f. 62. a. f. 64. a.), deciduous, lined with a disk, the fifth lobe next the axis. Petals 5 (f. 62. a. f. 63. b.), perigynous. Stamens about 20 (f. 62. b. f. 63. b. f. 64. a.), inserted in the throat of the calyx, curved inwards in aestivation. Anthers innate, 1-celled, bursting lengthwise. Ovary superior, solitary, simple, 1-celled. Ovula 2, suspended. Style terminal, with a furrow on one side, terminating in a reniform stigma. Seed usually solitary, suspended. Embryo straight, with the radicle pointing towards the hilum, with thick cotyledons. Albumen none.—Trees or shrubs. Leaves simple, alternate, usually glandular towards the base. Stipulas simple, mostly glandular. Flowers white or pink.—This order is distinguished from *Rosacææ* and *Pomacææ* by its fruit being a drupe (f. 63. b. f. 64. d.), and by the presence of Prussic acid, from *Leguminosæ* in the equal petals and stamens; and by the fruit.

The plants contained in this order are astringent and febrile.

fugal, as the bark of *Cérusus Virginiàna* is prescribed in the United States, and of the *Cérusus Cápollin* in Mexico. They are, however, better known for yielding an abundance of prussic acid, a deadly principle residing in the leaves and kernels of the fruit, in consequence of which some of the species are poisonous to cattle which feed upon them, as for example *Cérusus capricida*, which kills the goats of Nipaul, and the *Cérusus Virginiàna*, which is known in North America to be dangerous. They all of them also yield a gum analogous to Tragacanth. Notwithstanding, however, the poisonous principle that is present in them, their fruit is in many cases a favourite food, as that of *Amygdalus* the almond, *Armeniaca* the apricot, *Pérsica* the peach and nectarine, *Prúnus* the plum, and *Cérusus* the cherry. The principle in which they abound is the basis of laurel-water, which when taken in small doses acts either as a violent purgative or as an emetic, and in larger doses is said to destroy the irritability without exciting inflammation; these properties, however, although thus dangerous in the distilled water of the laurel and other similar plants, can scarcely be said to exist in any important quantity in the plants in a state of nature. The leaves of *Prúnus spinosa*, and *Cérusus àrium* have been employed as a substitute for tea. The bark of *Cérusus Cápollin* is used in Mexico against dysentery. The prunes of the shops are chiefly prepared from those sorts of plums called St. Catharine and green-gage, and in Portugal from a sort that derives its name from the village of Guimaraens, where they are principally dried. They contain so large a quantity of sugar, that brandy is distilled from them when fermented. The kernel of *Cérusus Brigantiaca* yields a fixed oil called Huil des Marmottes, which is used instead of olive or almond oil. The *Prúnus Cocomilia* yields a bark the properties of which are spoken of very highly; according to Tenore it is a specific for the cure of the dangerous intermittent fevers of Calabria, where it grows. A variety of the *Cérusus àrium* is used for the preparation in the Vosges and the Black Forest of the liqueur known under the name of Kirschenwaesser. The kernel of *Cérusus occidentàlis* is used for flavouring the liqueur Noyeau.

#### *Synopsis of the Genera.*

1 AMYGDALUS. Drupe clothed with velvety pubescence (f. 62. c.), with a fibrous dry rind, separating irregularly, having the putamen pitted or smooth.

2 PÉRSICA. Drupe fleshy (f. 63. b.), glabrous or clothed with velvety down, having the putamen irregularly furrowed (f. 63. c.).

3 ARMENIACA. Drupe fleshy, clothed with velvety down, having the putamen obtuse at one end, and acute at the other, and surrounded by a furrow, the rest smooth, but never rugged.

4 PRÚNUS. Drupe fleshy, quite glabrous, but covered with a kind of grey bloom, having a compressed putamen, which is acute at both ends, and slightly furrowed on the margin, the rest smooth.

5 CÉRASUS. Drupe globose (f. 64. d.), fleshy, quite glabrous, containing a smooth flattened putamen (f. 64. f.).

6 POLYDONTIA. Drupe kidney-shaped, dry, containing a 1-seeded nut. Calyx 6-parted.

I. AMYGDALUS (from *αμύσσω*, *amyssō*, to lacerate; in reference to the fissured shell of the putamen). Tourn. inst. t. 402. D. C. fl. fr. 4. p. 486. D. C. prod. 2. p. 530.—Amygdalus species, Lin. mss.—Amygdalophora, Neck. elem. no. 717.

LIN. syst. *Icosándria, Monogýnia*. Drupe clothed with velvety pubescence (f. 62. c.), having a dry rind, which separates irregularly, containing a pitted or smooth putamen or nut.—Trees. Leaves conduplicate when young. Flowers nearly sessile, usually pink or rose-coloured, rising either singly or by pairs from the scaly buds earlier than the leaves. Fruit woolly.

§ 1. *Calyx cylindrically-campanulate*.

1 A. ARABICA (Oliv. voy. t. 47.) leaves oblong-linear, obtuse, crenated; petioles short; fruit ovate-globose, solitary, ending in a short blunt acumen; putamen ovate. h. II. Native of Arabia. Fruit the size of a filbert.

Arabian Almond. Shrub 2 to 3 feet.

2 A. NANA (Lin. mant. 396.) leaves oblong-linear, attenuated at the base, serrated, quite glabrous; flowers solitary and rose-coloured. Fruit the form of those of *A. communis*, but much smaller. Root creeping.

Var. *a*, *vulgâris* (D. C. prod. 2. p. 530.) calycine lobes ovate, obtuse, wrinkled, shorter than the tube; style thickly clothed with tomentum, exserted. h. II. Native of Calmuc Tartary, very frequent on the banks of the Volga, and about Odessa. *A. nana*, Pall. ross. p. 12. t. 6. Curt. bot. mag. t. 161. Mill. fig. t. 28. f. 2. Duh. arb. ed. 2. vol. 4. p. 115. t. 30.

Var. *β*, *Georgica* (D. C. l. c.) calycine lobes lanceolate, length of the tube; style inclosed, hardly tomentose at the base. h. I. S. Native of Georgia. *A. Georgica*, Desf. arbr. 2. p. 221.

Var. *γ*, *campêstris* (Ser. mss. in D. C. prod. 2. p. 530.) leaves broader; calycine lobes length of the tube; petals narrower, longer, and white; style hardly tomentose at the base. h. II. Native of the south of Podolia. *A. campêstris*, Besser. enum. p. 46. no. 1425. *A. Besseriâna*, Schott, in cat. hort. vind. 1818. The form of the nut is different from the other varieties according to Besser.

Dwarf Almond. Fl. March, April. Clt. 1683. Shrub 2 to 3 feet.

3 A. ORIENTALIS (Ait. hort. kew. ed. 1. vol. 1. p. 162. ed. 2. vol. 3. p. 195.) leaves lanceolate, quite entire, almost permanent, clothed with silvery tomentum, as well as the branches; fruit mucronate. h. II. Native of the Levant. *A. argentea*, Lam. dict. 1. p. 103. Duham, arbr. ed. 2. vol. 3. p. 115. Flowers rose-coloured. Hardly larger than *A. nana*.

Oriental or Silver-leaved Almond. Fl. March, April. Clt. 1756. Shrub 2 to 4 feet.

4 A. INCA'NA (Pall. ross. 1. p. 13. t. 7. Smith, fl. græc. t. 477.) leaves obovate, serrated, clothed with white tomentum beneath; flowers solitary; drupe compressed, pubescent. h. II. Native of Caucasus, and of the Levant between Smyrna and Bursa. Flowers red. Shrub spinose.

Hoary Almond. Fl. March, April. Clt. Shrub 2 feet.

§ 2. *Calyx campanulate*.

5 A. COMMUNIS (Lin. spec. 677.) leaves oblong-lanceolate, serrulated; flowers solitary; calyx campanulate; fruit compres-

sed, egg-shaped, tomentose. h. II. Native of Mauritania, in hedges. Flowers white or rose-coloured.

Var. *a*, *amara* (D. C. fl. fr. 4. p. 486.) style almost the length of the stamens, tomentose below; seeds bitter. Duham. ed. 2. p. 114. Flowers larger. Petals white, but rose-coloured at the base. There are varieties of this *bitter almond*, with hard and brittle shells to the nuts. 1 *Bitter almond*, with a tender shell. 2 *Bitter almond*, with a hard shell. *Amandier amer* (French).

Var. *β*, *dulcis* (D. C. fl. fr. 4. p. 486.) leaves of a greyish green colour; flowers earlier; style much exceeding the stamens; fruit ovate, compressed, acuminate; seeds sweet; shell of putamen hard. Lam. ill. t. 430. f. 2.—Sweet almond, with a hard shell. *Amandier à petits fruits*, *Amandier douce*.

Var. *γ*, *frágilis* (D. C. prod. 2. p. 531.) flowers rising with the leaves; petals broader, deeply emarginate; leaves shorter; petioles thick; fruit acuminate; putamen with a fragile shell; seed sweet. *A. frágilis*, Hell. fl. wirecb. 1. p. 500. Flowers pale rose-coloured.—Sweet almond, with a tender shell. *Amandier des Dames*. Duham, arb. ed. 2. vol. 4. p. 113. Nois. jard. fruit. p. 7. t. 3. f. 2. Commonly called in France *Coque-molle*.

Var. *δ*, *macrocarpa* (D. C. prod. 2. p. 531.) leaves broader, acuminate, hardly cinereous; peduncles shorter, turgid; fruit larger, umbilicate at the base, but acuminate at the apex; putamen hard. Flowers whitish rose-colour, large, rising before the leaves, with broadly obovate undulated petals. Sweet almond, with a large fruit. *Amandier à gros fruits*. Duham. arbr. ed. 2. vol. 4. p. 112. Nois. jard. fruit. p. 7. t. 3. There are two other varieties of this. 1 Sweet-almond, with a smaller fruit and tender shell. *Amandier sultane*. 2 Sweet-almond, with a smaller fruit. *Amandier Pistache*.

Var. *ε*, *persicoides* (D. C. l. c.) leaves almost like those of the peach; fruit ovate, obtuse, with the sarcocarp hardly succulent; putamen dark yellow; seeds sweet. Peach-almond. *Amandier pecher*. Duham. arb. ed. 2. vol. 4. p. 114. Nois. jard. fruit. p. 7. t. 3. f. 1. This variety is supposed by Duhamel to have been produced from the impregnation of the almond by the pollen of the peach.

Both the *bitter* and *sweet-almond* rise above 20 feet in height. The leaves resemble those of the peach, but the lower serratures are glandular, which has given rise to the conjecture that glandular leaved peaches have sprung more immediately from the almond than such as are without glands, as is generally the case with nectarines. Their flowers vary in colour from a fine blush to snow white. The chief distinction is in the fruit, which is flatter, with a coriaceous dry covering instead of the rich pulp of the peach and nectarine, opening spontaneously when the kernel is ripe. The *tubercs* of Pliny, Knight considers as swollen almonds, and the same with the *peach-almond*, having raised a similar variety from dusting the stigma of an almond with the pollen of a peach, which produced a tolerably good fruit. (Hort. trans. 3. p. 41. t. 1.) It is mentioned by Turner in 1548, and though hardly worth cultivating in England as a fruit tree for profit, yet it is a very satisfactory thing to produce almonds of one's own growing at the dessert. The tree forms an important article in the general culture of many parts of France, Italy, and Spain. In a forward spring the blossoms often appear in February, but in this case frost generally destroys them, and they bear little or no fruit, whereas when the trees do not flower till March they seldom fail to produce fruit in abundance.

Use. The kernel of the nut is the only part used, which is tender and of a fine flavour. The sweet almonds and other varieties are brought to the dessert in a green or imperfectly ripe and also in a ripe state. They are also much used in cookery, confectionery, perfumery, and medicine. Sweet almonds used as food, Professor Martin observes, are difficult of digestion,

and afford very little nourishment unless extremely well comminuted.

**Selection of sorts.** The tender shelled is in the greatest esteem, and next the sweet and Jordan.

**Propagation.** The almond is propagated like the peach, by seed for varieties or stocks, and by budding on its own or on a plum stock for continuing varieties. Plum stocks are preferred for strong moist soils, and peach and almond stocks for dry situations.

**Final planting.** The trees are generally planted as standards in shrubberies, and these will sometimes in good seasons ripen their fruit, but when fruit is the object they should be trained against a west or east wall like the peach.

**Mode of bearing and pruning.** The almond tree bears chiefly on the young wood of the previous year like the apricot and peach, and in part upon small spurs on the two year old and three year old, and older branches; it is therefore pruned like these trees.

**Gathering and preserving the crop.** A part may be gathered when nearly ripe daily for some weeks before gathering the whole crop. This operation generally falls to be performed in September, when a part may be laid in the fruit room, and a part thoroughly dried and bedded in sand in the fruit cellar for keeping through the winter.

**Medicinal properties.** Almond-oil is obtained both from bitter and sweet almonds by expression. Bitter almonds have been found poisonous to dogs and smaller animals; and a distilled water from them when made of a certain degree of strength has had the same effects. The essential oil obtained by distillation is one of the most virulent poisons known. Nevertheless bitter almonds are every day used in cookery on account of their agreeable flavour. Almond-oil is supposed to blunt acrimonious humours, and to soften and relax the solids; hence its use internally in tickling coughs, pains, and inflammations, and externally in tensions and rigidity of particular parts. On triturating almonds with water, the oil and water unite together by the mediation of the albuminous matter of the kernel, and form a bland milky liquor called an emulsion, which may be given freely in inflammatory disorders. The sweet almonds alone are employed in making emulsions, as the bitter almonds impart their peculiar taste. Several unctuous and resinous substances, of themselves not mixable with water, may by trituration with almonds be easily mixed into the form of an emulsion; and are thus excellently fitted for medicinal purposes. It is a singular fact that the seeds of the bitter and sweet almonds should differ so essentially in their chemical compositions; the bitter almonds containing a deleterious principle which does not exist in the sweet almond, although found in its bark, leaves, and flowers. The existence of hydrocyanic or prussic acid, as a vegetable principle, was discovered in 1802 by Bohm in the distilled water of bitter almonds. It was also discovered in the leaves of the cherry-laurel by Schröder in the same year; in peach blossoms and leaves by Vauquelin; in cherry-water by Von Ittner, and in the bark of the bird-cherry by Jahn. In all these, and many similar substances, the acid is modified by its ultimate combination with volatile oil. Laurel-water is prepared, according to the Prussian pharmacopœia, by drawing off three pounds of distilled water from two pounds of the fresh leaves. Thomassen Von Thuesink observed it to produce immediately cheerfulness, a lower pulse, and quiet sleep. It has hitherto been chiefly recommended in melancholy with an atrabilious constitution, and in obstructions of the liver, with a viscid state of the blood. Hydrocyanic acid has recently been much used in pulmonary inflammation, asthmas, sympathetic coughs, &c. It is prepared by the apothecaries' company in London from cyanuret of mercury, hydrochloric acid, and water. Dr. Duncan, however, prefers the dis-

tilled water of bitter almonds or cherry-laurel water in these diseases, as being more manageable and less liable to decomposition. Bitter almonds consist of 100 parts of fixed oil, 54 albumen, 24 liquid sugar, 6 gum, 3 fibre, 4 pellicles, 5 water, and a little acetate acid.

**Common, Sweet, and Bitter Almond.** Fl. March, April. Ch. 1548. Tree 10 to 30 feet.

6 *A. COCHINCHINENSIS* (Lour. fl. cochin. p. 316.) leaves oval, quite entire; racemes small, subterminal; calyx campanulate; fruit ovate, ventricose, acute at the apex. *h. G.* Native of Cochin-china, in woods. Corolla white. Kernel like the common almond in form and smell.

*Cochin-china Almond.* Tree 30 to 40 feet.

8 *A. MICROPHYLLA* (H. B. et Kunth, nov. gen. amer. 6. p. 245. t. 564.) shrub much branched; leaves oblong, acute, mucronate, crenately serrated, glabrous, small; stipulas twice the length of the petioles; calycine lobes obtuse, mucronate, reflexed; stigma peltate; fruit globose. *h. S.* Native of Mexico between Pachucha and Moran on arid hills at the height of 3900 feet. Flowers small, pink.

*Small-leaved Almond.* Shrub 3 feet.

**Cult.** All the kinds of almond are very ornamental when in flower; the larger species are proper trees for the backs of large shrubberies, or to stand singly, as they make a fine appearance in spring, being in blossom before most other trees. The dwarf kinds are well fitted for small shrubberies or the fronts of large ones. All the species are increased by grafting on plum stocks, or on the bitter almond, except some of the dwarf kinds, which may be easier increased by taking the suckers from the plants at the roots.

**II. PERSICA** (so named from the peach coming originally from Persia). Tourn. inst. t. 400. Mill. dict. D. C. fl. fr. 4. p. 487. —*Amygdalus* species of Lin. and Juss. —*Trichocarpus*, Neck. elem. no. 718.

**LIN. SYST.** *Icosandra*, *Monogyna*. Drupe fleshy (f. 63. b.), with a glabrous or velvety epicarp, and having the putamen wrinkled from irregular furrows (f. 63. c.). — Trees. Leaves conduplicate when young. Flowers almost sessile, solitary or twin, rising from the scaly buds earlier than the leaves.

1 *P. VULGARIS* (Mill. dict. no.

FIG. 63.

1. D. C. fl. fr. 4. p. 487.) fruit clothed with velvety tomentum. *h. H.* Native of Persia. *Amygdalus Persica*, Lin. spec. 677. Lam. dict. 1. p. 99. no. 1-23. and 28-42. Nois. jard. fruit. no. 1-16 and 22-35. with figures. There is a very elegant double flowered variety. The peach tree in its natural state is under the middle-size, with spreading branches, lanceolate, glabrous, serrated leaves. The flowers are sessile, with reddish calyxes, and pale or dark-red corollas; the fruit roundish, generally pointed, with a longitudinal groove; the pulp or sarcocarp large, fleshy, and succulent, white or yellowish, sometimes reddish, abounding in a grateful sweet acid juice; the stone hard, and irregularly furrowed; and the kernel bitter. The tree of quick growth, and not of long duration, blossoms in April, and ripens its fruit in August and September. Dr. Sickler considers Persia as the original country of the peach, which in Media is deemed unwholesome, but when planted in Egypt becomes pulpy, delicious, and salubrious. The peach also, according to Columella, when

first brought from Persia into the Roman empire possessed deleterious qualities, which T. A. Knight concludes to have arisen from those peaches being only swollen almonds (the *tubercles* of Pliny), or imperfect peaches, and which are known to contain the prussic acid, which operates unfavourably on many constitutions. The tree has been cultivated time immemorial in most parts of Asia; when it was introduced into Greece is uncertain; the Romans seem to have brought it direct from Persia during the reign of the emperor Claudius. It is first mentioned by Columella, and afterwards described by Pliny. The best peaches in Europe are at present grown in Italy on standards, and next may be cited those of Montreuil, near Paris, trained on lime-white walls. (Mozard sur l'Education du Pecher, &c. 1814.) In England there are but few sorts of peaches that come to tolerable perfection in the open air in ordinary seasons. The best adapted for this purpose are the *free-stones*, but all the sorts ripen well by the aid of hot-walls or glass, and may be forced so as to ripen in May and June. The tree is generally an abundant bearer; one of the *noblesse* kind is at Yokefield in Suffolk, which covers about 600 square feet of trellis under a glass case without flues, and ripens annually from 60 to 70 dozen of peaches. (Hort. trans. 3. p. 17.)

*Use.* The *peach* is a dessert fruit of the first order, and makes a delicious preserve. In Maryland and Virginia a brandy is made from the fruit. "The manufacture of this liquor, and the feeding of pigs, being (as Braddick observes, Hort. trans. 2. p. 205.) the principal uses to which the *peach* is applied in those countries." The leaves steeped in gin or whisky communicate a flavour resembling that of *noyau*.

*Criterion of a good peach.* A good peach, Miller observes, possesses these qualities, the flesh is firm, the skin is thin, of a deep or bright-red colour next the sun, and yellowish green next the wall, the pulp is of a yellowish colour, full of high flavoured juice, the fleshy part thick, and the stone small.

*Varieties.* Linnaeus divides his *Amygdalus Persica* into two varieties; that with downy fruit or the *peach*, and that with smooth fruit or the *nectarine*, but in the present work the *peach* and *nectarine* have been established into a genus called *Persica*, and the *peach* and *nectarine* made distinct species. There are, however, various instances on record (Hort. trans. 1. p. 103.) of both fruits growing on the same tree, and even on the same branch; and one case has occurred of a single fruit partaking of the nature of both. The French consider them as one fruit, arranging them in four divisions, the *pêches* or *free-stone peaches*, the flesh of whose fruit separates readily from the stone and the skin; the *peches lisse* or *free-stone nectarines*; the *paries* or *clingstone peaches*, whose flesh is firm, and adheres both to the stone and the skin; and the *Brugnons* or *cling-stone nectarines*. Knight (Hort. trans. 3. p. 1.), Robertson (Hort. trans. 3. p. 382.), and many other horticulturists, consider the *peach* and almond as one species. We have, however, in this work followed the established nomenclature, and treated them as distinct fruits. There are many fine varieties of the *peach*. Tusser in 1573 mentions peaches white and red; Parkinson in 1629 enumerates 21 sorts; and Miller in 1750 31 varieties. In the garden of Luxembourg at Paris are 70 varieties, and above double that number of names are to be found in the catalogues of our nurseries. Several attempts have been made to class the varieties of *peaches* and *nectarines* by the leaf and flower, as well as the fruit; the first is by M. Poiteau in the Bon Jardinier; the next by Count Lelieur in his Pomone Française; the next by John Robertson, nurseryman of Kilkenny, whose arrangement is founded on the glands of the leaves; and the fourth by George Lindley (Hort. trans. vol. 5.), also founded on the glands of the leaves; but none of these arrangements have been found sufficiently perfect for the purpose of this work.

### List of the varieties of peaches.

*Var. a*; flesh separating from the stone, called in English *free-stones*, and in French *pêches*.

### List of free-stone or melting peaches.

1 *Abricotée, abricotée à noyau partagé, admirable jaune, grosse jaune, grosse pêche jaune tardive, d'abricot, de Burai, D'Orange, Sandalic hermaphrodite, yellow admirable.* Duham. no. 13. Leaves with reniform glands. Flowers large. Fruit large, yellow and red, ripening in the beginning or middle of October. A second-rate sort.

2 *Acton Scot.* Hort. trans. 2. t. 10. Leaves with globose glands. Flowers large. Fruit middle-sized, pale yellow, and red, ripening about the end of August. A first-rate sort.

3 *Late admirable, royal, la royale, pêche-royale, Bourdine, Boudine, Narbonne, tétou de Venus, belle bausse or belle bauce* of some, *Judd's melting, Mottoux's.* Leaves with globose glands. Flowers small. Fruit large, pale yellow and red, ripening about the end of August. This is one of the very best late peaches, and ought to be in every collection; and is very proper for a peach-house to succeed the early sorts.

4 *Early admirable, admirable, l'admirable*, (Duham. 29.) *belle de Vitry* of Bon Jardinier. Flesh white, red at the stone, ripening end of August.

5 *Yellow alberge, purple alberge, red alberge, golden mignonne, gold-fleshed, alberge-jaune* (Duham. no. 5. t. 5.), *pêche-jaune.* Leaves with globose glands. Flowers small. Fruit middle-sized, yellow and dark red; flesh yellow. Ripening about the end of August. A second-rate sort.

6 *Almond peach.* Leaves without glands. Flowers large. Fruit middle-sized, pale yellow and red, ripening about the middle of September. A second-rate sort, raised from the almond.

7 *Ansley's colonel.* Leaves with globose glands. Flowers large. Fruit large, pale yellow and red, ripening in the middle of September. A first-rate sort, resembling the Barrington.

8 *Barrington, Buckingham mignonne.* Leaves with globose glands. Flowers large. Fruit large, pale yellow and red, ripening in the middle of September. A first-rate sort, but subject to mildew.

9 *Belle Chevreuse* (Duham. t. 13.), *Chevreuse, early Chevreuse.* Leaves with reniform glands. Fruit yellow and red. Flesh yellow, excellent. Much confusion exists with regard to this sort.

10 *Belle de Vitry* (Duham.), *late admirable, bellis, admirable tardive.*

11 *Bellegarde* (Hook. t. 8.), *galand, noire de Montreuil, violette hâtive, early galand* of some, *Brentford mignonne, French royal George* (Hook. t. 41.), *smooth-leaved royal George* of some, *French violette hâtive.* Leaves with globose glands. Flowers small. Fruit large, pale green and dark red, ripening in the beginning and middle of September. A very handsome and excellent peach, succeeds *royal George* and *grosse mignonne*.

12 *Swainson's black.* Leaves with globose glands. Flowers small. Fruit dark red, middle-sized, ripening about the beginning of September.

13 *Braddick's New York* (Hort. trans. 2. t. 13.), *Braddick's South American.* Leaves with reniform glands. Flowers small. Fruit middle-sized, pale green and red, ripening in the beginning of September. A second-rate fruit.

14 *Braddick's red.* Leaves without glands. Flowers large. Fruit large, pale green and dark red, ripening end of August, and beginning of September. A large handsome peach of good quality.

15 *Braddick's summer*. Leaves with reniform glands. Flowers small. Fruit large, pale green and red, ripening about the end of August. A second-rate sort.

16 *Cambray*. Leaves without glands. Flowers large. Fruit large, pale green and red, ripening about the end of August. A first-rate sort, resembling the *Malta*.

17 *Cardinal, le cardinal, cardinal de Furstenberg*. Leaves without glands. Flowers large. Fruit large, red, ripening in October. Flesh red, like beet-root, of little merit in this climate.

18 *Green Catharine* of the Americans. Leaves with globose glands. Flowers small. Fruit middle-sized, pale green and red, ripening about the end of September. A worthless kind.

19 *Chancellor, chancellière* var. of Duham. *late chancellor, Noisette*. Leaves with reniform glands. Flowers small. Fruit large, pale yellow and red, ripening about the middle of September. A first-rate sort.

20 *Yellow chevreuse*. Leaves with globose glands. Flowers small.

21 *Craavey's*. Leaves with globose glands. Flowers small. Fruit middle-sized, pale yellow and red, ripening about the end of September. A second-rate sort.

22 *Double-blossomed, pêcher à fleurs doubles, pêcher nain à fleurs doubles, pêcher à fleurs semidoubles*. Leaves with reniform glands. Flowers large. Fruit small, pale yellow and red. A worthless sort as regards its fruit.

23 *Double Montagne, Montagne, Montauban*. Lang. t. 28. Leaves without glands. Flowers large. Fruit like that of the *noblesse*.

24 *Early Downton*. Leaves with globose glands. Flowers large. Fruit middle-sized, pale yellow and red, ripening in the middle of August. A first-rate sort.

25 *Dumington beauty*. Leaves without glands. Flowers large. Fruit large, pale green and red, ripening about the beginning of September. A first-rate sort, very like the *noblesse*.

26 *Early Anne* (Duham. t. 10.), *Anne, white avant* of some. Leaves without glands. Flowers large. Fruit middle-sized, white, and red, ripening in the beginning and middle of August. Earliness is the chief recommendation of this sort.

27 *Early red*. Leaves with globose glands. Flowers large. Fruit middle-sized, pale yellow and red, ripening in the end of August. A second-rate sort.

28 *Flat peach* of China (Hort. trans. 4. t. 19.) *Chinese peach, Peen-to peach, Java peach*. Leaves with reniform glands. Flowers large. Fruit small, violet green and red, ripening in the beginning and middle of September, but may be forced in pots pretty early. A worthless sort.

29 *Ford's seedling*. Leaves without glands. Flowers large. Fruit large, pale green and red, ripening about the end of August. Resembles much the *noblesse*.

30 *Steward's late galande*. Leaves with reniform glands. Flowers small. Fruit large, pale yellow and red, ripening about the middle of September. A first-rate sort, hardly differing from the *chancellor*.

31 *George the Fourth*. Leaves with globose glands. Flowers small. Fruit middle-sized, pale yellow and red, ripening about the middle of September. A first-rate sort.

32 *Hemskirke*. Leaves without glands. Flowers large. Fruit middle-sized, pale green and red, ripening about the end of August. A first-rate sort.

33 *Hoffmann's favourite*. Leaves with reniform glands. Flowers small. Fruit middle-sized, white and red, ripening about the beginning of September. A second-rate sort.

34 *Hoffmann's white*. Leaves with reniform glands. Flowers small. Fruit middle-sized, white and red, ripening in the beginning and middle of September. A first-rate sort.

35 *Incomparable en Beauté*. Leaves with globose glands. Flowers small. Fruit large, pale yellow greenish and red, ripening in the middle of September. A second-rate sort.

36 *White-blossomed incomparable, white-blossomed*. Leaves with reniform glands. Flowers large. Fruit large, white, ripening about the end of August. Singular on account of its white blossoms and pale fruit.

37 *Pêche D'Ispahan, De Perse*. Leaves without glands. Flowers large. Fruit small, greenish and red, ripening in the middle of September. A worthless kind.

38 *Kew seedling, Kew royal seedling*. Leaves with globose glands. Flowers small. Fruit middle-sized, pale yellow and dark red, ripening in the beginning of September. A second-rate sort.

39 *Knapp castle seedling*. Leaves without glands. Flowers large. Fruit large, pale green and red, ripening about the end of August. A first-rate sort, very like the *noblesse*.

40 *Knight's early, Knight's early seedling*. Leaves with globose glands. Flowers large. Fruit middle-sized, pale green and dark red, ripening in the middle of August. A first-rate sort.

41 *Low's large melting*. Leaves without glands. Flowers small. Fruit large, pale yellow greenish and red, ripening in the beginning of September. Allied to the *royal George*, larger, but not so good.

42 *Madeleine de Bollwiller*. Leaves without glands. Flowers large. Fruit middle-sized, pale green and dark red, ripening in the beginning and middle of September. A first-rate sort.

43 *Madeleine de courson* (Duham. t. 10.), *red Madeleine* of Miller, *Madeleine rouge, rouge Paysanne, French Magdalene*. Leaves without glands. Flowers large. Fruit middle-sized, pale yellow and red, ripening about the beginning of September. A first-rate sort, and a good bearer.

44 *White Magdalen, Madeleine blanche* (Duham. t. 6.), *Montagne blanche*. Leaves without glands. Flowers large. Fruit middle-sized, yellow white and red, ripening in the middle and end of August. A second-rate sort.

45 *Malta, Italian, pêche de Malte, belle de Paris, Malte de Normandie*. Leaves without glands. Flowers large. Fruit middle-sized, pale greenish and red, ripening about the end of August. A first-rate sort, hardy, and keeps well after being gathered, and bears carriage.

46 *American mignonne*. Leaves with reniform glands. Flowers small. Fruit large, pale yellow and red, ripening in the end of September. A second-rate sort; comes near the *chancellor*.

47 *Dorsetshire mignonne*. Leaves with reniform glands. Flowers small. Fruit large, pale yellow and dark red, ripening in the end of September. A second-rate sort.

48 *Grosse mignonne* (Duham. t. 10.), *Grimwood's royal George, large French mignonne, mignonne Vincuse, royal sorcerer*, and 50 other names belong to this kind. Leaves with globose glands. Flowers large. Fruit large, yellow and red, ripening from the middle of August to the beginning of September. A first-rate sort, forces well, a good bearer, but does not bear carriage so well as many others.

49 *Lord Fauconberg's mignonne*. Leaves without glands. Flowers small. Fruit large, pale yellow green and red, ripening in the beginning and middle of September. A good peach, resembling the *royal Charlotte*.

50 *Petite mignonne* (Duham. t. 4.), *small mignonne, early mignonne, mignonette, double de Troyes, pêche de Troyes*. Leaves with reniform glands. Flowers small. Fruit small, pale yellow and red, ripening in the beginning and middle of August. A first-rate sort, succeeds the *brown nutmeg*, and is larger than it.

51 *Yellow mignonne*. Leaves with reniform glands. Flowers

small. Fruit small, pale green and pale red. Flesh full yellow. A second-rate sort.

52 *Morrisonia*, *Morrison's pound*, *Hoffmann's*. Leaves with globose glands. Flowers small. Fruit large, pale green and red, ripening in the beginning and middle of September. One of the best of the American sorts.

53 *Mountaineer*. Leaves with globose glands. Flowers large. Fruit large, pale yellow and red, ripening in the beginning of September. A first-rate sort. Fruit sometimes partly smooth, in consequence of its having been raised between the *red nutmeg peach* and *violette hâtive nectarine*.

54 *Nain pêcher*, *pêcher nain d'Orleans*, *dwarf Orleans*, *pot peach*. Leaves without glands. Flowers large. Fruit pale green and yellow.

55 *Nivette*, *niçette reloutée*, *reloutée tardive*, *Dorsetshire*. Leaves with globose glands. Flowers small. Fruit large, pale green and red, ripening in the middle of September. A first-rate sort, very like the *late admirable*.

56 *Noblesse* (Hook, t. 2.), *Mellish's favourite*, *vanguard*. Leaves without glands. Flowers large. Fruit large, pale green and red, ripening end of August and beginning of September. This is one of the very best peaches, either for forcing or the open wall.

57 *Red nutmeg*, *brown nutmeg*, *early red nutmeg*, *avant rouge*, *avant pêche de Troyes* (Duham. t. 3.), *red avant*. Leaves with reniform glands. Flowers large. Fruit small, pale yellow and dark red, ripening about the end of July. A second-rate sort.

58 *White Nutmeg*, *early white nutmeg*, *avant blanche* (Duham. t. 2.), *white avant*. Leaves without glands. Flowers large. Fruit small, white, ripening middle of July. Has little merit, except that of being the earliest.

59 *Ord's peach*. Leaves with reniform glands. Flowers small. Fruit large, yellow green and red, ripening beginning and middle of September. A second-rate sort, allied to the *chancellor*.

60 *Purprée hâtive*, *early avant* of some. Leaves with reniform glands. Flowers large. Fruit middle-sized yellow white, and red, ripening end of August. A good peach, as large as the *grosse mignonne* and earlier, but more tender.

61 *President*. Leaves with globular glands. Flowers small. Fruit large, pale yellow greenish and red, ripening middle and end of September. Though a good late peach, yet inferior to the *late admirable*.

62 *Early yellow*, *rare ripe*, *yellow rare ripe*. Leaves with reniform glands. Flowers small. Fruit middle-sized, yellow and red. Flesh yellow. A worthless sort.

63 *White luscious rare ripe*. Leaves with reniform glands. Flowers small. Fruit middle-sized, pale green and red, ripening middle of September. A second-rate sort.

64 *Rosanne*, *petite Rosanne*, *alberge jaune* (Duham. t. 5.), *pêche jaune*, *Saint Laurent jaune*. Leaves with reniform glands. Flowers small. Fruit middle-sized, yellow and dark red, ripening middle of September. A second-rate sort.

65 *Royal Charlotte*, *early purple of Kew*, *Madeleine rouge tardive*, *Madeleine rouge à petites fleurs*, *Madeleine rouge à moyennes fleurs*, *Lord Nelson's*, *new Royal Charlotte*, *Grimwood's Royal Charlotte*. Leaves without glands. Flowers small. Fruit large, pale green and dark red, ripening beginning of September. An excellent sort. Allied to the *Royal George*.

66 *Royal George* (Hook, t. 41.) *Millet's mignonne*, *red Magdalen*, *French chancellor*, *Lockyer's mignonne*, *early Royal George*. Leaves without glands. Flowers small. Fruit pale green white and red, large, ripening about the end of August. A first-rate sort, well known and much cultivated, forces and bears well, but subject to mildew.

67 *Royal George mignonne*, *new Royal George mignonne*. Leaves without glands. Flowers small. Fruit large, pale yellow white and red. A first-rate sort, ripening about the beginning of September.

68 *Melting sanguinole*. Leaves with reniform glands. Flowers loose. Fruit large, ripening about the end of September. A second-rate sort.

69 *Pitmaston sanguinole*. Leaves with reniform glands. Flowers large. Fruit dark red, small, ripening end of September.

70 *Spring-grove*. Leaves with globose glands. Flowers large. Fruit middle-sized, pale green and red. A first-rate sort, ripening about the beginning of September.

71 *Persian spring-grove*. Leaves without glands. Flowers large. Fruit middle-sized, pale green and red. A first-rate sort, ripening about the beginning of September.

72 *Southampton*. Leaves without glands. Flowers large. Fruit large, pale green and red. A first-rate sort, very like the *noblesse*, ripening about the end of August.

73 *Sweet water*, *early sweet water*. Leaves without glands. Flowers large. Fruit middle-sized, pale green and red. A second-rate sort, ripening about the end of August.

74 *Tryford's*, *Holmes's*, *Rickett's*. Leaves without glands. Flowers large. Fruit large, pale green and red. A first-rate sort, ripening about the beginning of August. Resembles the *noblesse* and is probably a seedling from it.

75 *Williams's early purple*, *Williams's seedling*. Leaves without glands. Flowers small. Fruit pale green and dark red, large. A first-rate sort, ripening in the end of August.

*Var. β*; flesh adhering to the stone, called in English *cling-stones*, and in French *paries*.

#### *List of Cling-stone peaches.*

1 *Blood clingstone*, *claret cling-stone*. Leaves without glands. Flowers large. Fruit middle-sized, dark red, ripening in October.

2 *Braddick's North American*, *Braddick's American*, *Braddick's American yellow*, *American clingstone*. Leaves with globose glands. Flowers small. Fruit large, yellow and red. Flesh yellow, firm, and coarse. A worthless sort, ripening in September.

3 *Kennedy's Caroline*. Leaves with reniform glands. Flowers small. Fruit middle-sized, yellow and red. Flesh yellow. A second-rate sort, ripening about the end of September.

4 *Catharine* (Lang. t. 33.). Leaves with reniform glands. Flowers small. Fruit large, pale green and red, ripening about the end of September. This is one of the best late *clingstone peaches*.

5 *Williams's Catharine*. Leaves with reniform glands. Flowers small. Fruit pale green and red, large. Very like the *Catharine*, but ripening later.

6 *Catline*. Leaves with globose glands. Flowers small. Fruit middle-sized, pale yellow and red, ripening about the end of September. A second-rate sort.

7 *Congress*. Leaves with reniform glands. Flowers small. Fruit large, pale yellow and red. A second-rate sort, ripening end of September. Resembles the *Catharine*.

8 *Cooper's early*. Leaves with globose glands. Flowers small. Fruit middle-sized, pale yellow and red. A worthless sort, ripening about the end of September.

9 *Golden purple*. Leaves with reniform glands. Flowers small. Fruit middle-sized, yellow and dark red. A worthless sort, ripening about the middle of September.

10 *Heath*, *fine heath*, *heath clingstone*, *red heath*. Leaves with reniform glands. Flowers small. Fruit large, pale yellow

and red, ripening in October. In a good season this is one of the very best late *clingstone* peaches.

11 *Incomparable, pavié admirable*. Leaves with reniform glands. Flowers small. Fruit large, pale yellow and red, ripening about the beginning of October. It is a larger sort than the *Catharine*, but not so good.

12 *Lemon clingstone*. Leaves with reniform glands. Flowers small. Fruit large, yellow and red. Flesh yellow, like that of the two following; all three are esteemed in America for sweetmeats. All ripen about the end of September.

13 *Hoyle's lemon clingstone*. Leaves with globose glands. Flowers small. Fruit large, yellow and dark red. A second-rate sort.

14 *Kennedy's lemon clingstone*. Leaves with reniform glands. Flowers small. Fruit large, yellow and red. *Kennedy's Carolina clingstone, pine-apple clingstone, pine-apple, large yellow pine-apple, red mallacoton*.

15 *Old Newington, Newington*. Leaves without glands. Flowers large. Fruit large, pale green and red, ripening about the middle of September. Very good as a *clingstone* peach.

16 *Smith's Newington, early Newington, Newington*. Leaves without glands. Flowers large. Fruit middle-sized, pale green and red. A second-rate sort, ripening about the end of August.

17 *Newington of the Americans*. Leaves with globose glands. Flowers small. Fruit large, pale yellow and dark red, ripening about the end of September. Unworthy of cultivation.

18 *Paric de Pomponne, paric de Pomponne grosse, monstros pavié of Pomponne, gros Persèque rouge, gros melecoton, paric monstros, paric rouge de Pomponne, paric rouge, paric canu*. Leaves with reniform glands. Flowers large. Fruit large, yellow and dark red. A second-rate sort, ripening middle and end of October, but will not ripen, unless in a warm season and good situation.

19 *Persique, persèque, gros persèque, persèque allongée*. Leaves with reniform glands. Flowers small. Fruit large, yellow and red, ripening in October. Requires a warm soil and situation. A second-rate sort.

20 *Portugal, Alberge* of some. Leaves with reniform glands. Flowers small. Fruit large, pale yellow and red. A white-fleshed late *cling-stone*, ripening about the end of September.

21 *Sanguinole à chair adhérente*. Leaves with reniform glands. Flowers large. Fruit middle-sized, dark red, ripening about the end of October.

22 *Tonbridge*. Leaves with globose glands. Flowers small. Fruit middle-sized, yellow and dark red. A hardy sort, ripening about the end of September.

23 *Washington cling-stone*. Leaves with reniform glands. Flowers small. Fruit middle-sized, pale yellow, greenish and red. An useless sort, ripening about the middle of September.

† *Peaches not well known, but none of them are probably worth notice.*

1 *Scarlet admirable, dragon*. 2 *Aster's*. 3 *Avant pêche jaune*. 4 *Bear's early, Bear's early avant*. 5 *Belle de Beaucaire*. 6 *Belle chevreuse, chevreuse, early chevreuse*. A free-stone. Leaves with reniform glands. 7 *Belle Tellemont*. 8 *Belle de Vitry* of Duhamel. *Late admirable, bellis, admirable tardive*. 9 *Early Bourdine*. Leaves without glands. Flowers small. 10 *Bourdine royale*. 11 *Burchell's early*. 12 *Brevort's seedling*, a free-stone peach. 13 *Large early Burlington*. 14 *Chancellière, véritable chancellière à grandes fleurs*. 15 *Chevreuse d'Italie*. 16 *Late chevreuse, chevreuse tardive, Pourprée*. 17 *Cothelstone's seedling*. 18 *Double swalsh, swalze, or swolze, swalch, Dutch*. 19 *Early red cling-stone*. 20 *Early sweetwater*. 21 *Early de Tours*. 22 *Edgar's late melting*. 23 *Emperor of Russia, serrated, unique*. 24 *Favorite large red*

*cling-stone*. 25 *Fuller's galande*. Leaves with globose glands. Flowers small. 26 *New galande*. 27 *De Gloria*. 28 *Grande-ville*. Leaves without glands. Flowers large. 29 *Grandemonarque*. Leaves with reniform glands. Flowers small. 30 *Grosse de Vitry*. 31 *Langier*. 32 *Large early*. 33 *Late purple, pourprée tardive*. 34 *Gough's late red*. 35 *Largest lemon*. 36 *Limon*. 37 *Mammoth, sachamoon*. 38 *Cobb's mignonne*. Leaves with globose glands. 39 *Earliest mignonne*. Leaves with globose glands. Flowers small. 40 *Mignonne hâtive*. Leaves with globose glands. Flowers small. 41 *Large-fruited mignonne*. Leaves without glands. Flowers large. 42 *Purple mignonne*. 43 *Royal mignonne*. 44 *Woburn early mignonne*. Leaves without glands. Flowers large. 45 *Morris's red free-stone*. 46 *Morris's white free-stone*. 47 *New cut-leaved*. 48 *New York white cling-stone*. 49 *New serrated*. 50 *Early noblesse*. 51 *Noblesse of Outlands*. Leaves without glands. Flowers large. 52 *Seedling noblesse*. 53 *Pitmaston seedling noblesse*. 54 *Early yellow nutmeg*. 55 *Period's early nutmeg*. 56 *Oldmixon*. 57 *Paric*. Leaves with globose glands. Flowers large. 58 *Paric de Jalagnier*. 59 *Paric jaune*. 60 *Philadelphia free-stone*. 61 *Port Royal*. Leaves without glands. Flowers large. 62 *Pourprée grosse*. 63 *Pourprée hâtive, early avant* of some. 64 *Véritable pourprée hâtive, du vin, early purple, true early purple*. 65 *La pourprée, pourprée tardive* of the French. 66 *Queen Caroline*. 67 *Rambouillet, Rambouillon* (Lang. t. 33.) a free-stone peach. 68 *Red rare-ripe*. 69 *White rare-ripe*. 70 *New white rare-ripe*. 71 *Ronde de Vallabregues*. 72 *Saint Eagus*. 73 *Sanguinole, bloody, Batterave, drusette*. Flesh like red beet, used for preserves, as are also other varieties of *sanguinole*. 74 *Scarlet Anne*. Leaves without glands. Flowers large. 75 *De Sernach*. 76 *Superb*. 77 *Ten-douc*. 78 *Transparente rouge*. 79 *Grosse violette hâtive*. Leaves with globose glands. Flowers small. 80 *Washington*. 81 *Wellington*. 82 *Williams's New York*. 83 *Witham's seedling*. Leaves without glands. Flowers large. 84 *Yellow peach*.

\* *Culture of the peach in the open air.*

*Selection of sorts.* Abercrombie says, "except the situation be completely favourable as to climate, aspect, and shelter, forbear to plant very early or extreme late fruit, for frost will almost invariably cut off the former, when blossoming and setting, and the latter will hardly ripen under the declining heat of autumn." The peaches proper for a small garden, according to Forsyth, are; the *early avant, small mignonne, Anne, Royal George, Royal Kensington, noblesse, early Newington, Galande, early purple, chancellor, nivette, Catharine, and late Newington*. The peaches in the duke of Buccleuch's garden at Dalkeith, and which ripen in the order in which they are placed, are as follows; those marked † are planted against a hot wall. 1 *Early nutmeg*. 2 *Early Anne*. 3 *Red Magdalene*. 4 *Royal George*. 5 *Grinwood's Royal George*. 6 *Noblesse*. 7 *Galande* †. 8 *Belle-gard* †. 9 *Montauban* †. 10 *Miller's mignon* †. 11 *Smith's early Newington* †. 12 *Chancellor* †. 13 *White Magdalene*.

*Propagating to procure new varieties.*—The peach is raised from the stone; and this mode is pursued in North America, even for procuring trees for common purposes. The peaches called *Acton-Scot* and *Spring grove* were thus originated; the parent trees were dwarfs planted in large pots; these being brought into a state of vigorous health, the pistils of the blossoms of one sort were impregnated with the pollen of another; only 3 peaches were suffered to remain on each tree; and from sowing the stones of these the above-mentioned peaches and other varieties were produced; the male parent of the latter was the large French mignon, and the female the little red nutmeg, which choice is consistent with the general principle,

that the most perfect and vigorous offspring will be obtained of plants as of animals, when the male and female parent are not too closely related to each other. Some excellent papers on this subject will be found in the Hort. Trans. vol. 1. by T. A. Knight.—The *peach* does not, like many other species of fruits, much exercise the patience of the gardener who raises it from the seed; for it may always be made to bear when 3 years old. In prosecuting such experiments, Mr. Knight recommends the seedling *peach* trees to be retained in pots, and buds from them only to be inserted in older trees; for their rapid and luxuriant growth is extremely troublesome on a wall, and pruning is death to them. Mr. Knight, by leaving on the lateral branches near the extremities of the shoots, and by exposing the leaves as much as possible to the sun, in order to promote the growth and ripening of the wood, procured blossom-buds the first year from seed.

*Propagation to perpetuate varieties.*—The *peach* is generally budded on Damask-plum stocks, and some of the more delicate sorts on apricot stocks, or old apricot trees cut down, or on seedling peaches, almonds, or nectarines. Knight recommends growing almond stocks for the finer nectarines and apricots, as likely to prevent the mildew, and as being allied to the *peach*. He says, "almond stocks should be raised and retained in the nursery in pots, as they do not transplant well." Perform the budding in July and August, in the side of the stock, one bud in each: they should be inserted near the bottom for the principal wall-trees, and at the height of 3 or 4 or 5 feet for riders. The bud will shoot the following spring, and attain the length of 3 or 4 feet in the summer's growth. After the budded trees have ripened the first year's shoot, they may either be planted where they are to remain, or be trained in the nursery for 2, 3, or 4 years, till in a bearing state. Whether the plants be removed into the garden at a year old, or remain longer in the nursery, the first year's shoot from the budding must be headed down, either early in June the same year, to gain a season, or in March following, to 4, 5, or 6 eyes, to produce lateral shoots, with 1 upright leader to begin the formation of the head in a fan-like expansion; the second year's shoot should also be shortened to a few eyes at the return of June or March; and those also of the third year in such degree as may seem expedient.

*Soil.*—A good soil for *peach* trees, according to Abercrombie, "is composed of 3 parts mellow unexhausted loam, and 1 part drift sand, moderately enriched with vegetable mould. If the soil be lean and poor, and at the same time light, have the borders improved by decomposed dung and fertile mellow earth; if the ground be strong and heavy, add some light earth or dung; if very gravelly, remove the grossest part, excavating to the proper depth, and in the same proportion apply a compost as above. Let the soil be made good to the depth of 30 inches or 3 feet. The nectarine wants the warmer, richer, and deeper soil, if any difference be made. Bad cold ground or an exhausted mould, is often the cause of the trees gumming." Forsyth says, "*Peaches* require a lighter soil than pears and plums, and a light mellow loam is best."

*Choice of plants.*—Abercrombie, Forsyth, Nicol, and most authors agree in recommending the choice of trees, 2, 3, or 4 years trained. Forsyth says they should be procured in the latter end of October or beginning of November, as soon as the leaf begins to fall.

*Final planting.*—The *peach* is almost universally planted against walls in Britain; in some few warm situations they have been tried as dwarf standards or as low espaliers, covering with mats in spring to protect their blossoms. Early autumn planting is best on dry soils. Spring planting may be successfully performed in February and March, but the sooner the better, that

the trees may take root immediately before the dry warm weather commences.

*Mode of bearing.*—"All the varieties of the *peach* and *nectarine* bear the fruit upon the young wood of a year old; the blossom-buds arise immediately from the eyes of the shoots. The same shoot seldom bears after the first year, except on some casual small spurs on the two years wood, which is not to be counted upon. Hence the trees are to be pruned as bearing entirely on the shoots of the preceding year, and a full supply of every year's shoots must be trained in for successional bearers the following season."

*The summer pruning.*—In May and June, and occasionally in the succeeding months, is to regulate the shoots of the same year, and to prevent improper growths by rubbing off the buds. Pinch off fore-right buds or shoots, and pinch off or cut out, ill placed, very weakly, spongy or deformed shoots, and very strong luxuriant growths, retaining a plentiful supply of good lateral shoots in all parts of the tree, and leaving a leader to each branch. Let them mostly be trained in at full length all summer, about 3 inches asunder for next year's bearers, and divest them of any lateral twigs, to prevent a thicket-like intricacy, and to promote a healthy fruitful growth in the shoots left. In the course of the summer regulation, if any partial vacancy occurs, or should a young tree under training want an additional supply of wood, shorten some conveniently placed strong shoot in June to a few eyes, to furnish a supply of laterals the same season.

*The winter-pruning* may be performed at the fall of the leaf, and thence, according to some professional writers, at any time in mild weather until spring. It should be completed in February, or early in March, before the blossom-buds are considerably advanced, which are distinguishable by being round, plump, and prominent, while the leaf and shoot-buds are oblong and narrow. There is some advantage in pruning when the blossom-buds can be certainly known. Retain in all parts of the tree a competent supply of such regular grown shoots of last year as are apparently fruitful in blossom-buds. Most parts of these should be shortened, not indiscriminately, but according to their strength and situation; the very strong shoots should be left longest, being topped about one-fourth or one-third of their length; shoots of middling vigour reduce one-third or one-half, and prune the very weak to 2 or 3 buds. Always cut at a shoot-bud, to advance for a leader; sometimes a shoot-bud lies between a twin blossom-bud; cut half an inch above the bud. As many new shoots as will lay from 3 to 6 inches asunder may be deemed a competent supply for next year's bearers. Cut out quite close the redundant, irregular, and other improper shoots; remove or reduce some part of the former bearers of the two preceding years; cutting the most naked quite away, and others down to the most eligible younger branch or well-placed shoot. Also take out all diseased and dead wood, retaining young where necessary to fill a vacancy. In cold and late situations, T. A. Knight recommends a mode of pruning adapted to obtain fruit-bearing spurs on the *peach*, and these spurs he finds best calculated in such situations and late seasons to generate well organised and vigorous blossoms. "Instead of taking off so large a portion of the young shoots, and training in a few only, to a considerable length, as is usually done, and as I should myself do, to a great extent in the vicinity of London, and in every favorable situation, I preserve a large number of the young shoots, which are emitted in a proper direction, in early spring by the yearling wood, shortening each where necessary, by pinching off the minute succulent points, generally to the length of 1 or 2 inches. Spurs which lie close to the wall are thus made, upon which numerous blossom-buds form very early in the ensuing summer. It is only in cold and late situa-

tions that the mode of management above suggested is recommended. The spurs must not be shortened in the winter or spring till it can be ascertained what parts of them are provided with leaf-buds." In a very cold and elevated situation, C. Harrison (Hort. trans. 2. p. 14.) prunes and nails his *peach* and *nectarine* trees in December and January, taking away two-thirds of the young shoots; and in two hand-dressings in May and July, he leaves the lowest and weakest shoots for a succession in the year following, pinching off the leading and other shoots. The chief rule which he follows, is never to allow the shoots that are left for bearing fruit to run to any length from the strong wood, for which reason, when the trees are pruned in autumn, the bearing branches for the next year are shortened, taking care not to leave more fruiting-buds than he thinks will come to perfection.

*Training.*—The *peach* is almost universally trained in the fan-manner, either straight-lined or wavy, though some allege that it bears better in rich soils, when two leading branches are encouraged, and the bearing shoots trained outwards from these, so as to form a sort of horizontal training.

*Thinning the fruit.*—"In favorable seasons the blossoms often set more fruit than the trees can support, or than have room to attain full growth, and if all were to remain it would hurt the trees in their future bearing, therefore they should be timely thinned, when of the size of large peas or half-grown gooseberries. There should be a preparatory thinning before the time of stoning, and a final thinning afterwards, because most plants, especially such as have overborne themselves, drop many fruit at that crisis. Finish the thinning with great regularity, leaving those retained at proper distances, 3, 4, or 5 on strong shoots, 2 or 3 on middling and 1 or 2 on the weaker shoots, and never leaving more than one peach at the same eye. The fruit on weakly trees thin more in proportion."—*Abercrombie*.

*Renovating old decaying trees.*—Head down, and renew the soil from an old upland pasture, and if the bottom of the border is moist, or if the roots have gone more than 2 feet downwards, pave the bottom, or otherwise render it dry, and impervious to roots at the depth of 20 inches or 2 feet from the surface. This plan will be found almost universally successful, in restoring sufficient vigour to resist insects and diseases, and produce abundance of fruit.

*Protecting the blossoms.*—This may be done by various modes. Forsyth recommends old netting as the best covering. C. Harrison protects his trees from the frost in the month of January by branches of broom; these are previously steeped in soap-suds mixed with one-third of urine for 48 hours, in order to clear them from insects, and when dry are disposed thinly over the whole tree, letting them remain on only until the trees begin to break into leaf. At the time of the blooming and setting of the fruit, he applies cold water in the following manner, viz. if, upon visiting the trees before the sun is up in the morning after a frosty night, he finds there is any appearance of frost on the bloom or young fruit, he waters the bloom or young fruit thoroughly with cold water from a garden-engine, and he affirms that even if the blossoms or young fruit are discoloured, this operation recovers them, provided it be done before the sun comes upon them. Dr. Noehden remarks, Hort. trans. vol. 2. "that this operation of watering before sun-rise, in counteracting the frost, seems to produce its effect in a manner analogous to the application of cold water to a frozen joint or limb, which is injured by the sudden application of warmth." J. Carr, of St. Ann's, near Leeds, protects his blossoms by retardation; and the means used are, detaching the branches of the trees from the walls in autumn, and not refixing them till late in the

spring, when the blossoms are about to expand. In addition to unfastening the trees, a wedge is put in behind the main stem to throw it forward, in order that the tree may receive as little protection from the wall as possible. (*Calcd. mem.* 3. p. 25.)

*Ripening peaches on leafless branches.*—Whenever the part of the bearing branch which extends beyond the fruit is without foliage, the fruit itself rarely acquires maturity, and never its proper flavour and excellence. This Knight conjectures to be owing to the want of the returning sap, which would have been furnished by the leaves, and he proved it experimentally by inarching a small branch immediately above the fruit. The fruit in consequence acquired the highest degree of maturity and perfection. (*Hort. trans.* 2. p. 25.)

*Insects and diseases, &c.*—The leaves of the *peach* tree are liable to the attacks of the acarus, its greatest enemy, and also to be devoured by the chermes, aphid, and even a much smaller insect, the thrips. These are to be kept under by the usual means of watering over the leaves, and fumigation with tobacco smoke. The honey-dew, mildew, gum, and canker are chiefly to be kept under by regimen; dusting with sulphur has been found to destroy the mildew, but the only certain way of remedying it is by a renewal of the soil, which will commonly be found old mould long in use and too rich, and by abundance of air. J. Kirk (*Calcd. hort. mem.* 4. p. 159.) has tried renewing the soil for 50 years, and always found it an effectual remedy.

The young wood of the *peach* tree is liable to be covered with black spots or blotches, which Kenment proved to be produced by over rich soil (*Calcd. hort. mem.* 2. p. 79 and 80.). The fruit, when ripe, is very liable to the attacks of the wasp, the large fly, and especially the earwig, &c., the two first may be excluded by nets, or enticed by honied bottles, and the latter caught by the beetle-trap, reeds or bean-stalks laid in behind the leaves, and examined every morning.

*Gathering.*—Use the peach-gatherer, and gather one day or two before the fruit is to be used, and before it be quite ripe, laying it on clean paper in a dry airy part of the fruit-room.

*Use of hot walls.*—The ripening of the *peach* may be accelerated in the open air, when planted against a hot wall, by the application of gentle fires in cold moist weather, in August and September. This will ripen the fruit and wood; but no attempt should ever be made to accelerate the blossom early in spring, as without the protection of glass they are almost certain of being cut off.

#### \* \* Culture of the Peach-house.

*Soil.*—*Abercrombie* uses the same soil as for those grown in the open air. The border or bed to be 30 inches or 3 feet deep. The *nectarine* wants the warmer and richer and deeper soil, if any difference be made. The soil for *peaches* that are forced, M'Phail recommends to be, "fine, loamy, well prepared earth, of a medium texture, neither very light nor of a strong binding quality, well mixed with some good manure. The border to be 4 feet deep and so broad that the roots cannot get into a bad soil" (*Gard. Rem.* 18.). The bottom of the border being made comfortable by draining and paving, if not naturally dry. Nicol directs the breadth of the border to be the width of the house within, and to the extent of 10 or 12 feet without. The average depth 30 inches at the least; but if a yard it would not be too much. The soil to be thus composed: three-fourths strong loam, one-eighth part of light sandy earth, and an eighth part of rotten stable-yard dung, with a competent quantity of lime and marl, all being properly mixed before planting.—*Kal.* p. 291.

*Choice of sorts.*—Select from the catalogue given, according to quality. The following list is given by *Abercrombie* as the most proper for forcing:—

**Native of the Coast (ex icon.).** ☉. ? S. Native of the Indies. p. 249. Pl. t. 55. Flowers rose-coloured.

**Car-seeded Indigo.** Pl. 1 foot.

19 *I. RU'SCA*; stem erect, beset with long brown hairs; leaves with 2 or 3 pairs of cuneated, mucronate, pilose leaflets; stipulas filiform, also pilose; spikes or racemes of flowers axillary or lateral; calyx and legume clothed with fuscous hairs. ☉. S. Native of Guinea, among grass. Flowers small, flesh-coloured.

**Fuscous-haired Indigo.** Fl. July, Aug. Clt. 1823. Pl. 1 ft.

80 *I. HIRSU'TA* (Lin. spec. 1062. but not of Jacq.) stem suffrutescent, erect; branches terete, and are as well as the petioles and peduncles hairy; leaves with 3-5 pairs of obovate-oblong, obtuse leaflets, which are villous on both surfaces; racemes longer than the leaves; legumes tetragonal, 6-seeded, pendulous, hairy. ☉. S. Native of the East Indies and Guinea. Lam. ill. t. 626. f. 3. *I. Indica*, Mill. dict. no. 4. but not of Lam.—Burm. zeyl. 37. t. 14. Rheed. mal. 1. t. 55. Flowers purple or red.

**Hairy Indigo.** Fl. July, Aug. Clt. 1823. Pl. 1 foot.

81 *I. ASTRAGALINA* (D. C. prod. 2. p. 228.) stem herbaceous, erect, rough from simple hairs; leaves having 4 pairs of obovate, very obtuse leaflets, which are villous on both surfaces and white beneath; racemes shorter than the leaves; legume tetragonal, pendulous, very hairy, 2-seeded. ☉. S. Native of Senegal. *Astragalus*, Perr. in litt. 1825. This species is very nearly allied to the preceding, but the hairs on the upper surface of the leaves are adpressed and scarcely or not bifurcate. Flowers red.

**Milk-vetch-like Indigo.** Pl. 1 foot.

82 *I. SENEGALENSIS* (Lam. dict. 3. p. 248.) stem herbaceous, decumbent; branches slender, angular; leaves with from 1-3 pairs of leaflets; leaflets oblong, beset with adpressed bristly hairs on both surfaces; racemes longer than the leaves; legumes pendulous, much compressed, puberulous, oblong, mucronate, 3-4-seeded. ☉. S. Native of Senegal. *I. tetrasperma*, Vahl. ex herb. Juss. Habit of a species of *E'reum*. This is a very distinct species. Flowers red.

**Senegal Indigo.** Pl. procumbent.

83 *I. PARVULA* (Gailliaud, voy. mer. part. bot. t. 3. f. 1.) branches diffuse; leaves pinnate, with 2 or 3 pairs of obovate, grey leaflets; stipulas awl-shaped; spike of flowers about equal in length to the leaves. ☉. F. Native of Nubia. Flowers red.

**Least Indigo.** Pl. diffuse.

84 *I. LINEARIS* (D. C. prod. 2. p. 228.) stems herbaceous, rather diffuse; branches slender, angular; leaves having 1 or 2 pairs of linear leaflets, which are beset with adpressed bristly hairs on both surfaces; racemes rather longer than the leaves; legumes pendulous, linear, mucronate, straight, much compressed, scabrous, and puberulous, 10-12-seeded. ☉. S. Native of Senegal. Flowers red.

**Linear-leafletted Indigo.** Pl. diffuse.

85 *I. HENDECAPHYLLA* (Jacq. icon. rar. t. 570. coll. 2. p. 358.)

FIG. 33.

stem herbaceous, prostrate; branches terete and are as well as the leaves slightly covered with cinereous pubescence on both surfaces; leaves with 4-5 pairs of obovate, oblong, cuneated, obtuse leaflets; racemes shorter than the leaves; legumes reflexed, terete, but slightly tetragonal, straight, villous, 8-10-seeded. ☉. S. Native of Guinea, particularly of Senegal and the island of St. Thomas. Ker. bot. reg. 789. Beau.

fl. d'ow. 2. t. 84. Flowers rose-coloured. The plants of this species which are cultivated in the gardens are almost smooth, except the under surface of the leaves.

**Eleven-leafletted Indigo.** Fl. July, Aug. Clt. 1824. Pl. pr.

86 *I. PERROTTE'II* (D. C. prod. 2. p. 228.) stems herbaceous, prostrate, young ones compressed, and clothed with villous pubescence; leaves with 3 or 4 pairs of oblong-obovate leaflets, clothed on both surfaces with canescent pubescence, besides being dotted beneath; racemes crowded with flowers, shorter than the leaves; legumes oblong, terete, straight, pubescent, 3-4-seeded. ☉. ? S. Native of Senegal. *I. prostrata*, Perr. in litt. but not of Willd. Very like *I. encephylla*, but the petioles are longer, the stipulas linear-subulate, and the legume 3-4-seeded. Flowers red.

**Perrotte's Indigo.** Pl. prostrate.

87 *I. SESSILIFLORA* (D. C. prod. 2. p. 228.) stem herbaceous, erect, much branched; branches terete, and are as well as the leaves clothed with adpressed silky pubescence; leaflets 3 or 4 pairs, obovate; spikes crowded with flowers, sessile in the axils of the leaves, and shorter than them; legume terete, pubescent, straight, 4-6-seeded. ☉. S. Native of Senegal. Root simple, cylindrical, rather fusiform. Flowers red.

**Sessile-flowered Indigo.** Pl. 1 foot.

88 *I. A'NCERS* (Vahl. in Poir. suppl. 3. p. 147.) stems herbaceous, compressed, 2-edged, glabrous; leaflets 9 or 11, alternate, obovate-oblong, obtuse, smoothish; racemes longer than the leaves; legumes pendulous, linear, compressed, acute, puberulous, 8-10-seeded. ☉. S. Native of Guinea. Flowers rose-coloured.

**Two-edged-stemmed Indigo.** Pl. prostrate.

89 *I. ALTERNANS* (D. C. prod. 2. p. 229.) branches filiform, and are as well as the leaves clothed with adpressed, bristly hairs; leaflets 7-11, alternate, obovate, or oblong, a little mucronulate; racemes longer than the leaves; calycine lobes ending each in a setaceous acumen, about equal in length to the corolla; legumes reflexed. ☉. ? G. Native of the Cape of Good Hope. Burch. cat. no. 2079. Flowers reddish. Perhaps the same as *I. punctata*, Thunb. prod. 133. fl. cap. 599. but there are nothing like dots on the present plant to be seen.

**Alternating-leafletted Indigo.** Pl. 1 foot.

90 *I. CAROLINIANA* (Walt. cat. 187.) stem herbaceous, erect; branches terete; leaves with 6 or 7 pairs of oval-oblong leaflets, which are slightly covered with adpressed pubescence; racemes slender, longer than the leaves; legumes pendulous, usually 2-seeded, reticulately veined. ☉. G. Native of North America, from Carolina to Florida. Mich. fl. bor. amer. 2. p. 68. Flowers blue.

**Carolinian Indigo.** Pl. 1 foot.

91 *I. LAGASCA'NA* (D. C. prod. 2. p. 229.) stems herbaceous, erect; branches terete, beset with adpressed bristly hairs, canescent at the apex; stipulas linear, acuminate, rufous, and scarious; leaves with 5 pairs of obovate or oblong, mucronate leaflets, young ones clothed on both surfaces with adpressed bristly hairs, the adult ones only on the under surface; racemes pedunculate, longer than the leaves; legumes reflexed. Native of Peru, at Cheuchim. Flowers red?

**Lagasca's Indigo.** Pl. 1 foot.

92 *I. PLUMOSA* (Spreng. syst. 3. p. 278.) plant decumbent and villous; leaflets usually about 8 pairs, spatulate, emarginate; racemes few-flowered, on long peduncles; calycine segments at length elongated, very villous and plumose. ☉. ? S. Native of?

**Feathery-calyxed Indigo.** Pl. decumbent.

93 *I. ASPERA* (Perr. in litt. D. C. prod. 2. p. 229.) stem herbaceous, erect, branched; branches terete; leaves and peduncles covered with adpressed strigæ; leaves with 1 or 2 pairs of linear, acute leaflets; racemes slender, longer than the leaves; legumes

reflexed. ☉. S. Native of Senegal, on plains near Richard-Tole. Flowers red. Habit nearly like that of *I. psoraleoides*, but differs in the leaves being pinnate.

*Rough Indigo*. Pl. 1 foot.

94 *I. JAMAICENSIS* (Spreng. syst. 3. p. 277.) herbaceous; leaves with 3 pairs of oblong, mucronate leaflets, and are as well as the erect angular branches beset with adpressed bristly hairs; racemes straight, exceeding the leaves; legumes reflexed, almost terete. ☉. S. Native of Jamaica. Flowers red.

*Jamaica Indigo*. Pl. 1 foot.

95 *I. SPICATA* (Forsk. descr. 13. Vahl. symb. 1. p. 56.) stem herbaceous, decumbent, villous; leaves with 4 pairs of obovate villous leaflets, outer ones largest; stipulas lanceolate-subulate, dry; spikes longer than the leaves; legume terete, torulose, pendulous.—Native of Arabia Felix. Flowers red. Allied to *I. hirsuta*.

*Spicate-flowered Indigo*. Pl. decumbent.

96 *I. SCABRA* (Roth, nov. spec. 359.) the whole plant is scabrous from adpressed strigæ: stem erect, tetragonal; leaves with 4 pairs of oval, mucronate leaflets; racemes elongated, loose, exceeding the leaves; legume pendulous, a little arched, strigose, and somewhat tetragonal. ☉. ? S. Native of the East Indies.

*Scabrous Indigo*. Pl. 1 foot.

97 *I. MICROCARPA* (Desv. journ. bot. 1814. 1. p. 79.) stem?; leaves with 4 pairs of leaflets, covered with white hairs; racemes shorter than the leaves; legume very short, white, 2-seeded. Native of Brazil.

*Small-fruited Indigo*. Pl. ?

§ 4. *Brachypoda* (from βραχυς, *brachys*, short, and πους, *pous*, *podus*, a foot; in reference to the petioles being very short). *D. C. prod.* 2. p. 229. Leaves impari-pinnate; leaflets approximate. Petioles very short.

98 *I. FRAGRANS* (Retz, obs. 4. p. 29.) stems terete, rather pilose; leaves with 1 or 2 pairs of leaflets; leaflets ovate, terminal one obovate and larger; racemes longer than the leaves, 3-5-flowered; legume linear, tetragonal. ♀. S. Native of the East Indies.—Pluk. phyt. t. 166. f. 1. Flowers red.

*Fragrant Indigo*. Fl. June, July. Clt. 1816. Pl. 1 foot.

99 *I. PUSILLA* (Lam. dict. 2. p. 248.) stems terete, beset with a few adpressed strigæ; leaflets 3 or 4, alternate, oval, clothed beneath with white hairs, terminal one oblong and longer; racemes a little longer than the leaves, few-flowered; legume deflexed, linear, rather terete, 4-6-seeded, hardly puberulous. ☉. ? S. Native of Madagascar and the Island of Bourbon. *I. tenella*, Vahl. mss. Flowers red.

*Small Indigo*. Pl. prostrate?

100 *I. GLABRA* (Lin. spec. 1062.) stem herbaceous, smoothish; leaves with 1 or 2 pairs of obovate leaflets, which are smooth above and pubescent beneath; racemes few-flowered, length of leaves; legumes horizontal, glabrous, terete, acute. ☉. H. Native of the East Indies.—Pluk. alm. t. 166. f. 1. Branches with a few long hairs. Stipulas setaceous. Flowers red.

*Glabrous Indigo*. Fl. July, Aug. Clt. 1820. Pl. 1 ft. ? or pr.

101 *I. ENNEAPHYLLA* (Lin. mant. 272.) stem herbaceous, procumbent, pubescent; branches compressed; leaves with 3-5 pairs of obovate-oblong, approximate leaflets; racemes sessile, length of leaves; legume straight, somewhat tetragonal, 2-seeded. ☉. S. Native of the East Indies. *Hedysarum prostratum*, Burm. ind. t. 55. f. 1.—Pluk. alm. t. 166. f. 2. Stipulas membranous, dilated at the base, acuminate at the apex. Corolla dark purple.

*Nine-leafletted Indigo*. Fl. July, Aug. Clt. 1776. Pl. pr.

102 *I. PENTAPHYLLA* (Lin. syst. veg. 564.) stems herbaceous, depressed; leaves with 2 pairs of oval leaflets; peduncles 2-flowered. ☉. S. Native of? Very like the preceding species. Flowers red.

*Five-leafletted Indigo*. Pl. prostrate.

103 *I. SEMITRILUGA* (Forsk. descr. 137. Vahl. symb. 1. p. 56.) stem suffruticose, prostrate; branches terete, clothed with hoary villi; leaves with 2 pairs of obcordate, mucronate leaflets; racemes longer than the leaves; legumes pendulous, oblong, torulose, 2-seeded. ♀. S. Native of Arabia and eastern Asia. Mart. acad. mon. 6. p. 189. The whole plant is very villous. Flowers red. Perhaps only a variety of *I. enneaphylla*.

*Var. β*; legumes 4-seeded. ♀. G. Native of Persia. *I. argentea*, Burm. fl. ind. 171. but not of Lin. *Coronilla Persica argentea*, Garcin. in herb. Burm.

*Half-three-paired-leafletted Indigo*. Shrub prostrate.

104 *I. PULCHRA* (Willd. spec. 3. p. 1239.) stems fruticose; branches terete, hairy; leaves with 1 to 3 pairs of oblong, acute, villous leaflets, those on the branches are sometimes simple; racemes ovate, villous, with rufous hairs, length of leaves, terminal, somewhat capitate; legume oblong, hairy, 2-3-seeded. ♀. S. Native of Guinea. *I. ferruginea*, Thonn. in herb. Puer. *I. rufescens*, Poir. suppl. 3. p. 148. Flowers red.

*Fair Indigo*. Shrub 1 foot.

105 *I. MINIATA* (Ort. dec. 98.) stems herbaceous, procumbent, and are as well as the leaves clothed with adpressed silky pubescence; leaves with 2-3 pairs of oblong-linear leaflets; racemes pedunculate, longer than the leaves; legumes linear, tetragonal, 4-seeded. ☉. S. Native of Cuba. Flowers vermilion-coloured.

*Vermilion-flowered Indigo*. Pl. procumbent.

106 *I. CYTISOIDES* (Thunb. prod. 133.) stem shrubby, erect; branches angular, and are as well as the leaves clothed with fine adpressed pubescence; leaves with 2 or 3 pairs of oblong, mucronate leaflets; racemes twice the length of the leaves; legumes somewhat cylindrical, and somewhat torulose. ♀. G. Native of the Cape of Good Hope. Jacq. hort. schœnbr. t. 235. Curt. bot. mag. 742. *I. mucronata*, Lam. dict. 3. p. 247. *Psoralea cytisoides*, Lin. spec. 1076.—Pluk. phyt. t. 185. f. 5. Racemes sometimes terminal from the abortive branches. Bractæas ovate, mucronate, large, deciduous. Flowers rose-coloured. Calyx hoary.

*Cytisus-like Indigo*. Fl. July, Aug. Clt. 1774. Sh. 3 to 5 ft.

107 *I. LOTODES* (Lam. dict. 3. p. 247.) stem shrubby, erect; branches terete, clothed with hoary pubescence; leaves with 2 pairs of lanceolate, velvety leaflets; racemes longer than the leaves; calyx short; legume linear, a little arched, velvety, rather torulose. ♀. G. Native of the Cape of Good Hope. Comm. hort. 2. t. 84. Flowers red. Very like the preceding species.

*Lotus-like Indigo*. Fl. July, Aug. Clt. 1800. Sh. 2 to 3 ft.

108 *I. NIGRICANS* (Vahl. in herb. Juss. Pers. ench. no. 46.) stem much branched, twiggy; leaves with 2 pairs of linear-cuneate leaflets; flowers panicked; legume short, strigose. ☉. ? S. Native of Guinea. Allied to *I. pulchra*, but differs in the pedicels rising from the axils of the superior leaves, solitary, 1-flowered, and therefore constituting a racemose panicle. Stems, pedicels, petioles, and under surface of leaves beset with white strigæ. Legume oval, 2-3-seeded, clothed with brown villi. Flowers purple.

*Blackish Indigo*. Pl. 1 foot.

109 *I. CAPILLARIS* (Thunb. prod. 133. fl. cap. 599.) stem suffruticose; branches slender, terete, glabrous; leaves with 2 or 3 pairs of filiform, acute, glabrous, approximate leaflets; racemes pedunculate, much longer than the leaves. ♀. G.

Native of the Cape of Good Hope. *J. tenuifolia*, Lam. dict. 3. p. 249. Flowers red.

*Capillary-leaved Indigo*. Shrub  $\frac{1}{2}$  foot.

110 *I. PERRINIA'NA* (Spreng. neue. entd. 2. p. 161.) branches terete, beset with adpressed pili; leaves with usually 4 pairs of linear, obtuse, mucronate leaflets, which are lined above, and silky beneath; racemes few-flowered; legumes linear, clothed with rusty villi.  $\odot$ . ? S. Native of South America.

*Perrin's Indigo*. Pl. 1 foot?

111 *I. ANGUSTIFOLIA* (Lin. mant. 272.) stem shrubby; branches terete, hoary; leaves with 2-3-4 or 5 pairs of approximate, linear, obtuse leaflets, which are canescent on the under surface, and somewhat revolute at the margins; racemes 3 times longer than the leaves; calyxes canescent.  $\mathfrak{h}$ . G. Native of the Cape of Good Hope. Thunb. fl. cap. 599. Sims, bot. mag. 465. *Polygala pinnata*, Burm. cap. 20. Corolla purplish.

*Narrow-leaved Indigo*. Fl. Ju. Oct. Clt. 1774. Sh. 1 to 2 ft.

112 *I. HUMBOLDTIA'NA* (Spreng. syst. 3. p. 276.) shrubby, erect, smoothish; leaves with 3 pairs of spatulate, mucronate leaflets, which are rather silky beneath; racemes exceeding the leaves; legumes pendulous, nearly terete.  $\mathfrak{h}$ . G. Native of Mexico. *I. mucronata*, Willd. herb. Flowers red.

*Humboldt's Indigo*. Shrub 2 to 3 feet.

113 *I. ORNITHOPODIODES* (Schlecht. and Cham. in Linnæa. 5. p. 577.) leaves with 2 pairs of leaflets; pili strigose, cinereous; stems diffuse, prostrate; racemes on long peduncles, few-flowered, exceeding the leaves; calycine segments subulately-acuminated, equal in length to the corolla; legume deflexed, 8-seeded, straight.  $\odot$ . S. Native of Mexico. Habit of *I. encaphylla*. Stipulas subulate. Flowers red.

*Ornithopus-like Indigo*. Pl. prostrate.

§ 5. *Digitata* (from *digitatus*, fingered, in reference to the leaflets all rising from a common centre, as the fingers of the hand). Leaflets 3 or 5, rising from the same dot or centre, either from the top of petioles, or directly from the branches.

114 *I. SULCATA* (D. C. prod. 2. p. 231.) branches angular and furrowed, rather canescent; petioles wanting; leaflets 3-5, linear, mucronate, stiff, with somewhat revolute margins, clothed with hoary villi beneath; flowers axillary, on short pedicels, in fascicles.  $\mathfrak{h}$ . G. Native of the Cape of Good Hope. Flowers red.

*Furrowed-stemmed Indigo*. Sh. 1 to 2 feet.

115 *I. ASPALATHOIDES* (Vahl. in herb. Juss. D. C. prod. 2. p. 231.) branches terete, hoary from adpressed down, which is fixed by the centre; petioles wanting; leaflets 3-5, linear, very slender, somewhat complicated, beset with adpressed hairs; pedicels axillary, solitary, 1-flowered; legumes straight, terete, 4-6-seeded, rather puberulous.  $\mathfrak{h}$ . S. Native of Ceylon and Malabar. *Aspalathus Indica*, Lin. spec. 1001.—Burm. fl. ind. 155.—Pluk. phyt. t. 201. f. 1.—Rheed. mal. 9. t. 3. Flowers red? Habit of *Aspalathus*, but the stamens are diadelphous, and the down and the legumes are that of *Indigofera*.

*Aspalathus-like Indigo*. Fl. Ju. Jul. Clt. 1817. Sh. 1 to 2 ft.

116 *I. FILIFORMIS* (Thunb. fl. cap. 598.) branches terete, young ones rather hairy; petioles almost wanting; leaflets 5, oblong, cuneate, mucronate, strigose above, but white beneath, with the margins revolute; racemes pedunculate, much longer than the leaves; legumes straight, terete, spreading, glabrous, 8-10-seeded.  $\mathfrak{h}$ . G. Native of the Cape of Good Hope. *I. candicans*, Sieh. pl. exsic. cap. no. 55. Very like the following species, but differs in the flowers being loosely racemose, not capitate. Thunberg says his plant has terminal racemes of flowers; in ours they are axillary.

*Filiform Indigo*. Fl. Ju. Aug. Clt. 1822. Shrub 1 to 2 ft.

117 *I. ALOPECUROIDES* (D. C. prod. 2. p. 231.) branches

terete, young ones hairy; petioles very short; leaflets 5, elliptic-oblong, mucronate, clothed with adpressed strigæ on both surfaces; peduncles axillary, slender, 3 times longer than the leaves, bearing at the top an ovate head of flowers.  $\mathfrak{h}$ . ? G. Native of the Cape of Good Hope. *Lötus alopecuroides*, Burm. cap. p. 23. Flowers red.

*Fox-tail-like Indigo*. Shrub.

118 *I. CORIA'CEA* (Ait. hort. kew. 3. p. 68.) branches terete, hairy; petioles very short; leaflets 5, obovate, cuneate, somewhat emarginate and mucronate, beset with adpressed strigæ above, but hoary beneath; peduncles 3 times longer than the leaves; flowers disposed in dense heads; legumes straight, terete, glabrous.  $\mathfrak{h}$ . G. Native of the Cape of Good Hope. *Lötus Mauritanicus*, Lin. spec. 1091. *I. Mauritanica*, Thunb. fl. cap. 598. *Lötus fruticosus*, Berg. cap. 226. *Lötus racemoides*, Poir. suppl. 3. p. 508. *Indigofera*, Sieh. pl. exsic. cap. no. 54. This plant has very much the habit of *Dorjenum*. Flowers red or purple.

*Coriaceous Indigo*. Fl. July, Aug. Clt. 1774. Sh. 2 to 3 ft.

119 *I. SARMENTOSA* (Lin. fil. suppl. 334. Thunb. fl. cap. 596.) stem very short, much branched; branches filiform; leaves and calyxes clothed with adpressed strigose pubescence; petiole very short; leaflets ovate, small, mucronate; peduncles axillary, usually 2-flowered, much longer than the leaves; legumes cylindrical, glabrous.  $\mathfrak{h}$ . G. Native of the Cape of Good Hope. *Ononis filiformis*, Lin. mant. 266. *Lötus exstipulatus*, Berg. cap. 227. Flowers red.

*Var.  $\beta$ , microphylla* (Lam. dict. 3. p. 250.) leaves with 3-5 leaflets.

*Sarmentose Indigo*. Fl. June, July. Clt. 1786. Pl. straggling.

120 *I. DIGITATA* (Thunb. fl. cap. 598.) branches slender, angular at the apex, and are, as well as the leaves and calyxes, somewhat canescent from adpressed strigæ; leaves stalked, palmately 5-6-foliate; leaflets lanceolate-linear, acute, complicated; peduncles much longer than the leaves, bearing at the top of each a dense ovate-oblong spike of flowers.  $\mathfrak{h}$ . G. Native of the Cape of Good Hope. Flowers red.

*Digitate-leaved Indigo*. Shrub 1 to 2 feet.

121 *I. BURCHELLII* (D. C. prod. 2. p. 231.) branches slender, angular at the apex, and are, as well as the petioles and leaves, hoary from adpressed strigæ; leaves stalked, 4-5-foliate; leaflets obcordate, mucronate, hoary beneath, and rather strigose above.  $\mathfrak{h}$ . G. Native of the Cape of Good Hope. Burch. cat. no. 2918. Flowers red.

*Burchell's Indigo*. Shrub 1 to 2 feet.

122 *I. SESSILIFOLIA* (D. C. prod. 2. p. 231.) branches terete, young ones canescent, at length becoming spinose; petioles wanting; leaflets 3, obovate-cuneate, retuse, somewhat emarginate, pubescent beneath; spikes pedunculate, longer than the leaves; legumes compressed, rather arched, glabrous, 4-seeded.  $\mathfrak{h}$ . G. Native of the Cape of Good Hope. This species is nearly allied to *I. spinosa*, but differs in the leaves being all sessile, and in the legume being compressed, not terete. Flowers red.

*Sessile-leaved Indigo*. Shrub 1 to 2 feet.

123 *I. SPINOSA* (Forsk. descr. 137. Vahl. symb. 1. p. 55.) branches grey; leaves on short petioles, trifoliate; leaflets obovate, hoary; stipulas acrose; peduncles spinose, 2-3-flowered, twice the length of the leaves; legume terete, but somewhat tetragonal, scabrous.  $\mathfrak{h}$ . G. Native of Arabia Felix, and the East Indies. This plant has the habit of a species of *Alhagi*. Flowers red.

*Spiny Indigo*. Fl. May, July. Clt. 1820. Shrub 1 to 2 ft.

124 *I. CANDICANS* (Ait. hort. kew. 3. p. 67.) branches slender, angular, clothed with adpressed silky canescent down; leaves stalked, trifoliate; leaflets lanceolate-linear, silky beneath; stipulas small; spikes pedunculate, few-flowered, much longer than

the leaves; legumes cylindrical, straight.  $\frac{1}{2}$ . G. Native of the Cape of Good Hope. Flowers red. Curt. bot. mag. 198.

*White-leaved Indigo*. Fl. May, June. Clt. 1774. Sh. 1 to 2 ft.

125 *I. PSORALEOIDES* (Lin. syst. nat. 469.) branches angular, hardly pubescent; leaves petiolate, trifoliate; leaflets lanceolate, clothed with adpressed pubescence beneath; stipulas linear-subulate, elongated; racemes pedunculate, much longer than the leaves; legumes pendulous.  $\frac{1}{2}$ . G. Native of the Cape of Good Hope. Lam. ill. t. 626. f. 4. Sims, bot. mag. 476. *Cytisus psoraleoides*, Lin. spec. 1043. Burn. cap. prod. p. 22. *I. racemosa*, Lin. spec. 1062.—Pluk. phyt. t. 320. f. 3. ? but the racemes in the figure are shorter than the leaves. Flowers red.

*Psoralea-like Indigo*. Fl. Ju. Sept. Clt. 1758. Shrub 2 feet.

126 *I. CINEREA* (Willd. spec. 3. p. 1225.) branches rather angular, clothed with greyish silky pubescence; leaves petiolate, trifoliate; leaflets oblong-lanceolate, silky; racemes length of leaves; legumes spreading, linear, mucronate, silky.  $\frac{1}{2}$ . S. Native of the East Indies. Flowers small, red.

*Grey Indigo*. Shrub 2 feet.

127 *I. MOLUCCANA* (D. C. prod. 2. p. 232.) branches slender, terete, puberulous; leaves petiolate, trifoliate; leaflets oblong-lanceolate, pubescent beneath; flowers axillary, sessile; legumes spreadingly deflexed, puberulous, rather tetragonal, 4-6-seeded.  $\frac{1}{2}$ . ? S. Native of the Moluccas. The middle leaflet is on a short petiole. The flowers are probably red.

*Molucca Indigo*. Shrub.

128 *I. STIPULARIS* (Link. enum. 2. p. 250.) stem beset with short strigæ; leaves trifoliate; leaflets oval, with a few adpressed hairs; stipulas oval, acute; racemes longer than the leaves.  $\frac{1}{2}$ . G. Native of the Cape of Good Hope. Perhaps belonging to a different section. Flowers red.

*Stipular Indigo*. Fl. May, July. Clt. 1824. Sh. 1 to 2 feet.

129 *I. INCA'NA* (Thunb. prod. 132. fl. cap. 596.) stems decumbent, very much branched, suffrutescent at the base; branches clothed with silky pubescence; leaves petiolate, trifoliate; leaflets ovate, acute, silky; legume reflexed, silky.  $\frac{1}{2}$ . G. Native of the Cape of Good Hope. Flowers red.

*Hoary Indigo*. Fl. May, July. Clt. 1812. Shrub decumbent.

130 *I. ARCUATA* (Willd. spec. 3. p. 1228.) branches angular, clothed with hoary pubescence; leaves petiolate, trifoliate; leaflets elliptic, obtuse, mucronate, canescent beneath; racemes about equal in length to the petioles; legume arched, reflexed, tetragonal, canescent.  $\odot$ . ? S. Native of the East Indies. Flowers red.

*Arched-podded Indigo*. Pl.

131 *I. TRI'TA* (Lin. fil. suppl. 335.) stem erect; branched at the base; leaves petiolate, trifoliate; leaflets ovate-lanceolate, acute; racemes shorter than the leaves.  $\odot$ . ?  $\delta$ . ? S. Native of the East Indies. Flowers red.

*Worn Indigo*. Fl. June, July. Clt. 1802. Pl. 1 foot.

132 *I. HEDYSAROIDES* (Lam. dict. 3. p. 250.) stem erect, branched at the base; leaves petiolate, trifoliate; leaflets ovate, obtuse; legume arched.  $\frac{1}{2}$ . G. Native of the East Indies, ex Rheed. mal. 9. t. 36. and perhaps of China if *I. coccinea*, Lour. coch. p. 457. be the same. Flowers deep red.

*Hedysarum-like Indigo*. Fl. June, Aug. Clt. 1822. Pl. 1 ft.

133 *I. ERECTA* (Thunb. prod. 133. fl. cap. 597.) stem herbaceous, nearly erect; leaves petiolate, trifoliate; leaflets obovate, acute, glabrous above, and clothed with fine pubescence beneath; legume cylindrical, acute, reflexed, pubescent.—Native of the Cape of Good Hope. Flowers red.

*Erect Indigo*. Pl. 1 foot.

134 *I. PROCUMBENS* (Lin. mant. 271.) stems flexuous, decumbent, compressed, smoothish; leaves petiolate, trifoliate; leaflets obovate, smooth above, but clothed with adpressed pubescence beneath; racemes much longer than the leaves.  $\frac{1}{2}$ . G.

Native of the Cape of Good Hope. Thunb. fl. cap. 597. Flowers blood-coloured, large for the size of the plant.

*Procumbent Indigo*. Fl. May, July. Clt. 1818. Pl. procumbent.

135 *I. PROSTRATA* (Willd. spec. 3. p. 1226.) stems filiform, prostrate, rather angular, and rather pubescent; leaves petiolate, trifoliate; leaflets obovate, whitish beneath; racemes shorter than the leaves; legumes pendulous, filiform. Native of the East Indies. Plant tufted. Flowers red.

*Prostrate Indigo*. Pl. prostrate.

† *Species not sufficiently known.*

136 *I. ROTUNDIFOLIA* (Lour. coch. p. 458.) stem twining, herbaceous, pilose; leaves trifoliate; leaflets roundish, tomentose on both surfaces; racemes axillary, short; legumes oblong, flat, acuminate, glabrous, 2-seeded.  $\odot$ .  $\odot$ . G. Native of China, near Canton. Flowers yellow.

*Round-leafletted Indigo*. Pl. twining.

137 *I. BUFALINA* (Lour. coch. p. 458.) stems suffruticose, climbing, glabrous; leaves trifoliate; leaflets ovate, glabrous; racemes axillary and terminal, on long peduncles; legumes straight, rather compressed, villous.  $\frac{1}{2}$ .  $\odot$ . G. Native of Cochin-china, among bushes. Flowers between white and purple.

*Ox Indigo*. Shrub cl.

138 *I. STRIGOSA* (Spreng. neue entd. 3. p. 54.) shrubby; stems filiform; leaves abruptly-pinnate? leaflets 5-7, linear, acute, strigose; stipulas cuspidate; racemes terminal? flaccid.  $\frac{1}{2}$ . G. Native of the Cape of Good Hope. Allied to *I. filiformis*.

*Strigose Indigo*. Shrub 1 foot.

139 *I. OXYCARPA* (Desv. journ. bot. 1814. vol. 1. p. 79.) stem angular, pentagonal, pilose; leaflets oblong-ovate, mucronate, pilose; spikes of flowers on long peduncles; legumes terete, a little incurved, acute.  $\frac{1}{2}$ . ? S. Native of the Antilles. Perhaps the leaves are pinnate or digitate.

*Sharp-fruited Indigo*. Shrub.

140 *I. DIFFUSA* (Desv. l. c.) branches diffuse; leaflets obovate, somewhat emarginate, pilose; spikes of flowers very short; legumes divaricate, rather pilose.  $\frac{1}{2}$ . ? S. Native of the African islands.

*Diffuse Indigo*. Shrub.

*Cult.* The whole of the species of this genus are rather elegant delicate plants, and all the green-house shrubby kinds are worthy of general cultivation; these grow best in a mixture of sandy loam and peat, and they are easily propagated by young cuttings planted in sand with a bell-glass placed over them. The stove kinds require to be grown in the same kind of soil as the green-house kinds, and to be propagated in the same manner. The seeds of the annual species require to be sown in a hot-bed in spring, and when the plants have grown a sufficient height they may be planted singly in separate pots, and placed again in the hot-bed, and some may be planted out in the open ground in a sheltered situation.

LXXX. OUSTROPIS (from *οὖς*, *ous*, an ear, and *τροπις*, *tropis*, a keel; in reference to the keel of the flower being furnished with an auricle on each side).  $\odot$

LIN. SYST. *Diadelphia, Decandria*. Calyx hairy, tubular, 5-cleft; the segments subulate and acute, upper ones shortest. Vexillum broad, not emarginate, about equal in length to the wings, but longer than the keel. Keel furnished with an auricle on each side. Stamens diadelphous. Ovary pubescent, linear. Style glabrous. Stigma capitate and glandular. Legume short, cylindrical, and rather compressed, ending in the straight acute style, 3-seeded, the seeds lodged in as many cells.—A graceful small plant, with decumbent slender stems, which are slightly hairy; and small, trifoliate, rather hairy leaves, small subulate

stipulas; umbels of small rose-coloured flowers, on long axillary peduncles.

1 *O. MICROPHYLLUS*. 2. G. Native of the Cape of Good Hope. *Lötus microphyllus*, Hook, bot. mag. 2808.

*Small-leaved Outropis*. Fl. July. Clt. 1827. Pl. decumbent.

*Cult.* The seeds of this plant should be sown thinly in a pot of light mould, and placed in the green-house, where the plants will rise, flower and seed, the same season.

LXXXI. CLITORIA (from *clitoris*, an anatomical term, a resemblance to the subject of which has been fancied to exist in the flower). Lin. gen. no. 869. Lam. ill. 609. Gært. fruct. 2. p. 149. D.C. legum. mem. vi. prod. 2. p. 233.—*Ternatea*, Tourn. act. acad. par. 1706. t. 1.—*Clitorius*, Pet. in Rai. hist. 3. p. p. p.

LIN. SYST. *Diadelphia*, *Décandria*. Calyx furnished with 2 large bracteas at the base, 5-cleft (f. 34. a.). Vexillum large (f. 34. b.). Stamens diadelphous (f. 34. d.), inserted along with the petals above the base of the calyx. Style rather dilated at the apex. Legume linear, compressed (f. 34. c.), straight, 2-valved, acuminate by the base of the style, 1-celled, many-seeded. Seeds usually separated by cellular substance.—Climbing herbs, with impari-pinnate leaves, having 2 to 4 pairs of leaflets, but usually the leaves are pinnately-trifoliate; the leaflets usually stipellate. Flowers axillary, pedicellate, large, white, blue or purple, usually resupinate.

SECT. I. TERNA'TEA (in allusion to *C. Ternatea* being a native of the island of Ternate). Kunth, nov. gen. amer. 6. p. 415. D. C. prod. 2. p. 233. Calyx tubular. Vexillum spurless. Leaves impari-pinnate, having 2 to 4 pairs of leaflets.

1 *C. HETEROPHYLLA* (Lam. dict. 2. p. 51.) stems twining, slender, glabrous; leaves with 2 to 4 pairs of roundish, ovate, or linear leaflets; stipels none; pedicels solitary, 1-flowered; bracteoles small, acute. 2. G. S. Native of the Mauritius. Vent. choix. t. 26. Sims, bot. mag. 2111. Flowers blue.

*Variable-leaved Clitoria*. Fl. July, Aug. Clt. 1812. Pl. tw.

2 *C. TERNA'TEA* (Lin. spec. 1026.) stems twining, and rather pubescent; leaves with 2 to 4 pairs of oval or ovate leaflets; stipels subulate; pedicels solitary, one-flowered; bracteoles large, roundish; legumes smoothish. 2. G. S. Native of the East Indies, Mauritius, Arabia, Cuba, and usually cultivated in gardens in almost all parts of the world. Sims, bot. mag. 1542.—Rumph. amb. 5. t. 31.—Rheed. mal. 8. t. 38. *C. spectabilis*, Sal. prod. 336. *Lathyrus spectabilis*, Forsk. descr. 135. *Ternatea vulgaris*, H. B. et Kunth, nov. gen. amer. 6. p. 415. Plumule inconspicuous according to Gært. There are varieties of this plant with blue and white flowers, and also variegated with those colours.

*Var. β, bracteata* (Poir. suppl. 2. p. 301.) leaflets rather scabrous; legumes pubescent. 2. G. S. Native of? Flowers whitish-purple.

*Ternatea Clitoria*. Fl. July, Aug. Clt. 1739. Pl. tw.

SECT. II. EUCLITORIA (from *eu*, well or good, and *clitoria*; in reference to this section containing the true species of the genus). D. C. legum. mem. vi. prod. 2. p. 234. Calyx tubular. Vexillum spurless. Leaves pinnately trifoliate, that is, with only one pair of leaflets and an odd one.

3 *C. MARIA'NA* (Lin. spec. 1026.) stems twining, glabrous; leaflets ovate-lanceolate; pedicels solitary, 1-3-flowered; bracteoles lanceolate, and arc, as well as the calyxes, smooth; teeth of calyx nearly equal. 2. G. F. Native of North America, from Virginia to Carolina, in hedges by the sides of rivulets. Michx. fl. bor. amer. 2. p. 62. Flowers pale-blue, and flesh-coloured. Legume torulose. Seeds glutinous according to Michx.

*Maryland Clitoria*. Fl. Aug. Clt. 1759. Pl. tw.

4 *C. MEXICA'NA* (Link. enum. 2. p. 235.) stems twining; leaflets mucronate, glaucescent and pilose beneath; pedicels twin, 1-flowered; calyx cylindrical, much longer than the linear bracteoles; legume straight, hairy. 2. G. S. Native of Mexico. Flowers of an obscure purple colour. The plant is said to be nearly allied to the preceding species.

*Mexican Clitoria*. Fl. Sept. Nov. Clt. 1823. Pl. tw.

5 *C. ANGUSTIFOLIA* (H. B. et Kunth, nov. gen. amer. 6. p. 417.) stems twining, glabrous; leaflets linear-lanceolate, obtuse, and rather mucronate, rather scabrous above and glabrous beneath; pedicels usually solitary, 1-flowered; calyx smoothish, having the 4 superior teeth very short. 2. G. S. Native of South America, near Angustura. Flowers rose-coloured.

*Narrow-leaved Clitoria*. Pl. tw.

6 *C. FORMOSA* (H. B. et Kunth, nov. gen. amer. 6. p. 417.) stems twining, smoothish; leaflets oblong, obtuse, ending in a short mucrone each, glabrous; pedicels 1-4 together, 1-flowered; calyx urceolate, glabrous, having the 4 superior teeth very short. 2. G. S. Native on the banks of the river Orinoco. Flowers violaceous. Legume compressed, sessile, glabrous.

*Beautiful Clitoria*. Fl. July, Aug. Clt. 1823. Pl. tw.

7 *C. RACEMOSA*; stems twining, pilose; leaves pinnately trifoliate; leaflets ovate, entire, pilose; racemes axillary, spike-formed; legume curved. 2. G. S. Native of the island of St. Thomas, in the Gulf of Guinea. Flowers large, blue. Vexillum spurless?

*Racemose-flowered Clitoria*. Pl. tw.

8 *C. ? ALBA*; plant glabrous, twining; leaves pinnately trifoliate; leaflets oblique, entire, glabrous; peduncles 2-3-flowered. 2. G. S. Native of the island of St. Thomas, in the Gulf of Guinea. Flowers white. Vexillum spurless?

*White-flowered Clitoria*. Pl. tw.

9 *C. POITEAU* (D. C. prod. 2. p. 234.) stems erect, rather velvety; leaflets elliptic, glabrous above, but clothed with silky velvety pubescence beneath, as well as the peduncles and calyxes; racemes longer than the leaves, rather paniced, spicate, many-flowered; calycine lobes acuminate, nearly equal. 2. G. S. Native of French Guiana. Flowers large, red, and beautiful, disposed along the peduncles, sessile, and furnished with a bractea and 2 bracteoles each, appearing at first sight to be furnished with 3 bracteoles each; legume compressed, linear, glabrous, each standing on a stipe, which is equal in length to the calyx, 4 or 5 inches long, and 6 lines broad.

*Poiteau's Clitoria*. Pl. 2 feet?

SECT. III. CENTROSEMA (from *κεντρον*, *centron*, a spur, and *σημα*, *sema*, a standard or vexillum; in reference to the vexillum being furnished with a spur behind). D. C. legum. mem. vi. prod. 2. p. 234. Calyx campanulate, cleft into 5 beyond the middle. Vexillum furnished with a spur behind. Bracteoles striated lengthwise. Leaves pinnately trifoliate, having one pair of leaflets, and an odd one.

10 *C. VIRGINIA'NA* (Lin. spec. ed. 1. p. 753.) stems climbing, and arc, as well as the leaves, glabrous or puberulous; peduncles 1-4-flowered; bracteoles lanceolate, about the length of the calyx; legumes linear, compressed. 2. G. F. Native of Virginia, Carolina, Jamaica, St. Domingo, and Porto-Rico, growing in hedges. Flowers very large, purplish or blue. Lindl. bot.

reg. 1047. *C. calcarigera*, Sal. par. t. 51. Perhaps there are numerous species confounded under this name.

Var. *a. angustifolia* (D. C. prod. 2. p. 234.) leaflets linear.

Var. *b. elliptica* (D. C. l. c.) leaflets ovate-oblong or elliptic.

—Dill. hort. ethn. t. 76.

Var. *γ. ovata* (D. C. l. c.) leaflets ovate.—Pluk. alm. t. 90.

f. 1.

*Virginian Clitoria*. Fl. July, Aug. Clt. 1732. Pl. cl.

11 *C. BRASILIANA* (Lin. spec. 1026.) stems climbing, rather glabrous; leaflets ovate-oblong, glabrous; pedicels: twin; 1-flowered; bracteas ovate, longer than the calyx, and hiding it; legume linear, compressed. *℥. S.* Native of Brazil and Cayenne, and of Maranham. *C. amœna*, Roth. cat. 2. p. 92. t. 3. ex Pers.—Brey. cent. 78. t. 32. Flowers large, blue or white (ex Meyer.)

*Brazilian Clitoria*. Fl. July, Aug. Clt. 1759. Pl. cl.

12 *C. PLUMIERI* (Turp. in Pers. ench. 2. p. 303.) stems climbing; leaflets ovate-oblong, acuminate or ovate, glabrous; pedicels 1-3, somewhat racemose; bracteoles ovate, longer than the calyx; legumes linear, somewhat tetragonal. *℥. S.* Native of Mexico, St. Domingo, and perhaps of Peru. Ker. bot. reg. 268. *C. racemosa*, Moc. et Sesse, fl. mex. icon. ined. *C. calcarata*, Lher. in herb. Domb.—Plum. amer. 1. t. 108. Flowers large, white, but with the middle of the vexillum and wings of a rose-purple colour, tomentose.

*Plumier's Clitoria*. Fl. Sept. Nov. Pl. cl.

13 *C. SPECIOSA* (Cav. curs. 182. ex Lag. et Rod. in anal. sc. nat. 1802. vol. 5. p. 72.) stems climbing; leaflets 3; calyx shorter than the bracteoles, and furnished with a cucullate scale; stipulas spotted with purple. *℥. S.* Native of New Spain. Very like *C. Plumieri*.

*Sherry Clitoria*. Pl. tw.

14 *C. ARBORESCENS* (Ait. hort. kew. ed. 2. vol. 4. p. 302.) stem arborescent; leaflets 3; peduncles many-flowered; ovary tomentose; style villous. *℥. S.* Native of Trinidad. Flowers pink.

*Arborescent Clitoria*. Fl. Aug. Sept. Clt. 1824. Sn. 8 feet.

SECT. IV. GLYCINOPSIS (from *glycine* and *opsis*, resemblance; the plants contained in the section resemble species of *Glycine*). D. C. legum. mem. vi. prod. 2. p. 235. Calyx campanulate, 5-toothed. Corolla and stamens inserted almost at the base of the calyx. Style dilated at the apex. Bracteoles striated lengthwise. Leaves pinnately trifoliate, that is, with one pair of leaflets, and an odd one.

15 *C. BERTERIANA* (D. C. legum. mem. vi. prod. 2. p. 234.) stems twining, and are, as well as the leaves, pubescent; leaflets ovate, acuminate; peduncles longer than the leaves, bearing a kind of raceme at the apex, containing 5 or 6 flowers; legumes linear, compressed, apiculate, straight; bracteoles longer than the calyx. *℥. S.* Native of St. Domingo. Flowers yellowish, with the vexillum pubescent on the outside.

*Bertero's Clitoria*. Pl. tw.

16 *C. COCCINEA* (Schrad. gætt. anz. 1821. p. 717.) stem twining; leaflets 3, elliptic-ovate or oblong, pubescent above, clothed with rusty villi beneath on the nerves, as well as on the petioles; peduncles elongated, usually 3-flowered; upper segment of the calyx truncate. *℥. S.* Native of Brazil. *C. falcata*, Nees in flora. 1821. p. 329. but not of Lamarck. Flowers large, scarlet.

*Scarlet-flowered Clitoria*. Fl. July, Aug. Clt. 1820. Pl. tw.

† Species not sufficiently known.

17 *C. VICTORDES* (Nees et Mart. nov. act. bonn. 12. p. 28.) branches angular; leaves pinnate, having 10 or 11 pairs of oblong-elliptic pubescent leaflets; racemes axillary, pedunculate; calyx 4-toothed; flowers resupinate. *℥. S.* Native of Bra-

zil, on the road to Felisbert. *Galactia vicieformis*, Spreng. syst. 8. p. 257. Corolla white. Vexillum broad and roundish.

*Vetch-like Clitoria*. Pl. tw.

*Cult.* The species of this genus are beautiful climbers and twiners, with large elegant pea-flowers, which are produced in abundance in hot seasons. The soil best adapted to them is a mixture of peat, loam, and sand. Cuttings will root under a bell-glass in heat; but the best method of increasing them is by seeds, which sometimes ripen in this country, and are generally received yearly from the places of their natural growth.

LXXXII. NEUROCARPUM (from *νευρον*, *neuron*, a nerve, and *καρπος*, *carpos*, a fruit; in reference to the valves of the pod being furnished with a strong longitudinal nerve each). Desv. journ. bot. 1814. 1. p. 75. H. B. et Kunth, nov. gen. amer. 6. p. 406. D. C. prod. 2. p. 235.—*Rhombifolium*, Rich. herb.

LIN. SYST. *Diadelphia*, *Decandria*. Calyx tubular, permanent, having 5 nearly equal acuminate teeth, furnished at the base with 2 lanceolate bracteas. Vexillum large, roundish. Keel obtuse. Wings 2. Stamens diadelphous. Legume stipitate, compressed, rather triquetrous, mucronate by the base of the style, the valves marked with a prominent nerve along the middle lengthwise. Stipe of legume girded by a sheath, which rises from the torus. Seeds 4 to 8, when young, generally separated by cellular substance.—Usually twining shrubs, with pinnately trifoliate leaves, and stipellate leaflets. Peduncles axillary, 1-2-flowered. Flowers large, white or purplish. Legume glabrous.

1 *N. SIMPLICIFOLIUM* (Kunth, mim. 213. t. 59. nov. gen. 6. p. 407.) shrubby, erect; leaves simple, ovate-elliptic, rounded at both ends, emarginate, glabrous, rather glaucous beneath, puberulous on the nerves and veins; peduncles 2-flowered. *℥. S.* Native of South America, on the banks of the river Orinoco. Flowers large, white.

*Simple-leaved Neurocarpum*. Clt. 1824. Shrub 2 feet?

2 *N. ANGUSTIFOLIUM* (Kunth, mim. p. 218. t. 60. nov. gen. amer. 6. p. 408.) shrubby, erect; leaves trifoliate; leaflets linear-lanceolate, obtuse, mucronate, ciliated, glabrous, glaucous beneath, and pilose on the nerves; peduncles solitary, 1-flowered. *℥. S.* Native of South America, in sandy places near Maypures, on the Orinoco, and of New Andalusia, near Que-tepe. Flowers large, white.

*Narrow-leaved Neurocarpum*. Shrub 2 feet.

3 *N. GLYCINOIDES* (Desv. obs. leg. in Schlecht. Linnæa. vol. 2. p. 510.) stems climbing, hairy; leaflets ovate-elliptic, mucronate, glabrous above, but pale and puberulous beneath along the nerves; racemes pedunculate, longer than the petioles, few-flowered; calyx clothed with adpressed villi, 5-cleft; the lobes acuminate, lowest one longest. *℥. S.* Native of Cayenne. Legume 6-8-seeded. Flowers red in a dried state. *Clitoria glycinoïdes*, D. C. prod. 2. p. 234.

*Glycine-like Neurocarpum*. Pl. cl.

4 *N. GUIANENSE* (Desv. journ. bot. 1814. 1. p. 75.) stem erect, shrubby; leaves sessile, trifoliate; leaflets oblong, obtuse, and somewhat mucronate, and are, as well as the branches, pubescent; flowers 2-3, on very short peduncles. *℥. S.* Native of Guiana, in meadows. *Crotalaria Guianensis*, Aubl. guian. 2. p. 761. t. 305. *Crotalaria longifolia*, Lam. dict. 2. p. 201. *Rhombifolium canescens*, Rich. herb. Stamens diadelphous. Flowers purplish.

*Guiana Neurocarpum*. Fl. June, July. Clt. 1824. Pl. 1 foot.

5 *N. LAURIFOLIA* (Desv. obs. legum. ex Schlecht. Linnæa. 2. p. 510.) erect; leaves on short petioles; leaflets 3, oblong-lanceolate, reticulated, obtuse; flowers axillary, usually twin. *℥. S.* Native of Porto-Rico, in pastures. Corolla yellowish. *Clitoria laurifolia*, Poir. suppl. 2. p. 301.

*Laurel-leaved Neurocarpum*. Shrub erect.

6 *N. ELLIPTICUM* (Desv. l. c.) stems twining, rather herbaceous, pilose; leaves on longish petioles, trifoliate; leaflets elliptic, membranous, rather puberulous above, but glaucous beneath, and puberulous on the nerves; peduncles few-flowered, axillary, solitary; legume mucronate, resinous inside.  $\frac{1}{2}$ .  $\odot$ . S. Native of St. Domingo. *Crotalaria elliptica*, Poir. *Clitoria tetragona*, Poir. *Clitoria rubiginosa*, Pers. ench. no. 9.

*Elliptic-leafletted Neurocarpum*. Pl. tw.

7 *N. FALCATUM* (D. C. prod. 2. p. 236.) twining; branches hairy; leaves trifoliate; leaflets ovate, glabrous above, and hairy beneath; peduncles longer than the leaves, usually bearing about 3 flowers; legumes usually falcate.  $\frac{1}{2}$ .  $\odot$ . S. Native of St. Domingo and Porto-Rico. *Clitoria falcata*, Lam. dict. 2. p. 51. ex herb. Juss. *Phaseolus amplissimus magno-flore*, &c. Plum. spec. 8. mss. 2. t. 85. ex Lam. Flowers purplish.

*Falcate-podded Neurocarpum*. Pl. tw.

8 *N. ? JAVITENSE* (H. B. et Kunth, nov. gen. amer. 6. p. 409.) creeping, suffruticose; leaves trifoliate; leaflets elliptic-oblong, acuminate, rounded at the base, coriaceous, glabrous above, and rather pilose beneath.  $\frac{1}{2}$ . S. Native of South America, on the banks of the river Tuamini near Javita, at the missions of the Rio-Negro. Flowers purplish?

*Javita Neurocarpum*. Shrub creeping.

9 *N. ? MACROPHYLLUM* (H. B. et Kunth, l. c.) arboreous; leaves trifoliate; leaflets roundish-elliptic, acuminate, rather cuneate at the base, membranous, hairy above, and clothed with fine pubescence beneath; peduncles bifid, racemose.  $\frac{1}{2}$ . S. Native of New Granada, near Turbaco. Flowers red. Legume hairy. Perhaps this shrub ought to be removed from the genus.

*Large-leaved Neurocarpum*. Shrub 10 feet.

*Clt.* The climbing and twining species of this genus should be treated in the same manner as the species of *Clitoria*, see p. 216. The upright kinds like other common stove shrubs.

LXXXIII. MARTIUSIA (in honour of C. F. P. Von Martius, M.D. professor of botany at Munich, in Bavaria, and companion of Spix in his travels in Brazil; author of a splendid work on Brazilian palms, &c.) Schultes, mant. 1. p. 69. D. C. prod. 2. p. 236. — *Martia*, Leander, sacr. akad. munch. 7. p. 233. t. 12.

LIN. SYST. *Tetrandria*, *Monogynia*. Calyx tubular, permanent, somewhat bilabiate, having 5 acute teeth, the lower tooth longest. Corolla wanting. Stamens 4, 2 bearing anthers, and 2 sterile; filaments all distinct, one-half shorter than the ovary. Anthers somewhat ciliated. Legume stipitate, girded at the base by the calyx, with the stipe also sheathed, compressed, somewhat tetraquetrous; the valves furnished with a longitudinal nerve in the centre of each. Calyx, and especially the fruit, very like that of *Neurocarpum*. The want of petals, and the few distinct stamens, are the characters by which this genus can be known.

1 *M. PHYSALOIDES* (Schultes, l. c.)  $\frac{1}{2}$ .  $\odot$ . S. Native near Rio Janeiro, in fields, where it is called *cow poison* and *timbo*. *Martia physaloides*, Leand. l. c. Stems frutescent, twining, villous. Leaves pinnately trifoliate; leaflets ovate-oblong, mucronate, glabrous above, but pubescent beneath. Peduncles 2-flowered. This plant is supposed to be deleterious to cattle and sheep in Brazil.

*Physalis-like Martiusia*. Shrub tw.

*Cult.* See *Clitoria* for culture and propagation, p. 216.

LXXXIV. COLOGANIA (named by Kunth in honour of a family of the name of Cologan, residing at Port Orotavo, in Teneriffe, from whom men of science visiting that island experience the greatest hospitality). Kunth, mim. p. 205. H. B. et Kunth, nov. gen. amer. 8. p. 411. D. C. prod. 2. p. 236.

LIN. SYST. *Diadelphia*, *Decandria*. Calyx tubular, bibracteolate at the base, somewhat bilabiate; upper lip entire or bifid,

lower one 3-parted. Vexillum roundish. Stamens diadelphous, inserted with the petals in the base of the calyx. Ovary stipitate, linear, very hispid, girded at the base by an orbicular disk. Style glabrous, obtuse. — Stems procumbent or twining, beset with retrograde hairs. Leaves pinnately trifoliate, rarely unifoliate. Flowers axillary, twin, pedunculate, violaceous or purple. Perhaps sufficiently distinct from *Clitoria* and *Galactia*.

*Leaves simple.*

1 *C. PROCUMBENS* (Kunth, mim. 205. t. 57.) procumbent; leaflet oblong or oblong-lanceolate, obtuse, smooth above, but strigose beneath, as well as the calyxes.  $\frac{1}{2}$ . S. Native of South America, near Popayan.

*Procumbent Cologania*. Pl. procumbent.

*Leaves trifoliate.*

2 *C. OVALIFOLIA* (H. B. et Kunth, nov. gen. amer. 6. p. 412.) twining; leaflets ovate-elliptic, obtuse, mucronate, rounded at the base, strigulose on both surfaces, rather glaucescent beneath; calyxes pilose.  $\frac{1}{2}$ .  $\odot$ . S. Native of South America, on the banks of the river Amazon near Tomependa, in the province of Bracamora.

*Oval-leafletted Cologania*. Pl. tw.

3 *C. PULCHRELLA* (H. B. et Kunth, nov. gen. amer. 6. p. 413.) twining; leaflets elliptic-oblong, obtuse, rounded at the base, and somewhat cordate, rather strigose on both surfaces, glaucescent beneath; calyx pilose.  $\frac{1}{2}$ .  $\odot$ . S. Native of New Spain, near Pazuaro.

*Neat Cologania*. Pl. tw.

4 *C. INTERMEDIA* (H. B. et Kunth, nov. gen. amer. 6. p. 414.) twining; leaflets oblong or linear-oblong, glabrous above, paler beneath, and strigose, as well as the calyxes.  $\frac{1}{2}$ .  $\odot$ . S. Native of Mexico, in shady woods near Real del Monte.

*Intermediate Cologania*. Pl. tw.

5 *C. ANGUSTIFOLIA* (Kunth, mim. p. 209. t. 58.) twining; leaflets linear, obtuse, rather strigose on both surfaces; calyx covered with hispid pili.  $\frac{1}{2}$ .  $\odot$ . S. Native of Mexico, in temperate parts of hills and mountains.

*Narrow-leaved Cologania*. Clt. 1827. Pl. tw.

6 *C. BROUSSENETII* (D. C. prod. 2. p. 237.) twining; leaflets ovate-oblong, mucronate, rather strigose on both surfaces, paler beneath; flowers twin, on short pedicels; calyx villous, rather 5-cleft, the 2 superior lobes hardly connected, lower one longest.  $\frac{1}{2}$ .  $\odot$ . S. Native of? *Clitoria Broussonetii*, Balb. cat. taur. 1813. p. 26. Allied to *C. ovalifolia*, but is perhaps specifically distinct from all in the 2 superior lobes of the calyx being hardly connected.

*Broussonet's Cologania*. Clt. 1827. Pl. tw.

*Cult.* For culture and propagation see *Clitoria*, p. 216.

LXXXV. GALACTIA (from γαλα, *gala*, milk; the *G. pendula* yields a milky juice when cut or broke). P. Browne, jam. 298. Michx. fl. bor. amer. 2. p. 61. D. C. prod. 2. p. 237.

LIN. SYST. *Diadelphia*, *Decandria*. Calyx bibracteate, 4-cleft; the segments acute, and nearly equal. Corolla papilionaceous, having 5 oblong distinct petals; the vexillum broader than the rest, and incumbent. Stamens diadelphous. Style glabrous, crowned by an obtuse stigma. Legume terete or compressed, many-seeded, 2-valved, 1-celled, elongated. — Climbing subshrubs or herbs, with imparipinnate or pinnately trifoliate leaves, with the leaflets stipellate. Racemes of flowers axillary.

1 *G. ? PENDULA* (Pers. ench. 2. p. 302. Ker. bot. reg. t. 269.) twining, pubescent; leaflets ovate-oblong, villous beneath, as well as the petioles; racemes longer than the leaves; flower twin, pendulous; petals 4 times longer than the leaves.  $\frac{1}{2}$ .  $\odot$

S. Native of Jamaica and Cayenne.—Sloane, jam. 1. t. 114. f. 4.—P. Browne, jam. 298. t. 32. f. 2. *Clitòria Galáctia*, Lin. spec. 1026. Flowers red. Shrub yielding a milky juice, and the legume is terete according to Sloane.

*Pendulous-flowered Galactia*. Fl. Jul. Aug. Clt. 1794. Sh. tw.

2 *G. SERÍCEA* (Pers. ench. 2. p. 302.) stem twining, pubescent: leaflets ovate, rather retuse, hoary and silky on both surfaces; racemes sub-spicate, axillary, shorter than the leaves; corolla a little longer than the calyx.  $\frac{1}{2}$ .  $\odot$ . S. Native of the Island of Bourbon. *Clitòria Phrync*, Comm. Juss. Legume glabrous, compressed, 4-5-seeded.

*Var.  $\beta$ , phrynoides* (D. C. prod. 2. p. 237.) leaves silky and rather hairy; pedicels axillary, and usually 1-flowered.  $\frac{1}{2}$ .  $\odot$ . S. Native of the Mauritius. Superior lobes of calyx a little broader than the rest. Perhaps a proper species.

*Silky Galactia*. Clt. 1824. Shrub tw.

3 *G. CUBE'NSIS* (H. B. et Kunth, nov. gen. amer. 6. p. 429.) stem twining, beset with retrograde pubescence; leaflets elliptic, rounded at both ends, membranous, puberulous above, but clothed with soft canescent pubescence beneath; calyxes and legumes silky.  $\frac{1}{2}$ .  $\odot$ . S. Native of Cuba, near the Havannah. Flowers purple.

*Cuba Galactia*. Pl. tw.

4 *G. PILÒSA* (Nutt. gen. amer. 2. p. 116.) stem twining, clothed with dense and soft pili; leaflets oval, obtuse, and pilose, paler beneath; racemes pedunculate, longer than the leaves; flowers nearly sessile; legume villous.  $\frac{1}{2}$ .  $\odot$ . F. Native of Carolina and Georgia. Flowers reddish.

*Pilose Galactia*. Pl. tw.

5 *G. MÓLLIS* (Michx. fl. bor. amer. 2. p. 61.) stem twining, clothed with soft villi; leaflets ovate-oblong, obtuse, glaucous beneath, and nearly glabrous, smooth above; racemes pedunculate, a little longer than the leaves; flowers pedicellate; calyxes acuminate; legumes compressed, pubescent.  $\frac{1}{2}$ .  $\odot$ . F. Native of Carolina and Georgia. Pursh. fl. sept. amer. 2. p. 486. *Hedysarum volubile*, Lin. spec. 1057.—Dill. hort. elth. 1. f. 170. Flowers purple, and variegated with yellow and white.

*Soft Galactia*. Fl. July, Aug. Clt. 1827. Pl. tw.

6 *G. GLABÉLLA* (Michx. fl. bor. amer. 2. p. 62.) stem prostrate and naked, twining, smoothish; leaflets elliptic-oblong, obtuse, emarginate at both ends, glabrous; racemes axillary, simple, short, few-flowered; flowers pedicellate; calyxes and legumes glabrous.  $\frac{1}{2}$ .  $\odot$ . F. Native of North America, from New Jersey to Carolina, in pine barrens and sandy places. *Ervum volubile*, Walt. car. 187. *Dólichos regularis*, Lin. spec. 1022. Flowers purple, red and white mixed.

*Smooth Galactia*. Fl. July, Aug. Pl. tw.

7 *G. PURSHII* (Desv. obs. leg. in Schlecht. Linnaea. 2. p. 510.) stem prostrate and somewhat twining, smoothish; leaflets elliptic-oblong, obtuse, emarginate at both ends, glabrous; racemes axillary, simple, short, few-flowered; calyx glabrous; legumes villous.  $\frac{1}{2}$ .  $\odot$ . F. Native of North America, from New Jersey to Carolina. *G. glabélla*, Pursh. fl. sept. amer. 2. p. 487. but not of Michx. Flowers purple, red, and white mixed. Roots fusiform.

*Pursh's Galactia*. Fl. July, Aug. Pl. tw.

8 *G. RADICA'TA* (D. C. prod. 2. p. 238.) stem weak, twining, smoothish; leaflets oblong-linear, obtuse, glabrous; flowers axillary, pedicellate, twin; legume pubescent.  $\frac{1}{2}$ .  $\odot$ . S. Native of Mexico. *Clitòria Mariàna*, Moc. et Scuss. fl. mex. icon. ined. but not of Lin. Flowers of a violet-purplish colour. Root woody, thick. Teeth of calyx 4, acute.

*Thick-rooted Galactia*. Pl. tw.

9 *G. TUBEROSA* (D. C. prod. 2. p. 238.) stem twining, villous; leaflets ovate; flowers axillary, twin, almost sessile, and with the upper abortive leaves mixed among the flowers so as to

give them the appearance of an interrupted spike of flowers; root tuberos, oblong.  $\frac{1}{2}$ .  $\odot$ . S. Native of Mexico. Very like the preceding species. Flowers purple.

*Tuberous-rooted Galactia*. Pl. tw.

10 *G. DU'BIA* (D. C. prod. 2. p. 238.) stem twining, terete, beset with strigose pili, as well as the under side of the leaves and petioles; leaflets elliptic, obtuse, somewhat emarginate, glabrous above; racemes axillary, about equal in length to the leaves; legumes linear, rather falcate, acute, clothed with adpressed hairs.  $\frac{1}{2}$ .  $\odot$ . S. Native of Guadaloupe. *Galèga dù-bia*, Balb. herb. Calyx when young strigose, but at length becoming smooth, having the lobes acuminate. Corolla copper-coloured in a dried state.

*Doubtful Galactia*. Shrub tw.

11 *G. JUSSIEA'NA* (Kunth, mim. 196. t. 55. nov. gen. amer. 6. p. 427.) stem creeping, suffruticose, clothed with silky tomentum; leaflets elliptic, rounded at both ends, rather coriaceous, silky-canescant above, but clothed with silky white tomentum beneath as well as the legumes; calyx clothed with silvery silky pubescence.  $\frac{1}{2}$ . S. Native of South America, on the banks of the river Orinoco, near Atures. Flowers rose-coloured.

*Jussieu's Galactia*. Shrub creeping.

12 *G. BERTERIA'NA* (D. C. prod. 2. p. 238.) stem twining, clothed with retrograde pili; petioles and leaves clothed with villous pubescence beneath; leaflets ovate, acutish, glabrous above; racemes spicate, longer than the leaves; calyxes glabrous, cleft into 4 beyond the middle: legume compressed, hooked at end, in consequence of the bent style, hairy in the middle of the valves, but glabrous on the margins.  $\frac{1}{2}$ .  $\odot$ . S. Native of Porto-Rico. Flowers purple.

*Bertero's Galactia*. Shrub twining.

13 *G. ANGUSTIFÓLIA* (Kunth, mim. t. 56. nov. gen. amer. 6. p. 428.) stem erect, clothed with silky tomentum; leaflets linear-oblong, rounded at both ends, with the margins undulately-repand, coriaceous, clothed above with silky pubescence, and beneath with silky silvery tomentum; calyxes silky.  $\frac{1}{2}$ . S. Native of New Andalusia, on the declivities of Mount Tumiriquiri. Flowers purple?

*Narrow-leafletted Galactia*. Pl. 1 to 2 feet.

14 *G. GLAUCE'SCENS* (H. B. et Kunth, l. c.) stem erect? smoothish; leaflets elliptic-oblong, obtuse at both ends, coriaceous, glabrous, shining above, but glaucescent beneath; calyxes and legumes clothed with silky pubescence.  $\frac{1}{2}$ . S. Native of South America, in the province of Quito, at the river Cuella. Flowers violaceous.

*Glaucous Galactia*. Shrub.

15 *G. CORIA'CEA* (Nees et Mart. nov. act. bonn. 12. p. 30.) shrubby, glabrous; leaflets ovate, cuspidate, glabrous, and reticulately veined beneath; racemes erect; pedicels tern; flowers pendulous.  $\frac{1}{2}$ . S. Native of Brazil. Calyx cylindrical, 4-cleft. Flowers of a beautiful red colour.

*Coriaceous-leaved Galactia*. Shrub 2 feet.

16 *G. MA'RTII* (D. C. prod. 2. p. 238.) stem prostrate, but twining at the apex; leaflets cordate-lanceolate, clothed beneath with yellowish silky pubescence, at length glabrous; racemes axillary; calyxes clothed with rufous villi.  $\frac{1}{2}$ .  $\odot$ . S. Native of Brazil, in fields. *Clitòria? angustifólia*, Nees. et Mart. nov. act. bonn. 12. p. 29. Calyx 4-cleft, in which particular it agrees with the rest of the species of this genus. Flowers bluish-purple.

*Martius's Galactia*. Pl. tw.

17 *G. ? NEESII* (D. C. prod. 2. p. 238.) stems twining, tomentose; leaflets oblong, obtuse, tomentose beneath; flowers somewhat capitate; bractees lanceolate; segments of calyx acuminate, villous.  $\frac{1}{2}$ .  $\odot$ . S. Native of Brazil, in fields. *Clitòria rubiginosa*, Nees et Mart. l. c. p. 29. but not of Pers. Corolla pale-blue. Calyx 4-cleft.

*Nees's Galactia.* Pl. tw.

18 G. ? *ELLIOTTII* (Nutt. gen. amer. 2. p. 117.) stems twining; leaves pinnate, with 3 pairs of oblong-elliptic, coriaceous, mucronulate, glabrous, shining leaflets, which are emarginate at both ends; racemes pedunculate, few-flowered, shorter than the leaves.  $\gamma$ .  $\circ$ . F. Native of South Carolina. Flowers pale-red. Lower segments of the calyx elongated. Ell. sketch. 2. p. 240. Flowers pale-red.

*Elliott's Galactia.* Pl. tw.

*Cult.* These plants should be cultivated and propagated in the same manner as that recommended for *Clitòria*, p. 216. but those species natives of North America do not require any heat.

LXXXVI. ODO'NIA (from *ὀδὸν* *odon*, *odous* *odontos*, a tooth; in reference to the wings being furnished with one tooth each on the upper side). Bertol. lucub. 1822. p. 35. D. C. prod. 2. p. 239.

LIN. SYST. *Diadélphia*, *Decándria*. Calyx bractless, 4-parted, shorter than the corolla, the segments undivided and nearly equal. Vexillum erectly spreading. Wings having each a single tooth on the upper side. Carina bipartite below, deflexed, remote from the vexillum. Stamens diadelphous. Style hooked at length. Legume compressed, 1-celled, usually 8-seeded.—A twining, sarmentose herb, with pinnately trifoliate leaves and axillary racemes of flowers, which are shorter than the leaves. This genus comes very near *Galáctia*.

1 O. TOMENTOSA (Bertol. l. c.).  $\gamma$ .  $\circ$ . S. Native of St. Domingo. Glycine velutina, Bertero, in herb. Balb. Young legumes clothed with velvety tomentum, adult ones almost glabrous.

*Tomentose Odonia.* Pl. tw.

*Cult.* See *Clitòria*, p. 216. for culture and propagation.

LXXXVII. STEGANO'TROPIS (from *στεγανος*, *steganos*, covered, and *τροπις*, *tropis*, a keel; in allusion to the keel being covered by the vexillum). Lehm. hort. sem. hamb. and nov. act. bonn. vol. 14. p. 820.

LIN. SYST. *Diadélphia*, *Decándria*. Calyx 5-toothed, bibracteate, permanent. Vexillum cucullate, bicallos at the base, and spurred behind, inclosing the wings and keel, which are membranous. Style membranous, dilated, and bearded at the apex. Legume linear, many-seeded.—A twining herb, with pinnately ternate leaves and 2-flowered peduncles.

1 S. CONJUGATUS (Lehm. in sem. hort. hamb. nov. act. bonn. xiv. p. 821.) stems villous; leaflets sessile, lanceolate, pubescent.  $\circ$ .  $\circ$ . S. Native of South America. Flowers greenish-yellow.

*Conjugate-flowered Steganotropis.* Fl. Ju. Jul. Clt. 1827. Pl. cl.

*Cult.* For culture and propagation see *Clitòria*, p. 216.

LXXXVIII. VILMORINIA (in honour of M. Vilmorin, Member of the Agricultural Society of Paris). D. C. prod. 2. p. 239.

LIN. SYST. *Diadélphia*, *Decándria*. Calyx bractless, cylindrical, obtusely 4-toothed, somewhat bilabiate. Corolla papilionaceous; petals oblong, with the wings shorter than the carina. Stamens diadelphous. Style glabrous, subulate, acute. Legume pedicellate, lanceolate, attenuated at the base, compressed, ending in a filiform point. Seeds 12-16.—An upright shrub, with impari-pinnate leaves. Stipulas broadish at the base, ending in a long subulate point. Racemes axillary. Flowers dark-red.

1 V. MULTIFLORA (D. C. prod. 2. p. 239.) stem erect, glabrous; leaves pinnate, with 5 or 6 pairs of ovate leaflets, which are pubescent on the under surface; racemes shorter than the leaves.  $\gamma$ . S. Native of the West Indies, particularly in St. Domingo. *Clitòria multiflora*, Swartz, fl. ind. occid. 3. p. 1253.

*Many-flowered Vilmorinia.* Clt. 1820. Shrub 6 feet.

*Cult.* For culture and propagation see *Clitòria*, p. 216.

LXXXIX. DIPLO'NYX (from *διπλος*, *diploos*, double, and *ὄνυξ*, *onyx*, a claw; in reference to the wings, which are furnished with two claws each). Rafin. ex Spreng. syst. 3. p. 154.

LIN. SYST. *Diadélphia*, *Decándria*. Calyx urceolate, bilabiate, upper lip bifid, lower one trifid. Vexillum bent, with the claw glandular. Wings biunguiculate. Legume terete, 1-celled, many-seeded.—A twining shrub, with impari-pinnate leaves, having 6 pairs of leaflets; leaflets hastate, tomentose beneath. Flowers violaceous, disposed in racemes.

1 D. ELEGANS (Rafin. ex Spreng. syst. 3. p. 277.).  $\gamma$ .  $\circ$ . G. Native of Louisiana.

*Elegant Diplonox.* Shrub tw.

*Cult.* See *Clitòria* for culture and propagation, p. 216.

XC. BARBIERIA (in honour of J. B. G. Barbier, M. D. a French physician and naturalist, author of *Principes Generaux de Pharmacologie ou de Matière Medicale*, 1 vol. 8vo. Paris. 1806). D. C. leg. mem. vi. prod. 2. p. 239.

LIN. SYST. *Diadélphia*, *Decándria*. Calyx tubular, 5-cleft, bibracteate at the base; segments acuminate, equal. Corolla elongated; petals 5, on long stipes; wings shorter than the carina, and the carina shorter than the vexillum. Stamens diadelphous. Style filiform, bearded lengthwise at the apex. Stigma obtuse. Legume, judging from the ovary, linear, villous, 1-celled, many-seeded.—A shrub, with impari-pinnate leaves, having many pairs of stipellate leaflets. Racemes axillary, few-flowered, shorter than the leaves. Flowers of a scarlet-purplish colour. Stipulas and bracteas acuminate.

1 B. POLYPHYLLA (D. C. l. c. t. 39.).  $\gamma$ . S. Native of Porto-Rico. *Clitòria polyphylla*, Poir. suppl. 2. p. 300. *Galáctia pinnata*, Pers. ench. 2. p. 302. Flowers 2 inches long. Leaves having 9 to 11 pairs of elliptic-oblong, mucronate leaflets; the young ones canescent beneath, the adult ones pubescent.

*Many-leafletted Barbieria.* Clt. 1818. Shrub.

*Cult.* See *Clitòria*, p. 216. for culture and propagation.

XCI. KIESERIA (in honour of Kieser, some botanist known to Reinwardt). Reinw. ex Spreng. syst. 3. p. 153.

LIN. SYST. *Diadélphia*, *Decándria*. Calyx campanulate, 5-toothed, gibbous at the base, the lowest tooth longest and carinated. Vexillum orbicular. Stamens diadelphous. Style villous in front. Legume linear, compressed, hooked at the apex, 1-celled, many-seeded.—A tomentose shrub, with impari-pinnate leaves, and terminal racemes of white flowers.

1 K. SERICEA (Reinw. ex Spreng. syst. 3. p. 245.).  $\gamma$ . S. Native of Java.

*Silky Kieseria.* Shrub.

*Cult.* For culture and propagation see *Clitòria*, p. 216.

XCH. GRO'NA (from *γρῶνη*, *gronc*, a cavern; in reference to the keel, which is hollowed beneath). Lour. coch. p. 459. D. C. prod. 2. p. 239.

LIN. SYST. *Diadélphia*, *Decándria*. Calyx permanent, 4-cleft; the lobes nearly equal, superior one emarginate. Corolla papilionaceous. Vexillum obcordate. Wings obtuse. Keel bent, concave below, joined with the wings as far as the middle. Stamens diadelphous, 9 joined together, and 1 free. Style filiform, crowned by a simple stigma. Legume straight, linear, compressed, many-seeded. Seeds kidney-shaped.—A suffruticose, creeping, prostrate plant, with simple, ovate, entire leaves, and subulate stipulas. Flowers purple, disposed in spikes, each bractea containing 2 flowers. Nearly allied to *Galáctia*.

1 G. REPENS (Lour. l. c.).  $\gamma$ . G. Native of Cochinchina, on hills.

*Creeping Grona.* Pl. creeping.

*Cult.* A mixture of loam and sand will suit this genus, and cuttings will root freely in sand, under a hand-glass.

**XCVIII. COLLÆA** (in honour of Aloysio Colla, of Turin, an acute botanist, author of *Hortus Ripulensis*). D. C. ann. sc. nat. 1825. jan. p. 96. Leg. mem. vi. prod. 2. p. 240.

**LIN. SYST.** *Diadelphia, Decándria*. Calyx 4-cleft (f. 35. a.), rather coloured on the inside; lobes oval-lanceolate, equal in length, upper one rather the broadest. Petals on long claws (f. 35. f.); the vexillum having 2 auricles, and the rest of the petals having only 1 auricle (f. 35. f.), those of the keel free at the base, obtuse, and straight. Stamens monadelphous, with the tube cleft in front, one of the stamens almost free (f. 35. c.). Ovary linear-oblong, very villous. Style linear, glabrous. Stigma capitate (f. 35. b.). Legume compressed, oval-oblong (f. 35. e.), tomentose, 4-6-seeded.—Shrubs, with terete, woody branches, ovate free deciduous stipulas, palmately trifoliate leaves, on short stalks, large purple flowers on long pedicels, 3 or 4 of which stand on the top of each peduncle, which is axillary and very short. Branches, peduncles, and lower surface of leaves tomentose, as well as the outside of the calyxes.

1 *C. SPECIOSA* (D. C. l. c. t. 40. prod. 2. p. 240.) leaflets oblong, acutish, quite smooth above, but clothed with hoary tomentum beneath.  $\frac{1}{2}$ . S. Native of Peru, about Huasa-Huasi. *Cytisus speciosus*, Lois. in Duham. arb. ed. nov. 5. p. 160. *Odònia speciosa*, Spreng. syst. append. p. 279. Stamens 8, 5 of which bear anthers.

*Shewy Collæa.* Shrub.

2 *C. TRINERVIA* (D. C. l. c. t. 41.) leaflets elliptic, emarginate at the base, 3-nerved, obtuse, mucronulate, clothed with velvety pubescence, reticulated, and somewhat tomentose beneath.  $\frac{1}{2}$ . S. Native of the East Indies, on the Nelligery mountains. *Odònia trinervia*, Spreng. l. c. Stamens 10, diadelphous. Legume mucronated by the style, which is hooked at the base.

*Three-nerved-leafletted Collæa.* Shrub.

*Cult.* These shrubs will grow well in a mixture of loam and peat, and young cuttings will root freely in sand, under a bell-glass. They are both elegant shrubs when in flower.

**XCIV. OTOPTERA** (from *ὠς* *ōs*, *ous otos*, an ear, and *πτερον*, *pteron*, a wing; in allusion to the wings being furnished with an auricle on the unguis). D. C. legum. mem. vi. prod. 2. p. 240.

**LIN. SYST.** *Monadelphia, Decándria*. Calyx 5-cleft, with the tube attenuated at the base; lobes acuminate, somewhat unequal, 2 superior ones approximate. Corolla papilionaceous. Vexillum large, roundish. Wings oblong, furnished each with an incurved, acute auricle on the stipe. Carina 2-edged. Stamens joined into an entire tube. Ovary linear, straight, compressed, many-ovulate. Style incurved, thickened at the apex. Legume unknown.—A smooth Cape subshrub, with pinnately trifoliate leaves; leaflets lanceolate-linear, ending each in a long mucrone, the lateral ones furnished each with one little stipule, the terminal one with two. Peduncles axillary, longer than the leaves, 2-flowered. Perhaps allied to *Psoralea* or *Clitòria*.

1 *O. BURCHÉLLII* (D. C. leg. mem. vi. t. 42.).  $\frac{1}{2}$ .  $\infty$ . G. Native of the Cape of Good Hope. Branches terete, and perhaps twining. *Lebéckia Burchéllii*, Spreng. syst. app. 273.

*Burchell's Ooptera.* Shrub tw.?

*Cult.* For culture and propagation see *Clitòria*, p. 216.

**XCV. PUERARIA** (in honour of M. M. N. Puerari, a professor at Copenhagen). D. C. ann. sc. nat. 1825. jan. p. 29. Leg. mem. vi. prod. 2. p. 240.

**LIN. SYST.** *Monadelphia, Decándria*. Calyx campanulate, bluntly bilabiate, upper lip entire or hardly bidentate, lower one trifid. Corolla papilionaceous. Keel straight, obtuse. Vexillum obovate. Stamens monadelphous. Legume compressed, attenuated into a stipe at the base, and apiculated by the style, 2-valved, continuous, many-seeded.—Climbing Indian shrubs, with deciduous stipulas, distinct from the petiole. Leaves trifoliate; leaflets large, ovate, acute, reticulately nerved, stipellate at the base. Racemes compound, branched. Flowers pedicellate, twin, or tern, yellowish. Fruit not sufficiently known. A very distinct genus from *Hedysarum*.

1 *P. TUBEROSA* (D. C. l. c.) leaves pubescent on the upper surface, but clothed with silky villi on the under as well as the calyxes and pedicels.  $\frac{1}{2}$ .  $\infty$ . S. Native of the East Indies. Racemes of flowers nearly 2 feet long. *Hedysarum tuberosum*, Roxb. in Willd. spec. 3. p. 1197.

*Tuberous-rooted Pueraria.* Shrub cl.

2 *P. WALLICHII* (D. C. leg. mem. vi. t. 43.) leaves glabrous on the upper surface, but pubescent on the under as well as the calyxes and pedicels.  $\frac{1}{2}$ .  $\infty$ . G. Native of Nipaul. Racemes 3 or 4 inches long.

*Wallich's Pueraria.* Shrub cl.

*Cult.* For culture and propagation see *Clitòria*, p. 216.

**XCVI. DUMASIA** (in honour of M. Dumas, one of the editors of *Annales des Sciences Naturelles*). D. C. ann. sc. nat. jan. 1825. p. 96. leg. mem. vi. prod. 2. p. 241.

**LIN. SYST.** *Diadelphia, Decándria*. Calyx cylindrical, obliquely truncate, toothless, bibracteolate at the base. Corolla papilionaceous, the claws of the petals about equal in length to the calyx. Carina obtuse. Stamens diadelphous, permanent. Style dilated in the middle. Stigma terminal. Legume attenuated at the base, 2-valved, compressed, few-seeded, torulose.—Climbing herbs, which are perhaps suffruticose at the base. Leaves pinnately trifoliate; leaflets ovate. Racemes axillary, usually shorter than the leaves. Legumes velvety, from crowded short down. Bracteoles 2, small, subulate, under the calyx.

1 *D. VILLOSA* (D. C. l. c. t. 44. prod. 2. p. 241.) branches, petioles, peduncles, and young leaves, hairy; leaflets ovate-lanceolate, adult ones almost glabrous; legume 3-times longer than the calyx.  $\frac{1}{2}$ .  $\infty$ . G. Native of Nipaul. Flowers pale in a dried state, 5 lines long.

*Villous Dumasia.* Fl. Aug. Dec. Clt. 1824. Pl. tw.

2 *D. PUBESCENS* (D. C. l. c. t. 45. prod. 2. p. 241.) branches, petioles, peduncles, and leaves pubescent; leaflets ovate; legume 4-times longer than the calyx.  $\frac{1}{2}$ .  $\infty$ . G. Native of Nipaul. Flowers yellow. Lindl. bot. reg. 962.

*Pubescent Dumasia.* Fl. Aug. Dec. Clt. 1824. Pl. tw.

*Cult.* For culture and propagation see *Clitòria*, p. 216.

**XCVII. GLYCINE** (from *γλυκύς*, *glycys*, sweet; the leaves and roots of one or two of the species are sweet). D. C. leg. mem. vi. prod. 2. p. 241. Glycine species of authors.

**LIN. SYST.** *Diadelphia, Decándria*. Calyx 5-cleft, somewhat bilabiate; upper lip bifid, lower one trifid. Corolla papilionaceous; vexillum not bicallous at the base. Keel not spirally twisted. Stamens diadelphous. Style filiform, acute. Legume linear, compressed, straight, many-seeded, 2-valved, 1-celled, ending in a thickish, hooked mucrone from the style.—Climbing herbs, with pinnately trifoliate leaves, and with the

flowers rising in fascicles from the axils of the leaves or in racemes. Many genera are established from *Glycine*, as it formerly stood, as *Rhynchosisia*, *Kennedia*, *Apios Voandzèia*, *Ròthia*, *Amphicarpa*, *Wistaria*, and *Chaetodilyx*.

1 *G. HEDYSAROIDES* (Willd. spec. 3. p. 1062.) stem erect, tomentose; branches twining a little; leaflets ovate, obtuse, mucronate, pilose beneath; flowers axillary, usually 5 together; legume broadest at the apex, ending in a short, erect, obtuse mucrone.  $\hbar$ .  $\circ$ . S. Native of Guinea. Flowers purple.

*Hedysarum-like Glycine*. Fl. Ju. Jul. Clt. 1823. Pl. 2 ft. tw.

2 *G. CLANDESTINA* (Wendl. obs. Willd. spec. 3. p. 1054.) stem twining, filiform, villous; leaflets lanceolate, pubescent beneath; flowers axillary, tern; calyx closed, larger than the 3-petalled corolla; legume hardly pubescent.  $\hbar$ .  $\circ$ . G. Native of New Holland. Flowers small, pale-yellow. Valves of legumes rather convex.

*Clandestine-flowered Glycine*. Fl. July, Aug. Clt. 1824. Shrub tw.

3 *G. EMARGINATA* (Desv. herb. ex Hamilt. prod. fl. ind. occ. p. 50.) stem woody; leaflets 3, elliptic-oblong, emarginate, about 2 inches long, quite glabrous, reticulated; flowers in spikes; calycine segments subulate, elongated.  $\hbar$ . S. Native of St. Domingo.

*Emarginate-leafletted Glycine*. Shrub.

4 *G. DE'BILIS* (Ait. hort. kew. ed. 1. vol. 3. p. 54.) stem twining, filiform, beset with retrograde hairs; leaflets oval, pubescent beneath; flowers axillary, crowded; calyx silky, a little shorter than the corolla; legume glabrous, ending in a hooked style.  $\delta$ .  $\circ$ . S. Native of the East Indies. G. labialis, Lin. fil. suppl. 3. p. 325. Flowers small, copper-colored.

*Weak Glycine*. Fl. June, July. Clt. 1778. Pl. tw.

5 *G. MINIMA* (Willd. enum. 756.) stem twining, beset with retrograde pili; leaflets elliptic, acutish at both ends; flowers axillary, almost sessile, twin; legume glabrous, hooked at the apex.  $\mathcal{U}$ .  $\circ$ . G. Native of New Holland. Flowers purple.

*Least Glycine*. Fl. July, Aug. Clt. 1818. Pl. tw.

6 *G. ? LAGASCA'NA* (D. C. prod. 2. p. 241.) stems twining; leaves and legumes clothed with villous tomentum; leaflets oval; racemes sessile, axillary, very short, few-flowered; legume ending in a short, straight mucrone.  $\hbar$ .  $\circ$ . S. Native of? Legume an inch and a half long, 2-4 lines broad, 4-6-seeded; seeds intercepted by cellular substance.

*Lagasca's Glycine*. Shrub tw.

7 *G. STRIATA* (Lin. fil. suppl. 326. Jacq. hort. vind. t. 76.) stem twining; leaflets oblong, clothed with hoary, soft, pubescence; racemes axillary, length of leaves; legumes very hairy.  $\hbar$ .  $\circ$ . S. Native of South America. Flowers striped, purple.

*Striated-flowered Glycine*. Fl. Jul. Aug. Clt. 1818. Sh. tw.

8 *G. TENUIFLORA* (Klein, in Willd. spec. 3. p. 1059.) stem twining; leaflets oblong, mucronate, shining, pilose beneath; racemes axillary, filiform; legume linear, acute, rather falcate, and rather pilose.  $\hbar$ .  $\circ$ . S. Native of the East Indies, on hills about Pondicherry. Flowers small, twin, remote, purplish?

*Fine-flowered Glycine*. Shrub tw.

9 *G. PARVIFLORA* (Lam. dict. 2. p. 738.) stems twining, rather angular; branches clothed with retrograde villi; leaflets ovate, pubescent beneath; racemes axillary, shorter than the leaves; legume linear, smoothish, ending in a thick hooked mucrone.  $\delta$ . ?  $\circ$ . S. Native of the East Indies. Flowers small, red.

*Small-flowered Glycine*. Fl. Jul. Aug. Clt. 1812. Pl. tw.

10 *G. SENEGALE'NSIS* (D. C. prod. 2. p. 242.) stem twining, terete; branches clothed with retrograde villi; leaflets ovate, pubescent above, but at length smooth, villous beneath; racemes axillary, longer than the leaves; legume linear, glabrous,

ending in a thick hooked mucrone.  $\hbar$ .  $\circ$ . S. Native of Senegal. Flowers small, purplish?

*Senegal Glycine*. Shrub tw.

11 *G. SERICEA* (Willd. spec. 3. p. 1059.) stems twining; leaflets ovate, retuse, silky beneath; racemes longer than the leaves; legumes, when not mature, linear, acuminate, clothed with white silky pubescence.  $\hbar$ .  $\circ$ . S. Native of Guinea. Flowers of *Clitoria*, reddish, but the vexillum is narrow, oblong-obovate, and reflexed.

*Silky Glycine*. Shrub tw.

12 *G. GUINEE'NSIS*; plant twining and villous; leaves pinnately trifoliate; leaflets ovate-lanceolate, clothed with silky villi beneath; peduncles 3-4-flowered; legume compressed.  $\mathcal{U}$ .  $\circ$ . S. Native of the Island of St. Thomas, in the Gulf of Guinea. Flowers small.

*Guinea Glycine*. Pl. tw.

13 *G. BILORA* (Lindl. bot. reg. 1418.) stem twining, pilose; leaflets oval, mucronulate, pubescent; racemes axillary, many-flowered, erect, shorter than the leaves; vexillum 2-lobed.  $\mathcal{U}$ .  $\circ$ . S. Native of Mexico. Flowers violaceous.

*Two-lobed Glycine*. Fl. Nov. Clt. 1827. Pl. tw.

† *Species not sufficiently known*.

14 *G. ANGULATA* (Desv. journ. bot. 1814. vol. 1. p. 78.) stem angular; the angles hairy; leaflets ovate-oblong, obtuse, silky beneath; legumes linear, compressed, hairy. Native of North America.

*Angular-stemmed Glycine*. Pl. ?

15 *G. EMARGINATA* (Desv. l. c.) stems twining, woody; branches pubescent; leaflets quite smooth, emarginate at the apex; flowers racemose.  $\hbar$ .  $\circ$ . S. Native of the Antilles.

*Emarginate-leafletted Glycine*. Shrub tw.

16 *G. LEUCOSPERMA* (Desv. l. c.) stem twining, herbaceous, pubescent; leaflets elliptic, coriaceous, quite smooth; legume pilose.  $\hbar$ .  $\circ$ . S. Native of St. Domingo.

*White-seeded Glycine*. Shrub tw.

17 *G. LANCEFOLIA* (Jacq. nov. gen. et spec. p. 24.) stem twining; leaflets narrow, lanceolate, glabrous, lateral ones oblique; peduncles axillary, solitary, racemously 4-flowered.  $\hbar$ .  $\circ$ . G. Native of the Canary Islands.

*Lance-leafletted Glycine*. Shrub tw.

18 *G. ERECTA* (Thunb. l. c.) stem erect, hairy; leaflets oblong, villous, having rather revolute margins; flowers usually 4 in an umbel.  $\hbar$ . G. Native of the Cape of Good Hope. Flowers rufescent.

*Erect Glycine*. Shrub 2 to 3 feet.

19 *G. HETEROPHYLLA* (Thunb. l. c.) stems decumbent and twining a little, glabrous; leaflets oblong and linear, glabrous; with somewhat revolute margins; flowers umbellate.  $\mathcal{U}$ .  $\circ$ . G. Native of the Cape of Good Hope. Flowers yellow.

*Variable-leaved Glycine*. Fl. July, Aug. Clt. 1816. Pl. tw.

20 *G. ARGENTEA* (Thunb. l. c.) stems twining, clothed with silky tomentum; leaflets ovate, somewhat mucronate, clothed with white tomentum beneath; peduncles axillary, 4-5-flowered; flowers umbellate.  $\mathcal{U}$ .  $\circ$ . G. Native of the Cape of Good Hope. Flowers yellowish.

*Silvery Glycine*. Pl. tw.

21 *G. MONNIERA* (D. C. prod. 2. p. 242.) stems diffuse, terete, glabrous; branches twining a little, clothed with adpressed pubescence; leaflets obovate or oval, rather acute, glabrous above, but clothed with adpressed pubescence beneath; peduncles longer than the leaves; flowers racemose, at length reflexed.  $\hbar$ . ?  $\circ$ . G. Native of the Cape of Good Hope. Monnièra trifolia, Burm. cap. prod. p. 20. exclusive of the synonymes.

*Monnier's Glycine*. Shrub cl.

22 *G. SECUNDA* (Thunb. prod. 131. fl. cap. 591.) stems decumbent, filiform, angular, pubescent; leaflets roundish, glabrous above; racemes pedunculate, axillary, many-flowered; flowers secund; legumes hairy.  $\mathcal{U}$ . G. Native of the Cape of Good Hope, in grassy places. Flowers yellow.

*Secund-flowered Glycine.* Fl. Jul. Aug. Clt. 1825. Pl. dec.

23 *G. JAVA'NICA* (Lin. spec. 1024.) stem twining, beset with retrograde villi as well as the petioles; peduncles length of leaves; flowers disposed in dense spikes, nodding; bracteas lanceolate, minute. Native of the East Indies and Japan. Thunb. in Lin. trans. vol. 2. p. 340. Flowers violaceous. The plant under this name in the herbarium of Retzius has 3-lobed repand leaflets, the middle lobe acute, the lateral ones short and very blunt; the peduncles are also longer than the leaves, and the flowers are disposed in rather loose spikes, also the calyx is acutely 5-toothed. It is, however, only the same species.

*Java Glycine.* Pl. tw.

24 *G. VILLOSA* (Thunb. fl. jap. 283.) stems twining, tomentose; leaflets 3-lobed, acute, tomentose; racemes pedunculate, axillary, 2-5-flowered; legume tomentose.  $\mathcal{U}$ . ?  $\mathcal{C}$ . G. Native of Japan. Flowers purplish?

*Villous Glycine.* Pl. tw.

*Cult.* See *Clitoria* for culture and propagation, p. 216.

XCVIII. CHÆTOCALYX (from  $\chi\alpha\iota\tau\eta$ , *chaite*, a bristle, and  $\kappa\alpha\lambda\upsilon\varsigma$ , *calyx*; in reference to the calyx being covered with spiny bristles). D. C. Leg. mem. vi. prod. 2. p. 243.

LIN. SYST. *Diadelphia*, *Decandria*. Calyx beset with glands and spiny bristles, bilabiate; segments subulate, those of the superior lip recurved, of the lower lip adpressed. Vexillum roundish, emarginate; keel conforming to the wings. Stamens diadelphous; filaments connected at the base. Ovary linear, many-seeded. Style compressed, filiform, villous. Legume unknown.—Frutescent twining plants, with impari-pinnate leaves, having 2 pairs of oval, mucronate, exstipellate leaflets. Stipulas lanceolate-linear, spreadingly deflexed. Pedicels filiform, 1-flowered, rising in numbers from the axils of the leaves. Flowers yellow. This genus has the habit of *Tephrosia*, but is perhaps more nearly allied to *Glycine*.

1 *C. VINCENTINA* (D. C. prod. 2. p. 243.) leaflets obovate, glabrous on both surfaces, but pale beneath.  $\mathcal{H}$ .  $\mathcal{C}$ . S. Native of the Island of St. Vincent. *Glycine Vincentina*, Lindl. bot. reg. 799.

*St. Vincent Chæto calyx.* Fl. May, Aug. Clt. 1823. Sh. tw.

2 *C. PUBESCENS* (D. C. prod. 2. p. 243.) leaflets oval, mucronate, clothed with velvety pubescence on both surfaces, as well as branches.  $\mathcal{H}$ .  $\mathcal{C}$ . S. Native of St. Domingo. *Glycine pubescens*, Bertero, in herb. Balb. The stamens which were examined in one young flower were seen to be almost distinct.

*Pubescent Chæto calyx.* Shrub tw.

*Cult.* See *Clitoria* for culture and propagation, p. 216.

SUBTRIBE IV. GALEGÆ (plants agreeing in some important characters with *Galega*). Bronn. l. c. exclusive of some genera, D. C. prod. 2. p. 243. Legume 1-celled (f. 36. c. f. 37. c.). Stamens diadelphous, rarely monadelphous. Stems herbaceous, shrubby, or arboreous. Leaves alternate or opposite, lower ones simple, the rest impari-pinnate.

XCIX. PETALOSTEMUM (from  $\pi\epsilon\tau\alpha\lambda\omicron\nu$ , *petalon*, a petal, and  $\sigma\tau\eta\mu\omega\nu$ , *stemon*, a stamen; in reference to the stamens being joined to the petals at the base). Michx. fl. bor. amer. 2. p. 48. D. C. prod. 2. p. 243.

LIN. SYST. *Monadelphia*, *Pentandria*. Calyx 5-cleft or 5-toothed. Petals 5, unguiculate, like each other in shape. Stamens 5, joined together into a tube. Vexillum conuplicate, free. Legume covered by the calyx, 1-seeded,

indehiscent.—Perennial North American herbs, beset with glandular dots, with impari-pinnate leaves, and with the flowers disposed in dense, pedunculate spikes, which are either opposite the leaves, or terminal from the upper branches becoming abortive.

SECT. I. PETALOSTEMON (see genus for derivation). D. C. prod. 2. p. 243.—*Dalea*, with pentandrous flowers, Vent. Calyx 5-toothed; teeth short, not plumose. Petals on long claws, with roundish limbs. Spikes of flowers cylindrical; bracteas subulate.

1 *P. CA'NDIDUM* (Michx. fl. bor. amer. 2. p. 48. t. 37. f. 1.) spike cylindrical, on a long peduncle; bracteas longer than the flowers; leaves glabrous, with 3 pairs of lanceolate leaflets.  $\mathcal{U}$ . F. Native of Tennessee, in the Illinois region, and on the banks of the Missouri. *Dalea candida*, Willd. spec. 3. p. 1337. *Psoralea candida*, Poir. suppl. Flowers white.

*White-flowered Petalostemum.* Fl. July, Aug. Clt. 1811. Pl. 1 foot.

2 *P. CA'RNEUM* (Michx. l. c.) spikes cylindrical, pedunculate; bracteas subulate, length of calyx; bracteoles setaceous, permanent; calyxes glabrous; leaflets lanceolate.  $\mathcal{U}$ . F. Native of Georgia and Florida, in pine forests. Flowers pale flesh-coloured.

*Flesh-coloured-flowered Petalostemum.* Fl. July, Aug. Clt. 1811. Pl. 1½ foot.

3 *P. VIOLA'CEUM* (Michx. l. c. t. 37. f. 2.) spike cylindrical, on a short peduncle; bracteas about equal in length to the calyx; bracteoles spatulate, deciduous; calyxes silky; leaves having 2 pairs of linear leaflets.  $\mathcal{U}$ . F. Native of Tennessee, in the Illinois country, and in the prairies of the Missouri. *Dalea violacea*, Willd. spec. 3. p. 1337. *Dalea purpurea*, Vent. hort. cels. t. 40. *Psoralea violacea*, Poir. suppl. Sims, bot. mag. 1707. Flowers pale-purple.

*Vioaceous-flowered Petalostemum.* Fl. July, Sept. Clt. 1811. Pl. 1 foot.

4 *P. MACROSTA'CHYUM* (Torrey, in ann. lyc. 2. p. 176.) spike cylindrical, compact, very long; bracteas lanceolate; calyxes clothed with silky villi; leaves generally with 3 pairs of lanceolate-oblong glabrous leaflets.  $\mathcal{U}$ . H. Native of North America, about the forks of the Platte. Flowers small, white.

*Long-spiked Petalostemum.* Pl. 2 feet.

5 *P. ROSEUM* (Nutt. in Sillim. amer. journ. 5. p. 1822. p. 298.) plant glabrous; leaflets linear; bracteas subulate, very short, permanent; calyx striated, glabrous.  $\mathcal{U}$ . F. Native of Eastern Florida. Very like *P. violaceum*, but differs in the calyxes being perfectly glabrous, and in the petals being rose-coloured.

*Rose-coloured-flowered Petalostemum.* Pl. 1 foot.

6 *P. VILLOSUM* (Nutt. gen. amer. 2. p. 85.) plant villous, decumbent; spike cylindrical, nearly sessile; bracteas shorter than the woolly calyx; leaves having 7 pairs of linear-oblong leaflets.  $\mathcal{U}$ . F. Native in sandy places near the river Missouri about Fort Mandan, at the Knife river. Root fusiform. Petals pale-red.

*Villous Petalostemum.* Pl. decumbent.

SECT. II. KUHNISTE'RA (in honour of Adam Kuhn, a pupil of Linnæus. There is, however, a genus *Kuhnia*, named by Linnæus in compliment to him; the different termination of the word is to distinguish it from that genus). Lam. dict. 3. p. 370. Vent. mem. soc. hist. nat. par. p. 113. D. C. prod. 2. p. 244.—Cylipogon, Rafin. in journ. phys. aug. 1819. p. 97. Calyx almost 5-parted; segments plumose. Petals linear, attenuated at the base. Flowers capitate. Bracteas scarious, roundish, forming as it were an involucre to the head of the flowers. Perhaps a proper genus.

7 *P. CORYMBOSUM* (Michx. ex Poir. in herb. Juss. D. C. prod. 2. p. 244.) flowers disposed in paniced corymbs; leaves having 2-3 pairs of linear, awnless, glabrous leaflets; segments of the calyx very villous. ♀. F. Native of Carolina and Georgia, in pine barrens. *Kuhnìa affinis*, Walt. car. 103. *Kuhnistèra Carolinensis*, Lam. dict. 1. c. *Dàlea Kuhnistèra*, Willd. spec. 3. p. 1337. *Cylipogon virgatum*, Rafin. 1. c. Petals white.

*Corymbose-flowered Petalostemum*. Fl. July, Sept. Clt. 1811. Pl. 1½ foot.

8 *P. ? CAPITATUM* (D. C. prod. 2. p. 244.) stem striated, silky; leaflets 5, oblong-cuneiform, obtuse, entire, silky; spike oblong, capitate, clothed with rufous villi; bractæas imbricated; stamens inclosed. ♀. F. Native of the plains of Missouri. *Cylipogon capitatum*, Rafin. 1. c. Flowers yellow. Stamens 8, connected together at the base in this, as well as the following species, according to Rafin. 1. c.

*Capitate-flowered Petalostemum*. Pl. 1 foot.

*Cult.* The species of this genus are very difficult to preserve in gardens. They should be grown in pots in a mixture of loam, leaf mould, and sand; and they are increased by seeds, or by dividing the plants at the roots.

C. DALEA (in honour of Thomas Dale, an English botanist of the last century). Lin. hort. cliff. 363. Michx. fl. bor. amer. 2. p. 56. D. C. prod. 244.—*Parosella*, Cav. elench. hort. madr.—*Dàlea*, with decandrous flowers, Vent. Willd.

LIN. SYST. *Monadèlphia, Decàndria*. Calyx 5-cleft (f. 36. a.) or 5-toothed, sometimes beset with glands. Wings and carina adhering to the tube of the stamens. Vexillum short, free (f. 36. b.). Stamens 10, monadelphous. Legume ovate, 1-seeded (f. 36. c.), shorter than the calyx.—American herbs, which are sometimes suffruticose at the base, beset with glandular dots in every part. Stipulas adhering to the petioles at the base. Leaves impari-pinnate, having the terminal leaflet sessile. Flowers disposed in pedunculate spikes, which are opposite the leaves.

1 *D. LAXIFLORA* (Pursh, fl. sept. amer. 2. p. 741.) plant quite glabrous; stem tall, branched; leaves with usually 4 pairs of linear-oblong leaflets; racemes few-flowered; flowers distinct, having 9 stamens; bractæas glabrous, acute; calycine segments acuminate, silky, and plumose. ♀. F. Native of Upper Louisiana, Nutt. gen. amer. 2. p. 101. *D. enneandra*, Fras. *Psoràlea laxiflora*, Poir. suppl. Flowers white. Leaves small, strong-scented. Calyx almost like that of *Petalostemum*, Sect. vi. *Kuhnistèra*. Root reddish, and rather fusiform.

*Loose-flowered Dalea*. Fl. Jul. Aug. Clt. 1811. Pl. 3 to 4 ft.

2 *D. AUREA* (Nutt. in Fras. cat. 1813. gen. amer. 2. p. 101.) plant clothed with silky villi; stem erect; leaves having 4 pairs of obovate leaflets, which are pilose beneath; spikes of flowers dense, cylindrical; bractæas rhomboid-ovate, about equal in length to the calyx; calyx densely clothed with wool; the teeth subulate. ♀. F. Native of Upper Louisiana, near White-river, on the Missouri. Pursh, fl. sept. amer. 2. p. 741. *Psoràlea aurea*, Poir. suppl. Flowers golden-yellow.

*Golden-flowered Dalea*. Fl. July, Aug. Clt. 1811. Pl. 2 ft.

3 *D. ALOPECUROIDES* (Nutt. gen. amer. 2. p. 101.) plant glabrous and erect; leaves having 10-15 pairs of linear-elliptic retuse leaflets; spikes of flowers ovate or cylindrical, pedunculate, beset with silky villi; bractæas length of calyx. ☉. H. Native of Georgia, Florida, and Louisiana. Lin. hort. cliff. t. 22. *Psoràlea Dalea*, Lin. D. Linuæi, Michx. fl. bor. amer. 2. p. 57. t. 38. *D. alopecuroides* and *D. Cliffortiàna*, Willd. spec. 3. p. 1336. *Petalostemum alopecuroides*, Pursh, fl. sept. amer. 2. p. 461. *Psoràlea alopecuroides*, Poir. Flowers having a white vexillum, and pale-violet wings and keel.

*Fox-tail-like-spiked Dalea*. Fl. Jul. Aug. Clt. 1812. Pl. 1 ft.

4 *D. PEDUNCULATA* (Pursh, fl. sept. amer. 2. p. 474.) plant smoothish; leaves with usually 6 pairs of linear, acute, mucronate leaflets; spikes of flowers oblong, axillary, rather crowded, and short; peduncles 3 times shorter than the leaves; bractæas minute, length of pedicels; teeth of calyx subulate. ☉. H. Native on the banks of the river Mississippi. Flowers rose-coloured. Perhaps the same as *D. alopecuroides*, ex Nuttall.

*Pedunculate-spiked Dalea*. Pl. 1 foot.

5 *D. LAOPUS* (Willd. spec. 3. p. 1340.) plant glabrous, erect; leaves with 9-15 pairs of obovate-oblong obtuse leaflets; spikes of flowers pedunculate, cylindrical, beset with silky villi; bractæas ovate, acuminate, shorter than the calyx. ☉. H. Native of Mexico. *Psoràlea lagopus*, Cav. icon. 1. t. 86. *P. leporina*, Ait. hort. kew. ed. 1. vol. 3. p. 81. Spike about an inch long. Flowers violaceous.

*Hare's-foot Dalea*. Fl. Oct. Nov. Clt. 1780. Pl. 2 to 4 feet.

6 *D. ANGUSTIFOLIA*; plant herbaceous, smooth; leaflets 3 or 5 pairs, linear, pointless, glandular beneath; spike cylindrical; calyx downy, fulvous, with awl-shaped feathery teeth. ☉. H. Native of Mexico. Stipels obsolete. Spike of flowers 2 inches long. Bractæas ovate, acuminate, blackish. Flowers small, purple. (v. s. herb. Lamb.)

*Narrow-leafletted Dalea*. Pl. 1 foot.

7 *D. ALOPECURUS* (Sesse and Moc. mss.) plant herbaceous, simple, hairy; leaves with 5 pairs of lanceolate, acute leaflets; spikes ovate-cylindrical, on long peduncles; calyx very hairy, with awl-shaped, feathery teeth; stipulas long and narrow. ☉. H. Native of Mexico. Flowers large, purple. (v. s. herb. Lamb.)

*Fox-tail-spiked Dalea*. Pl. 1 foot.

8 *D. SERICEA* (Lag. nov. gen. et spec. p. 23.) plant ascending, clothed with adpressed silky villi; leaves with 4 or 5 pairs of oval-lanceolate acute leaflets; spikes of flowers ovate, on very long peduncles, silky-villous; bractæas oblong, acuminate, shorter than the calyx. ♀. S. Native of Mexico, near Guanajuato. *D. longipes*, Moc. et Sesse, fl. mex. icon. ined. *D. gracili*, Kunth, mim. 166. t. 48. H. B. et Kunth, nov. gen. amer. 6. p. 481. Flowers of a dark-violaceous colour. Peduncles 8 or 9 inches long.

*Silky Dalea*. Fl. July, Aug. Clt. 1824. Pl. 1½ foot.

9 *D. ACUTIFOLIA* (Moc. et Sesse, fl. mex. ined. D. C. prod. 2. p. 245.) plant glabrous, erect; leaves with 3 or 4 pairs of oblong-linear acute leaflets, the odd one longest; spike of flowers oblong, almost terminal, pedunculate; bractæas longer than the calyx. ☉. G. Native of Mexico, on the mountains of Chilapan, in humid places. Flowers mixed with white and purple.

*Acute-leaved Dalea*. Pl. 1 foot.

10 *D. HYPOGLOTTIDEA* (D. C. prod. 2. p. 245.) plant spreading, smoothish; leaves with 11-13 pairs of ovate leaflets; spikes of flowers ovate, on long peduncles, which are lateral and pubescent; bractæas length of calyx. ♀. S. Native of Mexico. Flowers purple. *D. astragalina*, Moc. et Sesse, fl. mex. ined.

*Under-tongued Dalea*. Pl. spreading.

11 *D. ASTRAGALINA* (H. B. et Kunth, nov. gen. amer. 6. p. 484.) plant shrubby, much branched; leaves with 8-11 pairs of lanceolate-oblong, mucronate leaflets, which are hardly scabrous above, but pubescent beneath, as well as the branches, and

somewhat glandular; spikes of flowers opposite the leaves, cylindrical, pedunculate; calyx glandular at the base, and with a hairy limb.  $\frac{1}{2}$ . S. Native of South America, near Quito, and on the mountains about Popayan. Flowers rose-coloured.

*Astragalus-like Dalea.* Shrub 4 to 6 feet.

12 *D. PECTINATA* (Kunth, *min.* 169. t. 49. nov. gen. amer. 6. p. 483.) plant erect or procumbent, many-stemmed; leaves with 20-30 pairs of linear, acutish, canaliculately-concave, glabrous, glaucescent leaflets; spikes of flowers ovate-oblong, on long peduncles; bractæas subulate; calyx glandular and hairy.  $\frac{1}{2}$ . G. Native of Mexico, near Villalpando. Flowers violaceous, but yellow at the claws.

*Pectinated-leaved Dalea.* Pl. procumbent.

13 *D. LANATA* (Sesse et Moc. mss.) herbaceous, smooth; leaflets in many pairs, elliptic-oblong, blunt, glandular beneath; stipels obsolete; spike capitate; teeth of calyx awl-shaped, feathery.  $\odot$ . S. Native of Mexico. *D. lutescens*, Cerv. mss. Flowers large, white, tinged with purple. (v. s. herb. Lamb.)

*Woolly Dalea.* Pl.  $\frac{1}{2}$  foot.

14 *D. FULCHELLA*; herbaceous, smooth, with glandular, slightly warted branches; leaves with many pairs of obcordate leaflets, glandular on both surfaces, lower pair the largest and recurved; stipulas minute; spikes capitate; calyx very hairy, with bristle-shaped, feathered teeth.  $\odot$ . S. Native of Mexico. Leaflets very small. Flowers large, purple. A slender plant. (v. s. herb. Lamb.)

*Neat Dalea.* Pl.  $\frac{1}{2}$  to 1 foot.

15 *D. TUBERCULATA* (Lag. nov. gen. et spec. p. 23.) plant erect, suffruticose, glabrous; stem and branches beset with tubercles; leaves with 4 pairs of cuneate-oblong retuse leaflets, which are beset with dot-like tubercles beneath; spikes of flowers oblong-cylindrical, villous; bractæas ovate, shorter than the calyx.  $\frac{1}{2}$ . G. Native of Mexico. *Parosella tuberculata*, Cav. *clench.* hort. madr. 1805. *D. pendulina*, Moc. et Sesse, fl. mex. icon. ined. ? Flowers purple.

*Tubercled Dalea.* Fl. July, Aug. Clt. 1824. Shrub 1 to 2 ft.

16 *D. FORMOSA* (Torrey, in *ann. lyc.* 2. p. 177.) suffruticose, much branched, glabrous; leaves with 5 pairs of cuneate-oblong, retuse leaflets, which are beset with black dots beneath; spikes loose, few-flowered, on short peduncles; bractæas ovate, shorter than the calyx; calyx feathery, villous.  $\frac{1}{2}$ . G. Native of North America, on the Platte. Flowers large and showy bright-purple. Allied to *D. tuberculata*, Lag. but differs in its smooth stem and branches, and loose spikes of flowers.

*Showy Dalea.* Shrub 1 to 2 feet.

17 *D. CITRIODORA* (Willd. spec. 3. p. 1339.) plant erect, glabrous, branched; stems beset with a few tubercles; leaves with 9-11 pairs of elliptic-oblong, glandless leaflets; spikes of flowers ovate, pedunculate; calyx villous, 10 nerved; bractæas ovate, mucronate by a bristle, rather longer than the calyx, deciduous.  $\odot$ . H. Native of Mexico. *Psoralea citriodora*, Cav. icon. 3. t. 271. *Psoralea foliolosa*, Ait. hort. kew. ed. 1. vol. 3. p. 32. *Dalea latéripes*, Moc. et Sesse, fl. mex. icon. ined. Flowers mixed with white and purple. Plant when bruised smelling of lemon.

*Citron-scented Dalea.* Fl. Oct. Nov. Clt. 1780. Pl. 1 foot.

18 *D. LUTEA* (Willd. spec. 3. p. 1341.) plant decumbent, tomentose; leaves with 6 or 8 pairs of obovate, slightly emarginated leaflets, but the terminal one is longest; spikes of flowers ovate at first, but at length becoming cylindrical, pedunculate, villous; bractæas ovate, acute, shorter than the calyx.  $\frac{1}{2}$ . G. Native of Mexico. *D. ovalifolia*, Ort. dec. p. 30. t. 3. *Psoralea lutea*, Cav. icon. 4. t. 325. *D. flava*, Moc. et Sesse, fl. mex. icon. ined. Flowers yellow. Teeth of calyx awl-shaped, feathery.

*Yellow-flowered Dalea.* Pl. decumbent.

19 *D. MUTABILIS* (Willd. spec. 3. p. 1339.) erect, branched,

glabrous; leaves with 5-10 pairs of obovate or obcordate leaflets; spikes of flowers cylindrical, at length much elongated, pedunculate; peduncles hispid just under the spike; calyx glabrous, striated with 10 black nerves; bractæas ovate, terminated by a bristle, shorter than the calyx.  $\frac{1}{2}$ . S. Native of Mexico and of the island of Cuba. Sims, bot. mag. 2486. *D. bicolor*, Willd. hort. berl. t. 89. ex Sims. *D. obovatifolia*, Ort. dec. p. 31. *Psoralea mutabilis*, Cav. icon. 4. t. 394. *D. unguiculata*, Moc. et Sesse, fl. mex. icon. ined. Corolla at first white, but at length becoming of a violet colour.

*Changeable-flowered Dalea.* Fl. Oct. Nov. Clt. 1818. Pl.  $1\frac{1}{2}$  ft.

20 *D. UNCFERA* (Schlecht. et Cham. in Linnæa. 5. p. 580.) stem herbaceous, branched, beset with glandular hairs; leaves with 4 pairs of obovate, obtuse, mucronulate, stalked leaflets, which are dotted beneath and ciliated on the margins; stipulas filiform; spike terminal, ovate-cylindrical; bractæas navicular, longer than the calyx, ending each in a hooked acumen; calyx glandless.  $\odot$ . ? H. Native of Mexico. Corolla violaceous.

*Hook-bearing Dalea.* Pl.  $\frac{1}{2}$  foot.

21 *D. THYMOIDES* (Schlecht. et Cham. in Linnæa. 5. p. 580.) shrubby, clothed with cinereous pubescence, decumbent; branches erect, beset with black dots; leaves petiolate, with 4 pairs of elliptic-lanceolate, obtuse, petiolulate leaflets, beset with black dots beneath; stipulas setaceous; spikes terminal, conical, but becoming at length cylindrical and loose-flowered; bractæas lanceolate, acuminate, hardly exceeding the calyx, which is glandless; calycine segments subulate, nearly equal.  $\frac{1}{2}$ . S. Native of Mexico. Corolla purple, but with the vexillum pale and perhaps yellow.

*Thyme-like Dalea.* Shrub procumbent.

22 *D. VERBENACEA* (Schlecht. et Cham. in Linnæa. 5. p. 579.) leaves with 2-pairs of obovate-cuneate, mucronate leaflets, tomentose on both surfaces, and beset with black dots beneath; stipulas subulately-acuminate; spike terminal, ovate; bractæas exceeding the calyx.  $\frac{1}{2}$ . S. Native of Mexico. Flowers purple.

*Var.  $\beta$ , sericea* (Schlecht. et Cham. l. c.) leaves with 4-pairs of leaflets, densely clothed with silky tomentum.  $\frac{1}{2}$ . S. Flowers paler than in the species.

*Ferrain-like Dalea.* Shrub 1 to 2 feet.

23 *D. LEVIGATA* (Sesse et Moc. mss.) plant herbaceous, smooth; leaves with 8 pairs of oblong, slightly mucronulate glandular leaflets; spike elongated, loose; calyx hairy, with prominent ribs and lanceolate pointed teeth.  $\odot$ . H. Native of Mexico. Flowers large, purple. Stipulas and stipels minute. (v. s. herb. Lamb.)

*Smooth Dalea.* Pl. 1 foot.

24 *D. DORYCNIOIDES* (D. C. prod. 2. p. 245.) plant erect, rather suffruticose and velvety; leaves with 2, rarely with only one pair of obovate-cuneate retuse leaflets, beset with dots on both surfaces; spikes of flowers capitate, pedunculate; peduncles and branches tubercular; bractæas ovate, acute, length of calyx.  $\frac{1}{2}$ . S. Native of South America. The heads of flowers are smaller than in any other species.

*Dorycnium-like Dalea.* Shrub 1 to 2 feet.

25 *D. TRIPHYLLA* (Sesse et Moc. mss.) plant suffruticose, hairy; leaflets 3-lanceolate, acuminate; spike oblong; teeth of calyx and stipulas setaceous, feathery.  $\frac{1}{2}$ . S. Native of Mexico. Flowers large, yellow. (v. s. herb. Lamb.)

*Three-leafletted Dalea.* Shrub trailing.

26 *D. HUMILIS*; herbaceous, hairy; leaflets 5 or 7, lanceolate, acuminate; spikes ovate; teeth of the calyx awl-shaped, feathery.  $\odot$ . H. Native of Mexico. *D. herbacea*, Sesse et Moc. mss. Plant spreading. Flowers small, yellow.

*Humble Dalea.* Pl.  $\frac{1}{2}$  foot.

27 *D. LEPTOSTACHYA* (D. C. prod. 2. p. 246.) plant erect,

suffruticose, glabrous; leaves with 3 pairs of oval leaflets, which are acuminate at both ends; racemes cylindrical, slender, pedunculate; bractæas ovate, acuminate, glabrous, deciduous, rather shorter than the calyx, which is villously tomentose and 10-ribbed.  $\frac{1}{2}$ . S. Native of South America. Leaflets 8 lines long, and 3 lines broad, with the petioles covered with dot-like tubercles. Flowers spreading, rather distant, apparently somewhat distich.

*Slender-spiked Dalea.* Shrub 1 to 2 feet.

28 *D. VIRGATA* (Lag. nov. gen. et spec. p. 23.) shrubby; leaves with many pairs of elliptic retuse leaflets; spikes of flowers ovate, rather aggregate, terminal; calycine teeth hairy.  $\frac{1}{2}$ . S. Native of Mexico.

*Twiggy Dalea.* Shrub 1 to 2 feet.

29 *D. NU'TANS* (Willd. spec. 3. p. 1339.) plant erect, branched, quite smooth; leaves with 10-15 pairs of elliptic, glandularly-crenated leaflets, with the petiole rather dilated between the pairs of leaflets; racemes cylindrical; flowers rather loose, nodding; calyx 10-ribbed, and ornamented with rows of glands; calycine teeth 5, lower one longest.  $\odot$ . G. Native of Mexico. Flowers crimson. Leaflets stipellate; stipels minute, subulate, permanent. *D. melilotoides*, Moc. et Sesse, fl. mex. icon. ined. Calyx turbinate, with broad membranous teeth.

*Nodding-flowered Dalea.* Fl. July, Aug. Clt. 1824. Pl. 3 ft.

30 *D. PULCHERRIMA* (Sesse et Moc. mss.) herbaceous, smooth; branches glandular; leaflets many-pairs, linear-oblong, mucronulate, with the margins slightly crenate, together with the under surface glandular; stipels prominent; spike elongated, loose; calyx smooth, with prominent ribs, the teeth broad and membranous.  $\odot$ . S. Native of Mexico. Flowers large, crimson. *D. violacea*, Cervantes, mss. (v. s. herb. Lamb.)

*Ferry-fair Dalea.* Pl. 1 foot.

31 *D. BICOLOR* (Willd. hort. berl. 2. t. 89.) spikes terminal, elongated; leaves usually with 3-5 pairs of obovate leaflets; stem shrubby; stipulas subulate.  $\frac{1}{2}$ . G. Native of Mexico. Hook. exot. fl. t. 43. Flowers yellowish white, having the keel tipped with blue. Plant smooth.

*Two-coloured-flowered Dalea.* Fl. Oct. Nov. Clt. 1817. Sh. straggling.

32 *D. FLA'VO-RO'SEA* (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 246.) plant erect, suffruticose, clothed with velvety pubescence; leaves with 5 pairs of oval obtuse leaflets; spikes ovate, pedunculate; bractæas length of calyx.  $\frac{1}{2}$ . S. Native of Mexico. Corolla with a yellow vexillum, but with the rest of the petals rose-coloured.

*Yellow-and-Red-flowered Dalea.* Shrub 1 to 2 feet.

33 *D. RECLINATA* (Willd. spec. 3. p. 1340.) plant procumbent or ascending, clothed with silky villi; leaves with 6 pairs of lanceolate mucronate leaflets; spikes of flowers dense, cylindrical, villous; bractæas linear-subulate, length of calyx; calycine segments linear-subulate, feathery, length of vexillum.  $\frac{1}{4}$ . S. Native of Mexico. *Psoralea reclinata*, Cav. icon. 1. t. 87. Corolla of a pale violet colour.

*Reclinate Dalea.* Fl. July, Aug. Clt. 1820. Pl. proc.

34 *D. TOMENTOSA* (Willd. spec. 3. p. 1341.) plant erect, villously-tomentose; leaves with 3 or 4 pairs of obovate mucronate leaflets; spikes of flowers ovate-cylindrical, almost terminal; bractæas filiform, longer than the calyx.  $\frac{1}{4}$ . S. Native of Mexico. Corolla pink. Perhaps *D. onobrychioides*, Moc. et Sesse, fl. mex. icon. ined. ex D. C. Stipels obsolete.

*Tomentose Dalea.* Pl. 1 to 3 feet.

35 *D. ARGENTEA*; shrubby, upright, densely silky; leaflets 3 or 5, obovate-oblong, mucronate, glandular beneath; spikes ovate; calyx downy, with lanceolate, pointed teeth.  $\frac{1}{2}$ . S. Native of Mexico, near Jalapa. An upright branched shrub, clothed with silky down. Flowers small, pink. (v. s. herb. Lamb.)

*Silvery Dalea.* Shrub 2 feet.

36 *D. VERRUCOSA*; shrubby, pubescent, with warty upright branches; leaflets 5 or 9, obovate, retuse, glandular beneath; spikes of flowers elongated, loose; calyx downy, with lanceolate pointed teeth.  $\frac{1}{2}$ . S. Native of Mexico. Spikes loose, 3 inches long. Flowers pale-purple. (v. s. herb. Lamb.)

*Warty-branched Dalea.* Shrub 1 foot.

37 *D. PROSTRATA* (Ort. dec. t. 69.) stems prostrate, clothed with canescent hairs, thickest towards the apex; leaves with 1 or 2 pairs of lanceolate leaflets, glabrous above, and pubescent beneath; spikes of flowers ovate, on short peduncles, recurved; bractæas lanceolate, length of the calyx, which is very villous.  $\odot$ . ? G. Native of Mexico. Flowers yellow.

*Prostrate Dalea.* Pl. prostrate.

38 *D. PROCUMBENS* (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 246.) stems prostrate, pubescent, thickest at the base; leaves with 8 or 9 pairs of oval obtuse leaflets; spikes of flowers cylindrical, ascending, pedunculate; flowers drooping a little; vexillum very short.  $\odot$ . G. Native of Mexico, at Chilapa. Flowers white, but with the keel rather violaceous.

*Procumbent Dalea.* Pl. procumbent.

39 *D. MUCRONATA* (D. C. prod. 2. p. 246.) plant erect, branched; axillary branches bearing a spike of flowers, and one leaf in the middle of each; leaves with 5 or 6 pairs of elliptic-oblong mucronate leaflets, which are acute at both ends; spikes of flowers dense, ovate; calyx quite smooth, with short teeth; bractæas subulate, rather longer than the calyx.  $\frac{1}{4}$ . S. Native of Mexico. Flowers small, white.

*Mucronate-leafletted Dalea.* Pl. 1 foot.

40 *D. THOUINII* (Schrunk, hort. mon. t. 9.) plant erectish, glabrous; leaves with 3-5 pairs of obovate emarginate leaflets; spikes of flowers ovate, on short peduncles; bractæas ovate, acuminate, rather pilose, shorter than the calyx, which is rather hairy.  $\odot$ . S. Native of South America. The spikes of flowers according to the figure are sessile, but according to the description pedunculate. Perhaps the same as *Petalostemum sessile*, Moc. et Sesse, fl. mex. icon. ined. Perhaps a variety of *D. alopecuroides* only.

*Thouin's Dalea.* Fl. July, Aug. Clt. 1816. Pl. 1 foot.

41 *D. PHYMATODES* (Willd. spec. 3. p. 1338.) plant erect, shrubby, smooth; leaves with 7 or 8 pairs of obovate, somewhat mucronate leaflets, which are dotted beneath; spikes of flowers capitate, on short peduncles; bractæas lanceolate-subulate, ciliated, shorter than the calyx; calycine lobes subulate, long, and very villous.  $\frac{1}{2}$ . S. Native of Caracas. *Psoralea phymatodes*, Jacq. icon. rar. 3. p. 563. *Psoralea emphysodes*, Jacq. coll. 4. p. 144. Flowers at first white, but at length becoming violaceous.

*Impostume-like Dalea.* Fl. July, Aug. Shrub 2 to 3 feet.

42 *D. DOMINGENSIS* (D. C. prod. 2. p. 246.) erect, clothed with velvety pubescence; leaves with 6 or 7 pairs of obovate, obtuse, or emarginate leaflets, which are dotted beneath; spikes of flowers capitate, on short peduncles; bractæas ovate, acute, shorter than the calyx, which is villous; calycine lobes subulate.  $\frac{1}{2}$ . S. Native of St. Domingo. *D. encephylla*, Bert. in herb. Balb. This species comes very near *D. phymatodes*, but differs in the whole plant being clothed with velvety pubescence, not glabrous.

*St. Domingo Dalea.* Shrub 1 to 2 feet.

43 *D. AYAVACENSIS* (H. B. et Kunth, nov. gen. amer. 6. p. 486.) plant shrubby; branches villously-tomentose, and glandular; leaves with 7 or 8 pairs of oblong, somewhat mucronate leaflets, which are glabrous above, and pubescent beneath; spikes of flowers terminal, and opposite the leaves, oblong-cylindrical, pedunculate; calyx ornamented with rows of glands, with a hairy limb.  $\frac{1}{2}$ . S. Native of Peru, near Ayavaca. Flowers violaceous.

• G g

*Ayaraca* Dalea. Shrub 3 to 6 feet.

44 *D. ENNEAPHYLLA* (Willd. spec. 3. p. 1338.) plant erect, shrubby, glabrous; leaves with 4 pairs of oblong obtuse leaflets, which are dotted beneath; spikes of flowers dense, on short peduncles, which are about equal in length to the leaves; lobes of calyx setaceous.  $\frac{1}{2}$ . S. Native of Carthage, in bushy places. *Psoralea enneaphylla*, Lin. spec. 1076. *P. Carthagenensis*, Jacq. amer. 206. exclusive of the synonyme of Pluk. *P. enneaphylla* and *P. Carthagenensis*, Poir. dict. 5. p. 560. Perhaps Jacquin's plant and that of Linnæus are distinct species. Flowers small, reddish.

*Nine-leafletted* Dalea. Fl. June, Aug. Clt. 1772. Shrub 2 to 4 feet.

45 *D. ONORRYCHIS* (D. C. prod. 2. p. 247.) plant erect, glabrous; leaves with 4-6 pairs of elliptic, somewhat mucronate leaflets, which are covered with dots beneath; peduncles opposite the leaves, and 4-times longer than them; spikes of flowers ovate-cylindrical, dense, villous; bractæas ovate, concave, ending in a bristle-like mucrone, rather longer than the calyx, which is villous.  $\frac{1}{2}$ . ? S. Native of Peru. Flowers violaceous. Branches villous. Stipulas setaceous. Peduncles rather scabrous from a few tubercles.

*Saintfoin-like* Dalea. Pl. 1 to 2 feet.

46 *D. MUTISII* (Kunth, mim. 161. t. 47. nov. gen. amer. 6. p. 485.) plant erect, pubescent; leaves with 4-6 pairs of elliptic leaflets, which are beset with glandular dots and villi beneath, as well as the branchlets; spikes of flowers cylindrical, pedunculate, dense; bractæas ovate, ending in a long bristle point, longer than the flowers.  $\frac{1}{2}$ . S. Native of South America, at Santa Fe de Bogota. *Galèga cærùlea*, Lin. fil. suppl. 335. *Tephrosia cærùlea*, Pers. ench. 2. p. 329. Flowers blue.

*Mutis's* Dalea. Shrub 2 to 3 feet.

47 *D. CYLINDRICA* (Hook, bot. misc. 1. p. 213.) plant procumbent, smoothish; leaves with 6 pairs of obovate, somewhat mucronate leaflets, which are dotted beneath; peduncles opposite the leaves, and 3 times longer than them; spikes cylindrical, dense; bractæas ovate, concave, mucronate; calyx full of black dots, smooth, longer than the bractæa; segments broad-awl-shaped, ciliated.  $\frac{1}{2}$ . S. Native of Peru, in the valley of Canta. Flowers blue.

*Cylindrical-spiked* Dalea. Shrub.

48 *D. EXILIS* (D. C. prod. 2. p. 247.) plant erect, glabrous; leaves with 5-7 pairs of oblong acute leaflets, small, beset by dots beneath; spikes of flowers pedunculate, nearly globose, dense; bractæas ovate, glabrous, obtuse, mucronate, or acuminated, length of the calyx, which is villous.  $\frac{1}{2}$ . ?  $\frac{1}{2}$ . ? S. Native of Peru. Flowers violaceous. Bractæas differing in shape even in the same head of flowers. Leaflets a line and a half long.

*Lean* Dalea. Pl. 1 to 2 feet.

49 *D. MICROPHYLLA* (H. B. et Kunth, nov. gen. amer. 6. p. 482.) plant shrubby, procumbent; leaves with 9 or 10 pairs of glabrous, oblong, obtuse, thickish leaflets, beset with glandular dots beneath; spikes of flowers oblong-cylindrical; bractæas ending in a subulate acumen, beset with dots above, but silky beneath, length of calyx, which is clothed with glands and silky hairs.  $\frac{1}{2}$ . S. Native of Peru, on the mountains. Flowers yellow and red on the same plant according to Bonpland.

*Small-leaved* Dalea. Shrub procumbent.

50 *D. OVALIFOLIA*; herbaceous, spreading, smooth; leaflets 5, elliptic, glandular beneath; stipulas minute; spike long and slender, few flowered; calyx hairy, ribbed, with long-pointed recurved teeth.  $\odot$ . S. Native of Mexico. Plant much branched, spreading. Leaflets nearly an inch long. Spikes often a span long. Flowers white, stained with purple. (v. s. herb. Lamb.)

*Wool-leafletted* Dalea. Pl. 2 feet.

51 *D. CORONILLA*; herbaceous, upright, slightly villous; leaf-

lets 7-9, obovate, mucronulate, glandular beneath; stipulas long, setaceous; spikes of flowers oblong; calyx truncate, fringed with obsolete teeth.  $\odot$ . S. Native of Mexico. Flowers pale-purple. (v. s. herb. Lamb.)

*Coronilla-like* Dalea. Pl. 1 foot.

52 *D. FRUTICOSA*; shrubby, minutely pubescent; leaves with many-pairs of oblong leaflets, which are rounded at both ends, minutely mucronulate, coriaceous and veiny; stipels prominent; spikes of flowers loose, with short blunt teeth.  $\frac{1}{2}$ . S. Native of Mexico. Spikes about 2 inches long, thinly flowered, somewhat corymbose. Flowers small, yellow? (v. s. herb. Lamb.)

*Shrubby* Dalea. Shrub.

*Cult.* All the species of this genus grow best in a mixture of loam and peat, and the shrubby and perennial kinds are easily increased by young cuttings planted in sand, with a hand-glass placed over them; those of the stove species in heat. The seeds of annual kinds should be sown in pots, which should be placed in a hot-bed, and the plants separated and planted into other pots singly when they have grown a sufficient size for that purpose, and some of them may be planted out into the open border in a warm sheltered situation, where they will probably ripen their seeds. None of the species are worth cultivating except in botanical gardens.

CI. GLYCYRHIZA (from γλυκύς, *glycys*, sweet, and ῥίζα, *rhiza*, a root; the sweetness of the root of liquorice is well known). Tourn. inst. 210. Lin. gen. 882. D. C. prod. 2. p. 247.—*Glycyrrhiza* and *Liquiritia*, Mærch. meth. 132 and 152. Pers. ench. 2. p. 313.

LIN. SYST. *Diadelphia*, *Decandria*. Calyx naked, tubular, 5-cleft, bilabiate; lobes, especially the 2 superior ones, joined together much farther than the others. Vexillum ovate-lanceolate, straight. Keel 2-edged or of 2 petals, straight, acute. Stamens diadelphous. Style filiform. Legume ovate or oblong, compressed, 1-celled, 1-4-seeded.—Perennial herbs, with long, perpendicular, sweet roots, impari-pinnate leaves, axillary racemes of blue, violaceous, or white flowers. This is the genus to which the various kinds of *liquorice* belong.

1 *G. GLABRA* (Lin. spec. 1046.) leaflets ovate, rather retuse, and somewhat clammy beneath, as well as the branches; stipulas wanting; spikes or racemes of flowers pedunculate, shorter than the leaves; flowers distant; legumes glabrous, 3-4-seeded.  $\frac{1}{2}$ . H. Native of the south of Europe, from Spain to Tauria, also of China, and cultivated in France, Italy, Germany, and England for the sake of its roots. Lam. ill. t. 625. f. 2. Wood. med. bot. 458. t. 167. *G. lævis*, Pall. itin. ed. gall. append. no. 364. *Liquiritia officinalis*, Mærch. l. c. Roots long, perpendicular. Stem only terete at the apex. Leaves usually with 5 pairs of leaflets. Flowers pale-blue. The name *liquorice*, according to Du Theis, is said to be a corruption of the French word *Reglisse*, which is itself a corruption of *Glycyrrhiza*. It is more probable that the name *liquorice* has been given on account of the quantity of liquor the roots contain. *Liquorice* is much cultivated in Spain, and since Elizabeth's time has been grown in different parts of England. The soil most congenial to the growth of *liquorice* is a deep sandy loam trenched by the spade or plough, or with the aid of bow, to  $2\frac{1}{2}$  or 3 feet in depth, and manured if necessary. The plants are procured from old plantations, and consist of the side shoots which have eyes or buds. These may be taken off either in autumn, when a crop of *liquorice* is taken up for use, and laid in earth till spring, or taken from a growing plantation as wanted for planting. The planting season may be either October, or February, or March. In general the latter is preferred. The plants are dibbled in the rows 3 feet apart, and from 18 inches to 2 feet in the row, according to the richness or poverty of the soil. The after culture

consists of horse-hoeing, and deep-stirring in weeding, and in cutting down and carrying away the haulm every autumn, after it is completely withered. As the plants do not rise above a foot the first season after planting, a crop of onions is sometimes taken in the intervals. The plants must be three summers' growth, at the end of which the roots may be taken up by trenching over the ground. The roots are then either sold immediately to the brewers' druggists or to common druggists, or preserved like carrots or potatoes in sand, till wanted for use.

The roots of *liquorice* are externally brown, and internally yellow. Their taste is very sweet, combined with a slight degree of bitter when long kept in the mouth. The powder of *liquorice* usually sold is often mingled with flour, and perhaps also with substances not so wholesome. The best sort is of a brownish-yellow colour, the fine pale-yellow being generally sophisticated, and it is of a very rich sweet taste, much more agreeable than that of the fresh root.

Robiquet obtained from *liquorice-root*, 1. Amylaceous fecula. 2. A saccharine substance, having little resemblance to sugar. 3. A new crystalline substance. 4. A resinous oil, which is the cause of its acrimony in the decoctions. 5. Phosphate and malate of lime and magnesia. 6. Woody fibre.

The sweetness of *liquorice-root* depends upon a peculiar principle discovered by Robiquet, and called by him *glycyrrhizin* and *glycion*. He prepared it by subjecting a strong cold infusion of the root to ebullition, which separated a coagulable matter. It was then filtered, and acetate acid added, which gradually threw down an abundant, transparent, gelatinous magna, which being washed with a little cold water to separate any adhering acid, he considered as pure *glycion*. Its taste is peculiar, and intensely sweet, and its smell is not perceptible unless thrown upon hot coal, when it is resinous.

The predominant constituents of *liquorice* being saccharine and mucilaginous matter, its only action is that of a mild demulcent, and as such it is frequently used in catarrh, and in some stomach complaints, which seem to arise from a deficiency of the natural mucus, which should defend the stomach against the acrimony of the food and the fluids secreted into it. On account of its bulk it is rarely exhibited in substance, but more frequently in infusion or decoction.

The extract of *liquorice* is never prepared by the apothecary, but is commonly imported from other countries. It is imported in cylindrical rolls, covered with bay leaves. It should be perfectly black, brittle when cold, and break with a smooth and glassy fracture, have a sweet taste without empyreume, and be almost entirely soluble in water. It is prepared from the fresh roots by expression, decoction, and inspissation. The best foreign extract of *liquorice* is prepared in Catalonia. The refined *liquorice* sold in the shops in small cylindrical pieces not thicker than a goose quill, is a composition with mucilage of glue. The extract possesses the same properties with the root, and is used for the formation of several kinds of troches.

Common or *Smooth Liquorice*. Fl. June, Sept. Clt. 1562. Pl. 3 to 4 feet.

2 *G. GLANDULIFERA* (Waldst. et Kit. hung. 1. p. 20. t. 21.) leaflets oblong-lanceolate, clothed beneath with clammy pubescence, acute or emarginate; stipulas marcescent; spike of flowers pedunculate, shorter than the leaves; flowers distant; legumes 3-4-seeded, usually echinated with glands. 2. H. Native of Hungary and of Caucasus, on the banks of the river Don. Stems angular at the apex. *G. hirsuta*, Pall. itin. append. no. 363. ex Bieb. fl. taur. suppl. 1431. Flowers blue.

*Var. β*; legumes smoothish. 2. H. Native of Russia, on the banks of the Don. *G. glabra*, Pall. itin.

*Gland-bearing Liquorice*. Fl. June, Aug. Clt. 1805. Pl. 2 to 4 feet.

3 *G. LEPIDOTA* (Nutt. gen. amer. 2. p. 106.) leaflets oblong-lanceolate, acute, squamulose, under surface covered with glandular dots; stipulas linear-subulate; spikes of flowers pedunculate, shorter than the leaves, dense; legumes oblong, echinated by hooked bristles. 2. H. Native of North America, abundant around St. Louis, and on the alluvial banks of the Missouri to the mountains, and is in all probability the *liquorice* mentioned by Sir A. Mackenzie as indigenous to the coasts of the North Pacific Ocean. Sims, bot. mag. 2150. *Liquiritia lepidota*, Nutt. in Fras. cat. 1813. Root flagelliform, creeping, possessing the taste of the common *liquorice* in a considerable degree.

*Lepidoted Liquorice*. Fl. July, Aug. Clt. 1811. Pl. 3 to 5 ft.

4 *G. FÆTIDA* (Desf. atl. 2. p. 170. t. 199.) leaflets oblong, mucronate, rather lepidoted, the odd one on a short petiole; stipulas subulate; spikes of flowers dense, pedunculate, about equal in length to the leaves; legumes oval, mucronate, 2-seeded, echinated by bristles. 2. H. Native of Algiers and of Barbary, near Mayane. Leaflets 9-11. Root creeping. Flowers pale-yellow. The whole plant has a fetid scent when bruised.

*Fetid Liquorice*. Fl. July, Aug. Clt. 1817. Pl. 2 to 3 ft.

5 *G. ASPERRIMA* (Lin. fil. suppl. 330.) stems diffuse; leaflets obovate, retuse, or emarginate, usually mucronate, rather scarious beneath, as well as the petioles and stems; stipulas lanceolate; legumes rather terete, torulose, 3-8-seeded, glabrous. 2. H. Native of Siberia, on hills between the rivers Volga and Jaick, in the desert of Tartary, at the river Karaman, on the Ural mountains, and at Lake Inderskoi. *G. aspera* and *G. hispida*, Pall. itin. ed. gall. no. 365 and 366. t. 80 and t. 81. f. 1 and 2. Racemes axillary. Flowers pale-violet.

*Very-rough Liquorice*. Fl. July, Aug. Clt. 1795. Pl. 2 feet.

6 *G. URALENSIS* (Fisch. in litt. D. C. prod. 2. p. 248.) stem erect, covered with velvety pubescence; leaflets obovate, obtuse, almost glabrous; stipulas lanceolate; calyxes villous. 2. H. Native of Siberia, on the Ural mountains. Fruit unknown. Very nearly allied to *G. asperrima*. Flowers pale-violet.

*Ural Liquorice*. Fl. July, Aug. Pl. 2 feet.

7 *G. ECHINATA* (Lin. spec. 1046.) leaflets oval-lanceolate, mucronate, glabrous; stipulas oblong-lanceolate; spikes of flowers capitate, on very short peduncles; legumes oval, mucronate, 2-seeded, echinated by bristles. 2. H. Native of Apulia, on mount Gardano, and in the northern provinces of China, and of Tartary. Jacq. hort. vind. t. 95. Sims, bot. mag. 252. Schkuhr, handb. 225. Racemes not half so long as the leaves. Flowers purple. The whole plant is glutinous to the touch. Roots horizontal, in taste like the common *liquorice*.

*Echinated-podded Liquorice*. Fl. Ju. July. Clt. 1596. Pl. 3 ft.

8 *G. HIRUTA* (Lin. spec. 1046.) leaflets oblong-lanceolate; legumes hairy. 2. H. Native of the Levant. Tourn. cor. 26. Flowers purple.

*Hairy-podded Liquorice*. Fl. Ju. Sept. Clt. 1739. Pl. 2 to 3 ft.

9 *G. UNDULATA* (Ruiz et Pav. mss. in herb. Lamb.) leaves large, with 6 pairs of elliptic-oblong, undulated, acuminate, glabrous leaflets; panicles large, shorter than the leaves, spreading, composed of numerous racemes; rachis of flowers and calyxes pubescent; bractees tomentose, 1-flowered. 2. S. Native of Peru. Flowers purple.

*Waved-leaved Liquorice*. Shrub.

*Cult.* A deep light soil suits all the species of *Liquorice*, and they are easily increased by taking slips from the roots with eyes, and planting them in spring.

CII. GALEGA (from γαλα, *gala*, milk; supposed to increase the milk in animals eating of the herb). Tourn. inst. t. 222. Lam. ill. t. 625. Pers. ench. 2. p. 328.—*Galëga* species of Lin. and others.

LIN. SYST. *Monadelphæa*, *Decandriæ*. Calyx with 5 subulate, g g 2

equal teeth. Vexillum obovate-oblong. Keel obtuse. Stamens monadelphous, having the tenth one concrete, with the others one-half of its length. Style filiform, glabrous, crowned by a terminal dot-formed stigma. Legume rather terete, torulose, obliquely-striated. Seeds cylindrical.—Smooth, erect, perennial herbs, with impari-pinnate leaves, ovate or lanceolate, somewhat sagittate stipulas, and axillary, simple, many-flowered racemes. Flowers blue and white.

1 *G. OEFACINALIS* (Lin. spec. 1063.) leaflets lanceolate, mucronate, glabrous; stipulas broad-lanceolate; racemes longer than the leaves. *Æ. H.* Native of the south of Europe, in gravelly soils; also of Tauria and Barbary. Mill. fig. t. 137. *G. vulgaris*, Blackw. icon. t. 92.—Moris, hist. 2. p. 91. sect. 2. t. 7. f. 9. Flowers blue. Goat's-rue was formerly accounted cordial and sudorific; but is now out of repute. Mr. Boyle celebrated its virtues in pestilential and malignant fevers.

*Var. β, albiflora*; flowers white.

*Var. γ, Africana* (Mill. dict. no. 2.) leaflets broader and blunter; racemes longer.

*Official Goat's-rue.* Fl. Ju. Sept. Clt. 1568. Pl. 3 to 4 ft.

2 *G. PERSICA* (Pers. ench. 2. p. 328.) leaves usually with 5 pairs of ovate-oblong, rather retuse, mucronate, glaucescent leaflets; stem angular, flexuous; stipulas narrow-lanceolate, sagittate; bracteas linear-subulate, longer than the pedicels. *Æ. H.* Native of Persia. Sweet, fl. gard. 244. Flowers white.

*Persian Goat's-rue.* Fl. Ju. Sept. Clt. 1823. Pl. 2 to 3 ft.

3 *G. BI'LOBA* (Sweet, fl. gard. t. 159.) stem angularly striated, rather flexuous; leaves usually with 5-8 pairs of oblong, silky, pubescent leaflets, which are mucronate and 2-lobed at the apex; stipulas ovate-lanceolate, acute, acutely-serrated, sagittate; flowers crowded; bracteas subulate; twice the length of the pedicels. *Æ. H.* Native country unknown. Flowers bluish lilac.

*Two-lobed-leaved Goat's-rue.* Fl. June, Sept. Clt. 1823. Pl. 3 to 4 feet.

4 *G. ORIENTALIS* (Lam. dict. 2. p. 596.) leaflets ovate, acuminate, smooth; stipulas broad-ovate; racemes longer than the leaves; legumes pendulous; roots creeping. *Æ. H.* Native of Caucasus, and on all the oriental mountains. Sims, bot. mag. 2192. Ker. bot. reg. 326. *G. montana*, Schultes, obs. 154. Flowers blue. The creeping roots and simple flexuous stems are sufficient to distinguish this species from all the others.

*Oriental Goat's-rue.* Fl. June, Aug. Clt. 1801. Pl. 2 to 4 ft.

*Cult.* All the species of this genus are very elegant, and well adapted for ornamenting flower borders. They are all easily increased by dividing the plants at the root in spring, or by seeds.

CIII. CALLOTROPIS (from *καλλος*, *kallos*, beauty, and *τροπή*, *trope*, a keel; in reference to the keel being beautifully variegated). *Galëga* species, Hooker.

LIN. SYST. *Diadélphia*, *Décándria*. Calyx with 5 equal filiform teeth. Vexillum erect, ovate. Wings shorter than the keel. Keel incurved. Style incurved, tipped by a hairy stigma. Stamens diadelphous, joined ones incurved, the free one straight. Legume stipitate, compressed, rather terete, tapering to both ends, many-seeded.—A herb, clothed with pubescent pili, with impari-pinnate leaves, having 6-7 pairs of oblong-cuneate, pubescent, retuse, mucronulate leaflets, axillary racemes of drooping flowers, and lanceolate-subulate semisagittate stipulas.

1 *C. TRICOLOR.* *Æ. G.* Native of New Holland, on the north coast. *Galëga tricolor*, Hook. exot. fl. t. 185. Flowers pale blue, with the base of the wings and vexillum white, the latter tipped with yellow.

*Three-coloured-flowered Callotropis.* Fl. June, Sept. Clt. 1823. Pl. 2 to 3 feet.

*Cult.* An elegant plant when in flower. For its culture and propagation see *Galëga*. It requires to be protected in winter.

CIV. TEPHROSIA (from *τεφρος*, *tephros*, ash-coloured; in allusion to the colour of the foliage of some of the species, as those of *T. cinerea*, &c.) Pers. ench. 2. p. 328. Kunth, nov. gen. amer. 6. p. 458.—Cracca, Lin. fl. zeyl. 139. amœn. 3. p. 18.—Needhamia, Scop. but not of R. Brown, nor Cass.

LIN. SYST. *Monadélphia* or *Diadélphia*, *Décándria*. Calyx bractless, nearly equal, 5-toothed (f. 37. a.). Vexillum large (f. 37. b.), roundish, silky or pubescent on the outside, spreadingly reflexed. Wings adhering to the keel, which is obtuse. Stamens variously connected, monadelphous or diadelphous. Style filiform. Stigma terminal. Legume usually sessile, compressed, linear (f. 37. c.), many-seeded, with the valves flat. Seeds compressed.—Shrubs or herbs, with usually impari-pinnate leaves, lanceolate or subulate stipulas, which are distinct from the petiole, not sagittate. In the true *Tephrosias* the leaves are impari-pinnate; in the spurious ones trifoliate or palmate. Racemes axillary, rarely opposite the leaves. Flowers white or purplish. This genus will hereafter probably be divided into several genera, when the characters are better known.

SECT. I. MUNDU'LIA (from *mundulus*, delicate, handsome; appearance of plants). D. C. leg. mem. vi. prod. 2. p. 249.—Robinia, Roxb. hort. beng. 56. but not of Lin. Leaves impari-pinnate. Racemes axillary, erect, usually panicled. Calyx truncate, or with 5 short teeth. Stamens monadelphous. Style glabrous, or as in *T. candidum*, bearded.

1 *T. SUBEROSA* (D. C. prod. 2. p. 249.) leaves with 7-10 pairs of elliptic-oblong mucronulate leaflets, which are glabrous above, and clothed with adpressed pubescence beneath; carina straightish; style glabrous; legume canescent, irregularly coarctate between the seeds. *h. S.* Native of Bengal. Robinia suberosa, Roxb. l. c. Flowers rose-coloured. Vexillum hardly pubescent.

*Corky-barked Tephrosia.* Fl. Ju. Aug. Clt. 1818. Sh. 2 to 4 ft.

2 *T. CHINE'NSIS* (Lindl. hort. trans. 7. p. 38.) shrubby; leaves with 9-10 pairs of oblong, obtuse, pubescent leaflets; racemes axillary, horizontal, compressed, many-flowered; calyx bibraeteolate; corolla pubescent; style glabrous; stigma capitate. *h. G.* Native of China. Stamens diadelphous. Flowers bright rose-coloured. Like *T. suberosa*.

*China Tephrosia.* Fl. June. Clt. 1822. Shrub 2 to 3 feet.

3 *T. FRUTICOSA* (D. C. prod. 2. p. 249.) leaves with 4 or 5 pairs of ovate-oblong, acute, glabrous leaflets, but are rather villous on the nerves beneath; petals and style glabrous; legume broadly oblong, compressed, velvety, drawn out downwards into a short acumen. *h. S.* Native of the East Indies. Robinia fruticosa, Roxb. l. c. Racemes panicled, short. Flowers small, red. Legume rusty.

*Shrubby Tephrosia.* Fl. June, Aug. Clt. 1816. Shrub cl.

4 *T. SOPHOROIDES* (D. C. in ann. sci. nat. 4. p. 99.) leaves with 3-5 pairs of elliptic-oblong, glabrous, acuminate leaflets; petals and style glabrous. *h. G.* Native of Nipaul. Flowers apparently white in a dry state, small.

*Sophora-like Tephrosia.* Shrub 2 to 4 feet.

5 *T. BRACHYSTACHYA* (D. C. l. c.) leaves with 7-8 pairs of elliptic, obtuse leaflets, the young ones clothed with adpressed silky pubescence on both surfaces, adult ones glabrous on the upper surface, but pubescent beneath; racemes panicled, shorter than the leafless part of the petiole; petals and style glabrous. *h. G.* Native of Nipaul. Flowers probably red.

*Short-spiked Tephrosia.* Shrub.

6 *T. SERICEA* (D. C. prod. 2. p. 249.) leaves with 6 pairs of oblong-lanceolate obtuse leaflets, which are glabrous above, but clothed with silky tomentum beneath; racemes nearly terminal. *h. S.* Native of Tranquebar. *Cytisus sericeus*, Willd. nov.

act. nat. cur. berl. 4. 1803. p. 204. spec. 3. p. 1121. Flowers red. Legume 2 inches long, compressed, silky.

*Silky Tephrosia.* Fl. July, Aug. Clt. 1800. Shrub 2 to 4 ft.

7 *T. CANDIDA* (D. C. prod. 2. p. 249.) leaves with 8-11 pairs of elliptic-oblong mucronate leaflets, which are glabrous above, and pale and covered with silky pubescence beneath; legume linear, much compressed, clothed with adpressed pubescence, apiculated by the long style. *h. S.* Native of Bengal. *Robinia candida*, Roxb. hort. beng. p. 56. Style curved into an angle, and the keel as if it were truncate. Vexillum silky on the outside. Flowers pale rose-coloured in a dried state.

*White-leaved Tephrosia.* Clt. 1816. Shrub 2 to 4 feet.

SECT. II. *BRISSEONIA* (in honour of M. Brisson, a French ornithologist). Neck. elem. no. 1348. D. C. prod. 2. p. 249.—*Erebinthus*, Mich. gen. 210. Leaves impari-pinnate. Lobes of calyx broadest at the base, but ending in an elongated acumen. Stamens monadelphous. Style bearded laterally. Legumes more or less velvety, or hispid.

\* *Flowers in fascicles, disposed in terminal racemes or panicles. Peduncles axillary.*

8 *T. TOXICARIA* (Pers. ench. 2. p. 328.) plant suffruticose, erect; leaves with 18 or 20 pairs of oblong-lanceolate, obtuse, somewhat mucronate leaflets, which are pubescent on the upper surface, but clothed with silvery-silky pubescence beneath; the down adpressed on both surfaces; legumes linear, rather terete, clothed with velvety villi, ending each in a short mucrone. *h. S.* Native of the West Indies and Cayenne, and said by Tussac to have been first imported from Africa.—*Plum. icon. t. 135.* *Galèga toxicaria*, Swartz, fl. ind. occid. 1278. *Tuss. ant. t. 20. Lam. dict. 2. p. 596.* *Galèga sinapon*, Buchoz, nat. hist. 10. dec. 10. t. 4. Flowers pale-red. The stamens, according to Swartz, are diadelphous, and the legume stipitate within the calyx, but in Plumier's specimen examined by De Candolle, the stamens are monadelphous, and the legume sessile; therefore, perhaps 2 distinct plants are here confused. The leaves and branches of this shrub well pounded, and thrown into a river or pond, very soon affects the water, and intoxicates the fish, so as to make them float on the surface as if dead; most of the large ones recover after a short time, but the greater part of the small fry perish on those occasions. It has been introduced to Jamaica and cultivated there on account of its intoxicating qualities.

*Poison Tephrosia.* Clt. 1791. Shrub 2 to 3 feet.

9 *T. VIRGINIANA* (Pers. ench. 2. p. 329.) plant herbaceous and erect; leaves with 8-11 pairs of oval-oblong acute leaflets, clothed beneath with white villi; calyxes woolly. *u. F.* Native from Canada to Florida, in dry sandy woods. *Galèga Virginiana*, Lin. spec. 1062. but not of hort. Cliff.—*Pluk. t. 23. f. 2.* Flowers reddish, handsome. Plant covered with hoary villi. This species is considered in America as a powerful vermifuge.

*Virginian Tephrosia.* Fl. Ju. Aug. Clt. 1765. Pl. 1 to 3 ft.

\* \* *Peduncles opposite the leaves.*

10 *T. HISPIDULA* (Pursh, fl. amer. sept. 2. p. 489.) plant herbaceous, trailing, slender, and pubescent; leaves having 6 or 7 pairs of oblong-oval, obtuse, mucronate leaflets; peduncles elongated. 3-5-flowered; legume oblong, falcate, rather hispid. *u. F.* Native from Virginia to Georgia, in pine woods, and on slate hills. *Galèga hispidula*, Michx. fl. bor. amer. 2. p. 68. *G. spicata*, Walt. Flowers pale red, and yellowish white.

*Hispid Tephrosia.* Pl. trailing.

11 *T. GRACILIS* (Nutt. gen. amer. 2. p. 119.) plant herbaceous, erect, slender, smoothish, dichotomous; leaves with 6-7 pairs of oblong-elliptic, acute, mucronated leaflets, the lower pair approximating the stem; peduncles length of leaves, usually 3-flowered; legume linear, hairy, rather incurved. *u. F.* Native of Carolina and Georgia. Flowers pale red.

*Slender Tephrosia.* Pl. 1 foot.

12 *T. PACIFOLIA* (Nutt. gen. amer. 1. c.) plant herbaceous and erect, simple, velvety, and pilose; leaves with 6-9 pairs of remote, cuneate-oval, very obtuse leaflets, which are villous on both surfaces; peduncles length of leaves, usually 3-flowered. *u. F.* Native of Georgia and Florida. Flowers purple. The leaves are far apart upon the stem.

*Few-leaved Tephrosia.* Pl. 2 feet.

13 *T. PROSTRATA* (Nutt. 1. c.) plant herbaceous, prostrate, pubescent; leaves with only 1 or 2 pairs of cuneate-obovate, coriaceous leaflets, which are glabrous above, but clothed with silky villi beneath, the lower ones approximating the stem; peduncles 3-flowered, longer than the leaves; legume linear, almost straight. *u. F.* Native of Georgia. Common about Savannah, in dry and sandy woods. *Galèga villosa*, Michx. fl. bor. amer. 2. p. 67. *T. chrysophylla*, Pursh, fl. amer. sept. 2. p. 489. Flowers purple.

*Prostrate Tephrosia.* Pl. prostrate.

14 *T. HISPIDA* (D. C. prod. 2. p. 250.) plant herbaceous, erect, dichotomous; stem and petioles beset with stiff ferruginous hairs; leaves with 5 pairs of cuneate-obovate leaflets, which are villous on both surfaces; peduncles 7-10-flowered, much longer than the leaves; flowers spicate, lower ones distant; legume linear, straight, rather hispid. *u. F.* Native of Carolina. Flowers purplish.

*Hispid Tephrosia.* Pl. 1 to 2 feet.

SECT. III. *CRACCOIDES* (*Cracca* and *idea*, similar; plants having the aspect of *Vicia cracca*). D. C. leg. mem. vi. prod. 2. p. 250. Leaves impari-pinnate. Lobes of calyx broadest at the base, ending in an elongated acumen. Stamens diadelphous. Style bearded. Disk in flower not manifest.

15 *T. OCHROLEUCA* (Pers. ench. 2. p. 329.) plant suffruticose, erect, pubescently-villous; stipulas subulate; leaves with 2-3 pairs of ovate leaflets; peduncles axillary, longer than the leaves; flowers racemose; legume straight, quite smooth, and very narrow, containing from 14 to 18 seeds. *h. S.* Native of the Caribbee islands. *Galèga ochroleuca*, Jacq. icon. rar. t. 150. *Galèga pubescens*, Lam. dict. 2. p. 597. Flowers cream-coloured, changing to reddish before fading. Legumes torulose.

*Cream-coloured-flowered Tephrosia.* Clt. 1799. Shrub 2 to 3 ft.

16 *T. MOLLIS* (H. B. et Kunth, nov. gen. amer. 6. p. 462.) herbaceous, clothed with soft pubescence; leaves with 4-6 pairs of stipellate elliptic-oblong leaflets, which are rounded at the apex, and mucronate, clothed with adpressed pubescence above, and silky-silvery down beneath; racemes axillary. *h. S.* Native of New Andalusia. Flowers rose-coloured.

*Soft Tephrosia.* Shrub 2 to 3 feet.

17 *T. ASTRAGALINA* (H. B. et Kunth, 1. c.) stem shrubby, tomentose; leaves with 8-9 pairs of stipellate, oblong, somewhat mucronate leaflets, which are rounded at both ends, and covered with adpressed pubescence above, but with canescent tomentum beneath, as well as the legumes; racemes axillary; flowers scattered. *h. S.* Native about Quito. Flowers white.

*Milk-etch-like Tephrosia.* Shrub 2 feet.

18 *T. ? OROBORDES* (H. B. et Kunth, nov. gen. amer. 6. p. 462. t. 578.) plant erect, shrubby, branched; leaves with 4-6-

FIG. 37.

pairs of lanceolate-linear, acute, pilosely-pubescent leaflets; pedicels axillary, elongated, 1-2-flowered, 1-leaved at the apex; legume terete, puberulous. *h. G.* Native of Mexico, near Guanajuato. Habit nearly of *T. stricta*.

*Var. β, leiocarpa* (D. C. prod. 2. p. 255.) young legumes glabrous; leaves with 4 pairs of lanceolate short leaflets.

*Orobis-like Tephrosia.* Shrub 2 to 3 feet.

SECT. IV. REINERIA (in honour of Joseph Reiner Von Hohenwarth, author of *Botanische reisa*, 1 vol. 8vo. 1796). *Mench. suppl.* p. 44. *D. C. prod.* 2. p. 251. Leaves imparipinnate. Teeth of calyx linear-subulate. Stamens sometimes somewhat monadelphous, and sometimes diadelphous. The species contained in this section are disposed in an artificial manner, some with many pairs of leaflets and some with few.

19 *T. CARIBÆA* (D. C. prod. 2. p. 251.) shrubby, branched, smooth; leaves with 10-12 pairs of oval, awnedly-mucronate leaflets; peduncles axillary, rather longer than the leaves, few-flowered; legume linear, deflexed, glabrous, furrowed between the seeds. *h. S.* Native of the Caribbee Islands. *Galèga Caribæa*, Jacq. *amer.* 212. t. 125. Flowers scentless, variegated with white and red. Stamens diadelphous.

*Caribbean Tephrosia.* Fl. June, July. Clt. 1786. Sh. 3 ft.

20 *T. EMARGINATA* (H. B. et Kunth, *nov. gen. amer.* 6. p. 461.) arborescent; branches tomentose; leaves with 14 pairs of linear-oblong leaflets, which are deeply emarginate at the apex, clothed with adpressed pubescence above, and silvery silky down beneath; racemes terminal; flowers in fascicles; legumes straightish, clothed with silky tomentum as well as the calyxes. *h. S.* Native of South America, in the missions of Orinoco. Stamens diadelphous. The root of this species is used to intoxicate fish, as *T. toxicaria*, which see, no. 8.

*Emarginate-leafletted Tephrosia.* Shrub 2 to 4 feet.

21 *T. GRANDIFLORA* (Pers. *ench.* 2. p. 329.) shrubby, erect, glabrous; leaves with 7-9 pairs of oblong, mucronate leaflets, which are pubescent beneath; stipulas ovate, acuminate; racemes opposite the leaves, and somewhat terminal, straight, bearing 4 flowers at the apex; bracteas ovate, concave, large, deciduous. *h. G.* Native of the Cape of Good Hope. *Galèga grandiflora*, Vahl. *ymb.* 2. p. 84. *Ker. bot. reg.* 769. *Lher. stirp.* 2. t. 44. *Galèga rosea*, Lam. *dict.* 2. p. 599. Flowers rose-coloured, larger than those of any other species in the genus.

*Great-flowered Tephrosia.* Fl. May, Sept. Clt. 1774. Sh. 2 to 3 feet.

22 *T. COCCINEA* (Wall. *pl. asiat. rar.* vol. 1. t. 60.) suffruticose, erect; branches terete, flexuous, and are as well as under surface of the leaves clothed with white and adpressed wool; leaves sessile, with 3-4 pairs of cuneiform-obovate, retuse leaflets; racemes axillary, on long peduncles; teeth of calyx lanceolate, acuminate; stamens diadelphous; style villous beneath; legume linear, pendulous. *h. S.* Native of the East Indies, on the left bank of the Irawaddi, near Yenangheum. Flowers scarlet.

*Scarlet-flowered Tephrosia.* Shrub 2 to 3 feet.

23 *T. VILLOSA* (Pers. *ench.* 2. p. 329.) plant herbaceous, branched, pubescent; leaves with 7-9 pairs of obovate-cuneated, retuse leaflets, which are silky-villous beneath and pilose above; stipulas setaceous; racemes opposite the leaves, nearly terminal, many-flowered; legumes linear, mucronate, densely villous, 4-5-seeded. *h. S.* Native of the East Indies. *Galèga villosa*, Lin. *spec.* 1063.—Pluk. *alm.* t. 59. f. 6.—Burm. *zeyl.* t. 33. Flowers white?

*Villous Tephrosia.* Fl. June, July. Clt. 1779. Pl. proc.

24 *T. SERICEA* (Hamilt. in Lin. *trans.* 13. p. 545.) leaves with 8-10 pairs of cuneated leaflets, silky beneath; racemes

opposite the leaves, sessile; stipulas subulate; legumes pubescent, arched, recurved. *h. S.* Native of the south of India. Flowers red. Stamens diadelphous. Calyx 5-toothed.

*Silky Tephrosia.* Shrub 2 feet.

25 *T. PURPUREA* (Pers. *ench.* l. c.) plant herbaceous, branched; leaves with 7-9 pairs of oblong-cuneated, somewhat mucronate leaflets, hardly pubescent beneath; stipulas subulate; racemes opposite the leaves or terminal; legume linear, much compressed, 5-8-seeded, finely pubescent. *h. S.* Native of the East Indies, and Ceylon. *Galèga purpurea*, Lin. *amœn.* 3. p. 19. *Roxb. hort. beng.* 57. *Sieb. fl. maur. exsic.* no. 156. *Burm. zeyl.* t. 32. but this differs from the plant of Linnaeus in the legumes, which are said to be terete. Flowers purple. Stamens monadelphous. This plant is prescribed by Indian doctors in cases of dyspepsia, henterig, and tympanitis.

*Purple-flowered Tephrosia.* Fl. Jul. Aug. Clt. 1768. Pl. 2 ft.

26 *T. HIRTA* (Hamilt. in Lin. *trans.* 13. p. 546.) suffruticose, erect, tomentose; branches somewhat tetragonal; leaves with 4-8 pairs of cuneate, emarginate leaflets, which are glabrous above, but beset with long, adpressed hairs beneath; stipulas broad from the base; racemes opposite the leaves, leafy, pedunculate; legume falcate, pendulous, hairy, 6-seeded. *h. S.* Native of the East Indies. Flowers bluish, but with the keel white. Stigma bearded.

*Hairy Tephrosia.* Shrub 1½ foot.

27 *T. LANCEOLATA* (Link. *enum.* 2. p. 252.) plant suffruticose; leaflets obversely lanceolate, emarginate, mucronate, clothed with close-pressed hairs beneath; stipulas subulate; racemes terminal; legumes terminal, straight, spreading. *h. S.* Native country unknown. This species is said to be very like *T. purpurea*, but the flowers are cream-coloured, not purple. De Candolle has a specimen which was sent from the Calcutta Botanic Garden, under the name of *T. lanceolata*, which is scarcely distinct from *T. purpurea*.

*Lance-leaved Tephrosia.* Fl. July, Aug. Clt. 1820. Shrub 2 to 3 feet.

28 *T. PROCUMBENS* (Hamilt. in Lin. *trans.* 13. p. 547.) plant suffruticose, procumbent, filiform, pilose; leaves with 4-5 pairs of stalked, cuneiform, hairy, mucronate leaflets; stipulas setaceous; racemes opposite the leaves, leafy; legume straight, pilose, compressed, 9-seeded. *h. S.* Native of the East Indies. Calyx 5-cleft, with setaceous segments, length of corolla.

*Procumbent Tephrosia.* Pl. procumbent.

29 *T. DOMINGENSIS* (Pers. *ench.* 5. p. 330.) plant herbaceous, branched, glabrous; leaves with 7-9 pairs of linear-cuneated, obtuse, mucronate leaflets, which are clothed with adpressed pubescence beneath; stipulas lanceolate-subulate; racemes axillary; legumes pendulous, minutely pubescent. *h. S.* Native of St. Domingo, in sterile places. *Galèga Domingensis*, Willd. *spec.* 3. p. 1249. Flowers small, pale red.

*St. Domingo Tephrosia.* Pl. 1 foot.

30 *T. PERRINIANA* (D. C. prod. 2. p. 251.) plant branched, hairy; leaflets linear-oblong, mucronate, ciliated, rather hairy; panicle hairy, terminal, cymose. Native of South America. *Galèga Perriniana*, Spreng. *neue. entd.* 2. p. 161. Said to be like *T. Domingensis*.

*Perrin's Tephrosia.* Pl. 1 foot

31 *T. MUCRONATA* (D. C. prod. 2. p. 251.) shrubby, erectish, branched, pubescent; leaves with 8 pairs of ovate, mucronate, villous leaflets; peduncles axillary, longer than the leaves, 1-2-flowered; legume pubescent. *h. G.* Native of the Cape of Good Hope. *Galèga mucronata*, Thunb. *fl. cap.* 609. Flowers probably red.

*Mucronate-leafletted Tephrosia.* Shrub.

32 *T. LEPTOSTACHYA* (D. C. prod. 2. p. 251.) plant herbaceous, erect, branched, hardly pubescent; leaves with 7 pairs

of oblong, rather cuneated, retuse, mucronate leaflets, the young ones silky beneath; stipulas subulate; racemes elongated, slender, opposite the leaves, or terminal; flowers distant, and are as well as the legumes erectish. ☉. S. Native of Senegal. Flowers purple. Stamens monadelphous.

*Slender-spiked Tephrosia.* Pl. 1 foot.

33 *T. MA'XIMA* (Pers. ench. 2. p. 329.) glabrous; leaflets oval-lanceolate, obtuse, mucronate, striated beneath; stipulas lanceolate; racemes terminal, very long; pedicels tern, rising from the axils of the bracteas, which are ovate and acuminate; calyxes and legumes glabrous. ♀. S. Native of Ceylon. *Galèga máxima*, Lin. spec. 1063. exclusive of the synonyme of Burman, which is said to have short, 2-flowered pedicels and abruptly pinnate leaves.

*Largest Tephrosia.* Shrub 1 to 2 feet.

34 *T. ARGENTEA* (Pers. ench. 2. p. 329.) suffruticose, clothed with silvery tomentum; leaves with 7-8 pairs of oblong, obtuse leaflets, which are silky beneath; stipulas ovate, but subulate at the apex, nerved; racemes almost terminal; pedicels twin; calyxes villous. ♀. S. Native of the East Indies. *Galèga argentea*, Lam. dict. 2. p. 599. *Galèga bárba-jövis*, Burm. ind. 172.—Pluk. alm. t. 52. f. 1. Flowers purple.

*Var. β, glabrúscula* (D. C. prod. 2. p. 252.) branches and leaves sparingly pubescent. ♀. S. Native of the East Indies. Stipulas 3-nerved.

*Silvery Tephrosia.* Shrub 2 feet.

35 *T. COLUTEA* (Pers. ench. 2. p. 329.) shrubby, branched, hoary-tomentose; leaflets 5-7 pairs, oblong-obovate, retuse; stipulas lanceolate, tomentose; peduncles axillary and terminal; legume straight, erect. ♀. S. Native of the East Indies. *Galèga Colútea*, Burm. ind. 172.—Pluk. alm. t. 166. f. 3. Flowers purple. Stamens diadelphous.

*Colutea-like Tephrosia.* Shrub 2 feet.

36 *T. VENU'STULA* (H. B. et Kunth, nov. gen. amer. 6. p. 459.) shrubby; leaves with 5-7 pairs of lanceolate, obtuse, mucronate leaflets, and are as well as the calyxes clothed with adpressed canescent pubescence; stipulas ovate, acuminate; racemes opposite the leaves, furnished with one leaf at the base; flowers in fascicles; legume somewhat cultriform, pubescent. ♀. S. Native of Cumana, about Borbones. Flowers red.

*Pretty Tephrosia.* Shrub 1 to 2 feet.

37 *T. PISCATORIA* (Pers. ench. 2. p. 329.) shrubby; leaves with 5-6 pairs of oblong, obtuse leaflets, which are rather pilose beneath; stipulas subulate; peduncles 2-edged; legume straight, ascending, rather villous. ♀. S. Native of the East Indies, and in the islands of the Pacific ocean. *Galèga littoralis*, Forst. prod. no. 277. *G. piscatoria*, Ait. hort. kew. 3. p. 71. Flowers purple. This species is used to intoxicate fish in the East Indies, as the *T. toxicaria* is in the West Indies.

*Fisher's Tephrosia.* Fl. June, July. Clt. 1778. Pl. 2 feet.

38 *T. REFLEXA* (D. C. prod. 2. p. 252.) shrubby, pubescent; branches rather triquetrous; leaves with 5 pairs of oblong leaflets, each ending in a reflexed mucrone; peduncles axillary, generally 1-flowered, longer than the leaves; legumes rather hairy. ♀. S. Native country unknown. Flowers red. Stamens monadelphous. *Reinèria refléxa*, Mœench. suppl. 45.

*Reflexed-pointed leaved Tephrosia.* Shrub 1 to 2 feet.

39 *T. LEUCANTHA* (H. B. et Kunth, nov. gen. amer. 6. p. 460. t. 577.) shrubby; leaves with 3-8 pairs of oblong-lanceolate, obtuse, mucronate leaflets, which are clothed with adpressed pubescence on both surfaces, but canescent beneath; racemes terminal, usually twin; flowers in fascicles; calyxes covered with silky strigæ; legume tomentose. ♀. S. Native of Mexico, near Guanajuato. Said to be allied to *T. Virginiana*. Flowers white.

*White-flowered Tephrosia.* Shrub 2 feet.

40 *T. CORONILLÆFOLIA* (D. C. prod. 2. p. 252.) shrubby; clothed with cinereous pubescence; branches angular; leaves with 5 pairs of obovate-cuneated, obtuse, mucronate leaflets; racemes axillary; legumes rather villous. ♀. S. Native of Bourbon. *Galèga coronillæfolia*, Desf. cat. hort. par. 194. Poir. suppl. 2. p. 699. *Brissônia coronillæfolia*, Desv. journ. 1814. vol. 1. p. 78. Perhaps distinct from *T. refléxa*.

*Coronilla-leaved Tephrosia.* Shrub 1 to 2 feet.

41 *T. COLONTIA* (Hamilt. Lin. trans. 13. p. 545.) legumes glabrous, arcuately-recurved; leaves with 8-10 pairs of smooth leaflets; racemes opposite the leaves, sessile; stipulas subulate. ♀. S. Native of the East Indies. Stamens diadelphous. Calyx pilose, 5-toothed. Indigo is obtained from this plant in India, and it is cultivated for that purpose.

*Colonil Tephrosia.* Fl. June, July. Clt. 1818. Shrub 2 feet.

42 *T. TINCTORIA* (Pers. ench. 2. p. 329.) shrubby, glabrous; leaves with 5 pairs of oblong, obtuse, emarginate leaflets, silky and villous beneath; peduncles axillary, spicate, length of leaves; legumes straight, pendulous. ♀. S. Native of Ceylon, where it is called *Anil*. Cracca, no. 302. Lin. fl. zeyl. *Galèga tinctoria*, Lin. spec. 1063. Flowers purple or flesh-coloured. It is from this plant that the inhabitants of Ceylon prepare their indigo, which yields a dye of a pale blue colour.

*Dyers' Tephrosia or Ceylon Indigo.* Shrub 1 to 3 feet.

43 *T. CAPE'NSIS* (Pers. ench. 2. p. 330.) plant suffruticose, decumbent, glabrous; leaves with 4-5 pairs of oblong, mucronate leaflets; stipulas lanceolate-subulate; peduncles opposite the leaves, very much elongated; flowers racemose, distant; legumes erect, pubescent. ♀. G. Native of the Cape of Good Hope. *Galèga Capensis*, Thunb. fl. cap. 602. Jacq. icon. rar. t. 574. Flowers purple. Stamens monadelphous.

*Cape Tephrosia.* Fl. July, Aug. Clt. 1825. Sh. decumbent.

44 *T. TOMENTOSA* (Pers. ench. 2. p. 329.) plant clothed with villous tomentum; leaves with 4-6 pairs of linear, obtuse, somewhat mucronate leaflets, which are glabrous above; stipulas subulate; racemes opposite the leaves; pedicels in threes; legume straight, ascending. ♀. G. Native of Arabia Felix. *Galèga tomentosa*, Vahl. symb. 2. p. 84. *Lathyrus tomentosa*, Forsk. descr. 135. but not of Cav. Flowers blue, with a white keel.

*Tomentose Tephrosia.* Shrub 1 to 2 feet.

45 *T. CINEREA* (Pers. ench. 2. p. 328.) plant herbaceous, decumbent, clothed with cinereous, silky down; leaves with 4-6 pairs of linear, obtuse, mucronate-leaflets, which are covered with silky villi beneath; stipulas lanceolate; racemes opposite the leaves; pedicels solitary; legumes straight, spreading. ☉. S. Native of Jamaica and St. Domingo. *Galèga cinerea*, Lin. amœn. 5. p. 403. Jacq. icon. rar. t. 575. Flowers violaceous.

*Cinereous Tephrosia.* Fl. June, July. Pl. decumbent.

46 *T. LITTORALIS* (Pers. ench. 2. p. 329.) plant herbaceous, decumbent, clothed with cinereous canescent down; leaves with 5 pairs of oblong-cuneated, emarginate or obtuse leaflets; stipulas subulate; racemes opposite the leaves, terminal, and 3 times longer than them; pedicels aggregate; legume straight, spreading, rather pubescent. ♀. S. Native of Carthage and the Caribbee Islands. *Galèga littoralis*, Lin. syst. 565. *Vicia littoralis*, Jacq. amer. t. 124. Flowers purple. Stamens monadelphous.

*Shore Tephrosia.* Fl. July, Aug. Clt. 1824. Pl. decumb.

47 *T. BRACHYSTACHIA* (D. C. prod. 2. p. 253.) plant suffruticose, erect, pubescent; leaves with 5 pairs of oblong-cuneated, emarginate leaflets, which are silky beneath, lower pairs approximating the stem; racemes axillary, shorter than the leaves; legume straight, spreadingly-pendulous, 8-10-seeded. ♀. S. Native of the East Indies. Flowers purple. Stamens monadelphous. Legumes hardly pubescent even when young.

*Short-spiked Tephrosia.* Pl. 1 to 2 feet.

48 *T. HYPARGYREA* (D. C. in ann. scienc. nat. 4. p. 99.) plant suffruticose, erect; stem angular, rather velvety; leaves with 2-4 pairs of leaflets, which are glabrous above but clothed beneath with silky-silvery down; the lower leaflets roundish and approximating the stem, superior ones oval-oblong, terminal one very large; peduncles axillary; legumes straight, secund, rather deflexed, 10-seeded, pubescent. *h. S.* Native of the East Indies. *T. heterophylla*, Fisch. cat. hort. gor. This is a very beautiful and distinct species. The flowers are small and purple, and the stamens are monadelphous. Peduncles sometimes shorter, sometimes longer than the leaves.

*Silvery-leaved Tephrosia.* Fl. June, July. Clt. 1825. Shrub 1 to 2 feet.

49 *T. MARIA'NA* (D. C. prod. 2. p. 253.) plant suffruticose, erect; stem terete, villous; leaves with 4 pairs of oblong leaflets, which are glabrous above, and silky-silvery beneath, the lower ones approximating the stem; stipulas lanceolate, elongated, villous; flowers axillary, crowded, almost sessile, and disposed in a somewhat terminal raceme, legume straight, erect, velvety-villous, 10-12-seeded. *h. S.* Native of the Marianne Islands. Leaflets nearly 2 inches long.

*Marianne Island Tephrosia.* Shrub.

50 *T. LAGASCA'NA* (D. C. prod. 2. p. 253.) plant clothed with cinereous tomentum; branches terete; leaves with 4 pairs of obovate-oblong, obtuse, rather mucronate leaflets; lower pair approximating the stem; stipulas subulate; peduncles opposite the leaves, almost terminal, and longer than them; legume ascending, straight, velvety, 10-12-seeded. *h. S.* Native country unknown.

*Lagasca's Tephrosia.* Shrub 2 feet.

51 *T. STRICTA* (Pers. ench. 2. p. 329.) plant suffruticose, clothed with cinereous tomentum; branches terete; leaves with 4 pairs of oblong or cuneate leaflets, each ending in a recurved mucrone, lower leaflets approximating the stem; stipulas subulate; flowers few, almost sessile, axillary; legumes spreading, velvety, 6-8-seeded. *h. G.* Native of the Cape of Good Hope. *Galèga stricta*, Ait. hort. kew. 3. p. 70. *Galèga mucronata*, Thunb. fl. cap. 601. *G. pulchella*, Scop. insub. 1. t. 3. *Indigofera stricta*, Lin. fil. suppl. 334. ex Jacq. hort. schœnbr. t. 263. Flowers small, purplish. Stamens diadelphous.

*Straight Tephrosia.* Fl. May, June. Clt. 1774. Sh. 2 to 3 ft.

52 *T. SENNA* (H. B. et Kunth, nov. gen. amer. 6. p. 458.) branches rather angular, glabrous; leaves with 4 pairs of somewhat obovate-oblong, emarginate, mucronate, puberulous, rather glaucous leaflets; racemes opposite the leaves, furnished at the base with one leaf; flowers in fascicles; legumes erectish, and are as well as the calyxes covered with strigose pubescence. *h. S.* Native of Popayan, on the banks of the river Cauca, near Buga, where the leaves are used in place of senna by the inhabitants.

*Buga Senna.* Shrub.

53 *T. LINEARIS* (Pers. ench. 2. p. 330.) branches pubescent; leaves with 4-5 pairs of linear, narrow leaflets, which are silky beneath; stipulas filiform; racemes axillary, much elongated; flowers distant; bracteas conforming to the leaves; legume narrow, and is as well as the vexillum pubescent. *h. S.* Native of Guinea, among grass. *Galèga linearis*, Willd. spec. 3. p. 1248. *Indigofera angustifolia*, Perr. in litt. Stem flexuous. Flowers red.

*Linear-leafletted Tephrosia.* Fl. July, Aug. Clt. 1823. Shrub 1½ foot.

54 *T. FLEXUOSA*; stem suffruticose, erect, flexuous, branched, pubescent; leaves with 5 pairs of linear, emarginate, mucronate, soft, pilose leaflets; stipulas subulate; flowers somewhat spicate, terminal; legume compressed, clothed with soft pili. *h. S.*

Native of the island of St. Thomas, in the Gulf of Guinea, among grass. Flowers flesh-coloured.

*Flexuous-stemmed Tephrosia.* Shrub 1 foot.

55 *T. PALLENS* (Pers. ench. 2. p. 329.) shrubby, pubescent; leaves with 4-5 pairs of oblong, acute leaflets, which are pubescent beneath; stipulas subulate; legume straight, spreading, ciliated. *h. G.* Native of the Cape of Good Hope. *Galèga pallens*, Ait. hort. kew. 3. p. 71. *G. humilis*, Thunb. fl. cap. 601. but the legume is said to be recurved. Flowers pink.

*Pale-flowered Tephrosia.* Fl. July, Aug. Clt. 1787. Sh. 2 to 3 feet.

56 *T. SENTICOSA* (Pers. l. c. 330.) shrubby; leaves with 4 pairs of emarginate leaflets, clothed with fine silky down beneath; legumes twin, lateral, glabrous. *h. S.* Native of Ceylon. *Galèga senticosa*, Lin. amœn. 3. p. 19. Cracca, no. 303. Lin. fl. zeyl. p. 141.

*Brambly Tephrosia.* Shrub.

57 *T. PUMILA* (Pers. ench. 2. p. 330.) plant herbaceous, diffuse, rather pilose; leaves with 3-4 pairs of cuneiform, emarginate leaflets, villous beneath, and ending each in a recurved mucrone; stipulas subulate, villous; peduncles axillary, very short, 1-2-flowered; legume erect, villous. *h. S.* Native of Madagascar, at Fort Dauphin. *Galèga pumila*, Lam. dict. 2. p. 599. Flowers purple.

*Dwarf Tephrosia.* Pl. diffuse.

58 *T. APOLLINEA* (D. C. prod. 2. p. 254.) suffruticose, diffuse, clothed with adpressed pubescence; leaves with 2-3 pairs of obovate-oblong, emarginate leaflets, which are silky beneath; racemes opposite the leaves, length of leaflets; legume erectly-spreading, 6-7-seeded, rather pubescent. *h. G.* Native of Egypt, in corn fields. *G. Apollinea*, Delil. fl. arg. p. 144. t. 53. f. 5. Flowers blue. Stamens diadelphous according to the figure.

*Apollinean Tephrosia.* Fl. Jul. Aug. Clt. 1816. Sh. 1 to 2 ft.

59 *T. SPINOSA* (Pers. ench. 2. p. 330.) shrubby; branches canescent; stipulas spinose; leaves with 3 or 4 pairs of cuneate, emarginate, smoothish leaflets; flowers few, axillary, nearly sessile; legume falcate, 5-6-seeded, beset with adpressed very minute pubescence. *h. S.* Native of Coromandel, Timor, and Java, on the margins of fields. *Galèga spinosa*, Lin. fil. suppl. 335. Stamens monadelphous.

*Spiny Tephrosia.* Shrub.

60 *T. TIMORÆNSIS* (D. C. prod. 2. p. 254.) plant herbaceous, diffuse, clothed with canescent hairs; leaves with 3-4 pairs of obovate-oblong, obtuse leaflets, clothed with silky villi beneath, and each terminated in a straight mucrone; stipulas linear-subulate; peduncles 2-3, axillary, very short, 1-flowered; legume erect, straight, velvety, 8-10-seeded. *h. S.* Native of the Island of Timor. Perhaps sufficiently distinct from *T. pumila*.

*Timor Tephrosia.* Pl. diffuse.

61 *T. PINNATA* (Pers. ench. 2. p. 330.) plant herbaceous, decumbent, glabrous; leaves with 4 pairs of oblong, acute leaflets, which are dotted beneath; stipulas ovate; peduncles axillary; flowers umbellate; legumes ensiform, pubescent. *h. G.* Native of the Cape of Good Hope. *Galèga pinnata*, Thunb. fl. cap. 602. Flowers purple.

*Pinnate-leaved Tephrosia.* Shrub decumbent.

62 *T. BIFLORA* (D. C. prod. 2. p. 254.) plant shrubby, hardly pubescent; leaves with 2 or 3 pairs of oval-lanceolate, obtuse leaflets, which are silky beneath, lower ones smallest, terminal one very large; stipulas subulate, villous; flowers twin, almost sessile, axillary; legume pubescent, rather incurved at the apex. *h. S.* Native country unknown. *Galèga biflora*, Poir. suppl. 2. p. 699. Flowers purple. Calyx very villous. Very like *T. hypargyrea*, and especially *T. nervosa*.

*Two-flowered Tephrosia.* Fl. Jul. Aug. Clt. 1816. Sh. 1 to 2 ft.

63 *T. NERVOSA* (Pers. ench. 2. p. 328.) branches angular, pubescent; leaves with 1-2 pairs of elliptic-obtuse leaflets, which are narrowest at the base, quite glabrous above, and pinnately veined, but clothed with white tomentum beneath, the terminal leaflet largest; peduncles axillary, length of leaves, furnished with one leaf under the head of flowers; legumes linear, smoothish. *h. S.* Native of Madagascar.

*Nerved-leaved Tephrosia.* Shrub 2 to 3 feet.

† *Species not sufficiently known.*

\* *Leaves impari-pinnate.*

64 *T. STIPULARIS* (D. C. prod. 2. p. 254.) shrubby, quite smooth; leaflets oblong-linear, acute; stipulas large, almost opposite, connate, acute, nerved; legume linear-lanceolate. *h. S.* Native of South America. *Brissonia stipularis*, Desv. Journ. bot. 1814. 1. p. 74.

*Stipular Tephrosia.* Shrub.

65 *T. TRAPEZICARPA* (D. C. prod. 2. p. 255.) stems elongated, decumbent, quite smooth; leaflets oblong, pilose beneath; pili stiff and few; legume compressed, pilose, trapeziform. *h. ? S.* Native of the East Indies. *Brissonia trapeziformis*, Desv. l. c.

*Trapezium-fruited Tephrosia.* Shrub decumbent.

66 *T. UNIFLORA* (Pers. ench. 2. p. 329.) leaflets oblong, rather retuse, mucronate; calyx villous; legumes compressed, villous, a little arched, solitary, axillary. Native of Senegal.

*One-flowered Tephrosia.* Pl. 1 foot.

67 *T. CAPITULATA* (Link. enum. 2. p. 329.) leaflets obversely lanceolate, obtuse, emarginate, silky beneath; racemes terminal, short, furnished with a leaf; legumes hairy. *h. S.* Native of the Island of Owhyhee.

*Headed Tephrosia.* Pl. 1 foot.

68 *T. STRIATA* (Pers. ench. 2. p. 328.) herbaceous, erect, glabrous below, villous above; leaflets alternate, oblong, obtuse, mucronate, finely pubescent; racemes terminal, drooping. *h. ? G.* Native of the Cape of Good Hope. *Galèga striata*, Thunb. fl. cap. 602.

*Striated Tephrosia.* Pl. 1 to 2 feet.

69 *T. MYRTIFOLIA* (D. C. prod. 2. p. 255.) plant herbaceous, flexuous, glabrous; leaves with 3 pairs of elliptic-oblong, obtuse, somewhat mucronate, striated leaflets; stipulas subulate; racemes opposite the leaves; legumes linear, glabrous, spreading. *h. G.* Native of the Cape of Good Hope. *Coronilla myrtifolia*, Burm. cap. 22.

*Myrtle-leaved Tephrosia.* Pl. 1 foot.

70 *T. RHEEDI* (D. C. prod. 2. p. 255.) suffruticose, branched, diffuse; leaves with 4-5 pairs of oblong, somewhat obovate, obtuse, mucronate leaflets; peduncles longer than the leaves, few-flowered. *h. S.* Native of Malabar, in sandy places. *Man-Todda-vaddi*, Rheed, mal. 9. t. 22. *Rochèa*, Scop. introd. 296. no. 1340. Flowers apparently with only 3 petals, in consequence of the carina being very short, pale yellow.

*Rheede's Tephrosia.* Sh. 1 foot.

\* \* *Thermoideæ* (from *θερμος*, *thermos*, a lupine, and *ἰδέα*, *idea*, like; plants resembling the lupine in having palmate leaves). *Leaves palmately 5-foliate, having 2 little stipulas at the top of the petiole. Stipulas and stipels becoming hard and spinescent. Leaflets complicate, margined with a nerve. Flowers unknown. Perhaps a proper genus.*

71 *T. LUPINIFOLIA* (D. C. prod. 2. p. 255.) plant shrubby, pubescent; stipulas lanceolate, spreading; leaflets 5, oblong, cuneated, obtuse, clothed beneath with adpressed silky down. *h. G.* Native of the Cape of Good Hope. *Galèga lupinifolia*, Burch. cat. afr. austr. no. 2488.

*Lupine-leaved Tephrosia.* Shrub 1 to 2 feet.

VOL. II.

72 *T. DIGITATA* (D. C. prod. 2. p. 255.) plant suffruticose with hispid slender branches; stipulas lanceolate, spreading; leaflets 5, oblong-linear, acuminate at both ends, sparingly pubescent beneath; racemes axillary, and are as well as the petioles very long. *h. S.* Native of Senegal. Petioles 5 inches long. Flowers distant, usually twin. Calyx permanent, with acuminate segments. Corolla and stamens unknown. Legume linear, compressed, pubescent, 5-6-seeded.

*Digitate-leaved Tephrosia.* Shrub 1 foot.

\* \* \* *Glycinoideæ* (from *glycine* and *idea*, similar; the plants contained in this division agree with *Glycine* in having trifoliate leaves). *Leaves either pinnately or palmately trifoliate.*

73 *T. TOTTA* (Pers. ench. 2. p. 328.) plant herbaceous, clothed with hairs like tomentum, ascending; leaflets oblong, mucronate, longer than the petiole; stipulas ovate, opposite the leaves; flowers terminal, tern, somewhat umbellate. *h. G.* Native of the Cape of Good Hope. *Galèga Totta*, Thunb. fl. cap. 601.

*Hottentot Tephrosia.* Pl. ascending.

74 *T. SERICEA* (Pers. ench. 2. p. 328.) stem suffruticose, very short; branches tomentose, as well as the leaflets, which are ovate; flowers axillary, solitary; legumes lanceolate, villous. *h. G.* Native of the Cape of Good Hope. *Galèga sericea*, Thunb. fl. cap. 603. but not of Lam.

*Silky Tephrosia.* Shrub 1 foot.

75 *T. FALCATA* (Pers. ench. 2. p. 328.) plant herbaceous, erect, hairy; branches filiform; leaflets sessile, oblong, acute; flowers terminal, solitary; legumes falcate, erect, silky. *h. ? G.* Native of the Cape of Good Hope. *Galèga falcata*, Thunb. fl. cap. 602.

*Falcate-podded Tephrosia.* Pl. 1 foot.

76 *T. PUSILLA* (Pers. l. c.) plant herbaceous, erect, pubescent; leaflets sessile, ovate, mucronate, silky beneath, longer than the petiole; flowers lateral, pedunculate, solitary; legume elliptic. *h. ? G.* Native of the Cape of Good Hope. *Galèga pusilla*, Thunb. fl. cap. 602.

*Small Tephrosia.* Pl. 1 foot.

77 *T. TRIFOLIATA* (D. C. prod. 2. p. 256.) plant frutescent, erectish, pubescent; leaflets sessile, ovate, silky, convolute; calyx, corolla, and legume tomentose; flowers terminal, on very short peduncles. *h. G.* Native of the Cape of Good Hope. *Sophora trifoliata*, Thunb. prod. p. 79. *Galèga trifoliata*, Thunb. fl. cap. 600. Stamens diadelphous.

*Trifoliate Tephrosia.* Shrub.

78 *T. TERNATA* (D. C. prod. 2. p. 256.) shrubby, erect; branches villous; leaflets sessile, lanceolate, silky; flowers axillary, sessile; calyxes and corollas tomentose. *h. G.* Native of the Cape of Good Hope. *Sophora ternata*, Thunb. prod. 79. *Galèga ternata*, Thunb. fl. cap. 601. Stamens monadelphous.

*Ternate-leaved Tephrosia.* Shrub 1 to 3 feet.

79 *T. FILIFOLIA* (Pers. ench. 2. p. 328.) plant herbaceous, erectish, glabrous below; leaflets filiform, glabrous; flowers 2-3 in an umbel, terminal; calyx hairy. *h. ? G.* Native of the Cape of Good Hope. *Galèga filifolia*, Thunb. fl. cap. 602.

*Thread-leaved Tephrosia.* Pl. 1 foot.

80 *T. ULIGINOSA* (Spreng. syst. 3. p. 232.) shrubby, climbing; leaflets oblong, acuminate, glabrous; flowers racemose; peduncles 3-flowered. *h. S.* Native of the East Indies. *Robiunea uliginosa*, Roxb. and Willd.

*Bog Tephrosia.* Shrub cl.

81 *T. VELUTINA* (Spreng. syst. 3. p. 232.) shrubby, twining; leaflets oblong, obtuse, villous on both surfaces; racemes few-flowered; legumes lanceolate, pubescent. *h. S.* Native of St. Domingo.

*Velvety Tephrosia.* Shrub tw.

82 *T. LONGIFOLIA* (Pers. ench. 2. p. 328.) plant shrubby, twining; leaflets lanceolate, obtuse; racemes few-flowered; *h. H h*

legumes villous.  $\frac{1}{2}$ . S. Native of South America. Galèga longifolia, Jacq. icon. rar. 3. t. 572. Flowers purple. Legume linear. Racemes few-flowered.

*Long-leaved Tephrosia.* Clt.? Shrub tw.

\*\*\*\*\* *Mimosoideæ* (from *Mimosa* and *idea*, like; the plants resemble some species of *Mimosa* in having abruptly-pinnate leaves). *Leaves abruptly pinnate.*

83? T. MIMOSOIDES (Pers. ench. 2. p. 330.) plant suffruticose, scandent; leaves with 12 pairs of linear, obtuse, mucronate leaflets, beset with adpressed pili on both surfaces; racemes axillary, pedunculate; legumes pendulous, compressed.  $\frac{1}{2}$ . S. Native of the East Indies. Galèga mimosoides, Willd. spec. 3. p. 1249. Flowers probably red.

*Mimosa-like Tephrosia.* Shrub cl.

\*\*\*\*\* *Simplicifoliæ* (from *simplex*, simple, and *folium*, a leaf; the leaves are simple). *Leaves simple.*

84 T. FRUTESCENS (D. C. prod. 2. p. 256.) stem shrubby; leaves ovate-roundish; flowers lateral, paniced.  $\frac{1}{2}$ . S. Native of Campeachy. Galèga frutescens, Mill. dict. no. 3. Flowers scarlet.

*Frutescent Tephrosia.* Shrub.

*Cult.* All the species of this genus grow best in a mixture of loam and peat, and are easily propagated by seeds, or by young cuttings planted in sand, with a bell-glass placed over them; those of the stove species in heat.

CV. AMORPHIA (from  $\alpha$ , priv. and  $\mu\omicron\rho\phi\eta$ , *morphe*, form; in reference to the deformity of the corolla, from the want of the vexillum and keel). Lin. gen. 369. Lam. ill. t. 621. D. C. prod. 2. p. 256.—Bonafidia, Neck. elem. no. 1364.

LIN. SYST. *Monadelphina*, *Decandria*. Calyx 5-toothed, obconically campanulate. Vexillum ovate, concave. Wings and keel wanting. Style filiform, straight, glabrous. Stamens exserted, monadelphous at the very base. Legume compressed, ovate, or lunulate, 1-celled, 1-2-seeded.—North American shrubs, with impari-pinnate leaves, many pairs of leaflets, which are full of pellucid dots, and usually furnished with stipels at the base. Stipulas of the stem deciduous. Racemes spicate, elongated, usually in fascicles at the tops of the branches. Flowers blue or violet, or bluish-violet.

1 A. FRUTICOSA (Lin. spec. 1003.) shrub glabrous, or a little villous; leaflets elliptic-oblong, lower ones distant from the stem; calyx rather villous, with 4 of the teeth obtuse, and 1 acuminate; vexillum glandless; legume few-seeded.  $\frac{1}{2}$ . H. Native of North America, in Carolina and Florida, on the banks of rivers. Schkuhr, handb. t. 197. Mill. icon. t. 27. Ker. bot. reg. 427. There are varieties of this plant with mucronate, emarginate or narrower leaflets. This species was once used in Carolina as an indigo plant, but is now neglected.

*Shrubby Bastard Indigo.* Fl. Ju. Jul. Clt. 1724. Sh. 6 ft.

2 A. GLABRA (Desf. cat. hort. par. 192.) shrub glabrous; leaflets elliptic-oblong, lower ones distant from the stem; calyx glabrous, with 4 of the teeth obtuse, and 1 acuminate; vexillum glandular on the outside; legume few-seeded.  $\frac{1}{2}$ . H. Native of North America.

*Glabrous Bastard Indigo.* Fl. July, Aug. Clt. 1810. Sh. 3 to 6 feet.

3 A. NA'NA (Nutt. in Fras. cat. 1813. nov. gen. amer. 2. p. 91.) a smoothish dwarf shrub; leaflets elliptic, mucronate; calyx glabrous, with all the teeth setaceously acuminate; legume 1-seeded.  $\frac{1}{2}$ . H. Native on grassy hills, near the river Missouri. A. microphylla, Pursh, fl. bor. amer. 2. p. 466.

*Dwarf Bastard Indigo.* Fl. Jul. Aug. Clt. 1811. Sh.  $\frac{1}{2}$  to 1 ft.

4 A. HERBACEA (Walt. car. 179. Nutt. gen. amer. 2. p. 91.) plant dwarf, herbaceous, pubescent; leaflets elliptic, mucronate,

lower ones approximating the stem; calyx pubescent, with all the teeth acute and short; legume 1-seeded.  $\frac{1}{2}$ . F. Native of Carolina, Georgia, and Florida, in dry sandy pine woods. A. pumila, Michx. fl. bor. amer. 2. p. 64. A. pubescens, Willd. spec. 3. p. 970. Lodd. bot. cab. 689. Spike a foot long.

*Herbaceous Bastard Indigo.* Fl. June, July. Clt. 1803. Pl. 2 to 3 feet.

5 A. FRAGRANS (Sweet, fl. gard. 241.) shrubby, pubescent; leaves with 6-8 pairs of elliptic-oblong, mucronate leaflets, obtuse at both ends, young ones pubescent; calyx pubescent, pedicellate, superior teeth obtuse, lower one acute; style hairy.  $\frac{1}{2}$ . F. Native of North America. A. nana, Sims, bot. mag. 2112. but not of others. Flowers dark purple.

*Fragrant Bastard Indigo.* Fl. June, July. Clt. 1800. Sh. 7 to 8 feet.

6 A. CRŒCO-LANA'TA (Wats. dend. brit. t. 139.) plant clothed with tawny pubescence; racemes branched; leaves with 6-8 pairs of oblong-elliptic, mucronate, downy leaflets; the 3 upper teeth of calyx ovate, acute, the 2 lower ones very short and rounded.  $\frac{1}{2}$ . H. Native of North America. Flowers bluish-purple.

*Copper-woolled Bastard Indigo.* Fl. July, Aug. Clt. 1820. Shrub 3 to 5 feet.

7 A. CANESCENS (Nutt. in Fras. cat. 1813. gen. amer. 2. p. 92.) plant suffruticose, humble, every part clothed with hoary villi; leaflets ovate-elliptic, mucronate, lower ones approximating the stem; calyx tomentose, with the teeth ovate, acute, and equal; ovary containing 2-ovula; legume 1-seeded.  $\frac{1}{2}$ . H. Native on the banks of the Missouri and Mississippi.

*Canescent Bastard Indigo.* Fl. Jul. Aug. Clt. 1812. Sh. 3 ft.

*Cult.* *Amorpha* is a genus of elegant flowering shrubs, and are well adapted for small shrubberies, or the front of large ones. They thrive well in common garden soil. They may be increased by layers, or cuttings taken off at a joint, and planted in a sheltered situation early in autumn will strike root. Some of the species are rather tender, and require protection in severe weather.

CVI. EYSENHARDTIA (in honour of Charles William Eysenhardt, M.D. a professor in the University of Königsberg, in Prussia). H. B. et Kunth, nov. gen. amer. 6. p. 489. t. 592. D. C. prod. 2. p. 257.

LIN. SYST. *Diadelphina*, *Decandria*. Calyx obconically-campanulate, 5-toothed, upper teeth rather remote, lower one longest. Petals 5, disposed in a papilionaceous manner. Vexillum oblong, and the two keel petals distinct. Stamens diadelphous. Ovary biovulate. Style filiform, hooked at the apex. Legume unknown.—An unarmed tree, with impari-pinnate leaves, composed of many pairs of stipellate leaflets, and are, as well as the calyxes beset with glands. Racemes terminal, cylindrical. Flowers white. This genus comes very near *Amorpha*.

1 E. AMORPHOIDES (H. B. et Kunth, l. c.).  $\frac{1}{2}$ . G. Native of Mexico, near St. Augustin de las Guevas and Guanajuato. Dalbergia amorphoides, Spreng. syst. app. 268.

*Amorpha-like Eysenhardtia.* Tree 12 to 20 feet.

*Cult.* A mixture of loam and peat will suit this shrub, and young cuttings will strike root in sand, under a bell-glass, in heat.

CVII. NISSOLIA (in honour of William Nissole, an industrious French botanist. He was a member of the Academy of Montpellier, and author of some papers in its Transactions: he was born in 1647 and died in 1735.). Jacq. amer. 198. Lin. gen. no. 853. Lam. ill. t. 600. D. C. prod. 2. p. 257. but not of Tourn.

LIN. SYST. *Monadelphina*, *Decandria*. Calyx campanulate, 5-toothed. Corolla papilionaceous. Stamens 10, monadelphous, with a dorsal fissure or diadelphous. Legume stipitate, 1 or

few-seeded, 1-celled, or transversely few-celled, ending in a leafy, membranous wing, which is either ligulate or cultriform.—Usually climbing shrubs, with impari-pinnate leaves. Perhaps this genus is more nearly allied to *Hedyosarea* or *Dalbérgea*.

SECT. I. NISSOLIA'RIA (an alteration from the generic name). D. C. prod. 2. p. 257. Nissolia, Gært. fruct. 2. p. 309. t. 145. Pers. ench. 2. p. 276. Calyx 5-toothed, naked on the outside, the teeth acute. Petals of keel connected. Stamens monadelphous, with a dorsal fissure. Legume, according to Gærtner, terete below the wing, separating transversely into 2 or 3 1-seeded cells, but according to Jacquin the legume is 1-celled and 1-seeded. Pedicels 1-flowered, in fascicles.

1 *N. FRUTICOSA* (Jacq. amer. 198. t. 145. f. 44. hort. vind. 167.) stems twining, and are smoothish as well as the petioles; leaflets oval, mucronate, smoothish; pedicels 3-4, aggregate, axillary; teeth of calyx setaceous.  $\frac{1}{2}$ .  $\odot$ . S. Native of Carthage in woods, and in the plains of Mexico, near Queretaro. ex H. B. et Kunth, nov. gen. amer. 6. p. 504. Flowers yellow.

*Shrubby Nissolia.* Fl. July, Nov. Clt. 1766. Sh. cl.

2 *N. HIRSU'TA* (D. C. prod. 2. p. 257.) stems twining, and are as well as the petioles hairy; leaflets oval, mucronate, rather hairy beneath and on the margins; pedicels 15-20, aggregate, axillary; teeth of calyx setaceous, very short.  $\frac{1}{2}$ .  $\odot$ . S. Native of Mexico, near Guanajuato.

*Hairy Nissolia.* Shrub tw.

3 *N. RACEMOSA* (D. C. prod. 2. p. 257.) stems twining, and are as well as the leaves smoothish; leaflets oval-oblong, acute, tapering to the base; pedicels numerous, in fascicles; fascicles disposed in elongated racemes; teeth of calyx almost wanting;  $\frac{1}{2}$ .  $\odot$ . S. Native of St. Martha. Racemes numerous, axillary, and terminal. Nissolia polypérma, Bert. ined. Flowers white.

*Racemose-flowered Nissolia.* Fl. Ju. Aug. Clt. 1800. Sh. tw.

SECT. II. GOMEZ'IZUM (in honour of Juan Gomez, a Portuguese botanist). Calyx naked on the outside, with 5 rounded lobes. Petals of keel connected at the apex only. Stamens diadelphous. Legume indehiscent, 1-seeded. Perhaps a proper genus.

4 *N. ARBOREA* (Jacq. amer. 199. t. 174. f. 48.) stem arborescent, erect, leaflets 1-2 pairs with the odd one oblong and acuminate, rather pubescent beneath; flowers sessile.  $\frac{1}{2}$ . S. Native of Carthage and Martinico in woods. Segments of the calyx roundish. Flowers white?

*Arboreous Nissolia.* Shrub 12 feet.

5 *N. GLABRATA* (Link. enum. 2. p. 221.) stem erect; leaflets 1-2 pairs, with an odd one, oval, acuminate, quite smooth; flowers pedicellate, racemose.  $\frac{1}{2}$ . S. Native country unknown. Flowers white. Nearly allied to *N. arborea*.

*Smoothish Nissolia.* Clt. 1823. Shrub 6 to 12 feet.

SECT. III. MACHÆRIUM (an alteration from the Guiana name of *N. ferruginea*.) Pers. ench. 2. p. 276. D. C. prod. 2. p. 258. Calyx with 5 rounded lobes, girded by 2 concave, roundish bracteoles at the base. Petals of keel connected a little at the apex. Stamens monadelphous with a fissure on the upper side, or diadelphous. Legume indehiscent, 1-seeded. Perhaps a proper genus.

6 *N. DIADELPHA* (D. C. prod. 2. p. 258.) leaflets 5-7, somewhat alternate, oval-oblong, mucronate, clothed beneath with rusty velvety down; flowers panicled, diadelphous; legume somewhat incurved, rather velvety.  $\frac{1}{2}$ .  $\odot$ . S. Native of Cayenne. Legume 3-4 inches long and 5 lines broad, standing on a stipe 3 or 4 lines long.

*Diadelphous Nissolia.* Shrub tw.

7 *N. FERRUGINEA* (Willd. spec. 3. p. 900.) leaflets 7-11, alternate, oblong, mucronate, clothed with rusty velvety down be-

neath; flowers panicled; monadelphous; legume straightish, rather velvety.  $\frac{1}{2}$ .  $\odot$ . S. Native of Guiana, on the banks of rivers. *N. quinata*, Aubl. guian. 2. p. 743. t. 297. Lam. ill. t. 600. f. 4. Flowers violaceous.

*Rusty Nissolia.* Shrub tw.

8 *N. ACUMINATA* (D. C. prod. 2. p. 258.) leaflets 5, alternate, oblong, ending each in a very long acumens, membranous, glabrous; legume rather cultriform, falcate below.  $\frac{1}{2}$ .  $\odot$ . S. Native of the province of Caraccas, near Hacienda del Tuy, between San Pedro and La Vittoria. *Machærium acuminatum*, H. B. et Kunth, nov. gen. amer. 6. p. 391.

*Acuminated Nissolia.* Shrub tw.

9 *N. LEIOPHYLLA* (D. C. prod. 2. p. 258.) leaflets 7, nearly opposite, oval-lanceolate, acuminate, glabrous on both surfaces; petioles, panicles, and calyxes clothed with rusty velvety down; flowers monadelphous; legumes quite smooth, straightish.  $\frac{1}{2}$ . S. Native of Guiana. A very distinct species.

*Smooth-leaved Nissolia.* Shrub.

10 *N. ROBINIIFOLIA* (D. C. prod. 2. p. 258.) leaflets 19-21, oblong, obtuse, glabrous; flowers panicled; legume pubescent, incurved at the base.  $\frac{1}{2}$ . S. Native of the Island of St. Vincent. Flowers unknown.

*Robinia-leaved Nissolia.* Clt. 1824. Shrub.

11 *N. POLYPHYLLA* (Poir. suppl. 4. p. 98.) leaflets 23-25, elliptic-oval, obtuse, tomentose beneath, lower ones smallest; flowers panicled; legumes pubescent at the base and at the sutures, rather cut at the base of the wing.  $\frac{1}{2}$ . S. Native of French Guiana. Bractes velvety. Calyx glabrous. Seeds elongated. Flowers probably white.

*Many-leaved Nissolia.* Shrub.

12 *N. MICROPTERA* (Poir. suppl. 4. p. 98.) leaflets usually 5, ovate, obtuse, clothed beneath with cinereous pubescence, almost sessile; legume glabrous, bicarinated on the back, ending in a short wing.  $\frac{1}{2}$ . G. Cultivated in the gardens of Teneriffe. Flowers white?

*Small-winged-podded Nissolia.* Clt. 1820. Sh.

† *Species not sufficiently known.*

13 *N. STIPITATA* (D. C. in ann. sc. nat. 4. p. 99.) leaves unknown; legumes oblong, incurved, obtuse, quite smooth, standing on a stipe, which is as large and as broad as the pod.  $\frac{1}{2}$ . S. Native of Brazil at Rio Janeiro, where it is called *Arasseiro*, not in Madagascar. Nissolia punctata, Lam. ill. t. 600. f. 1. Poir. dict. 4. p. 492. *Machærium punctatum*, Pers. ench. 2. p. 276. Flowers probably white.

*Stipitate-fruited Nissolia.* Shrub sarmentose.

14 *N. RETICULATA* (Lam. ill. t. 600. f. 2. dict. 4. p. 492.) leaflets obtuse; legumes on short stipes, rather cut at the base of the wing.  $\frac{1}{2}$ .  $\odot$ . S. Native of Madagascar. *Machærium reticulatum*, Pers. ench. 2. p. 276. Flowers unknown.

*Reticulated Nissolia.* Shrub tw.

15 *N. ACULEATA* (D. C. prod. 2. p. 258.) petioles furnished with 2 rather hooked prickles at the base of each; leaflets 31-33, alternate; flowers racemose; legumes hairy.  $\frac{1}{2}$ .  $\odot$ . S. Native of Brazil, on hills by the sea-side, at Rio Janeiro. *Machærium aculeatum*, Raddi, pl. bras. add. p. 19.

*Prickly Nissolia.* Clt. 1824. Shrub tw.

16 *N. DUMIA* (Poir. suppl. 4. p. 99.) leaflets 5, almost glabrous, lanceolate, acute at both ends; flowers racemose; pedicels in fascicles, pubescent; legume hardly stipitate.  $\frac{1}{2}$ . S. Native of Cayenne.

*Doubtful Nissolia.* Shrub.

17 *N. RETUSA* (Willd. enum. 742.) leaflets glabrous on both surfaces, ovate-oblong, emarginate, lower ones roundish.  $\frac{1}{2}$ .  $\odot$ . S. Native of South America.

*Retuse-leafletted Nissolia.* Clt. 1819. Shrub tw.

18 *N. SCA'NDENS* (König. ex Spreng. syst. 3. p. 191.) shrubby, scandent; leaves with 2 pairs of ovate-oblong, acute, rather coriaceous, smooth leaflets; flowers panicle.  $\frac{1}{2}$ . S. Native of the East Indies.

*Climbing Nissolia.* Shrub cl.

*Cult.* For culture and propagation see *Eysenhårdtia*, p. 234.

CVIII. MULLERA (in honour of Otto Frederick Muller, a Danish botanist, and one of the editors of *Flora Danica*). Lin. fil. suppl. 53. D. C. prod. 2. p. 259.

LIN. SYST. *Monadelphica*, *Decandria*. Calyx campanulate, 5-toothed, apparently cut round about at the base after the teeth have fallen. Petals 5, papilionaceous, caducous. Stamens 8-10, monadelphous, having the tube compressed, falling off along with the calyx. Ovary sessile. Style filiform. Legume moniliform, having 1-5 1-celled 1-seeded, indehiscent, distinct joints. Seeds compressed, reniform. Flowers almost like those of a species of *Robinia*, but the stamens are monadelphous, the fruit almost like that of *Sophora*, and the habit of *Pterocarpus*.

1 *M. MONILIFORMIS* (Lin. fil. l. c.) leaves impari-pinnate; joints of legume smooth.  $\frac{1}{2}$ . S. Native of Surinam and of French Guiana. *Goublandia frutescens*, Aubl. guian. 4. p. 937. t. 356. Leaves with 2 pairs of ovate, acute, glabrous, petiolulate leaflets. Racemes axillary, simple. Bracteas subulate, small, caducous. Flowers pale-yellow.

*Necklace-formed-podded Mullera.* Clt. 1782. Sh. 6 to 7 ft.

*Cult.* See *Eysenhårdtia*, p. 234. for culture and propagation.

CIX. LONCHOCARPUS (from  $\lambda\omicron\nu\chi\eta$ , *lonche*, a lance, and  $\kappa\alpha\rho\tau\omicron\varsigma$ , *karpos*, a fruit; in reference to the lance shape of the pods). H. B. et Kunth, nov. gen. amer. 6. p. 383. D. C. prod. 2. p. 259.

LIN. SYST. *Mona-Diadelphia*, *Decandria*. Calyx campanulately-urceolate, obsoletely 5-toothed. Corolla papilionaceous. Vexillum somewhat orbicular, spreadingly-reflexed. Wings, vexillum, and keel about equal in length. Stamens diadelphous and monadelphous. Legume on a short stipe, oblong-lanceolate, straight, flat, membranous, 2-4-8-seeded. Seeds compressed, reniform. Radicle uncinately inflexed. Unarmed trees, from the West Indies and South America, with impari-pinnate leaves, opposite, exstipellate, stalked leaflets, and purplish flowers. This genus is not sufficiently defined. Perhaps the diadelphous species should be separated from the monadelphous ones, but the habit of both are very similar.

1 *L. PUNCTATUS* (H. B. et Kunth, nov. gen. amer. 6. p. 383.) leaves with 5-7 oblong, obtuse, glabrous leaflets, full of pellucid dots, shining above, having the middle nerve rather prominent below; calyx glabrous; lower peduncles of raceme 2-flowered.  $\frac{1}{2}$ . S. Native of South America, near Cumana. *Dalbergia punctata*, Spreng. syst. app. 3. p. 268. Legumes unknown.

*Dotted-leaved Lonchocarpus.* Tree 20 feet.

2 *L. MACROPHYLLUS* (H. B. et Kunth, l. c.) leaves with 9 elliptic-oblong, acuminate, dotless, glabrous leaflets, shining above, having the middle nerve and primary veins rather prominent; calyx clothed with brownish tomentum.  $\frac{1}{2}$ . S. Native of South America, near Angostura de Carara, on the banks of the river Magdalena. *Dalbergia macrophylla*, Spreng. syst. app. 268. This species is nearly allied to *L. Domingensis*.

*Long-leaved Lonchocarpus.* Clt. 1818. Tree 40 feet.

3 *L. DOMINGENSIS* (D. C. prod. 2. p. 259.) leaves with 11 oval, acuminate, glabrous, petiolate leaflets; racemes axillary, shorter than the leaves; calyx somewhat truncate, bibracteate at the base, and are as well as the legumes pubescent.  $\frac{1}{2}$ . S. Native of St. Domingo. *Dalbergia Domingensis*, Pers. ench. 2. p. 276. *L. Turpinii*, Kunth, l. c. Stamens monadelphous. Legume 1-2-seeded. Flowers red.

*St. Domingo Lonchocarpus.* Clt. 1820. Tree 20 feet.

4 *L. VIOLA'CEUS* (H. B. et Kunth, l. c. in a note) leaves with from 7-11 ovate, obtuse, rather emarginate, glabrous leaflets, full of pellucid dots, membranous, with the middle nerve rather prominent; calyxes glabrous; peduncles of racemes 2-flowered.  $\frac{1}{2}$ . S. Native of Carthagen and Guadaloupe, in bushy places. *Robinia violacea*, Jacq. amer. 210. t. 177. f. 49. pict. 103. t. 262. f. 61. Flowers diadelphous, violaceous, large, having the scent of violets. Stamens somewhat monadelphous, the tenth one only free at the base.

*Violaceous-flowered Lonchocarpus.* Clt. 1799. Tr. 12 ft.

5 *L. PENTAPHYLLUS* (H. B. et Kunth, l. c. in a note) leaves with 5-7 nerved, bluntly acuminate, quite glabrous leaflets; racemes shorter than the leaves; legumes lanceolate, glabrous, 1-3-seeded.  $\frac{1}{2}$ . S. Native of Porto-Rico. *Dalbergia pentaphylla*, Poir. suppl. 2. p. 145. Flowers unknown.

*Five-leafletted Lonchocarpus.* Tree 20 feet.

6 *L. HEPTAPHYLLUS* (D. C. prod. 2. p. 259.) leaves with 7 lanceolate, obtusely mucronate, glabrous leaflets, pale beneath, and with the nerve and lateral veins rather prominent; racemes a little longer than the leaves; calyx 5-toothed; legumes oblong, narrow at the base, slender, glabrous, 2-3-seeded.  $\frac{1}{2}$ . S. Native of St. Domingo. *Dalbergia heptaphylla*, Poir. l. c. suppl. 2. p. 446. Perhaps sufficiently distinct from *L. pentaphyllus* and *L. violaceus*. Flowers purple.

*Seven-leafletted Lonchocarpus.* Tree 20 feet.

7 *L. LEONE'NSIS*; an erect, branched tree; leaflets oblong, mucronate, undulated, entire; racemes axillary and terminal; flowers on short pedicels.  $\frac{1}{2}$ . S. Native of Sierra Leone. Corolla violaceous.

*Sierra Leone Lonchocarpus.* Tree 20 feet.

8 *L. ALBIFLORUS*; leaflets 7, ovate, acuminate, glabrous, entire; flowers on long peduncles or racemose, axillary; legume flat, pubescent.  $\frac{1}{2}$ . S. Native of the Island of St. Thomas, in the Gulf of Guinea. Flowers white.

*White-flowered Lonchocarpus.* Fl. Oct. Tree 50 feet.

9 *L. FORMOSI'ANUS* (D. C. prod. 2. p. 260.) leaflets 7, coriaceous, glabrous, oval, obtusely acuminate, having the nerve and lateral veins rather prominent; racemes panicle; pedicels usually 2-flowered; calyx truncate, and is as well as the petals and legumes clothed with silky pubescence.  $\frac{1}{2}$ . S. Native of Africa, on the banks of the river Formosa. *Robinia violacea*, Beauv. fl. d'ow. 2. p. 28. t. 76. *Dalbergia Guineensis*, Spreng. syst. app. 3. p. 266. Stamens monadelphous. Flowers violet.

*Formosa Lonchocarpus.* Tree 20 feet.

10 *L. SERICEUS* (H. B. et Kunth, l. c.) leaflets 7-11, oval, acuminate, coriaceous, glabrous above, but clothed with rufous, silky pubescence beneath, as well as the calyxes, pedicels, and branches; racemes erect, length of leaves; pedicels very short, usually twin or 2-flowered; petals clothed with silky-silvery pubescence on the outside.  $\frac{1}{2}$ . S. Native of the Islands of Montserrat, St. Christopher, and Trinidad. *Robinia sericea*, Poir. diet. 6. p. 226. *R. mollis*, Vahl. in herb. Puer. Calyx truncate. Legume unknown. Stamens monadelphous.

*Silky Lonchocarpus.* Clt. 1826. Tree 20 feet.

11 *L. PYXIDARIUS* (D. C. prod. 2. p. 260.) leaflets 7, ovate, acuminate, glabrous above, but clothed with adpressed villous-pubescent beneath; petioles, peduncles, and calyxes clothed with short velvety down; racemes erect, shorter than the leaves; vexillum clothed with adpressed silky down on the outside.  $\frac{1}{2}$ . S. Native of Cuba, where it is called *Palo de Caja* or box-wood. Stamens monadelphous. This species comes very near to *L. sericeus*.

*Box Lonchocarpus.* Clt. 1820. Tree 20 feet.

12 *L. LATIFOLIUS* (H. B. et Kunth, l. c.) leaflets 7, ovate, short-acuminate, glabrous, pale beneath, having the nerve, and lateral veins rather prominent; racemes axillary, much longer

than the leaves, and arc, as well as the pedicels and calyxes, pubescent; corolla glabrous. *h. S.* Native of Porto-Rico. *Amerimum latifolium*, Willd. spec. 4. p. 611. exclusive of the synonyme, and therefore the same as *Pterocarpus latifolius* of Poir. dict. 4. p. 611. Calyx 5-toothed. Flowers of a purplish-violet colour. Stamens monadelphous. Ovary pubescent, linear, tapering to both ends.

*Broad-leaved Lonchocarpus.* Clt. 1808. Tree 12 to 20 ft.

13 *L. PUBESCENS* (D. C. prod. 2. p. 260.) leaflets 11-13, ovate-lanceolate, acuminate, glabrous, pubescent beneath; racemes axillary, filiform, length of leaves. *h. S.* Native of Caraccas. *Amerimum pubescens*, Willd. spec. 3. p. 909. *Pterocarpus pubescens*, Poir. dict. 5. p. 740. The legume is said to be 2-valved and many-seeded, and the stamens monadelphous. Flowers small, violet.

*Pubescent Lonchocarpus.* Clt. 1824. Tree 20 to 30 feet.

14 *L. ROSEUS* (D. C. prod. 2. p. 260.) leaflets 13-15, lanceolate, acuminate, glabrous, shining above, but rather pale beneath; racemes erect; pedicels 1-flowered; calyx truncate; young legumes clothed with rufous-velvety down. *h. S.* Native of South America. *Pseudo-acacia latifolia*, Plum. spec. 19. *Robinia rosea*, Mill. dict. no. 4. but not of Ell. *Robinia latifolia*, Poir. dict. 6. p. 224. but not of Mill. Flowers large, showy, rose-coloured, ex Plum. Legume oblong, acute, 1-4-seeded, tapering to the base.

*Rose-coloured-flowered Lonchocarpus.* Clt. 1700. Tree 20 to 30 feet.

15 *L. ? PTEROCARPUS* (D. C. prod. 2. p. 260.) leaflets 5, oval-oblong, acuminate, quite smooth, shining above, but glaucescent beneath; racemes axillary, length of leaves; legume oblong, acuminate at both ends, winged on the upper suture. *h. S.* Native of French Guiana. Flowers unknown. Legume 2 or 3 inches long, and 1-2-seeded from abortion.

*Wing-fruited Lonchocarpus.* Tree 20 to 30 feet.

16 *L. SÆPIUM* (D. C. prod. 2. p. 260.) leaflets 11-15, ovate, bluntly acuminate, membranous, rather puberulous above, but glabrous and pale beneath; racemes shorter than the leaves; pedicels 1-flowered; calyx truncate; legumes glabrous, oblong-obtuse, compressed, callous at the sutures. *h. S.* Native of St. Martha, and at Carthage, where it is used for hedges to gardens. *Robinia sæpium*, Jacq. amer. 211. t. 129. f. 101. Flowers rose-coloured. Stamens diadelphous. Legume about 4 inches long, 4-seeded.

*Hedge Lonchocarpus.* Clt. 1821. Tree 30 feet.

17 *L. MACULATUS* (D. C. prod. 2. p. 260.) leaflets 17, oblong, obtuse, beset with adpressed pili above, but glaucescent and spotted with black beneath; calyx campanulately urceolate, nearly entire, puberulous; legume linear, compressed, with thickened margins. *h. S.* Native about Campeachy. *Robinia maculata*, H. B. et Kunth, nov. gen. amer. 6. p. 394. This plant, along with the preceding species, may form a distinct genus, which may be called *Glyciridia*.

*Spotted-leaved Lonchocarpus.* Tree 30 feet.

18 *L. SWARTZII* (D. C. prod. 2. p. 261.) leaflets 5-7, oval, bluntly acuminate, glabrous, pale beneath; racemes shorter than the leaves; pedicels 2-flowered; calyx truncate; legumes glabrous, elliptic-oblong, compressed, few-seeded, rather callous at the sutures. *h. S.* Native of St. Domingo. *Robinia sæpium*, Swartz, prod. 106. Flowers rose-coloured. This species differs from *L. sæpium* in the flowers being smaller and monadelphous, not diadelphous.

*Swartz's Lonchocarpus.* Tree 20 feet.

19 *L. NICOÛ* (D. C. prod. 2. p. 261.) leaflets 7, ovate, acuminate, glabrous; branches sarmentose, rather climbing; racemes spike-formed; pedicels 1-flowered; calyx 5-toothed; legume elongated, glabrous, 4-seeded, rather callous at the

sutures. *h. S.* Native of French Guiana, in bushy places. *Robinia Nicou*, Aubl. guian. 2. p. 771. t. 308. *R. scandens*, Willd. spec. 3. p. 1134. Flowers purple, diadelphous. There is a plant native of Cayenne which differs from the plant of Aublet in the leaflets being silky-pubescent beneath, and in the spikes being longer than the leaves. The twigs are cut and thrown into ponds and rivers for the purpose of intoxicating fish, in order to take them, as those of *Tephrosia toxicaria*, see p. 229. *Nicou* is the Caribbee name of the tree.

*Nicou Lonchocarpus.* Shrub cl.

20 *L. OXYCARPUS* (D. C. prod. 2. p. 261.) leaflets 7, oval, abruptly, acutely, and mucronately acuminate, glabrous, palish beneath; racemes shorter than the leaves; pedicels 2-3-flowered; calyx usually 5-toothed; legume oblong, acuminate at both ends, compressed, few-seeded, not tumid at the sutures.

*h. S.* Native of Guadeloupe. Flowers purple, monadelphous.

*Sharp-fruited Lonchocarpus.* Tree 12 to 20 feet.

21 *L. ? AMERIMMUM* (D. C. prod. 2. p. 261.) leaflets 7, ovate, acuminate on long petioles, glabrous; racemes simple, loose, shorter than the leaves; calyx 5-toothed. *h. S.* Native about Carthage, in woods. *Amerimum pinnatum*, Jacq. amer. 200. t. 177. f. 50. Flowers yellow, monadelphous.

*Amerimum-like Lonchocarpus.* Tree 14 feet.

*Cult.* For culture and propagation see *Eysenhardtia*, p. 234.

**CX. ROBINIA** (in honour of Jean Robin, a French botanist, once herbalist to Henry IV. of France, author of *Histoire des Plantes*, 12mo. Paris, 1620. printed also with the second edition of Lonicier's *History of Plants*. His son Vespasian was subdemonstrator at the Jardin du Roi, and was the first person who cultivated the *Pseudacacia* in Europe). D. C. mem. leg. vi. prod. 2. p. 261.—*Pseudacacia*, Tourn. inst. t. 417. Mæch. meth. 145.—*Robinia* species of Lin. and others.

**LIN. SYST.** *Diadelphia*, *Decandria*. Teeth of calyx 5, lanceolate, 2 upper ones shorter and approximate. Corolla papilionaceous. Vexillum large. Keel obtuse. Stamens diadelphous, deciduous. Ovary 16-20-ovulate. Style bearded in front. Legume compressed, almost sessile, many-seeded, with the valves thin and flat, margined at the seminiferous suture.—North American trees, usually furnished with stipular spines. Leaves impari-pinnate; leaflets petiolulate, and furnished with stipels at the base. Flowers white or rose-coloured, disposed in axillary, usually nodding racemes.

1 *R. PSEUDACACIA* (Lin. spec. 1043.) spines stipular; branches twiggy; racemes loose, pendulous, and arc, as well as the legumes smooth; leaflets ovate. *h. H.* Native of North America, from Canada to Carolina. Lam. ill. t. 666. f. 1. Duham. arbr. ed. nov. 2. t. 16. *Æschynomene pseudacacia*, Roxb. *Pseudacacia odorata*, Mæch. l. c. Flowers white, sweet-scented. Roots creeping, the fibres sometimes bearing tubercles. The *Common, False, or Bastard Acacia*, called *Locust-tree* in America, grows very fast whilst young, so that in a few years from seed the plants rise to 8 or 10 feet high, and it is not uncommon to see shoots of this tree 6 or 8 feet long in one summer. The branches are armed with stipular hooked prickles. The leaves have 8 or 10 pairs of bright green leaflets. The flowers come out from the sides of the branches in pretty long bunches, hanging down like those of *Laburnum*, white, and smelling very sweet; they appear in June, and when the trees are full of flowers they make a very fine appearance, and perfume the air round them, but they seldom continue more than one week. The wood is valued in North America for its durability. Most of the houses which were built at Boston in New England on the first settling of the English, were constructed of this timber. The tree being very liable to be broken by high winds, and the leaves not appearing till late in the summer, and

falling off early in the autumn, makes it less valuable for ornamental plantations. The wood when green is of a soft texture, but becomes very hard when dry, of a close grain, and finely veined, and is more valued in America by cabinet-makers than any other native timber whatever. It is as durable as the best white oak, and is esteemed preferable for axletrees of carriages, trenails for ships, and many other mechanical purposes. It has been employed with success in Virginia for ship-building, and found to be far superior to American oak, elm, ash, &c. for that purpose. Posts for rail-fencing made of this tree stand wet and dry in the ground better than any other in common use, almost as well as posts of the swamp-cedar. It makes excellent fuel, and its shade is less injurious to grass than that of most other trees. The leaves afford wholesome food for cattle. A gentleman in New England sowed several acres of it for that purpose. Being very apt to throw out suckers from the running roots, and as it stolls freely, it seems peculiarly calculated for coppice woods. A locust-tree in New England 40 years old was in 1782 60 feet high and 4 feet 10 inches in girth at 3 feet from the ground. A cubic foot of *Acacia* in a dry state weighs from 48 to 53 pounds avoirdupoise. If we compare its toughness in an unseasoned condition with that of oak, it will not be more than 8-100 less. Its stiffness is equal to 99-100 of oak, and its strength nearly 96-100, but were it properly seasoned, it might possibly be found much superior to oak in strength, toughness, and stiffness. A piece of unseasoned *acacia* 2 feet 6 inches long, and an inch square in the vertical section, broke when loaded with a weight of 247 pounds avoirdupoise. Its medium cohesive force is about 11,500 pounds. (Diet. of Archi.)

*Var. β, inermis* (D. C. prod. 2. p. 261.) spines wanting or nearly obsolete; leaflets flat. D. C. cat. hort. monsp. 136. *R. spectabilis*, Dum. Cours. bot. cult. 6. p. 140.

*Var. γ, crispa* (D. C. l. c.) spines wanting; leaflets all or for the most part undulately curled.

*Var. δ, umbraculifera* (D. C. cat. hort. monsp. 157.) spines wanting; branches much crowded, smooth; leaflets ovate. This plant is common in gardens, but has not yet flowered. *Robinia inermis*, Dum. Cours. 6. p. 140. Commonly called *Parasol Acacia*. This variety is said to have been raised from the seed of *R. pseudacacia*, but it is more of a shrub than a tree.

*Var. ε, tortuosa* (D. C. prod. 2. p. 261.) branches much crowded, and twisted. *h. H.* *R. pseudacacia tortuosa*, D. C. cat. hort. monsp. 136. Racemes similar to those of *R. pseudacacia*, but are smaller and fewer flowered.

Bastard *Acacia*, *False Acacia*, or American Locust-tree. Fl. May, June. Clt. 1640. Tree 30 to 60 feet.

2 *R. du'RIA* (Fouc. in Desv. journ. bot. 4. p. 204. but not of Poir.) spines very short; branches, petioles, peduncles, and calyxes furnished with a few glands, rarely clammy; leaflets ovate; racemes loose, pendulous; bractees concave, caducous, ending each in a long bristle. *h. H.* Said to be a hybrid between *R. pseudacacia* and *R. viscosa*. *R. hybrida*, Audib. *R. ambigua*, Poir. suppl. 4. p. 690. and perhaps *R. echinata*, Mill. dict. no. 2. Flowers sweet-scented, pale rose-coloured. The pods, according to Miller, are thickly beset with short prickles.

*Doubtful*, Bastard, or False *Acacia*. Fl. May, Ju. Tree 60 ft.

3 *R. viscosa* (Vent. hort. cels. t. 4.) spines very short; leaflets ovate; branches and legumes glandular and clammy; racemes crowded, erect; bractees concave, deciduous, each ending in a long bristle; the 3 lower teeth of calyx acuminate. *h. H.* Native of North America, on the mountains of Georgia and Carolina, near rivers. Duh. arbr. ed. nov. 2. t. 17. *R. glutinosa*, Curt. bot. mag. 560. Flowers pale red mixed with white, scentless. Roots creeping.

*Clammy False Acacia*. Fl. June, Aug. Clt. 1797. Tree 30 to 40 feet.

4 *R. hispida* (Lin. mant. 101.) spines wanting; leaflets obovate; branches hispid; racemes loose, hispid; the 3 lower teeth of calyx acuminate; legumes hispid. *h. H.* Native of Virginia and Carolina, on high mountains. Mill. fig. t. 244. Curt. bot. mag. 311. *R. rosea*, Duh. l. c. t. 18. *R. montana*, Bartr. voy. 2. p. 128. *Æschynomene hispida*, Roxb. Flowers large, rose-coloured, showy, scentless. Perhaps many species are confused under the name of *R. hispida*. This is one of the most elegant of the species when in flower, it is usually grafted on the common sort, and flowers even when it is about 2 or 3 feet high, which renders it a very valuable plant for ornamental shrubberies, but it requires to be grown in a sheltered situation, otherwise the branches are very liable to be shattered or blown off by high winds. In young trees grafted above ground, the fracture commonly takes place at the graft, so that a good preventive is to graft on a root, a little below the surface. Grafts in this manner are also much more certain of success.

*Var. β, nana* (D. C. prod. 2. p. 262.) plant hardly a foot high. Native of Carolina, in pine woods.

*Hispid Bastard* or *Rose Acacia*. Fl. May, Sept. Clt. 1743. Shrub 3 to 6 feet.

5 *R. rosea* (Ell. sketch. 2. p. 213.) spines wanting; leaflets obovate, alternate; branches and racemes smoothish. *h. H.* Native of Georgia, in pine woods. *R. hispida* var. *β rosea*, Pursh. fl. sept. amer. 2. p. 488. Flowers large, rose-coloured, scentless. The 3 lower teeth of calyx acuminate.

*Upright Rose* or *Bastard Acacia*. Fl. May, Sept. Sh. 6 feet.

6 *R. macrophylla* (Schrad. in litt.) spines wanting; leaflets ovate-roundish; branches and peduncles glabrous, the 3 lower teeth of calyx acuminate. *h. H.* Native of North America. Flowers large, rose-coloured, scentless. *R. hispida* var. *γ macrophylla*, D. C. prod. 2. p. 262.

*Long-leaved Rose* or *Bastard Acacia*. Fl. May, June. Shrub 6 to 10 feet.

† *Trees and shrubs referred to Robinia by authors, which appear not to belong to the genus, and ought to be referred to some other genera; but they are not so sufficiently known as to enable us to refer them to their proper genera.*

7 *R. amara* (LOUR. coch. p. 455.) unarmed; leaves imparipinnate, usually with 5 pairs of ovate-oblong leaflets, which are white beneath; racemes long, erect; pedicels tern; legume almost terete, acuminate, glabrous. *h. G.* Native of Cochinchina and China. Flowers violaceous. Root very bitter, of a yellowish brown-colour.

*Bitter-rooted Robinia*. Shrub 4 feet.

8 *R. glycyphylla* (Poir. dict. 6. p. 227.) unarmed; leaves imparipinnate, with 6-9 pairs of glabrous, ovate, obtuse, discoloured leaflets; stipulas subulate, stiff; racemes elongated; calyx tubular; legume linear, compressed, obtuse, stipitate. *h. S.* Native of Martinique. Flowers small, white. Perhaps a species of *Lonchocarpus*.

*Sweet-leaved Robinia*. Tree 20 feet?

9 *R. guineensis* (Willd. ex Steud. D. C. prod. 2. p. 262.) unarmed; leaves imparipinnate, with 5-6 pairs of elliptic, mucronate, glabrous leaflets; stipulas linear-subulate; racemes 5-6-flowered; branchlets and calyxes hispid. *h. S.* Native of Guinea. *Cytisus hispidus*, Willd. spec. 3. p. 1121.

*Guinea Robinia*. Clt. 1822. Tree 40 feet.

10 *R. latifolia* (Mill. dict. no. 9. but not of Poir.) unarmed; leaves imparipinnate, with 6-7 pairs of oblong acuminate leaflets, which are shining above, and pale beneath; racemes elongated; legumes 1-2-seeded, oblong-ovate. *h. S.* Native of Campeachy. Flowers rose-coloured. Perhaps a species of *Lonchocarpus*.

*Broad-leaved Robinia*. Tree 20<sup>o</sup> to 30 feet.

11 *R. GLABRA* (Mill. dict. no. 5.) unarmed; leaves imparipinnate; leaflets oblong-obovate, obtuse, glabrous; peduncles racemose, crowded. *h. S.* Native of Campeachy. Flowers small, yellowish-red. Perhaps a species of *Lonchocarpus*.

*Glabrous Robinia.* Tree.

12 *R. PENDULA* (Ort. dec. p. 26.) unarmed; leaves imparipinnate, with 6-8 pairs of oval mucronulate leaflets; stipulas subulate; racemes twice the length of the leaves; pedicels twin, 1-flowered. *h. S.* Native of Peru, at the town called Huariaca. Flowers pale violet-coloured.

*Pendulous-flowered Robinia.* Tree.

13 *R. PURPUREA* (Link. enum. 2. p. 242.) petioles somewhat spinescent; leaves imparipinnate; leaflets lanceolate, mucronate, pubescent; pedicels 1-flowered. *h. S.* Native country unknown. Flowers purple.

*Purple-flowered Robinia.* Fl. July, Aug. Clt. 1810. Tree.

14 *R. RUBIGINOSA* (Mart. et Nees, nov. act. bonn. 12. p. 31. exclusive of the synonyme of Poir.) shrub unarmed, diffuse; leaves imparipinnate; leaflets 19-21, elliptic, obtuse, somewhat emarginate, pubescent beneath; racemes axillary, compound, and are, as well as the branches, clothed with rusty villi. *h. S.* Native of Brazil, about Tamburil and Valos. Flowers small, violaceous. Ovary crenulated.

*Rusty Robinia.* Shrub 10 to 12 feet.

15 *R. CUBENSIS* (H. B. et Kunth, nov. gen. amer. 6. p. 392.) arboreous; leaflets 9, ovate-oblong, obliquely falcate, glabrous; racemes in fascicles, pendulous; calyx urceolate, 5-toothed, pubescent. *h. S.* Native of Cuba, near Batabana. Flowers pale rose-coloured. Fruit unknown.

*Cuba Robinia.* Tree 40 feet.

16 *R. FERRUGINEA* (H. B. et Kunth, nov. gen. amer. 6. p. 395.) arboreous; branches glabrous, unarmed; racemes rising before the leaves; calyx urceolate, 5-lobed, somewhat bilabiate, clothed with rusty tomentum. *h. S.* Native of Caraccas. Flowers rose-coloured or white.

*Ferruginous Robinia.* Tree 20 feet.

17 *R. FLAVA* (Lour. coch. 456.) unarmed; leaves abruptly pinnate, usually with 8 pairs of oblong acutish leaflets; peduncles 3 together, each bearing 3 flowers. *h. G.* Native of the north of China. Root yellow, bitter. Flowers white. Perhaps a species of *Caragana*. The roots in decoction are febrifugal.

*Yellow-rooted Robinia.* Shrub 1 to 2 feet.

18 *R. PYRAMIDATA* (Mill. dict. no. 7.) unarmed; leaves bipinnate; leaflets ovate, sessile, shining above, but pale beneath; panicles spicately pyramidal, erect. *h. S.* Native of Campeachy. Flowers red. Perhaps a species of *Cæsalpinia*.

*Pyramidal-flowered Robinia.* Tree.

*Cult.* All the true species of *Robinia* are very handsome when in flower, and are very proper plants for ornamental shrubberies; the taller species to be placed at the back, and the shorter ones in front; they are either propagated by layers or by grafting the rarer on the commoner sorts, most commonly on the *R. pseudacacia*. Most of the species may be raised from seeds, which in some kinds ripen in plenty. The stove and greenhouse kinds, which are certainly very doubtful species of the genus, should be treated in the same manner as the genus *Sabinea*.

**CXI. POITÆA** (in honour of — Poiteau, a French botanist and traveller in South America, author of *Flore Parisienne*, in conjunction with Turpin, and author of many botanical memoirs in the *Annales du Muséum*). D. C. prod. 2. p. 263.—Poitæa, Vent. choix. t. 36.

*LIN. SYST.* *Diadelphia, Decandria*. Calyx obliquely truncate, 5-toothed; teeth very short, especially the 2 upper ones. Petals 5, disposed in a papilionaceous manner, conniving, oblong; vex-

illum retuse, shorter than the wings. Keel longer than the wings. Stamens somewhat exerted, diadelphous. Style filiform, glabrous. Stigma terminal. Legume stipitate, linear, compressed, many-seeded, mucronulate; valves flat. Seeds lenticular.—Shrubs, natives of St. Domingo, with the habit of *Galèga* and *Robinia*. Stipulas setaceous. Leaves imparipinnate; leaflets exstipellate. Flowers white or rose-coloured, disposed in axillary racemes. Legumes glabrous.

1 *P. GALEGIFORMIS* (Vent. choix. t. 36.) petioles wingless; leaflets 12-15 pairs, oblong, mucronate, and are, as well as the branches, clothed with adpressed pubescence; flowers and legumes nodding. *h. S.* Native of St. Domingo. *Galèga Berteri*, Spreng. in herb. Balb. *P. galegiformis*, Spreng. syst. 3. p. 272. Leaflets 3 lines long, and a line and a half broad. Flowers of a rose-purple colour.

*Goat's-rue-like Poitæa.* Shrub.

2 *P. VICIFOLIA* (D. C. in ann. sc. nat. 4. p. 99.) petiole with a very narrow wing; leaves with 16-18 pairs of oblong mucronate leaflets, which are clothed with hairy pubescence, as well as the branchlets; flowers and legumes erect. *h. S.* Native of St. Domingo. *Robinia vicifolia*, Bert. in herb. Balb. Flowers of a rose-purple colour. Leaflets an inch long, and about 3 or 4 lines broad.

*Fetch-leaved Poitæa.* Shrub.

3 *P. CAMPANILLA* (D. C. prod. 2. p. 263.) petiole terete, filiform; leaves with 4 pairs of distant, ovate-oblong, rather mucronulate leaflets, which are glaucous beneath, but smooth on both surfaces, as well as the branches and petioles. *h. S.* Native of St. Domingo, where it is called *Campanilla*. *Robinia latifolia*, Bertero in herb. Balb. Flowers white or pale rose-coloured. Leaflets an inch long, and half an inch broad, on long petioles.

*Campanilla Poitæa.* Shrub.

*Cult.* See *Sabinea* for culture and propagation.

**CXII. SABINEA** (named by De Candolle, in honour of Joseph Sabine, F.R.S. F.L.S. &c. who was a long time Secretary of the Horticultural Society of London). D. C. in ann. sc. nat. 1. jan. 1825. p. 92. prod. 2. p. 263.

*LIN. SYST.* *Diadelphia, Decandria*. Calyx cup-shaped, campanulate, with a truncate, nearly entire border. Corolla papilionaceous. Keel obtuse, rather shorter than the vexillum. Stamens diadelphous, the free one and 4 others shorter than the rest. Style filiform, glabrous, circimutely incurved, as well as the stamens. Legume stipitate, compressed, linear, elongated, many-seeded, mucronate by the style.—Unarmed Caribbean shrubs, with abruptly-pinnate leaves, glabrous mucronate leaflets, axillary fascicles of 1-flowered pedicels, and purplish flowers.

1 *S. FLORIDA* (D. C. l. c.) leaflets 8-9 pairs, elliptic-oblong; flowers rising before the leaves. *h. S.* Native of the American Islands, in St. John, Krabben Island, and St. Thomas. *Robinia florida*, Vahl. symb. 3. p. 89. t. 70.

*Flowery Sabinea.* Shrub 2 to 4 feet.

2 *S. DUBIA* (D. C. l. c.) leaflets 10-12 pairs, elliptic-oblong; flowers rising after the leaves. *h. S.* Native of Martinique and Porto-Rico. *Robinia dubia*, Lam. ill. t. 606. f. 2. Poir. dict. 6. p. 227. but not of Fouc. *Robinia Martinicensis*, Pers. ench. 2. p. 312. Perhaps sufficiently distinct from the preceding.

*Doubtful Sabinea.* Shrub 2 feet.

*Cult.* A mixture of loam, peat, and sand will answer the species of *Sabinea*, and young cuttings will root if planted in a pot of sand with a hand-glass placed over them in heat.

**CXIII. COURSETIA** (in honour of Dumont de Courset.

author of the *Botaniste Cultivateur*, 5 vols. in 8vo. Paris, 1802. and one of the editors of the *Bon Jardinier*). D. C. in ann. sc. nat. 4. jan. 1825. p. 92. prod. 2. p. 264.

**LIN. SYST.** *Diadelphia, Decandria*. Calyx 5-cleft, with nearly equal acute segments, 2 superior ones rather the shortest, and joined together a little higher up than the rest. Vexillum obcordate, shorter than broad. Keel obtuse, shorter than the wings. Stamens diadelphous. Style incurved, thick at the base and glabrous, but filiform at the apex and bearded with villi on all sides. Stigma capitate, terminal, smoothish. Legume compressed, 1-celled, 5-8-seeded, tapering to the apex, and mucronate by the style.—Tomentose shrubs, with subulate stipulas, abruptly-pinnate leaves, with many pairs of ovate small leaflets, the common petiole sometimes terminating in a bristle, but rarely in an odd leaflet. Flowers yellow. "This genus is allied to *Robinia* and *Caragana*, not to *Lathyrus* or *Æschynomene*.

1 *C. TOMENTOSA* (D. C. l. c.) the whole plant clothed with velvety tomentum; leaves with from 30-35-pairs of leaflets; racemes 2-3-flowered, shorter than the leaves; calyx 5-cleft. *h. S.* Native of Peru. *Lathyrus fruticosus*, Cav. icon. t. 84. *Orobis tomentosus*, Desf. cat. hort. par. ed. 1. p. 195. *Vicia fruticosa*, Willd. spec. 3. p. 1102. *Orobis fruticosus*, Pers. Flowers yellow.

*Tomentose Coursetia*. Shrub 2 feet.

2 *C. ? DUBIA* (D. C. prod. 2. p. 264.) branches clothed with white villi; leaflets elliptic, acutish, usually about 30 pairs, puberulous above, and villously tomentose beneath, and canescent; racemes 15-20-flowered, length of leaves; calyx 5-toothed. *h. S.* Native on the Andes about Pasto, near the river Guaritaria. *Sesbania dubia*, H. B. et Kunth, nov. gen. amer. 7. p. 268. t. 660. *Hymenopron Pastoensis*, Spreng. Flowers rose-coloured.

*Doubtful Coursetia*. Shrub 3 to 6 feet.

3 *C. VIRGATA* (D. C. l. c.) plant smoothish; leaflets 10-15 pairs; racemes 8-10-flowered; calyx 5-toothed. *h. S.* Native of New Spain. *Æschynomene virgata*, Cav. icon. t. 293. *Agati virgata*, Desv. journ. bot. 3. p. 120. Legume glabrous, compressed, somewhat torulose, not articulated, apiculated by the thick style. Calyx not bipartite. Stamens not equally diadelphous. Perhaps a proper species of *Coursetia*. Corolla yellow.

*Twiggy Coursetia*. Shrub 2 feet.

*Cult.* See *Sabinca* for culture and propagation, p. 239.

**CXIV. SESBANIA** (*Sesban* is the Arabic name of the first species). Pers. ench. 2. p. 316. Desv. journ. bot. 3. p. 120. t. 4. f. 5.—*Sésban*, Poir. dict. 7. p. 127.—*Sesbana*, R. Br. in hort. kew. 4. p. 330.—*Æschynomene* species of Lin. and others.—*Coronilla* species of Willd.

**LIN. SYST.** *Diadelphia, Decandria*. Calyx 5-cleft or 5-toothed (f. 38. a.) with the lobes nearly equal. Vexillum roundish, complicated, larger than the keel (f. 38. b.). Keel obtuse, 2-edged at the base. Stamens diadelphous, having the tube or sheath rather auricled at the base. Legume elongated, slender (f. 38. c.), compressed, or somewhat cylindrical; the sutures thickened, not truly articulated, but rather torulose.—Shrubs or herbs, having the cauline stipulas lanceolate. Leaves abruptly pinnate, with many pairs of leaflets, having the petioles drawn out into a bristle at the apex instead of an odd leaflet. Peduncles axillary. Flowers racemose, usually yellow. Perhaps this genus, with the three following, ought to have been referred to Tribe *Hedysæreæ*.

1 *S. ÆGYPTIACA* (Pers. ench. 2. p. 316.) shrubby, glabrous; leaflets 10 pairs, oblong-linear, obtuse, and rather mucronate; racemes many-flowered; legumes compressed, and rather terete, torulose, twice the length of the petiole. *h. S.* Native of Senegal, Egypt, and the East Indies. *Sésban*, P. Alp. 82. with a figure. *Æschynomene Sésban*, Lin. spec. 1061. *Coronilla*

*Sésban*, Willd. spec. 3. p. 1147. *Æ. Sésban* and *Æ. Indica*, Burm. fl. ind. 169 and 170. Vexillum roundish and dotless. Flowers yellow.

*Egyptian Sesban*. Fl. July, Aug. Clt. 1680. Shrub 5 feet.

2 *S. OCCIDENTALIS* (Pers. ench. 2. p. 316.) shrubby, glabrous; leaves with 12-15 pairs of elliptic leaflets; racemes few-flowered; legumes terete, straight, 3-times longer than the petioles. *h. S.* Native of South America or the Caribbee Islands. *Coronilla occidentalis*, Willd. spec. 3. p. 1147.—Plum. ed Burm. t. 125. f. 1. Corolla hairy according to Plumier, yellow.

*Occidental Sesban*. Fl. July, Aug. Clt. 1816. Shrub 4 feet.

3 *S. CASSIODES*; shrubby, smooth; leaves with from 20-35 pairs of lanceolate, obtuse, mucronate leaflets; stipulas subulate; peduncles axillary, 2-3-4-flowered; legumes long-linear, terete, longer than the leaves. *h. S.* Native of Guaiacul. *Æschynomene cassioides*, Ruiz et Pav. in herb. Lamb.

*Cassia-like Sesban*. Shrub 2 to 3 feet.

4 *S. EXASPERATA* (H. B. et Kunth, nov. gen. amer. 6. p. 534.) shrubby; branches angular, and are, as well as the rachis, prickly; leaves with about 30 pairs of linear, mucronate, rather falcate, glabrous leaflets, but with the nerves and margins beset with adpressed down; peduncles usually 3-flowered, one-half shorter than the leaves. *h. S.* Native of South America, in sand at the river Apures, and near La Laguna de Valencia. Corolla glabrous, yellow. Legume very long and cylindrical.

*Rough Sesban*. Shrub 3 to 4 feet.

5 *S. ACULEATA* (Pers. ench. 2. p. 316.) plant herbaceous and glabrous; rachis of leaves rather prickly; leaves having about 25 pairs of linear, obtuse, rather mucronate leaflets; racemes few-flowered; legumes filiform, one-half shorter than the petioles. *h. S.* Native of Malabar. *Æschynomene Sesban*, Jacq. coll. 2. p. 283. *Æ. hispidosa*, Jacq. icon. rar. t. 564. *Coronilla aculeata*, Willd. l. c.—Rheed. mal. 9. t. 27. Burm. zeyl. t. 41. There is a variety of this plant having only 12-15 pairs of leaflets. Flowers orange.

*Prickly Sesban*. Fl. July, Aug. Clt. 1690. Pl. 5 to 6 feet.

6 *S. PERUVIANA*; shrubby, smooth; leaves with 4-6 pairs of obovate, obtuse, mucronate leaflets, which are glaucous beneath; racemes short, few-flowered; stipulas ovate, subulate at the apex; petioles prickly; legumes longer than the leaves, elongated, terete. *h. S.* Native of Peru. *Æschynomene* spec. nov. Ruiz et Pav. in herb. Lamb.

*Peruvian Sesban*. Shrub 3 to 4 feet.

7 *S. CANNABINA* (Pers. l. c.) plant herbaceous, glabrous; rachis of leaves smooth; peduncles 1-flowered, twin; legume filiform, compressed. *h. S.* Native of Malabar. *Æschynomene cannabina*, Retz; obs. 5. p. 26. *Coronilla cannabina*, Willd. spec. 3. p. 1148. Flowers small, yellow. This plant, if treated as hemp, may be used for the same purposes.

*Hemp Sesban*. Fl. July, Aug. Clt. 1800. Pl. 2 to 4 feet.

8 *S. AFFINIS* (Schrad. sem. hort. goett. 1819.) plant herbaceous, smoothish; leaflets 12-18 pairs, oblong-linear, very blunt, mucronulate; rachis of leaves smooth; racemes few-flowered; legumes compressed, pendulous, length of rachis. *h. S.* Native of the East Indies. *Æschynomene cannabina*, Hortul. Flowers yellow.

*Allied Sesban*. Fl. July, Aug. Clt. 1800. Pl. 2 to 4 feet.

9 *S. PUNCTATA* (D. C. prod. 2. p. 264.) plant herbaceous,

FIG. 38.

glabrous; leaves having 10-30 pairs of oblong-linear, very blunt, mucronate leaflets; petioles pubescent above; racemes many-flowered; corolla 6-times longer than the calyx; legumes compressed, somewhat torulose, 3 or 4 times the length of the petiole. ☉. ? S. Native of Senegal. Flowers yellow, 8-9 lines long, having the vexillum spotted with purple on the outside.

*Spotted-flowered Sesban.* Fl. July, Aug. Clt. 1825. Pl. 2 to 3 feet.

10 *S. PACHYCARPA* (D. C. prod. 2. p. 265.) plant herbaceous, glabrous; leaflets oblong-linear, very blunt, and rather mucronate; petioles smooth; racemes 4-6-flowered, somewhat corymbose; corolla 3-times longer than the calyx; legumes rather terete, thick, 3-times the length of the rachis. ☉. ? S. Native of Senegal. Flowers yellow, but with the vexillum variegated with purple spots. Legume acuminate, 6-8 inches long.

*Thick-fruited Sesban.* Pl. 2 to 3 feet.

11 *S. PICTA* (Pers. ench. 27 p. 316.) plant herbaceous, glabrous; leaves with 12-16 pairs of oblong-linear obtuse leaflets; racemes many-flowered, nodding; corolla 3-times the length of the calyx; legumes filiform, when young terete, but at length becoming compressed, torulose, twice the length of the petioles. ♂. S. Native of New Spain. *Æschynomene picta*, Cav. icon. 4. p. 7. t. 314. *Coronilla picta*, Willd. l. c. Corolla yellow, having the vexillum variegated with black dotted lines. There is a variety of this plant with 1-flowered peduncles, but this is very rare.

*Painted-flowered Sesban.* Fl. July, Aug. Clt. 1823. Pl. 4 to 6 feet.

12 *S. MACROCARPA* (Muhl. ex Ell. sketch. 2. p. 221.) plant herbaceous, glabrous; leaflets elliptic, glaucescent beneath, many-pairs; racemes axillary, few-flowered; legumes rather terete, elongated. ☉. H. Native of Louisiana, and in the island of Paris. Flowers yellowish. Racemes shorter than the leaves.

*Long-fruited Sesban.* Fl. July, Aug. Clt. 1820. Pl. 3 ft.

13 *S. PUBESCENS* (D. C. prod. 2. p. 265.) plant herbaceous, clothed with adpressed villous pubescence; leaflets oblong-linear, obtuse, mucronate, about 20 pairs; racemes 7-8-flowered; legumes filiform, shorter than the petiole. ☉. S. Native of Guinea. *Æschynomene pubescens*, Vahl. ined. Flowers yellow.

*Pubescent Sesban.* Pl. 2 to 3 feet?

14 *S. PALUDOSA* (Jacq. hort. vind. ex sem. miss. D. C. pl. rar. jard. gen. prod. 2. p. 265.) plant herbaceous, glabrous; leaflets elliptic-linear, obtuse, mucronate, 10-20 pairs; racemes usually 2-flowered; legume terete, rather compressed, and somewhat torulose, length of rachis. ☉. S. Native of the East Indies. Corolla yellow, but with the vexillum rather brownish, and the top of the keel purplish. Perhaps the same as *Æschynomene paludosa* of Roxb.

*Marsh Sesban.* Fl. July, Aug. Clt. 1816. Pl. 2 to 4 feet.

15 *S. GRACILIS* (Schrader. cat. sem. gætt. 1819. D. C. prod. 2. p. 265.) plant glabrous; leaves with 12-15 pairs of oblong-linear, obtuse, mucronulate leaflets; rachis of leaves smooth; racemes few-flowered; legumes compressed, rather torulose, erect, twice the length of the rachis, apiculated by the style, which is twice the length of the ultimate joint. ☉. S. Native country unknown. Very nearly allied to the following species.

*Slender Sesban.* Fl. July, Aug. Clt. 1820. Pl. 2 to 3 feet.

16 *S. LEPTOCARPA* (D. C. prod. 2. p. 265.) plant herbaceous, glabrous; leaves with about 20 pairs of linear, obtuse, mucronate leaflets; racemes few-flowered, erect; legumes filiform, terete, torulose, twice the length of the rachis; style shorter than the ultimate joint of the pod. ☉. ? S. Native of Senegal. Flowers yellow, but with the vexillum dotted with black, as in *S. picta*.

*Slender-fruited Sesban.* Fl. 2 to 3 feet.

VOL. II.

17 *S. LONGIFOLIA* (D. C. prod. 2. p. 265.) plant shrubby, glabrous; leaves with from 7-18 pairs of ovate lanceolate, mucronulate, glaucous leaflets; racemes many-flowered; legumes linear, torulose, acute. ♀. S. Native of New Spain. *Æschynomene longifolia*, Ort. dec. 9. p. 70. Flowers yellow. Stems and fruit purplish.

*Long-leaved Sesban.* Shrub 4 to 6 feet.

18 *S. SERICEA* (D. C. prod. 2. p. 266.) plant herbaceous; leaflets lanceolate, acute, mucronate, narrowest at the base, silky beneath. ☉. S. Native country unknown. *Coronilla sericea*, Willd. enum. 773. Said to be nearly allied to *S. cannabina*.

*Silky Sesban.* Fl. July, Aug. Clt. 1818. Pl. 2 to 3 feet.

19 *S. COCHIN-CHINENSIS* (D. C. prod. 2. p. 266.) stem suffrutescent; leaves with 15 pairs of oblong, obtuse, mucronulate leaflets; peduncles 3-flowered; legumes filiform, torulose, erect. ♀. S. Native of Cochin-china. *Coronilla Cochinchinensis*, Lour. coch. p. 452. Flowers yellow.

*Cochin-China Sesban.* Shrub 4 feet.

*Cult.* All the species of this genus require a heat of 70 degrees of Fahrenheit, or they will not thrive. The shrubby kinds are increased by cuttings, and the annual species by seeds, which sometimes ripen in this country.

CXV. AGATI (*Touri* or *Agati* is the name of *A. grandiflora* in the Sanscrit language). Rheed. hort. mal. t. 51. Adans. fam. 2. p. 326. Desf. journ. bot. 3. p. 120. t. 4. f. 6.

LIN. SYST. *Diadelphina*, *Décandria*. Calyx campanulate, truncate, obtusely 5-toothed, repand. Vexillum oval-oblong, shorter than the wings. Wings oblong. Keel large, straightish, with its petals free at the base and apex. Stamens diadelphous, somewhat exserted, with the sheath furnished with large auricles above the base. Style filiform, straightish. Legume tapering into a stipe, compressed, linear, 2-valved, transversely many-celled inside, but with the upper suture prominent and truncate, not truly articulated. Seeds ovate, solitary in the cells.—Indian trees, with lanceolate stipulas, abruptly-pinnate leaves, having many pairs of leaflets; large flowers; few-flowered racemes, and with legumes a foot and a half long.

1 *A. GRANDIFLORA* (Desv. l. c.) leaflets glabrous; legumes evidently compressed. ♀. S. Native of the East Indies, where it is called *Tauri* or *Agati*. Rheed. mal. 1. p. 95. t. 51. Rumph. amb. 1. t. 76. *Æschynomene grandiflora*, Lin. spec. 1050. *Coronilla grandiflora*, Willd. spec. 3. p. 1145. *Sesbania grandiflora*, Poir. dict. 7. p. 127. *Dolichos arboreus*, Forsk. descr. 134. Flowers of a rusty-yellow colour according to Forsk, but according to Roxb. they are white or rose-red. The seeds are agreeable to domestic birds. The bark is bitter and tonic.

*Great-flowered Agati.* Fl. July, Aug. Clt. 1768. Tree 14 to 26 feet.

2 *A. COCCINEA* (Desv. l. c.) leaflets powdery; legumes rather terete. ♀. S. Native of the East Indies and the Society Islands. *Æschynomene coccinea*, Lin. fil. suppl. 330. *Coronilla coccinea*, Willd. l. c. *Sesbania coccinea*, Poir. l. c.—Rumph. amb. 1. t. 77. Flowers red, rather smaller than those of the other species, but similar.

*Scarlet-flowered Agati.* Fl. July, Aug. Clt. 1768. Tree 20 to 30 feet.

*Cult.* See *Sabinea* for culture and propagation, p. 239.

CXVI. GLOTTIDIUM (from γλωσσα or γλωττα, *glotta*, a tongue; in reference to the valves of the legume separating into two membranes each, which has been compared to the superior opening of the larynx). Desv. journ. bot. 3. p. 119. t. 1. D. C. prod. 2. p. 266.

II

LIN. SYST. *Diadelphia, Decandria*. Calyx 5-toothed, somewhat bilabiate, lower teeth rather the longest. Vexillum reniform, very short, and broad. Stamens diadelphous. Legumes on long stipes, compressed, flat, 2-valved, 2-seeded, 1-celled; the valves separating into 2 membranes when mature, outer membrane coriaceous, inner one membranous and covering the seeds. Seeds compressed, transversely oblong.—Annual smooth herbs, having the primordial leaves ovate and simple, and the rest abruptly-pinnate, of many-pairs of leaflets. Racemes axillary, pedunculate. Flowers few, loose, yellow.

1 G. FLORIDANUM (D. C. prod. 2. p. 266.) ☉. F. Native of Florida and Carolina. *Robinia vesicaria*, Jacq. icon. rar. 1. t. 148. *Phaca Floridana*, Willd. spec. 3. p. 1252. *Sesbania platycarpa*, Michx. *Sesbania dispersa*, Pursh. fl. amer. sept. 2. p. 485. *Dalbergia polyphylla*, Poir. suppl. 2. p. 446. Peduncles 4-5-flowered.

*Florida Glottidium*. Fl. July, Aug. Clt. 1816. Pl. 5 to 7 ft. *Cult.* The seeds of this plant require to be sown in a pot filled with peat and sand, and placed in a hot-bed, and when the plants have grown 2 or 3 inches high, they should be planted into separate pots in the same kind of soil, and shifted into larger pots as they grow.

CXVII. PISCIDIA (from *piscis*, a fish, and *cædo*, to kill or destroy; the leaves, bark, and twigs bruised are thrown into ponds or rivulets for the purpose of intoxicating fish, by which means they are easily taken). Lin. gen. 856. D. C. prod. 2. p. 267.—*Piscipula*, Læf. itin. 275.—*Ichthyomethia*, P. Browne, jam. 276.

LIN. SYST. *Monadelphia, Decandria*. Calyx campanulate, 5-cleft. Corolla papilionaceous. Keel obtuse. Stamens monadelphous, the tenth one free from the rest at the base. Style filiform, glabrous. Legume pedicellate, linear, furnished with 4 membranous wings; the seeds separated by spongy substance. Seeds ovate, compressed, having a lateral hylum. Embryo curved, with elliptic-oblong thickish cotyledons, and a hooked radicle.—West Indian trees, with broad impari-pinnate leaves, and terminal panicles of white and blood-coloured flowers mixed.

1 P. ERYTHRINA (Lin. spec. 993. Jacq. amer. 206.) leaflets ovate; legume standing on a stipe, which is thrice the length of the calyx; wings interrupted. ♀. S. Native of New Spain and Jamaica on the mountains, where it is called *Dog-wood* by the English. Swartz, obs. 277. Lunan. hort. jam. 1. p. 269. Kunth. nov. gen. amer. 6. p. 382. *Erythrina piscipula*, Lin. spec. ed. 1. p. 107. Sloane, jam. 2. t. 176. f. 4 and 5. Lam. ill. t. 605. f. A. Leaves rather coriaceous, adult ones smooth. Flowers rising before the leaves, of a dirty-white colour. The bark of the root (leaves and twigs, Jacq.) is used with the same effects as the leaves and branches of Surinam poison. It is pounded and mixed with the water in some deep and convenient part of a river or creek, whence it may spread itself; in a few minutes the fish that lie hidden under the rocks or banks rise to the surface, where they float as if they were dead; most of the larger ones recover after a time, but the smaller fry are destroyed. Jacquin observes that this quality of intoxicating fish is found in many other South American plants. The tree is considered in Jamaica as a good timber tree; the wood is hard and resinous, and lasts almost equally in or out of water. It is of a light-brown colour, coarse, cross-grained, and heavy. It makes excellent piles for wharfs. The stakes soon form a good living fence. The bark of the trunk is very restraining; a decoction of it is said to stop the immoderate discharge of ulcers, especially when it is combined with the mangrove bark; it is said to cure the mange in dogs, and it would probably answer well for tanning leather.

*Red Piscidia* or *Jamaica Dog-wood*. Fl. May, June. Clt. 1690. Tree 30 feet.

2 P. CARTHAGENSIS (Jacq. amer. 210. Lin. spec. 993.) leaflets obovate; stipe of legume hardly longer than the calyx; wings continuous. ♀. S. Native of Jamaica, Guadaloupe, and Carthage, on the mountains. *Piscidia erythrina* of Ait. hort. kew, according to a specimen in the herbarium of L. Heritier, which has the underside of the leaves villous, and the young leaves very villous, and the lower leaflets ovate, but the terminal one is obovate.—Plum. ed. Burm. t. 133. f. 2. Lam. ill. t. 605. f. B and C. Flowers dirty-white, rising after the leaves. Lunan, hort. jam. 1. p. 270.

*Carthage Piscidia*. Fl. May, June. Clt. 1690. Tree 30 ft.

*Cult.* Sandy loam suits these trees best, and cuttings may be rooted in sand under a hand-glass in heat.

CXVIII. DAUBENTONIA (in honour of M. Daubenton, a celebrated naturalist). D. C. legum. mem. vi. prod. 2. p. 267.—*Piscidia* species, Willd.

LIN. SYST. *Diadelphia, Decandria*. Calyx campanulate, rather truncate, with 5 small teeth. Corolla papilionaceous. Keel very blunt. Vexillum roundish, stipitate. Stamens diadelphous, having the free filament, as well as the stamiferous sheath, as if they were jointed at the base. Style filiform, glabrous. Legume on a long pedicel, oblong, compressed, coriaceous, ornamented with 4 wings rising near the margins of the sutures, and furnished with spongy substance between the seeds. Seeds ovate.—Mexican shrubs, with oblong stipulas, abruptly-pinnate leaves, and simple racemes of flowers. This genus is nearly allied to *Piscidia*, but the stamens are diadelphous, and the leaves are abruptly, not impari-pinnate. Perhaps this genus is allied to *Coursètia*.

1 D. PUNICEA (D. C. prod. 2. p. 267.) leaves with 8-10 pairs of oblong obtuse leaflets; racemes almost 3-times shorter than the leaves. ♀. S. Native of New Spain. Flowers scarlet. *Piscidia punicea*, Cav. icon. 4. t. 316. *Æschynomene miniata*, Ort. dec. p. 28.

*Scarlet-flowered Daubentonia*. Fl. July, Aug. Clt. 1820. Shrub 2 to 3 feet.

2 D. LONGIFOLIA (D. C. prod. 2. p. 267.) leaves having 11-12 pairs of lanceolate acute leaflets; racemes a little shorter than the leaves. ♀. S. Native of New Spain. Flowers yellow. *Æschynomene longifolia*, Cav. icon. 4. t. 315. *Piscidia longifolia*, Willd. spec. 3. p. 920.

*Long-leaved Daubentonia*. Fl. June, Aug. Clt. 1820. Sh. 6 ft.

*Cult.* To be propagated and cultivated in the same manner as that recommended for *Piscidia*.

CXIX. CORYNELLA (a diminutive of *κορυνη*, *koryne*, a club; in reference to the club-shaped style). D. C. in ann. sc. nat. 4. jan. 1825. p. 93. prod. 2. p. 267.

LIN. SYST. *Diadelphia, Decandria*. Calyx bilabiate, 5-toothed; teeth spreading, linear, subulate, 2 superior ones hardly shorter than the rest. Corolla papilionaceous; all the petals on very short claws. Keel obtuse. Stamens diadelphous, about equal in length to each other. Style glabrous, club-formed. Legume lanceolate, compressed, 3-angled, many-seeded.—St. Domingo shrubs, with abruptly-pinnate leaves, having the petioles and stipulas ending in spiny mucrones, and the leaflets exstipellate. Young branches pubescent. Pedicels 1-flowered, in fascicles. Flowers purplish.

1 C. POLYANTHA (D. C. l. c.) leaves with 5-7 pairs of oblong leaflets, which are glabrous above, and clothed with hoary hairs beneath. ♀. S. Native of St. Domingo among bushes, on the mountains. *Robinia polyantha*, Swartz, fl. ind. occid. 2. p. 1260. *Coryntis polyantha*, Spreng. syst. append. 280.

*Many-flowered Corynella.* Shrub 5 to 6 feet.

2 *C. PAUCIFOLIA* (D. C. l. c.) leaves with 2-3 pairs of elliptic leaflets, which are glabrous above, but puberulous on the nerves beneath. *h. S.* Native of St. Domingo. *Robinia Domingensis*, Spreng. in herb. Balb. *Corynitis Domingensis*, Spreng. syst. append. 280. Perhaps sufficiently distinct from the preceding.

*Few-leaved Corynella.* Shrub 5 to 6 feet.

*Cult.* See *Sabinea* for the culture and propagation, p. 239.

CXX. CARAGANA (*Caragan* is the name of *R. arborescens* among the Monguls). Lam. dict. 1. p. 611. ill. t. 607. f. 1-2. D. C. prod. 2. p. 268.

LIN. SYST. *Diadélphia*, *Decándria*. Calyx short, tubular, 5-toothed. Corolla obtuse, straight; the wings and vexillum about equal in length. Stamens diadelphous. Style glabrous. Stigma terminal, truncate. Legume sessile, young ones compressed, at length somewhat cylindrical and many-seeded, mucronate by the style. Seeds somewhat globose.—Trees or shrubs, natives of Siberia and the East, with abruptly-pinnate leaves, mucronate leaflets, having the common petiole ending in a bristle or a spine, and axillary 1-flowered pedicels, which are usually in fascicles. Flowers usually yellow, perhaps in all except *C. jubata*, which are white and reddish. The stipulas usually spinose.

1 *C. ALTAGANA* (Poir. suppl. 2. p. 89.) leaves having 6 or 8 pairs of glabrous, obovate-roundish, retuse leaflets; petiole unarmed; stipulas spinescent; pedicels solitary; legumes rather compressed. *h. H.* Native of Dahuria, in sandy places. *Robinia Altagana*, Pall. fl. ross. t. 42. exclusive of the variety. Lher. stirp. t. 76. *Caragana microphylla*, Lam. dict. 1. p. 615. Flowers yellow. *Altagana* is the vernacular name of the shrub. Root with somewhat of the smell and taste of liquorice.

*Altagana Caragana.* Fl. April, July. Clt. 1789. Shrub 2 to 3 feet.

2 *C. MICROPHYLLA* (D. C. prod. 2. p. 268.) leaves with 6-7 pairs of hoary retuse leaflets; petioles and stipulas rather spinescent at the apex; root creeping. *h. H.* Native of Siberia, in the desert of Baraba, and in the tract of the river Selenga. *Robinia microphylla*, Pall. fl. ross. t. 42. f. 1-2. *Caragana Altagana* var. Poir. suppl. 2. p. 89. Flowers yellow.

*Small-leaved Caragana.* Fl. April, June. Clt. 1819. Shrub 2 to 3 feet.

3 *C. ARBORESCENS* (Lam. dict. 1. p. 615.) leaves with 4-6 pairs of oval-oblong villous leaflets; petiole unarmed; stipulas spinescent; pedicels in fascicles. *h. H.* Native of Siberia. *Robinia Caragana*, Lin. spec. 1044. Duham. arb. ed. nov. 2. t. 19. Pall. ross. 1. t. 42. middle figure. Flowers yellow. The wood of this tree is hard and compact, very tough, yellow on the outside, but waved and striped with bay and red within. The leaves are said to be good food for cattle, and it is suggested that they contain a blue colouring matter like indigo. The seeds are good for poultry. The bark is tough, and fit for tying; the twigs may also be used as withes.

*Arborescent Caragana.* Fl. April, May. Clt. 1752. Tree 15 to 20 feet.

4 *C. CHAMLAGU* (Lam. dict. 1. p. 616.) leaves with 2 pairs of distant, oval, or obovate, glabrous leaflets; stipulas spreading, and are as well as the petioles spinose; pedicels solitary; flowers pendulous. *h. H.* Native of China. *Robinia Chamlagu*, Lher. stirp. t. 77. Duham. arb. ed. nov. 2. t. 21. Flowers large, yellow, at length becoming reddish. Root smelling like liquorice. *Chamlagu* is the Chinese name of the shrub.

*Chamlagu* or Chinese Caragana. Fl. May, June. Clt. 1773. Shrub 2 to 4 feet.

5 *C. FRUTESCENS* (D. C. prod. 2. p. 268.) leaves having 2 pairs of leaflets, approximating the top of the petiole, they are obovate-cuneate; stipulas membranous; petiole furnished with a short spine at the apex; pedicels solitary, twice the length of the calyx. *h. H.* Native of Siberia, on the banks of the Volga, as well as of Tartary, and Tauria. Sweet, fl. gard. t. 227. *Robinia frutescens*, Lin. spec. 1044. Pall. fl. ross. t. 43. *C. digitata*, Lam. dict. 1. p. 616. Flowers yellow, resupinate. Leaves with a yellow hue.

*Var. a, latifolia* (D. C. prod. 2. p. 268.) leaflets glabrous, broadly obovate. Frequent in gardens. There is a variety of this with 2-flowered peduncles.

*Var. b, angustifolia* (D. C. prod. 2. p. 268.) leaflets oblong-cuneate, glabrous. Native about Odessa.

*Shrubby Caragana.* Fl. April, May. Clt. 1752. Sh. 2 to 3 ft.

6 *C. MOLLI* (Bess. enum. pl. volh. p. 29.) leaves with 2 pairs of oblong-cuneate leaflets, approximating the top of the petiole, clothed with soft villi; petiole ending in a short spine; pedicels solitary. *h. H.* Native of Tauria and Podolia. *Robinia mollis*, Bieb. fl. taur. suppl. 477. *Robinia tomentosa*, Fisch. hort. gor. 1812. Flowers yellow.

*Soft Caragana.* Fl. April, May. Clt. 1818. Sh. 2 to 3 ft.

7 *C. GRANDIFLORA* (D. C. prod. 2. p. 268.) leaves with 2 pairs of oblong-cuneate leaflets, approximating near to the top of the petiole, which is very short; stipulas and petioles spinose; pedicels solitary, almost the length of the calyx, which is gibbous at the base. *h. H.* Native of the south of Iberia, near Tiflis. *Robinia grandiflora*, Bieb. fl. taur. 1. p. 168. Young leaves pubescent, adult ones hoary, ex. Bieb., but according to a specimen sent by Steven to De Candolle, the adult leaves are pale and glabrous. Legume terete, acute, brown, glabrous. Flowers an inch long, yellow.

*Great-flowered Caragana.* Fl. June, July. Clt. 1823. Sh.

8 *C. PYGMÆA* (D. C. prod. 2. p. 268.) leaves with 2 pairs of linear, glabrous leaflets, approximating at the top of the petiole, which is very short; stipulas and petioles spinescent; pedicels solitary, nearly the length of the calyx; calyx nearly equal at the base. *h. H.* Native of Siberia, on the Altaian mountains, and of Dahuria. *Robinia pygmæa*, Lin. spec. 1044. Pall. ross. 1. t. 45. Amm. ruth. t. 35. Leaflets acute, crowded, usually in the axils of trifid spines. Flowers yellow.

*Var. b, arenaria* (Fisch. in litt.) leaflets linear-cuneate; pedicels rather longer than the calyx. *h. H.* Native of Siberia, on the banks of the river Tschuia.

*Pygmy Caragana.* Fl. April, May. Clt. 1751. Sh. 1 to 2 ft.

9 *C. ARENARIA* (Donn. hort. cant. Sims, bot. mag. 1886.) leaves with usually 4 pairs of obcordate leaflets; pedicels usually twin, shorter than the flowers; stipulas subulate. *h. H.* Native of Siberia. Flowers yellow.

*Sand Caragana.* Fl. April, May. Clt. 1802. Sh. 1 to 2 ft.

10 *C. REDÓWSKI* (D. C. legum. t. 11. f. 45.) leaves with 2 pairs of ovate, acute, smooth leaflets; stipulas spinose. *h. H.* Native of Siberia. Flowers yellow. This plant has not been seen by us unless in a seedling state.

*Redowski's Caragana.* Fl. April, May. Clt. 1827. Shrub.

11 *C. SPINOSA* (D. C. prod. 2. p. 269.) leaves with 2-4 pairs of cuneate-linear, glabrous leaflets; stipulas small, spinose; adult petioles permanent, strong, and spinose, twice the length of the leaflets; flowers solitary, almost sessile. *h. H.* Native of Siberia, near the Selenga and Kiacha in dry sandy places on mountains. Lindl. bot. reg. 1021. *Robinia spinosa*, Lin. mant. 269. *Robinia ferox*, Pall. ross. 1. t. 44. itin. t. E. e. f. 2. and 3. *Robinia spinosissima*, Laxm. nov. act. pet. 15. t. 30. f. 4. *C. ferox*, Lam. dict. 1. p. 315. Flowers yellow. Legume rather compressed. This shrub is well adapted to make impenetrable hedges, on account of its long branches and strong thorns. It is

said also to be a native of China, about Peking, where they stick the bushes in clay on the tops of their walls, to prevent persons from getting or looking over them.

*Spinose Caragana.* Fl. April, May. Clt. 1775. Sh. 4 to 6 ft.

12 *C. TRAGACANTHOIDES* (Poir. suppl. 2. p. 90.) leaves with 2-4 pairs of oblong-lanceolate, silky leaflets, each ending in a little spine; stipulas spiny; adult petioles permanent, strong, and spinose, twice the length of the leaflets; pedicels solitary, short, legume hoary-villous.  $\zeta$ . H. Native of Siberia, among granite rocks beyond the Baikal. *Robinia tragacanthoides*, Pall. nov. act. petr. 10. t. 7. astr. 115. t. 86. *Robinia macracantha*, Lodd. cat. Flowers yellow, drooping.

*Goats'-thorn-like Caragana.* Fl. April, May. Clt. 1816. Sh.

13 *C. JUBATA* (Poir. suppl. 2. p. 89.) leaves with 4 or 5 pairs of oblong-lanceolate, lanuginously-ciliated leaflets; stipulas setaceous; petioles somewhat spinose, adult ones deflexed, filiform, permanent; pedicels solitary, very short; legume glabrous.  $\zeta$ . H. Native of Siberia, at Lake Baikal. *Robinia jubata*, Pall. in act. petr. 10. t. 6. astr. p. 113. t. 85. Lodd. bot. cab. 522. Flowers white, few, suffused with red.

*Matted-leafletted Caragana.* Fl. April, May. Clt. 1796. Shrub 1 to 2 feet.

† *A species not sufficiently known.*

14 *C. FRUTICOSA* (Bess. cat. hort. crem. p. 116.) said to be allied to *C. arborescens*, but differs in the flowers being larger and solitary, and in the young legumes being red.  $\zeta$ . S. Native of the Russian empire. Perhaps *Robinia Mongolica* of Fisch. and *R. speciosa* of Swartz ex Besser.

*Shrubby Caragana.* Shrub 2 to 3 feet.

*Cult.* All the species of this genus are well adapted for shrubberies. They are usually propagated by layers and by seeds. The species are all deciduous.

CXXI. HALIMODENDRON ( $\alpha\lambda\iota\mu\omicron\varsigma$ , *halimos*, maritime, and  $\delta\epsilon\upsilon\delta\rho\omicron\nu$ , *dendron*, a tree; in reference to the shrub, which grows in dry naked salt fields by the river Irtysh, in Siberia). Fisch. in litt. D. C. legum. mem. vi. prod. 2. p. 269. Halodendron, D. C. mem. ined. in soc. phys. gen. march, 1824. but not of Petit Thouars.

LIN. SYST. *Diadelphia, Decandria.* Calyx urceolately-campanulate, with 5 short teeth. Keel obtuse, straightish. Wings very acute and auricled. Stamens diadelphous, about equal in length. Style filiform, glabrous. Stigma terminal. Legume stipitate, inflated, bladdery, hard, ovate, and few-seeded, depressed at the seminiferous suture. Seeds oval, somewhat compressed, small, and smooth.—Siberian shrubs, with the habit of *Caragana*. Leaves abruptly pinnate, with 2 pairs of leaflets. Petioles and stipulas spinose. Peduncles 2-3-flowered. Flowers purplish. The shrubs are deciduous.

1 H. ARGENTEUM (D. C. prod. 2. p. 269.) leaves hoary; peduncles 2-flowered.  $\zeta$ . H. Native of Siberia, in dry salt fields at the river Irtysh, and of Iberia. *Robinia halodendron*, Lin. fil. suppl. 330. Pall. fl. ross. t. 36. itin. 2. t. W. ed gall. append. no. 360. t. 83. f. 1. *Caragana argentea*, Lam. in Pall. ed gall. l. c. This is an elegant silky shrub, it thrives well in the gardens, but seldom or never flowers, probably from the want of the saline principle in which it naturally grows.

*Var. a, vulgare* (D. C. prod. 2. p. 269.) leaves between hoary and silvery; vexillum length of keel. Sims, bot. mag. 1016.

*Var. b, brachysëma* (D. C. l. c.) leaves hoary and silvery; vexillum one half shorter than the wings and keel; style short. Perhaps only a monster raised in gardens.

*Silvery Salt-tree.* Fl. May, Jul. Clt. 1779. Sh. 4 to 6 ft.

2 H. SUBVIRESCENS; leaves greenish; vexillum length of

carina; pedicels 3-flowered.  $\zeta$ . H. Native of Siberia, in salt fields. *Robinia triflora*, Lher. stirp. nov. 162. *H. argenteum b*, subvirescens, D. C. prod. 2. p. 169.

*Greenish Salt-tree.* Fl. May, Ju. Clt. 1779. Sh. 4 to 6 ft.

*Cult.* See last genus for culture and propagation. They are elegant deciduous shrubs, and deserve to be cultivated in gardens.

CXXII. DIPHYSA (from  $\delta\iota\varsigma$ , *dis*, twice, and  $\phi\upsilon\varsigma\alpha$ , *physa*, a bladder; in reference to the legume, which is furnished with a large membranous bladder on each side of the legume, rising from the sutures). Jacq. amer. 208. Schreb. gen. no. 1104. Lam. ill. t. 605. D. C. prod. 2. p. 269.

LIN. SYST. *Diadelphia, Decandria.* Calyx 5-cleft, 2 superior lobes roundish, 3 lower ones acute. Vexillum obovate-oblong, reflexed; wings flat. Keel sickle-shaped. Stamens diadelphous. Legume linear, compressed, furnished on both sides with a large membranous bladder, which rises from the sutures, and are therefore opposite each other, 1-celled, 5-6-seeded.—A small unarmed tree, with impari-pinnate leaves, composed of 5 pairs of leaflets and an odd one, axillary 2-3-flowered peduncles, and yellow flowers. The place which this genus should occupy in the order is very doubtful, in consequence of the structure of the legume being imperfectly known.

1 D. CARTHAGENENSIS (Jacq. amer. 208. t. 180. f. 51.)

$\zeta$ . S. Native of Carthage, in bushy places, where it is called *Vivacca*.

*Carthagea Diphysa.* Clt. 1827. Shrub 6 to 10 feet.

*Cult.* For the culture and propagation of this shrub see *Sabinea*, p. 239.

CXXIII. CALOPHACA (from  $\kappa\alpha\lambda\omicron\varsigma$ , *kalos*, beautiful, and  $\phi\alpha\kappa\eta$ , *phake*, a lentil; in allusion to the beauty of the plant). Fisch. med. D. C. prod. 2. p. 270.

LIN. SYST. *Diadelphia, Decandria.* Calyx 5-cleft, the lobes acuminate. Keel obtuse. Stamens diadelphous. Style villous and straight at the base, but glabrous incurved at the apex. Stigma terminal. Legume sessile, oblong, somewhat cylindrical, mucronate, 1-celled; valves concave, beset with soft hairs, as well as with stiff, glandular bristles, mixed.—A deciduous shrub, with lanceolate stipulas, impari-pinnate leaves, and axillary pedunculate racemes of yellow flowers. This genus differs from *Cytisus* in the stamens being diadelphous, and in the pinnate leaves.

1 C. WOLGARICA (Fisch. in litt.).  $\zeta$ . H. Native of Siberia, on dry hills, and in arid places about the Volga. *Cytisus nigricans*, Pall. itin. 3. p. 764. t. G. g. f. 3. ed gall. append. no. 358. t. 101. f. 1. *Cytisus pinnatus*, Pall. fl. ross. 1. t. 47. *Cytisus Wolgaricus*, Lin. fil. suppl. 327. Duham. arb. ed. nov. t. 48. *Colutea Wolgarica*, Lam. *Adenocarpus Wolgensis*, Spreng. syst. 3. p. 226. Leaflets 6 or 7 pairs, orbicular, velvety beneath as well as the calyxes.

*Volga Calophaca.* Fl. May, June. Clt. 1786. Sh. 2 to 3 ft.

*Cult.* This shrub is well adapted for the front of shrubberies, and is increased by layers or by seeds. Being rather tender it should be protected by a mat in winter.

CXXIV. COLUTEA (said to be from  $\kappa\omicron\lambda\omicron\upsilon\omega$ , *koloio*, to amputate; the shrubs are said to die if the branches are lopped off. *Kolourtea* is also the name of a plant in Theophrastus). R. Br. in hort. kew. ed. 2. vol. 4. p. 325. *Colutea* species of Lin. and others.

LIN. SYST. *Diadelphia, Decandria.* Calyx 5-toothed. Vexillum flat, bicallous, larger than the keel, which is obtuse. Stamens diadelphous. Stigma lateral, hooked under the top of the style. Style bearded longitudinally behind. Legume stipitate, ovate, boat-formed, inflated, scarious.—Deciduous

shrubs, with small stipulas, impari-pinnate leaves, and axillary few-flowered racemes, which are a little shorter than the leaves.

1 *C. ARBORÆSCENS* (Lin. spec. 1045.) leaflets elliptic, retuse; peduncles usually bearing about 6 flowers; gibbositities on the vexillum short; legume closed.  $\gamma$ . H. Native of middle and south Europe, in hedges and bushy places, on Mount Vesuvius, even in the ascent to the crater, where hardly any other vegetable is to be found. D. C. astr. no. 1. Duham. arbr. ed. nov. 1. t. 22. Curt. bot. mag. t. 81. *C. hirsuta*, Roth. fl. germ. 1. p. 305. Flowers yellow. The *C. arboræscens* of Burm. fl. cap. 22. is probably a species of *Tephrosia*. The leaves are recommended as answering all the purposes of senna, and Allioni gives particular directions for the preparation of them. A larger dose seems to be required to produce the same effect. The seeds to the quantity of a drachm or two excite vomiting.

*Arborescent Bladder-Senna.* Fl. June, Aug. Clt. 1568. Shrub 6 to 10 feet.

2 *C. CRUENTA* (Ait. hort. kew. 3. p. 55.) leaflets obovate, emarginate, glaucous; peduncles 4 or 5-flowered; vexillum with small, obtuse gibbositities; legume gaping at the apex.  $\gamma$ . H. Native of the islands in the Archipelago, Iberia, and the Levant. D. C. astr. no. 3. Lher. stirp. nov. 2. t. 41. *C. orientalis*, Lam. dict. 1. p. 353. ill. t. 624. f. 3. Duham. ed. nov. 1. t. 23. *C. sanguinea*, Pall. *C. aptera*, Schmidt, arb. t. 119. *C. humilis*, Scop. Flowers of a reddish-copper colour, but with the vexillum having a yellow spot at the base. This species differs from the foregoing in the smaller different coloured flowers, in the wings being shorter than the keel, and in the pod being open at the apex.

*Bloody-flowered or Oriental Bladder-Senna.* Fl. June, July. Clt. 1731. Shrub 4 to 8 feet.

3 *C. HALÉPPICA* (Lam. dict. 1. p. 353. ill. t. 624. f. 2.) leaflets roundish-elliptic, very obtuse, mucronate; peduncles 3-flowered; gibbositities of vexillum elongated and ascending; legumes closed.  $\gamma$ . H. Native of fields about Aleppo. D. C. astr. no. 2. *C. Pocockii*, Ait. hort. kew. 3. p. 55. Schmidt, arb. t. 129. *C. Istria*, Mill. dict. no. 2. t. 100. *C. procumbens*, Lher. stirp. nov. 2. t. 42. Flowers yellow. A smaller shrub than *C. arboræscens*.

*Aleppo Bladder-Senna.* Fl. Ma. Oct. Clt. 1752. Sh. 3 to 6 ft.

4 *C. MEDIA* (Willd. enum. 771.) leaflets obovate, glaucescent; peduncles usually 6-flowered; legumes closed at the apex.  $\gamma$ . H. Native of Europe. Wats. dend. brit. 110. Flowers orange-coloured.

*Intermediate Bladder-Senna.* Fl. June, Aug. Sh. 6 to 8 feet.

5 *C. NIPAULENSIS* (Hook. bot. mag. 2622.) leaflets roundish-elliptic, retuse; racemes drooping, few-flowered; callosities of vexillum papilliform; legumes rather coriaceous, pubescent.  $\gamma$ . H. Native of Nipaul. Flowers yellow.

*Nipaul Bladder-Senna.* Fl. Aug. Sept. Clt. 1822. Shrub 5 to 10 feet.

† *Species not sufficiently known.*

6 *C. ? ÆSCHINOMENOIDES* (Scop. insub. 3. p. 22. t. 12.) plant herbaceous; leaflets large, ovate, obtuse, glabrous, acuminate by the nerve.  $\gamma$ . ? G. Native of the Bahama Islands. Perhaps a species of *Pictetia*.

*Æschinomene-like Bladder-Senna.* Pl. 2 feet.

7 *C. AMERICANA* (Mill. dict. no. 5.) shrubby; leaves with 3 pairs of oval leaflets; peduncles 2-3-flowered; legumes compressed.  $\gamma$ . S. Native of Vera Cruz. Perhaps a species of *Cæsalpinia*. Flowers yellow.—Pluk. alm. 111. t. 165. f. 3.

*American Bladder-Senna.* Shrub 6 to 8 feet.

*Cult.* The species of *Bladder-Senna* are proper for shrubberies, as they flower in great profusion, and continue in flower

the most of the season. They thrive in any common soil, and are increased by seeds, which ripen in abundance, or by cuttings, planted in the autumn. The two last species require to be sheltered in a greenhouse.

CXXV. SPHÆROPHYSA (from *σφαῖρα*, *sphaira*, a sphere, and *φύσα*, *physa*, a bladder; in reference to the shape of the legumes, which are spherical and bladdery). D. C. legum. mem. vi. prod. 2. p. 270.—Phæa species of Pallas.

LIN. SYST. *Diadelphia*, *Decandria*. Calyx 5-toothed. Vexillum flat. Carina obtuse. Stamens diadelphous. Style bearded lengthwise. Legume stipitate, inflated, spherical, hardish, 1-celled, mucronated by the style.—Oriental perennial herbs, with impari-pinnate leaves, small stipulas, and axillary, elongated racemes of red flowers.

1 *S. SALSULA* (D. C. prod. 2. p. 271.) stem erect, rather hoary; leaves with 6 or 7 pairs of oblong, ovate leaflets, which are glabrous above, but rather hoary beneath from adpressed bristly hairs.  $\gamma$ . H. Native of Daburia, in salt fields, about Lake Tarei. Phæa *salsula*, Pall. itin. 1. t. 9. f. 1 and 2. ed. gall. append. no. 387. t. 88. f. 1 and 2. Lin. fil. suppl. 336. *Colutea Daburica*, Spreng. syst. 3. p. 242. Flowers very red, almost like those of a species of *Lathyrus*.

*Salt Sphærophysa.* Pl.  $\frac{1}{2}$  to 1 foot.

2 *S. CASPICA* (D. C. prod. 2. p. 271.) stems erect, and are as well as the leaves clothed with adpressed pubescence; leaves with 8 pairs of oval, obtuse, mucronate leaflets.  $\gamma$ . H. Native of the plains between Caucasus and the Caspian Sea. *Colutea Caspica*, Bieb. fl. taur. suppl. 1429. Phæa *salsula*, Bieb. casp. 210. Flowers of a dirty pale-purple colour, and marked with more obscure veins. Perhaps only a variety of the first, according to Steven in litt.

*Caspian Sphærophysa.* Fl. Jul. Aug. Clt. 1818. Pl.  $1\frac{1}{2}$  ft.

*Cult.* The species of this genus succeed in common garden soil, or in pots in a mixture of loam and peat; they are very difficult to preserve in gardens on account of the want of that saline principle in which they grow in the places of their natural growth; and in order to preserve them in the gardens, they require to be watered with salted water occasionally. They are increased by seeds, which occasionally ripen in this country.

CXXVI. SWAINSONIA (in honour of Isaac Swainson, F.R.S. F.L.S. who was a great cultivator of plants about the end of the last century. His garden was at Twickenham in Middlesex. The present superintendent of the Cambridge Botanical Garden, Mr. Biggs, was gardener to Mr. Swainson for many years). Salisb. par. no. 28. R. Br. in hort. kew. ed. 2. vol. 4. p. 326. D. C. prod. 2. p. 271. *Loxidium*, Vent.

LIN. SYST. *Diadelphia*, *Decandria*. Calyx bicallous at the base, 5-toothed. Vexillum flat, large. Stamens diadelphous. Carina obtuse, rather longer than the wings. Stigma terminal. Style bearded longitudinally behind but beardless in front. Legume turgid.—Suffrutescent plants, natives of New Holland, having the habit of *Lessertia*, with impari-pinnate leaves, and elongated, axillary racemes of purple or scarlet flowers.

1 *S. GALEGIFOLIA* (R. Br. in hort. kew. ed. 2. vol. 4. p. 326.) suffrutescent, erect; leaves with 9 pairs of oval, somewhat emarginate leaflets; pedicel of legume evidently longer than the permanent filaments.  $\gamma$ . G. Native of New South Wales. *Vicia galegifolia*, Andr. bot. rep. t. 319. *Colutea galegifolia*, Sims, bot. mag. t. 792. Flowers red.

*Galea-leaved Swainsonia.* Fl. June, Aug. Clt. 1800. Sh. 1 to 3 feet.

2 *S. ALBIFLORA*; stem shrubby, erect; leaves with 5-11 pairs of oval obtuse leaflets; racemes longer than the leaves.  $\gamma$ . G.

Native of New Holland. *S. galegifolia*, var. *albiflora*, Lindl. bot. reg. 994. Flowers white.

*White-flowered Swainsonia*. Fl. July, Aug. Clt. 1826. Sh. 1 to 3 feet.

3 *S. coronillæfolia* (Salish. par. no. 28.) suffruticose, erect; leaves with 9-11 pairs of obovate, emarginate leaflets; pedicel of legume a little shorter than the permanent filaments.  $\frac{1}{2}$ . G. Native of New South Wales. Sims, bot. mag. 1725. Leaves smaller than those of the other species. Flowers of a violaceous purple colour.

*Coronilla-leaved Swainsonia*. Fl. June, Aug. Clt. 1802. Shrub 1 to 3 feet.

4 *S. lessertiiæfolia* (D. C. in ann. sc. nat. 4. p. 99.) stems rather herbaceous, erect; leaves with 6-7 pairs of elliptic-oblong, rather obtuse leaflets; pedicel of legume very short.  $\frac{1}{2}$ . G. Native of New Holland, on the southern coast. *S. astragalifolia*, Hortul. Peduncles 2 or 3 times longer than the leaves. Stipules ovate, obtuse. Younger leaves clothed with hoary pubescence, adult ones almost glabrous. Flowers red, smaller than those of the other species.

*Lessertia-leaved Swainsonia*. Fl. July, Aug. Clt. 1824. Sh. 1 to 2 feet.

*Cult.* All the species are elegant, delicate shrubs, which deserve to be cultivated in every greenhouse. They grow freely in a mixture of loam, peat, and sand, and young cuttings root readily if planted in a pot of sand, with a bell-glass placed over them, or they may be raised from seeds, which are often produced in gardens.

CXXVII. LESSE'RTIA (in honour of Benjamin Delessert, of Paris, a great promoter of botany, author of *Icones*, in 2 vols. folio, Paris, 1823). D. C. astrag. p. 37. prod. 2. p. 271. R. Br. in hort. kew. ed. 2. vol. 4. p. 327.—Sulitra, Medic and Mœnch.

LIN. SYST. *Diadelphia*, *Decandria*. Calyx half 5-cleft. Vexillum flat. Keel obtuse. Stamens diadelphous. Stigma capitate. Style bearded transversely in front at the apex, but beardless behind. Legume scarious, indehiscent, compressed, or inflated, the uppermost side the shortest.—Herbs, rarely subshrubs, natives of the Cape of Good Hope, with impari-pinnate leaves, and axillary peduncles bearing racemes of purplish nodding flowers.

1 *L. annua* (D. C. l. c. prod. 2. p. 271.) leaves with 8-10 pairs of leaflets, which are glabrous above, the lower ones oblong and emarginate and the upper ones linear; racemes longer than the leaves; calyxes bibracteate, beset with black hairs.  $\odot$ . G. Hook. exot. fl. t. 84. *Colutea herbacea*, Lin. spec. 1045. *Colutea annua*, Murr. comm. goet. 5. p. 40. t. 7. f. 12 and 13.—Comm. hort. amst. 2. t. 44. Flowers red.

*Annual Lessertia*. Fl. June, July. Clt. 1731. Pl. 1 foot.

2 *L. diffusa* (R. Br. in hort. kew. ed. 2. vol. 4. p. 327.) stems diffuse, herbaceous; leaves with 8-10 pairs of elliptic-linear, rather emarginate leaflets, which are rather hairy on both surfaces; racemes pedunculate, longer than the leaves; calyxes bractless, beset with black hairs.  $\odot$ . G. *Galèga dubia*, Jacq. icon. rar. 3. p. 576. Flowers purple.

*Diffuse Lessertia*. Fl. July, Aug. Clt. 1792. Pl. prostrate.

3 *L. perennans* (D. C. astrag. p. 37.) stem herbaceous, erect; leaflets oval, silky beneath, pubescent above; calyxes bractless; racemes longer than the leaves, loose, elongated, pedunculate; flowers numerous, drooping.  $\frac{1}{2}$ . G. *Colutea perennans*, Jacq. hort. vind. 3. t. 3. Murr. comm. goet. nov. 5. p. 38. t. 7. *Colutea fistulosa*, Hortul. Legume stipitate, compressed. Corolla with a pale base and red or purple apex.

*Perennial Lessertia*. Fl. Aug. Clt. 1776. Pl. 1 foot.

4 *L. pulchra* (Sims, bot. mag. 2064.) stem erect, suffrutescent; leaves with 7 pairs of ovate, acute, smoothish leaflets; racemes pedunculate, somewhat capitate, longer than the leaves; flowers secund.  $\frac{1}{2}$ . G. Flowers red or purplish. Legume unknown.

*Fair Lessertia*. Fl. May, July. Clt. 1817. Shrub  $1\frac{1}{2}$  foot.

5 *L. macrostachya* (D. C. in ann. sc. nat. 4. p. 100.) stem erectish, suffruticose at the base; leaves with 4-6 pairs of elliptic-oblong, obtuse leaflets, which are rather pubescent on both surfaces, the terminal leaflet is longest; racemes pedunculate, loose-flowered, 2 or 3 times longer than the leaves.  $\frac{1}{2}$ . G. Burch. cat. geogr. afr. aust. 2356. Flowers red or purple. Young legumes compressed, pendulous, few-seeded.

*Long-spiked Lessertia*. Shrub 1 to 2 feet.

6 *L. brachystachya* (D. C. legum. mem. vi. prod. 2. p. 272.) stem erect, suffruticose at the base; leaves with 6-8 pairs of linear-oblong, obtuse leaflets, which are rather pubescent beneath, the terminal leaflet longer than the others; racemes much shorter than the leaves; legumes oblong, straight, pendulous, 10-seeded.  $\frac{1}{2}$ . G. Burch. cat. geogr. afr. austr. no. 3353. Flowers red or purplish. Legumes secund, membranous, pubescent, about an inch long, each standing on a short stipe.

*Short-spiked Lessertia*. Fl. June, Aug. Clt. 1826. Sh. 1 ft.

7 *L. falciformis* (D. C. legum. mem. vi. t. 46.) stem erect; leaves with 8 pairs of elliptic-oblong, obtuse leaflets, which are pubescent beneath; racemes 3-4-flowered, one half shorter than the leaves; legume oblong, falcately curved, 10-seeded.  $\frac{1}{2}$ . ? G. Flowers purple or red. Legumes like those of the preceding species, but falcate, therefore the species is intermediate between *L. brachystachya* and *L. annularis*.

*Falciform-podded Lessertia*. Fl. June, Aug. Clt. 1826. Shrub 1 foot.

8 *L. fruticosa* (Lindl. bot. reg. 970.) stem erect, suffruticose; leaves with 5-6 pairs of linear obtuse leaflets; stem, petioles, and peduncles, as well as the branches, pilose; racemes erect, loose-flowered, a little longer than the leaves; legumes oblong, sessile, 4-seeded.  $\frac{1}{2}$ . G. Flowers purple.

*Shrubby Lessertia*. Fl. Jul. Aug. Clt. 1826. Sh. 1 to 3 ft.

† *Species not sufficiently known.*

9 *L. annularis* (Burch. cat. no. 1597. voy. 1. p. 304.) stem erect, a span high; legume flat, contracted into the form of a ring.  $\odot$ . ? G. Flowers red or purple.

*Ring-podded Lessertia*. Fl. June, Aug. Clt. 1816. Pl.  $\frac{1}{2}$  ft.

10 *L. rigida* (D. C. prod. 2. p. 272.) stem shrubby, erect; leaves with 5-6 pairs of lanceolate, acute, glabrous leaflets; racemes very long.  $\frac{1}{2}$ . G. *Colutea rigida*, Thunb. fl. cap. edit. Schult. p. 603. Legume ovate, compressed, tumid, glabrous. Flowers yellowish. Compare it with *L. macrostachya*.

*Stiff Lessertia*. Shrub  $1\frac{1}{2}$  foot.

11 *L. pubescens* (D. C. prod. 2. p. 272.) stem herbaceous, erect, pubescent; leaves with many pairs of lanceolate, villous leaflets; racemes oblong; calyxes hairy.  $\odot$ . ? G. *Colutea pubescens*, Thunb. l. c. Legume oblong, glabrous, hardly an inch long. Corolla rufescent.

*Pubescent Lessertia*. Pl. 1 foot.

12 *L. prostrata* (D. C. prod. 2. p. 272.) stem herbaceous, diffuse, pubescent; leaves with many pairs of lanceolate, acute, villous leaflets; peduncles usually 2-flowered.  $\odot$ . ? G. *Colutea prostrata*, Thunb. l. c. Legume ovate, pubescent, hardly stipitate.

*Prostrate Lessertia*. Pl. prostrate.

13 *L. excisa* (D. C. prod. 1. c.) stem herbaceous, decumbent, pubescent; leaves with many pairs of obovate, cut leaflets; racemes usually terminal.  $\odot$ . ? G. *Colutea excisa*,

Thunb. l. c. Corolla blood-coloured. Legume ovate-acinaciform, slightly pubescent.

*Cut-leaffletted Lessertia.* Pl. decumbent.

14 *L. obtusata* (D. C. l. c.) stem frutescent, erect; leaves with many pairs of linear, obtuse, hairy leaflets; racemes nearly terminal.  $\frac{1}{2}$  G. Calyxes clothed with cinereous pubescence. Legume glabrous. *Colutea obtusata*, Thunb. l. c.

*Obtuse-leaffletted Lessertia.* Shrub 1 to 2 feet.

15 *L. linearis* (D. C. l. c.) stem herbaceous, erect, glabrous; leaves with many pairs of linear, acute leaflets; racemes elongated.  $\odot$ ? G. *Colutea linearis*, Thunb. l. c. Legume ovate, glabrous, not half an inch long.

*Linear-leaffletted Lessertia.* Pl. 1 ft.

16 *L. vesicaria* (D. C. l. c.) stem herbaceous, decumbent, villous; leaves with many pairs of ovate, mucronate leaflets; legumes globose, bladdery, dehiscent at the apex.  $\odot$ ? G. *Colutea versicaria*, Thunb. l. c.

*Bladdery-podded Lessertia.* Pl. decumbent.

17 *L. tomentosa* (D. C. l. c.) stem herbaceous, very short, and tomentose; leaves with 6-7 pairs of ovate, hoary leaflets; racemes ovate; calyxes hairy.  $\odot$ ? G. *Colutea tomentosa*, Thunb. l. c. Legume ovate, inflated, hairy.

*Tomentose Lessertia.* Pl.  $\frac{1}{2}$  foot.

18 *L. procumbens* (D. C. l. c.) stem suffrutescent, procumbent; leaves with 12-14 pairs of ovate-linear, tomentose leaflets; peduncles very long, 3-4-flowered.  $\frac{1}{2}$  G. Flowers purple. Legume compressed, falcate. *Colutea procumbens*, Thunb. l. c.

*Procumbent Lessertia.* Fl. June, July. Clt. 1753. Pl. proc.

*Cult.* This is a genus of delicate little shrubs and herbs. Their culture and propagation is the same as for *Swainsonia*. The seeds of the annual kinds should be sown in pots early in the spring, and placed in the greenhouse, where the plants will soon rise, and when they have grown 2 inches high, they should be planted separately in small pots, and shifted into larger ones as they grow.

CXXVIII. SUTHERLANDIA (in honour of James Sutherland, one of the first superintendants of the Royal Botanical Garden at Edinburgh, and author of a catalogue of the plants grown in that garden in his time). R. Br. hort. kew. ed. 2. vol. 4. p. 327. D. C. prod. 2. p. 273.

LIN. SYST. *Diadelphina*, *Décandria*. Calyx 5-toothed, nearly equal. Vexillum with replicate sides, short. Keel oblong. Wings very short. Stamens diadelphous. Stigma terminal. Style bearded lengthwise behind and transversely at the apex. Legume inflated, scarious.—Cape shrubs, with impari-pinnate leaves and axillary racemes of large scarlet flowers.

1 *S. frutescens* (R. Br. l. c.) leaflets elliptic-oblong, and are as well as the calyxes and branches canescent from adpressed pubescence; peduncles few-flowered.  $\frac{1}{2}$  F. *Colutea frutescens*, Lin. spec. 1045. Curt. bot. mag. 181. Burm. cap. prod. 22. Mill. fig. t. 99. A hoary shrub, with large elegant shewy scarlet flowers.

*Frutescent Sutherlandia.* Fl. June, Aug. Clt. 1683. Sh. 2 to 4 feet.

2 *S. microphylla* (Burch. cat. pl. afr. austr. no. 1510. ined. D. C. prod. 2. p. 273.) leaflets oblong-linear, and are, as well as the branches and calyxes, pubescent; peduncles 2-3-flowered.  $\frac{1}{2}$  G. Flowers purple or scarlet.

*Small-leaved Sutherlandia.* Shrub 2 to 3 feet.

*Cult.* The species of *Sutherlandia* are very shewy when in flower, being profusely clothed with large scarlet pea blossoms. A mixture of loam and peat is the best soil for them, and they may be propagated by young cuttings in sand under a bell-glass, but the easiest and best method is by seeds, which ripen plentifully in the gardens. The *S. frutescens* will stand the

winter if planted in a sheltered situation, protected by a mat in severe weather.

SUBTRIBE V. *ASTRAGALEÆ* (plants agreeing with *Astragalus*, in the legumes being transversely 2-celled, in consequence of the upper suture being bent in so much). Adans. fam. l. c. D. C. prod. 2. p. 273. Legume (f. 39. c. f. 40. c.) longitudinally 2-celled or half 2-celled, in consequence of the upper suture being bent in so much. Stamens diadelphous, with 9 joined and one free. Stems herbaceous or suffrutescent. Leaves pinnate; primordial ones alternate.

CXXIX. PHACA (from *φαγω*, *phago*, to eat, or *φακη*, *phace*, a lentil; a name adopted from Dioscorides for this genus). Lin. gen. no. 891. D. C. astrag. no. 111. R. Br. in hort. kew. ed. 2. vol. 4. p. 358. D. C. prod. 2. p. 273.

LIN. SYST. *Diadelphina*, *Décandria*. Calyx 5-toothed (f. 39. a.), 2 superior teeth more remote than the others. Carina obtuse (f. 39. b.). Stamens diadelphous. Style beardless. Stigma capitate. Legume rather turgid (f. 39. c.), 1-celled, having the superior suture tumid.—Herbs, with impari-pinnate leaves, axillary pedunculate racemes of flowers. The mature legume usually resupinate.

\* *Flowers white or cream-coloured.*

1 *P. bœtica* (Lin. spec. 1064.) stem erect, pilose; stipulas lanceolate; leaves with 7-10 pairs of ovate mucronate leaflets, which are villous beneath; keel longer than the vexillum; legume oblong, boat-formed, compressed.  $\frac{1}{2}$  H. Native of Spain, Portugal, and Mauritania. D. C. astr. no. 1. *Astragalus Lusitanicus*, Lam. dict. 1. p. 312.—Moris. oxon. sect. 2. t. 8. f. 1. Flowers white, about the size and shape of those of *Sutherlandia*. The seeds are roasted and ground, and used as a substitute for coffee in Hungary.

*Bœtic Bastard-Vetch.* Fl. Sept. Clt. 1640. Pl. 1 to 2 feet.

2 *P. frigida* (Lin. fl. succ. 2. p. 657.) stem erect, glabrous, almost undivided; stipulas ovate-oblong, large, leafy; leaves with 4-6 pairs of ovate-oblong, rather ciliated leaflets; legumes stipitate, oblong, inflated, rather hairy.  $\frac{1}{2}$  H. Native of Siberia, Altai, Lapland, Norway, Sweden, Austria, Switzerland, and Savoy, on the frigid parts of mountains. *P. alpina*, Lin. spec. 1064. Oed. fl. dan. t. 856. Jacq. austr. 166. *P. ochreata*, Crantz. austr. 419. t. 2. f. 2. Flowers cream-coloured.

*Frigid Bastard-Vetch.* Fl. July. Clt. 1795. Pl. 1 foot.

3 *P. alpina* (Jacq. icon. rar. 1. t. 151.) stem erect, branched, pubescent; stipulas linear-lanceolate; leaves with 9-12 pairs of oblong, obtuse, pubescent leaflets; legumes compressed, half ovate, acute, smoothish.  $\frac{1}{2}$  H. Native of the Alps of Europe, the Pyrenees, and of Siberia. D. C. astr. no. 3.—Gmel. sib. 4. t. 14. *Astragalus penduliflorus*, Lam. fl. fr. Flowers yellow.

*Var.  $\beta$ , Dahurica* (Fisch. in litt. 1825.) plant more firm and more erect, and the legume is harder.  $\frac{1}{2}$  H. Native of Dahuria. *P. membranacea*, Fisch. in litt. 1822.

*Alpine Bastard-Vetch.* Fl. July. Clt. 1759. Pl. 1 foot.

4 *P. triflora* (D. C. astr. no. 7. t. 1.) stem almost erect, pubescent; stipulas acuminate, rather concrete at the base; leaves with 5-6 pairs of ovate, obtuse, pubescent leaflets; peduncles rather shorter than the leaves, few-flowered; legumes

FIG. 39.

semi-elliptic-oblong, turgid, depressed, pubescent. ☉. II. Native of Peru. Flowers 3-6 in a raceme, yellowish. P. Candolleana, H. B. et Kunth, nov. gen. amer. 6. p. 495. t. 586.

*Three-flowered* Bastard-Vetch. Pl.  $\frac{1}{2}$  to 1 foot.

5 P. VILLOSA (Nutt. gen. amer. 2. p. 97.) plant almost stemless, hairy; leaflets oblong-oval, glabrous above; peduncles shorter than the leaves, or equal in length to them; spike few-flowered, somewhat capitate; legume clothed with canescent villi, terete, and cymbiform. ☿. H. Native of Carolina and Georgia, in sandy pine-woods, and on hills about the Missouri, as well as of China. Astragalus villosus, Michx. fl. bor. amer. 2. p. 67. Flowers cream-coloured.

*Villos* Bastard-Vetch. Pl.  $\frac{1}{2}$  foot.

6 P. CÆSPITOSA (Nutt. gen. amer. 2. p. 98.) stemless, tufted, and clothed with canescent villi; leaves with 3-5 leaflets, which are disposed in a digitate manner, and are acute at both ends; flowers aggregate, without a scape; stipulas membranous, without any regular or decided form; legume pubescent, sub-cylindrical. ☿. II. Native of North America, on hills at the confluence of the rivers Sawnee and Missouri. Astragalus triphyllus, Pursh. fl. amer. sept. 2. p. 740. but not of Pall. Flowers cream-coloured. Leaflets lanceolate.

*Tufted* Bastard-Vetch. Pl.  $\frac{1}{2}$  to  $\frac{3}{4}$  foot.

7 P. ARENARIA (Pall. it. 4. t. 19. f. 3-4. ed. gall. append. no. 388. t. 91. f. 3-4.) stems spreading, ascending, glabrous; stipulas membranous, concrete; leaves with 5-6 pairs of linear-lanceolate acute leaflets, having the terminal one sessile; peduncles about the length of the leaves; legumes inflated, glabrous. Native of Siberia, about the Uda Selenga and the Baikal. Flowers cream-coloured. Pallas's plate exhibits 2 plants under this name, the one with ovate, and the other with globose legumes; the first belongs to *Phaca*, but the second is referrible to *Sphærosphyra*.

*Sand* Bastard-Vetch. Fl. July, Aug. Clt. 1796. Pl. ascending.

\* \* Flowers purplish, sometimes painted with white and violet.

8 P. MOLLIS (H. B. et Kunth, nov. gen. amer. 6. p. 496. t. 585.) stems short, diffuse, clothed with soft tomentum; leaves with 7-8 pairs of oblong, obtuse, silky, tomentose leaflets; racemes on long peduncles, of a cylindrical-oblong form, dense, and many-flowered; calyxes soft and silky. ☿. G. Native of Mexico, in valleys near Casave. Flowers purplish. The legume being unknown the genus is doubtful.

*Soft* Bastard-Vetch. Pl. diffusely procumbent.

9 P. DENSIFOLIA (Smith in Rees' cyclop. 27. no. 9.) stems decumbent, branched, and smooth; stipulas ovate, concave; leaves with 16-20 pairs of obovate emarginate leaflets, which are villous beneath; peduncles length of leaves; racemes dense, oblong; legumes ovate, turgid, almost smooth. ☿. II. Native of California. Flowers drooping, reddish.

*Dense-leaved* Bastard-Vetch. Pl. decumbent.

10 P. GLABRA (Clap. bull. philom. no. 61. D. C. astr. no. 4.) stem branched, prostrate, glabrous; stipulas broad, ovate; leaves with 6-7 pairs of oval-oblong, acute, glabrous leaflets; peduncles longer than the leaves; wings of flowers entire; legume stipitate, turgid, glabrous. ☿. II. Native of Provence, on the Lower Alps. Corolla white, tipped, and margined with violet.

*Glabrous* Bastard-Vetch. Fl. July. Clt. 1818. Pl. prostrate.

11 P. GERARDI (Vill. dauph. 3. p. 474.) stem diffuse, branched, prostrate; leaves and stipulas clothed with velvety pubescence, and ciliated; peduncles rather longer than the leaves; wings of flower oblong, and rounded at the apex; legumes ovate, rather velvety. ☿. H. Native of Dauphiny. Flowers white, having the carina tipped with purple.

*Gerardi's* Bastard-Vetch. Fl. July. Pl. prostrate.

12 P. AUSTRALIS (Lin. mant. 103. and 448.) stem branched, tufted, ascending, glabrous; stipulas ovate; leaves with 6-8 pairs of linear-lanceolate, glabrous leaflets, having the terminal one sessile; peduncles longer than the leaves; wings bifid at the apex, longer than the keel; legumes stipitate, ovoid, at length glabrous. ☿. H. Native of the alps of Europe and the Pyrenees. Jacq. misc. 2. t. 3. D. C. astr. no. 8. Lodd. bot. cab. 490. P. Halleri, Vill. dauph. 4. p. 473. Colutea australis, Lam. dict. 1. p. 354. Corolla pale, having the keel tipped with purple.

*Var. β, Altaica* (Fisch. in litt.) stem almost erect. ☿. H. Native of the Altaian mountains. Perhaps a proper species.

*Southern* Bastard-Vetch. Fl. May, July. Clt. 1779. Pl. asc.

13 P. ASTRAGALINA (D. C. astr. no. 9.) stems short, procumbent, smoothish; stipulas ovate, acute; leaves with 9-10 pairs of ovate leaflets, which are beset with adpressed pubescence on both surfaces; peduncles about the length of the leaves; wings entire, shorter than the keel; legumes stipitate, pendulous, when young beset with black hairs. ☿. H. Native of the alps of Switzerland, Savoy, Austria, Pyrenees, and on the Altaian mountains in Siberia. In July, 1831, this plant was found in plenty by Dr. Graham and others in Scotland on the Clova mountains, north of Forfar in Angushire. Astragalus alpinus, var. Lin. spec. 1070. Oed. fl. dan. 1. t. 51.—Lodd. bot. cab. 429. Flowers white, tipped with lilac. Root creeping.

*Astragalus-like* Bastard-Vetch. Fl. May, July. Scotland. Pl. procumbent.

14 P. LAPTONICA (D. C. prod. 2. p. 374.) stems elongated, ascending, glabrous; stipulas ovate, acute; leaves with 9 pairs of oval leaflets, which are glabrous above, and clothed with adpressed pubescence beneath; peduncles longer than the leaves; wings entire, longer than the keel; legumes stipitate, pendulous, half-bilocular, when young beset with black hairs. ☿. II. Native of the alps of Lapland and Sweden, and of Dahuria near Ochotsk. Astragalus alpinus, var. Lin. l. c. P. Lappónica, Wahlb. Flowers purplish. This I fear is not distinct from the last.

*Lapland* Bastard-Vetch. Fl. June, Jul. Clt. 1816. Pl. 1 ft.

15 P. OROBOIDES (D. C. prod. 2. p. 274.) stem elongated, ascending, glabrous; stipulas ovate, acute; leaves with 5-7 pairs of oval-oblong leaflets, which are glabrous above and hardly pubescent beneath; peduncles longer than the leaves; racemes elongated; wings entire, longer than the keel; legumes sessile, semi-bilocular, pendulous, when young beset with black hairs. ☿. II. Native of the alps of Norway and Lapland. Astragalus oroboides, Horn. in fl. dan. 8. t. 1396. Astrag. leontinus, Wahl. fl. lap. p. 191. t. 12. f. 4. but not of Jacq. Flowers purplish.

*Oroboides-like* Bastard-Vetch. Fl. Ju. Jul. Clt. 1820. Pl. asc.

16 P. BRACHYTROPIS (Stev. mem. soc. hist. nat. mosc. 4. p. 53.) stems ascending, smoothish; stipulas broad, short, and bluntish; leaves with 6 pairs of oblong-elliptic leaflets, which are smoothish above and rather pubescent beneath; peduncles longer than the leaves; racemes short; wings entire, longer than the keel; legumes on short pedicels, when young hairy. ☿. H. Native of Eastern Caucasus, Bieb. suppl. 485. Flowers purplish.

*Short-keeled* Bastard-Vetch. Pl. ascending.

† A species not sufficiently known.

17 P. TRIFOLIATA (Lin. mant. 270.) stem branched, filiform; stipulas lanceolate; leaves trifoliate; leaflets oval, obtuse; legumes semi-orbicular. ☉. II. Native of China. Smith, in Rees' cycl. Perhaps a species of *Glycine* or *Flemingia*, according to Smith. Perhaps a species of *Crotalaria*, according to the specimen in Delessert's herbarium at Paris.

*Trifoliolate-leaved Bastard Vetch.* Pl. procumbent.

*Cult.* Most of the species grow well in the open borders in common garden soil; the dwarfer kinds are well adapted for ornamenting rock-work, but the rarer and more tender species should be grown in pots in a mixture of sand, peat, and loam. They are all increased by dividing the plants at the root, or by seeds, which generally ripen in this country, which last is by far the best method. The seeds of the annual kinds only require to be sown in the open border in spring.

CXXX. OXYTROPIS (from *ὄξυς*, *oxys*, sharp, and *τροπή*, *tropis*, a keel; in reference to the keel of the flower ending in an exserted mucrone on the back at the apex). D. C. astr. no. 4. ed. maj. p. 19. and 53. prod. 2. p. 275.—*Astragalus* species of Lin. and others.

LIN. SYST. *Diadelphia*, *Dicandria*. Calyx 5-toothed (f. 40. a.). Keel of corolla ending in an exserted mucrone on the back at the apex (f. 40. b.). Stamens diadelphous. Legume (f. 40. c.), bilocular, or half bilocular in consequence of the upper suture being bent in so much.—Herbs with impari-pinnate leaves, axillary or radical peduncles, bearing spikes of flowers. There are a number of species with inflated legumes, which would constitute a good section of the genus, but from the fruit of most of the species being but slightly known or altogether unknown, it is at present impossible to separate them, and consequently they are here arranged according to habit.

§ 1. *Acaulis* (from *acaulis*, stemless; in reference to the species contained in this division being without stems). D. C. prod. 2. p. 275. Plants without stems or with very short ones. *Stipulas adnate to the petiole. Leaves with many opposite pairs of leaflets, not verticillate.*

\* *Flowers purplish or white.*

1 O. MONTANA (D. C. astr. no. 1.) plant almost stemless, villous, the hairs on the petioles and scape spreading; leaflets elliptic-lanceolate; scapes a little longer than the leaves; racemes short; bracteas one half shorter than the calyxes; legumes erect, terete-oblong, villous, acuminate by the style, half bilocular. 2. H. Native of Europe, on the mountains. *Astragalus montanus*, Lin. spec. 1070. Jacq. austr. t. 167. Curt. bot. mag. 483. Scop. carn. t. 45. *Phaca montana*, Crantz. austr. 422. Flowers of a bluish-purple colour, almost like those of *Phaca astragalina*. Calyx purplish.

*Mountain Oxytropis.* Fl. July, Aug. Clt. 1581. Pl.  $\frac{1}{2}$  ft.

2 O. MOREALIS (D. C. prod. 2. p. 275.) plant almost stemless, the hairs on the scapes and stipulas spreading and stiff, on the petioles there are but few; leaflets elliptic-lanceolate, glabrous beneath and pilose above; scapes length of leaves; flowers capitate; bracteas length of calyx, which is beset with black stiff hairs. 2. H. Native of Tschuktschor Land, in the Bay of St. Lawrence, and Kotzebue's Sound. Stipulas pale.

*Northern Mountain Milk-vetch.* Pl.  $\frac{1}{2}$  foot.

3 O. CYANÆA (Bieb. fl. taur. suppl. 502.) plant almost stemless, hoary, and pilose; the hairs on the petioles and scapes are adpressed; leaflets elliptic-lanceolate; scapes longer than the leaves; racemes short; bracteas one-half shorter than the calyxes; legumes oblong, ovate, villous, at length spreading. 2. H. Native of Iberia. *Astragalus montanus*, Bieb. fl. taur. 2. p. 197. exclusive of the synonyms. O. montana, Stev. mem. soc. mosc. 4. p. 54. Flowers spreading, blue, larger than those of O. montana, and the keel ending in a longer mucrone.

*Var. β, Albana* (Stev. l. c.) scapes declinate; legumes ovate, pubescent. 2. H. Native of the alps about Chinalug.

*Azure-flowered Mountain Milk-vetch.* Fl. July, Aug. Clt. 1818. Pl.  $\frac{1}{2}$  foot.

4 O. ARGYRÆA (D. C. prod. 2. p. 276.) plant almost stem-

less; stipulas white, membranous, hairy; leaflets elliptic-oblong, clothed with adpressed, silky, silvery down on both surfaces; petioles, scapes, and calyxes beset with spreading villi; scapes twice the length of the leaves; flowers erect, disposed in capitate spikes; bracteas linear, length of calyx. 2. H. Native of the Altaian mountains. Flowers deep-purple. Legumes unknown.

*Silvery Mountain Milk-Vetch.* Pl. 1 foot.

5 O. URALENSIS (D. C. prod. 2. p. 276.) plant stemless, clothed with silky hairs in every part; leaflets ovate, acute; scapes solitary or twin, longer than the leaves; calyx clothed with silky down, as well as the leaflets; heads of flowers round and dense; bracteas oblong, one to each flower; legumes oblong, tumid, pointed, shaggy, erect, bilocular. 2. H. Native of Siberia, on the Ural Mountains, Alps of Austria, Pyrenees, &c. In Scotland on mountains in sandy soil; plentiful near Burnt Island in Fife-shire. *Astragalus Uralensis*, Lin. spec. 1071. Smith, engl. bot. t. 466. Jacq. misc. 1. p. 150. Light. fl. scot. 401. t. 17. Pall. astrag. t. 42. f. A. *Phaca Uralensis*, Wahl. carp. 737. Flowers of a rich bluish-purple colour, rarely white. This is an elegant plant. The Siberian plant is more villous than silky; it may perhaps be a distinct species. The plant is also a native of Arctic America.

*Ural Mountain Milk-Vetch.* Fl. July, Scotland. Pl.  $\frac{1}{2}$  foot.

6 O. CORYLEA (D. C. astr. no. 2.) plant stemless and silky; leaflets lanceolate; scapes nearly twice the length of the leaves; flowers spicate, lower ones drooping a little; legumes ovate, ventricose, almost 1-celled, acuminate, glabrous. 2. H. Native of Siberia, on high mountains about Lake Baikal. *Astragalus coryleus*, Pall. itin. 3. p. 293. *Astr. Baicalensis*, Pall. astrag. p. 64. t. 52.—Gmel. sib. 4. t. 26. f. 2. Flowers blue. Mucrone of keel equal in length to the wings.

*Blue-flowered Mountain Milk-Vetch.* Pl.  $\frac{1}{2}$  foot.

7 O. ARCTICA (R. Br. chl. inelv. p. 20.) plant almost stemless, silky; leaflets opposite and alternate, ovate-oblong; heads sub-umbellate, few-flowered; legumes erect, oblong, and are, as well as the calyxes, clothed with black pubescence. 2. H. Native of Melville Island in the Arctic sea, &c. This species approaches O. Uralensis, but the leaflets are smaller, acute or obtuse, and much more numerous, and the flowers are disposed in umbels, not in spikes.

*Arctic Mountain Milk-Vetch.* Pl.  $\frac{1}{2}$  foot.

8 O. LEUCANTHA (Pers. ench. 2. p. 331.) plant stemless and glabrous; leaflets lanceolate; scapes hardly longer than the leaves, rather pilose; spikes almost globose; bracteas shorter than the calyx; the 2 upper teeth of the calyx shorter, and more distant than the rest. 2. H. Native of Eastern Siberia, among rocks. Flowers white, but according to Pallas's figure they are reddish. Legume unknown.

*White-flowered Mountain Milk-Vetch.* Pl.  $\frac{1}{2}$  foot.

9 O. ARGENTATA (Pers. ench. 2. p. 331.) plant almost stemless; leaflets lanceolate, silvery white on both surfaces; scapes hoary-pubescent, hardly longer than the leaves. 2. H. Native of Siberia, in the Kirghisean Steppe. *Astragalus argentatus*, Pall. astr. p. 60. t. 48. Flowers white, but with a tinge of blue. Legume unknown.

*Silvered Mountain Milk-Vetch.* Pl.  $\frac{1}{2}$  foot.

10 O. AMBIGUA (D. C. astr. no. 4.) plant stemless and hairy or smoothish; leaflets ovate, with rather villous margins; scapes longer than the leaves; spikes of flowers oblong; bracteas lanceolate, and are, as well as the calyxes, hairy; legumes erect, ovate, acuminate, somewhat bilocular. 2. H. Native throughout Siberia. *Astragalus ambiguus*, Pall. astr. p. 54. t. 43.—Gmel. sib. 4. t. 30. Flowers purplish-blue.

*Ambiguous Mountain Milk-Vetch.* Fl. May, July. Clt. 1817. Pl.  $\frac{1}{2}$  foot.

K k

11 *O. FILIFÓRMIS* (D. C. astr. no. 16. exclusive of the synonymes,) plant almost stemless, glabrous; leaflets lanceolate-linear; scapes 2 or 3 times longer than the leaves; flowers spicate, lower ones distant; teeth of calyx short; beak of keel shorter than the wings.  $\mathcal{U}$ . II. Native of Dahuria in deserts, near the river Amoor, and on mount Odon-Tschelon. Flowers small, bluish-purple. Very nearly allied to *O. cærúlea*, but differs in the plant being glabrous, the flowers being one-half smaller, and in the beak of the keel being shorter than the wings.

*Filiform Mountain Milk-Vetch.* Pl.  $\frac{1}{2}$  foot.

12 *O. SETÓSA* (D. C. astr. no. 5.) plant stemless; leaflets lanceolate, glabrous, but pilose on the edges; scapes hardly longer than the leaves, clothed with hoary hairs; heads of flowers ovate-roundish; bracteas pilose, about equal in length to the calyx, which is woolly; calycine teeth unequal, subulate, elongated.  $\mathcal{U}$ . H. Native of Siberia, on the higher Altaian mountains. *Astrágalus setosus*, Pall. astr. p. 5. Flowers purplish.

*Bristly Mountain Milk-Vetch.* Pl.  $\frac{1}{2}$  foot.

13 *O. LAMBERTI* (Pursh, fl. amer. sept. 2. p. 740.) plant stemless, silky and pilose in every part; leaflets lanceolate, acute, rather remote; scape rather longer than the leaves; flowers spicate or capitate; bracteas lanceolate-linear, rather shorter than the silky calyx.  $\mathcal{U}$ . II. Native of North America, on woodless hills about the river Missouri. Sims, bot. mag. 2147. Lindl. bot. reg. t. 1054. *Astrágalus Lamberti*, Spreng. syst. 3. p. 308. Flowers large, blue and white mixed.

*Lambert's Mountain Milk-Vetch.* Fl. Aug. Sept. Clt. 1811. Pl.  $\frac{1}{2}$  to 1 foot.

14 *O. GRANDIFLÓRA* (D. C. astr. no. 6.) plant stemless; leaflets oblong-lanceolate, clothed with adpressed silky down; scapes twice the length of the leaves; flowers disposed in loose spikes; wings obovate, dilated; legumes oblong, membranous, acuminate by the style, pubescent, bilocular.  $\mathcal{U}$ . H. Native of Siberia, especially beyond the Baikal. *Astrágalus grandiflorus*, Pall. astr. p. 57. t. 46. Willd. spec. 3. p. 1311. Flowers large, of a deep rose-colour. Bracteas shorter than the calyx. Vexillum emarginate.

*Var.  $\beta$ , cárnea* (D. C. prod. 2. p. 277.) flowers flesh-coloured, having the vexillum obtuse, not emarginate.  $\mathcal{U}$ . H. Native of Dahuria. *Astrágalus Dahúricus*, Patrin, ined.

*Var.  $\gamma$ , leptóptera* (D. C. l. c.) wings of flower oblong; vexillum obtuse; bracteas shorter than the calyx.  $\mathcal{U}$ . H. Native of Siberia, at Nerstinsky Savod near Doroninsk. *O. grandiflora*, Fisch. in litt. Flowers bluish-purple, not rose-coloured. Perhaps a proper species, or the same as *O. Lamberti*.

*Great-flowered Mountain Milk-Vetch.* Fl. June, Aug. Clt. 1818. Pl.  $\frac{1}{2}$  foot.

15 *O. CÁNDICANS* (D. C. astr. no. 7.) plant stemless, canescent; leaflets ovate-lanceolate, pubescent; scapes twice the length of the leaves; spikes ovate-oblong; bracteas length of calyx; legumes oblong-linear, erect, half-bilocular, hardly pubescent, ending each in a long inflexed acumen.  $\mathcal{U}$ . II. Native of Eastern Siberia, at the river Lena. *Astrágalus cándicans*, Pall. astr. p. 61. t. 49. Flowers very pale blue.

*White-leaved Mountain Milk-Vetch.* Pl.  $\frac{1}{2}$  foot.

16 *O. CAUDÁTA* (D. C. astr. no. 8.) plant stemless; leaflets oblong, acute, pubescent beneath, and almost glabrous above; scapes erect, twice the length of the leaves; spikes of flowers oblong, dense; bracteas shorter than the calyx, which is cylindrical.  $\mathcal{U}$ . H. Native of Siberia, on the Altaian mountains. *Astrágalus spicatus*, Pall. itin. 2. append. no. 118. t. 10. ed. gall. append. no. 741. t. 84. *Astr. caudatus*, Pall. astr. p. 62. t. 50. Flowers purple. Legume half bilocular.

*Tailed-legumed Mountain Milk-Vetch.* Pl.  $\frac{1}{2}$  foot.

17 *O. SONGÁRICA* (D. C. astr. no. 9.) plant stemless; leaflets

lanceolate, silky; scapes erect, twice the length of the leaves; flowers distant, in spikes, the lower ones almost opposite; bracteas shorter than the calyx.  $\mathcal{U}$ . II. Native of Siberia, in elevated fields at the Altaian promontory. *Astrágalus Songáricus*, Pall. astr. p. 63. t. 51. Flowers violaceous. Legume ovate, acute, pubescent.

*Songarian Mountain Milk-Vetch.* Fl. June, July. Clt. 1824. Pl.  $\frac{1}{2}$  foot.

18 *O. SYLVÁTICA* (D. C. astr. no. 18.) plant stemless; leaflets oval, acute, clothed with silky down; scapes longer than the leaves; spikes ovate, dense; bracteas longer than the calyx; legumes inflated, membranous, clothed with brown pili.  $\mathcal{U}$ . H. Native of Dahuria and Siberia, on the Altaian mountains in pine woods, and on their margins. *Phaca sylvatica*, Pall. itin. ed. gall. append. no. 381. t. 86. f. 1. *Astrágalus*, Willd. spec. 3. p. 1300. *Astr. sylvicolus*, Pall. astr. p. 95. t. 78. Flowers purplish. There is a variety of this species having 3 or 4 leaflets in a whorl.

*Wood Mountain Milk-Vetch.* Pl.  $\frac{1}{2}$  foot.

19 *O. LONGIRÓSTRA* (D. C. astr. no. 17. t. 5.) plant stemless, and rather silky; leaflets linear-oblong, acuminate; scapes twice the length of the leaves; spikes ovate; bracteas shorter than the calyx; keel of flower furnished with a long mucronate acumen.  $\mathcal{U}$ . H. Native of Siberia, at Lake Baikal, in the fissures of rocks. Flowers purplish. *O. Gmelini*, Fisch. ex Steven.

*Long-beaked-keeled Mountain Milk-Vetch.* Fl. June, July. Clt. 1820. Pl.  $\frac{1}{2}$  foot.

20 *O. BREVIRÓSTRA* (D. C. astr. no. 19. t. 6.) plant almost stemless; leaflets 23-29, lanceolate, glabrous; scapes hairy, about equal in length to the leaves; spikes ovate, dense; bracteas about equal in length to the calyx; legumes ovate, inflated, almost 1-celled, apiculated by the style, and are, as well as the calyxes, beset with black pubescence.  $\mathcal{U}$ . II. Native of Siberia, on the Altaian mountains, and in pine woods. *Astrágalus Altaicus*, Pall. astr. p. 56. t. 45. *O. Altaica*, Pers. *Stipulas* large, membranous, joined together. Flowers bluish-purple.

*Short-beaked Mountain Milk-Vetch.* Fl. July, Sept. Clt. 1802. Pl.  $\frac{1}{2}$  foot.

21 *O. LEPTOPHYLLA* (D. C. astr. no. 12.) plant stemless, glabrous; leaflets 9-13, linear-filiform; scapes reclinate, length of leaves; flowers few, almost capitate; bracteas shorter than the calyx, which is hairy; legume inflated, membranous, almost 1-celled, pubescent.  $\mathcal{U}$ . II. Native of Siberia, on high plains between the rivers Onon and Argun. Flowers of a deep rose-colour. *Astrágalus leptophyllus*, Pall. astr. p. 83. t. 66. f. A. but not of Desf. Gmel. sib. 4. t. 24. B.

*Slender-leaved Mountain Milk-Vetch.* Fl. July, Aug. Clt. 1818. Pl.  $\frac{1}{2}$  foot.

22 *O. CÆSPITÓSA* (Pers. ench. 2. p. 333.) plant stemless; leaflets from 13-15 in number, oblong, glabrous; scapes bearing about 5 flowers, about equal in length to the leaves; bracteas shorter than the calyx, which is villous; legumes inflated, ovate, acuminate, pubescently-tomentose, almost 1-celled.  $\mathcal{U}$ . H. Native of Dahuria, on rocks and among gravel. *Astrágalus cæspitosus*, Pall. astr. p. 70. t. 57. *Astr. vesicarius*, Pall. itin. but not of Linnæus. *O. physodes* var. *glabra*, D. C. astr. no. 14. f. 1. Flowers purple.

*Tufted Mountain Milk-Vetch.* Fl.  $\frac{1}{2}$  foot.

23 *O. AMPULLÁTA* (Pers. ench. 2. p. 333.) plant stemless; leaflets from 7-13 in number, lanceolate, and silky; scapes usually bearing about 3 flowers each, equal in length to the leaves; bracteas shorter than the calyx; legumes inflated, ovate-globose, tomentose, almost 1-celled.  $\mathcal{U}$ . H. Native of Siberia, on rocks at the river Yenesee, and about the Baikal. *Astrágalus ampullatus*, Pall. astr. p. 69. t. 56. f. B. *O. physodes* var. *villósa*, D. C. astr. no. 14. t. 2. f. 2.

*Cruet-shaped-podded Mountain Milk-Vetch.* Pl.  $\frac{1}{2}$  foot.

24 *O. NIGRESCENS* (Fisch. in litt. D. C. prod. 2. p. 278.) plant almost stemless, having numerous procumbent scapes; leaflets 7-11 in number, elliptic, acutish, villous; stipulas and calyxes beset with black hairs; peduncles 2-flowered, length of leaves; legumes oblong, inflated, pubescent, 1-celled. (Pall.) *U. H.* Native of the north-east of Siberia between the Aldan and the ocean, and in the island of St. Lawrence. Flowers bluish-purple, rather large; the keel furnished with a small mucrone, which is hardly evident. *Astragalus nigrescens*, Pall. astr. p. 65. t. 53.

*Blackish-haired Mountain Milk-Vetch.* Pl. procumbent.

25 *O. TRIPHYLLA* (Pers. ench. 2. p. 333.) plant almost stemless; leaflets 3, lanceolate, glabrous, ciliated; scape longer than the leaves, bearing 2-3 flowers at its apex; calyx very hairy. *U. H.* Native of Siberia, on islands in Lake Baikal, and of Dahuria on a granite hill between Ozeri and Kachira. *Astragalus triphyllus*, Pall. astr. p. 68. t. 56. f. A. but not of Pursh. Leaves sometimes furnished only with one leaflet. Flowers large, purple.

*Three-leafletted Mountain Milk-Vetch.* Pl.  $\frac{1}{2}$  foot.

\* \* *Flowers cream-coloured.*

26 *O. CAMPÉSTRIS* (D. C. astr. no. 10.) plant stemless; leaflets many pairs, lanceolate, acute, hoary, and rather hairy; scapes hairy, about equal in length to the leaves; spikes ovate-oblong, dense-flowered; flowers erect; bracteas a little shorter than the calyx, which is hairy; legumes ovate, inflated, erect, hairy, half-bilocular. *U. H.* Native of Europe, on the Alps. In Scotland upon a high rock on one of the mountains at the head of Clova, Angus-shire, near the White-water, in great abundance. *Astragalus campéstris*, Lin. spec. 102. Smith, engl. bot. vol. 36. 2522. *Astr. sordidus*, Willd. spec. 1313. with erroneous remarks. *A. sordidus*, Pers. ench. 2. p. 333. *Astr. Uralensis*, Oed. fl. dan. 1041. *Phaca campéstris*, Wahl.—Hall. helv. t. 13.—Scheuchz. trav. alp. 4. p. 330. with a figure. In size and habit much like *O. Uralensis*, but the leaflets are narrower, more numerous, much less silky, being only besprinkled with shining hairs, and sometimes quite smooth, except on the mid-rib. Flowers cream-coloured, the keel and wings tinged with purple.

FIG. 40.

*Field Mountain Milk-Vetch.* Fl. July, Aug. Scotland. Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

27 *O. SULPHUREA* (Fisch. in litt.) plant stemless; leaflets from 37-41 in number, lanceolate, when young clothed with adpressed silky pubescence, at length only besprinkled with a few hairs; scape a little longer than the leaves; spikes capitate; flowers spreading; bracteas about equal in length to the calyx; legume hairy? *U. H.* Native of Siberia, on the Altaian mountains at the metal mines. *O. campéstris*  $\gamma$  *sulphurea*, D. C. prod. 2. p. 278. Flowers cream-coloured. This species is very like the European *O. campéstris*, but differs in the leaflets being more numerous, and in the flowers being larger.

*Sulphur-coloured-flowered Mountain Milk-Vetch.* Fl. July. Clt. 1820. Pl.  $\frac{1}{2}$  foot.

28 *O. VISCOSA* (Vill. dauph. 3. p. 469. t. 43.) plant stemless; leaves with about 20 pairs of linear, acute, rather clammy leaflets; scapes and leaves erect; flowers 7-9 at the top of each scape; calyx clothed with clammy pubescence; legumes oblong, recurved, velvety. *U. H.* Native of Switzerland and Dauphiny.

*O. campéstris* var.  $\beta$ , *viscosa*, D. C. astr. no. 10. Flowers white.

*Clammy Mountain Milk-Vetch.* Fl. July. Clt. 1817. Pl.  $\frac{1}{2}$  ft.

29 *O. FÆTIDA* (D. C. astr. no. 11.) plant stemless; leaves with many pairs of lanceolate-linear, clammy, glabrous leaflets; scapes rather longer than the leaves, woolly at the apex; spikes capitate, few-flowered; bracteas shorter than the calyx; legumes erect, terete, inflated, rather incurved, pubescent. *U. H.* Native of the Alps of Dauphiny, Switzerland, and Piedmont. *Astragalus fætidus*, Vill. dauph. 3. p. 468. t. 43. *Astr. Halleri*, All. pedem. no. 1276.—Hall. helv. no. 407. Flowers cream-coloured.

*Fetid Mountain Milk-Vetch.* Fl. June, Aug. Clt. 1819. Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

30 *O. SQUAMULOSA* (D. C. astr. no. 15. t. 3.) plant stemless and glabrous; leaves with many pairs of linear leaflets; scapes shorter than the leaves, each bearing usually 2 or 3 flowers at the apex; calyxes covered with little scales; bracteas shorter than the calyx, and are, as well as the stipulas, ciliated; legumes ovoid. *U. H.* Native of Dahuria, in arid fields at the river Courba. Flowers cream-coloured.

*Scaly-calyxed Mountain Milk-Vetch.* Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

§ 2. *Verticillaris* (from *verticillatus*, whorled, or in a whorl; in reference to the leaflets being disposed somewhat in whorls on the petiole). D. C. prod. 2. p. 279. *Leaflets all or for the most part somewhat verticillate, or with 2-3 or 6 rising from the same centre, or dot from the petiole.*

31 *O. SPLENDENS* (Dougl. mss.) plant stemless, clothed with silky villi; leaflets ovate-lanceolate, acute, crowded; scapes much longer than the leaves; flowers in interrupted spikes; bracteas lanceolate-linear, longer than the calyx, silky, as well as the calyxes. *U. H.* Native of North America, about the Red river. Flowers blue, and probably mixed with white. Leaflets rising 2-3-4 together from the petiole.

*Splendid Mountain Milk-Vetch.* Pl. 1 foot.

32 *O. MICROPHYLLA* (D. C. astr. no. 20.) plant stemless; leaflets rising in pairs from the petiole, or somewhat verticillate, oblong, obtuse, hairy beneath; scape longer than the leaves; spikes ovate; calyxes rather mucronate, and woolly. *U. H.* Native of Siberia, in sandy islands in the river Selenga, and in Lake Baikal. *Astragalus microphyllus*, Pall. astr. 92. t. 76. *Phaca microphylla*, Pall. itin. ed. gall. in 8vo. append. no. 382. t. 90. f. 1. *Astr. polyphyllus*, Willd. spec. 3. p. 1300. Flowers large, purple. This appears to be intermediate between the character of this and the preceding division of the genus.

*Small-leaved Mountain Milk-Vetch.* Fl. June, July. Clt. 1819. Pl.  $\frac{1}{2}$  foot.

33 *O. BAICALIA* (Pers. ench. 2. p. 333.) plant stemless; leaflets lanceolate, clothed with silky wool, disposed somewhat verticillately; scapes pilose, rather longer than the leaves; flowers few, capitate; legumes ovate, inflated, acuminate, membranous, pubescent. *U. H.* Native of Siberia, about Lake Baikal. *Astragalus baicalia*, Pall. astr. 93. t. 77. f. 1. Flowers whitish, tinged with blue.

*Baikal Mountain Milk-Vetch.* Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

34 *O. INARIA* (D. C. prod. 2. p. 279.) plant stemless; leaflets linear, acute, pubescent, in pairs, or 3 or 4 in a whorl; scape erect, about equal in length to the leaves; spike capitate, few-flowered; bracteas rather longer than the calyx, which is pubescent. *U. H.* Native of Siberia, at the river Ina on the mountains of Tegerek, but very rare. *Astragalus inarius*, Willd. spec. 3. p. 1302. *Astr. inarius*, Pall. astr. p. 94. t. 77. f. 2. Flowers purple. Stipulas large, sheathing, silky.

*Ina Mountain Milk-Vetch.* Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

35 *O. PU'MILA* (Fisch. in litt. D. C. prod. 2. p. 279.) plant

stemless, dwarf, clothed with silky white hairs; leaves in pairs, or 3 or 4 in a whorl, linear, acute; scapes decumbent, longer than the leaves; spike capitate; bracteas white and membranous, rather longer than the calyx, which is villous. *Æ. H.* Native of Siberia, at the river Ina. Flowers blue, one-half smaller than those of *O. Inaria*. The legume, according to Fischer, is ovate, inflated, mucronate, and pubescent.

*Dwarf Mountain Milk-Vetch.* Pl. decumbent.

36 *O. LANATA* (D. C. astr. no. 26.) plant with a short suffrutescent stem; leaflets oblong, clothed with silky down, 4 in a whorl; stipulas joined together; scape shorter than the leaves; flowers capitate; legumes ovate, turgid, villous, and woolly, hardly bilocular. *Æ. F.* Native of Siberia, on hills. *Phæa lanata*, Pall. itin. ed. gall. in 8vo. append. no. 386. t. 87. f. 2. *Phæa Sibirica*, Lin. fil. suppl. 326. *Astragalus dasypyllus*, Pall. astr. p. 91. t. 75. Flowers purple.

*Woolly Mountain Milk-Vetch.* Pl.  $\frac{1}{2}$  foot.

37 *O. VERTICILLARIS* (D. C. astr. no. 25.) plant stemless; leaflets linear, acute, acuminate, clothed with silky villi, disposed 4 or 6 in a whorl on the petiole; scape hairy, longer than the leaves; spikes ovate; legumes erect, ovate, acuminate, hardly half-bilocular. *Æ. H.* Native of Siberia. *Astragalus verticillaris*, Lin. mant. 275.—Amm. ruth. t. 19. f. 1. Flowers flesh-coloured.

*Whorled-leafletted Mountain Milk-Vetch.* Fl. July. Clt. 1819. Pl.  $\frac{1}{2}$  foot.

38 *O. PROSTRATA* (D. C. astr. no. 22.) plant stemless; leaflets linear, inflexed, rather villous, disposed 3 or 4 in a whorl on the petiole; stipulas very villous; scapes decumbent, rather longer than the leaves; flowers capitate; bracteas shorter than the calyx, which is hairy. *Æ. H.* Native of Siberia, in sandy, gravelly, salt fields about Lake Tarei. *Phæa prostrata*, Lin. fil. suppl. 336. Pall. itin. ed. gall. 8vo. append. no. 303. t. 87. f. 1. *Astragalus Dahuricus*, Pall. astr. p. 88. t. 72. Legume unknown. Flowers purple or flesh-coloured.

*Prostrate Mountain Milk-Vetch.* Pl. prostrate.

39 *O. MYRIOPHYLLA* (D. C. astr. no. 24.) plant stemless; leaflets subulate, pilose, disposed 4 or 6 in a whorl on the petiole; scapes erect, longer than the leaves; flowers disposed in a spike, lower ones rather remote; bracteas about equal in length to the calyx, which is cylindrical and villous; legumes erect, cylindrical, acuminate, tomentose, half bilocular. *Æ. H.* Native of Siberia, on mountains in sandy places. *Phæa myriophylla*, Pall. voy. append. no. 384. t. 86. f. 2. *Astragalus myriophyllus*, Pall. astr. p. 87. t. 71. *Astr. verticillaris*, Lin. mant. 275. Willd. spec. 3. p. 1299. There are varieties of this plant with dark-purple, blue, flesh-coloured, and white flowers, and sometimes variegated with these colours.

*Myriad-leaved Mountain Milk-Vetch.* Fl. July, Aug. Clt. 1818. Pl.  $\frac{1}{2}$  foot.

40 *O. OXYPHYLLA* (D. C. astr. no. 21.) plant stemless; leaflets linear-lanceolate, clothed with silky pubescence, disposed 4 or 5 in a whorl, on the petiole; scape hairy, about equal in length to the leaves or longer than them; spikes ovate-oblong; legumes ovate, inflated, acuminate, pubescent, 1-celled. *Æ. H.* Native of Siberia and Dahuria, on hills. *Phæa oxyphylla*, Pall. itin. ed. gall. append. no. 380. t. 87. f. 3. *Astragalus oxyphyllus*, Pall. astr. p. 90. t. 74. There are varieties of this species with purple and pale flowers.

*Sharp-leafletted Mountain Milk-Vetch.* Fl. July, Aug. Clt. 1816. Pl.  $\frac{1}{2}$  foot.

41 *O. MURICATA* (D. C. astr. no. 23.) plant stemless; leaflets linear, glabrous, disposed 4-8 in a kind of whorl on the petiole, young ones mucronated beneath as well as the petioles and legumes; scapes glabrous, about equal in length to the leaves; bracteas rather longer than the calyx; spikes of flowers ovate;

legumes lanceolate, arched, acuminate. *Æ. H.* Native of Siberia, on mountains at the river Yenesee, and at lake Baikal. *Phæa muricata*, Lin. suppl. Pall. itin. ed. gall. append. no. 385. t. 89. f. 1. *Astragalus muricatus*, Pall. astr. p. 89. t. 73. Flowers yellow, ex Lin.

*Mucronated Mountain Milk-Vetch.* Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

§ 3. *Tragacanthoides* (from *τραγος*, *tragos*, a goat, *ἀκανθα*, *akantha*, a thorn, and *ἰδέα*, *idea*, similar; in reference to the plants contained in this section resembling the *Goat's-thorn*, in being spiny). *D. C. prod.* 2. p. 280. *Stems elongated, shrubby. Stipulas adnate. Petioles permanent, at length becoming spines.*

42 *O. TRAGACANTHOIDES* (Fisch. in litt. D. C. prod. 2. p. 280.) stem erect, branched; petioles becoming hardened into strong spines; leaves with 5 or 6 pairs of elliptic-oblong leaflets, which are clothed with adpressed silky down on both surfaces; peduncles few-flowered, length of leaves; calyx clothed with soft hairs, at length becoming inflated. *Æ. F.* Native of the Altaian mountains, at the river Baschka-us, where it was detected by Mardofkin, in July 1822. This is a very elegant plant, having larger flowers than any other species, they are purple. The keel is furnished with a long beak. The legumes, according to Fischer, are bladdery, almost globose, acuminate, and hairy.

*Tragacanth-like Mountain Milk-Vetch.* Shrub 1 foot.

§ 4. *Caulescentes* (a diminutive of *caulis*, a stem; the plants contained in this section are furnished with stems). *D. C. prod.* 2. p. 280. *Stems elongated. Stipulas not adnate to the petiole. Leaflets rising in pairs from the petiole, not in whorls.*

\* *Flowers cream-coloured.*

43 *O. PILOSA* (D. C. astr. no. 27.) stems erect, beset with soft hairs as well as the rest of the plant; leaflets lanceolate, acute; peduncles axillary, longer than the leaves; spikes ovate-oblong; legumes erect, terete, hooked at the apex, villous. *Æ. H.* Native of Europe, Tauria, and of Siberia, on mountains near the river Oby. Sims, bot. mag. 2483. *Astragalus pilosus*, Lin. spec. 1065. Jacq. austr. t. 51. Pall. astr. t. 80. Lodd. bot. cab. 544.—Gmel. sib. 4. t. 16. Flowers pale-yellow.

*Pilose Mountain Milk-Vetch.* Fl. June, Aug. Clt. 1732. Pl. 1 foot.

44 *O. PALLASII* (Pers. ench. 2. p. 334. Bieb. fl. taur. suppl. 502.) plant caulescent, prostrate, pubescent or villous; leaflets oblong-elliptic, acutish; peduncles rather longer than the leaves; spikes capitate; legumes erect, oblong-terete, mucronate, hairy. *Æ. H.* Native of Tauria, among stones near Sudak. *Astragalus lanatus*, Pall. astr. p. 108. t. 81. Bieb. fl. taur. 2. p. 188. Flowers very pale cream-coloured, much more so than the last species.

*Pallas's Mountain Milk-Vetch.* Fl. July, Aug. Clt. 1818. Pl. prostrate.

\*\* *Flowers purple or white.*

45 *O. TERES* (D. C. astr. no. 28.) plant caulescent, erect, almost glabrous; leaflets linear-oblong, acute, rather pubescent; peduncles twice the length of the leaves; flowers few, about 7 or 8, disposed in a loose spike; legumes erect, cylindrical, mucronate, glabrous. Native of Siberia, at the river Oby, at the place where the Irtysh falls into it. Corolla purplish-blue.

*Terete-podded Mountain Milk-Vetch.* Pl. 1 foot.

46 *O. FLORIBUNDUS* (D. C. astr. no. 30.) plant caulescent, erect, rather pilose; leaflets linear, acute at both ends, pubescent; stipulas lanceolate; peduncles axillary, at first shorter than the leaves, but at length longer; flowers spicate; le-

gumens oblong-subulate, 1-celled, pubescent. ♂. H. Native of Siberia, in sandy places along the banks of the river Irtysh. *Astragalus floribundus*, Pall. astr. p. 47. t. 37. Flowers numerous, elegant, of a purplish rose-colour.

*Bundle-flowered Mountain Milk-Vetch.* Pl.  $\frac{1}{2}$  to 1 foot.

47 O. GLABRA (D. C. astr. no. 31. t. 8.) plant caulescent, prostrate, glabrous; leaflets lanceolate-elliptic, acuminate; peduncles much longer than the leaves; flowers in spikes, remote; legumes pendulous, pubescent. ♀. H. Native of Siberia, Altai, and Dahuria. Very like the following. The hairs on the legume are blackish, but the other parts of the plant are clothed with adpressed pubescence or smooth.

*Glabrous Mountain Milk-Vetch.* Fl. June, Aug. Clt. 1823. Pl. prostrate.

48 O. DEFLEXA (D. C. astr. no. 32.) plant rather pilose; stems ascending; leaflets ovate-lanceolate, pubescent; peduncles much longer than the leaves; flowers disposed in spikes; legumes pendulous, hairy, 1-celled, gaping at the apex. ♀. H. Native of Siberia, about the Baikal on the mountains in cold springs, and North America on the banks of the Saskatchewan. *Astragalus deflexus*, Pall. act. petr. 1776. t. 15. Lher. stirp. t. 80. A. hians, Jacq. icon. rar. t. 153. Astr. parviflorus, Lam. Astr. retroflexus, Pall. astr. t. 27. Tium hians, Moench. meth. 162. Flowers purple.

*Deflexed-podded Mountain Milk-Vetch.* Fl. June, Jul. Clt. 1800. Pl. 1 foot.

49 O. FISCHERI (D. C. prod. 2. p. 281.) plant caulescent, assurgent, or procumbent, pubescent; stipulas distinct; leaflets oblong-linear, rather obtuse; peduncles longer than the leaves; flowers spicate, rather distant; wings obtuse, somewhat emarginate; mucrone of keel elongated, about equal in length to the wings. ♀. H. Native of Siberia, on the Altaian mountains. Flowers small, bluish-purple. O. versicolor, Fisch. in litt. but very distinct from *Astragalus versicolor*.

*Var. β, macrantha* (D. C. l. c.) flowers larger and rose-coloured; leaves and calyxes much more villous. ♀. H. Native of Siberia. Perhaps a proper species.

*Fischer's Mountain Milk-Vetch.* Fl. July, Aug. Pl. proc.

50 O. VAGINATA (Fisch. in litt. D. C. prod. 2. p. 281.) plant caulescent and ascending, sparingly pubescent; stipulas concrete; leaflets elliptic; peduncles a little longer than the leaves; spikes of flowers somewhat capitate; wings retuse; beak of keel equal in length to the wings. ♀. H. Native of Siberia, on the Altaian mountains at the metal mines. Flowers large, blue. It differs from *O. Fischeri macrantha* in the stipulas being joined into one. Legumes unknown.

*Sheathed-stipuled Mountain Milk-Vetch.* Pl. ascending.

51 O. TENELLA (Fisch. in litt. D. C. prod. 2. p. 281.) stems short, diffuse, or procumbent, pubescent; stipulas concrete; leaflets elliptic or oblong-linear, acutish, clothed on both surfaces with adpressed silky down; peduncles longer than the leaves; flowers disposed in a spike, rather distant; wings entire; mucrone of keel about equal in length to the wings; legumes nearly terete, acute, straight, 1-celled. ♀. H. Native of Seythia. Flowers small, bluish-purple.

*Tender Mountain Milk-vetch.* Pl. diffuse.

52 O. DICHOPTERA (D. C. astr. no. 33. exclusive of the synonymes) plant caulescent, ascending, pubescent; stipulas joined; leaflets oblong, acute; peduncles equal in length to the leaves; flowers capitate; wings emarginate; mucrone of keel small. ♀. H. Native of Siberia. Flowers blue.

*Fork-winged Mountain Milk-Vetch.* Fl. July. Clt. 1815. Pl. ascending.

*Cult.* All the species of this genus are very elegant when in bloom, and being for the most part dwarf evergreen plants, are very proper for ornamenting rock-work, or the front of flower-

borders. For this purpose the seeds of the species, whether perennial or annual, should be sown where the plants are to remain, especially those which are intended for rock-work, as it has been observed that no species of this genus thrives after being transplanted. The rarer kinds may be kept in pots, well drained with sherds, in a mixture of peat, sand, and a little loam, and treated as other alpine plants.

CXXXI. ASTRAGALUS (from *αστραγαλος*, *astragalos*, vertebra or talus; the seeds in the legumes in some species being squeezed into a squarish form in the legume, or perhaps *αστηρ*, *aster*, a star, and *γαλα*, *gala*, milk. It is also the name of a shrub of Greek writers). D. C. astrag. no. 5. ed. maj. p. 22. and p. 79. prod. 2. p. 281.—*Astragalus* species of Linnæus and others.

LIN. SYST. *Diadelphina*, *Decandria*. Calyx 5-toothed. Keel of flower obtuse. Stamens diadelphous. Legume bilocular or half bilocular, from the upper suture being bent in so much.—Herbs or subshrubs. The species of this genus are very distinct, but are very difficult to define. The following sections and divisions have been adopted with a view to define them more completely, viz.

I. PURPURASCENTES. Stipulas free from the petiole. Flowers purplish. This section contains the following divisions: *Hypoglottidei*, *Dissitiflori*, *Onobrychoidei*, *Sesamei*, *Vesicarii*, and *Annulæres*, see species 1 to 94.

II. OCHROLEUCI. Stipulas free from the petiole. Flowers cream-coloured. To this section belongs the following divisions: *Bucerates*, *Synochreati*, *Ciceroidei*, *Galegiformes*, *Alopecuroidei*, *Christiani*, see species 95 to 154.

III. TRAGACANTHACEI. Stipulas adnate to the petiole. Petioles permanent, usually becoming hardened into spines. To this section belong two divisions, viz. *Tragacanthæ* and *Chronopodii*, see species 155 to 196.

IV. PODOCHREATI. Stipulas adnate to the petioles. Petioles never becoming indurated. To this section the following divisions belong, viz. *Anthyllodei*, *Caprini*, *Incani*, and *Radiciflori*, see species 197 to 257.

SERIES I. PURPURASCENTES (so called from the flowers being purple or purplish). D. C. prod. 2. p. 281. Stipulas free from the petiole. Flowers purplish.

§ 1. *Hypoglottidei* (ὕπο, *hypo*, under, and γλωττα, *glotta*, a tongue; in reference to the shape of the pods). D. C. prod. 2. p. 281. Flowers purplish or white. Stipulas free from the petiole, but joined together, therefore they appear as if they were bifid at the apex and opposite the leaves.

I A. HYPOGLOTTIS (Lin. mant. 274.) stems prostrate, rather hairy; stipulas ovate, concrete; leaves with numerous, little, ovate, obtuse, dark-green leaflets, sometimes rather emarginate; heads of flowers roundish; peduncles longer than the leaves, ascending; bractæas one half shorter than the tube of the calyx; the hairs on the calyxes as well as those on the peduncles are black and white mixed; legumes ovate, deeply channelled along the back, compressed, hairy, hooked at the point, bilocular; cells 1-seeded. ♀. H. Native of Europe, on hills and mountains, also of Barbary, Tauria, Siberia, North America; and in Britain, on open mountainous heaths, in a chalky or sandy soil, also on the sea-coast; upon Newmarket and Royston heaths, on Swaffham heath, Norfolk; Gogmagog hills. Plentiful near Doncaster, on several parts of the sea-coast of Scotland, particularly beyond Newhaven, Edinburgh. D. C. astr. no. 18. t. 14. Smith. engl. bot. 274. A. arenarius, Huds. 323. Oed. fl. dan. 614. Pall. astr. t. 34. A. Dancicus, Retz. obs. fasc. 3. p. 41. Hoffm. A. glaucus, Vill. Oxytropis montana, Spreng. fl. hal. 207. with a figure, ex. Wallr. sched. 329. A. epiglottis, Dicks. hort. sic. fasc. 1-13.

—Raii, syn. 326. t. 12. f. 3. Flowers variegated with purplish, blue, and white. Root creeping, woody, though slender.

*Tongue-under-tongue* or *Purple Milk-Vetch*. Fl. June, July. Britain. Pl. prostrate.

2 *A. DASYGLÖTTIS* (Fisch. in litt. D. C. prod. 2. p. 282.) plant diffuse, nearly glabrous; stipulas concrete, opposite the leaves; leaflets elliptic-oblong, somewhat emarginate; spikes of flowers capitate; peduncles a little longer than the leaves; bracteas about equal in length to the tube of the calyx; calyx beset with white hairs; legumes erect, ovate-triangular, hairy, disposed in heads; cells 1-seeded. *Æ. H.* Native of Siberia, on the Altaian mountains. Root creeping. Flowers purple, blue, and white mixed. Very nearly allied to *A. hypoglottis*.

*Thick-tongued* or *Thick-podded Milk-Vetch*. Fl. June, July. Clt. 1818. Pl. diffuse.

3 *A. PURPUREUS* (Lam. dict. 1. p. 314.) plant diffuse, procumbent, rather villous; stipulas concrete, opposite the leaves; leaflets obovate, bidentate at the apex; spikes of flowers capitate; peduncles longer than the leaves; legumes erect, ovate-triangular, hairy, disposed in heads; cells 3-seeded. *Æ. H.* Native of Provence, on the mountains, Piedmont, and the Apennines. D. C. astr. no. 17. t. 12. Flowers purplish blue.

*Purple-flowered Milk-Vetch*. Fl. June, July. Clt. 1820. Pl. prostrate.

4 *A. TENUIFOLIUS* (Desf. atl. 2. p. 186. D. C. astr. no. 10. but not of Lin.) plant decumbent, hoary, and villous; stipulas concrete, opposite the leaves; leaflets elliptic-linear, about 15 or 17 pairs; peduncles shorter than the leaves; spikes capitate; vexillum elongated. *Æ. H.* Native of Barbary, near Cafza, in sand. Flowers rose-coloured. Legumes unknown.

*Fine-leaved Milk-Vetch*. Pl. decumbent.

5 *A. LOTOIDES* (Lam. dict. 1. p. 316.) plant prostrate, glabrous; stipulas not known; leaves with about 4 or 5 pairs of obovate, nearly orbiculate leaflets; flowers 4 or 5 in an umbel; peduncles length of leaves; legumes prismatic, triquetrous, erect, subulate at the apex. *Æ. H.* Native of China. *A. Sinicus*, Lin. mant. 103. Sims, bot. mag. 1350. Flowers rose-coloured. Lamarck's name has been adopted in preference to that of Linnæus in consequence of its being more expressive of the habit of the plant, and to prevent its being confounded with *A. Chinensis*. The specimen in the Linnean herbarium under the name of *A. Sinicus* is certainly a species of *Coronilla* very near *C. varia*.

*Lotus-like Milk-Vetch*. Fl. June, July. Clt. 1763. Pl. pr.

6 *A. VICIÆFORMIS* (D. C. astr. no. 19.) plant trailing and clothed with adpressed pubescence; stipulas half-concrete; leaves with from 10-15 pairs of obovate or orbiculate leaflets; spikes 5-7-flowered; peduncles angular, a little longer than the leaves; legumes oblong, acute, erect, villous. *Æ. H.* Native of Capadocia. *A. humifusus*, Willd. spec. 3. p. 1286. Flowers bluish-purple.

*Vicia-formed Milk-Vetch*. Pl. trailing.

7 *A. ONOBRYCHIOIDES* (Bieb. casp. 185. fl. taur. 2. p. 181.) plant rather diffuse, suffrutescent at the base, clothed with adpressed pubescence; stipulas concrete, opposite the leaves; leaves with 8-10 pairs of elliptic leaflets; spikes of flowers capitate, on long peduncles; vexillum linear, longer than the wings; legumes ovate-oblong, erect, villous, terminating in a hooked point. *Æ. H.* Native of Iberia, Persia, and Caucasus. *A. canescens*, D. C. astr. no. 39. t. 16. *A. cephalotes*, Pall. astr. no. 32. t. 24. Flowers beautiful purple.

*Saint-John-like Milk-Vetch*. Fl. July. Clt. 1819. Pl. diff.

8 *A. BICOLOR* (Lam. dict. 1. p. 317.) plant almost stemless, suffrutescent, hoary; stipulas concrete, opposite the leaves; leaves with from 6-9 pairs of oblong-linear leaflets; spikes of flowers capitate; peduncles twice the length of the leaves; ca-

lyxes villous, 5-cleft; legumes villous. *Æ. H.* Native of Armenia, D. C. astr. no. 41. Flowers white and purple in the same head, according to Tournefort, cor. 28.

*Two-coloured-flowered Milk-Vetch*. Pl.  $\frac{1}{2}$  foot.

9 *A. NANUS* (D. C. astr. no. 40. t. 17.) plant almost stemless, frutescent, canescent; stipulas concrete, opposite the leaves; leaves with 6-7 pairs of ovate leaflets; spikes of flowers capitate, on short peduncles; legumes ovate-oblong, pubescent. *Æ. H.* Native of Syria. Flowers purple.

*Dwarf Milk-Vetch*. Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

10 *A. PSORALEOIDES* (Lam. dict. 1. p. 317.) plant with short stems, ascending, suffrutescent and canescent; stipulas concrete, opposite the leaves; leaves with 6-9 pairs of linear-oblong leaflets, flowers capitate at first, but at length spicate, longer than the leaves; legumes oblong, very hairy. *Æ. F.* Native of the Levant. D. C. astr. no. 42. t. 18. f. 2. Flowers blue or purplish blue.

*Psoralea-like Milk-Vetch*. Pl.  $\frac{1}{2}$  foot.

11 *A. ALLYSOIDES* (Lam. dict. 1. p. 317.) plant with short, ascending, suffrutescent stems, hoary; stipulas concrete, opposite the leaves; leaves with from 5-10 pairs of linear-oblong leaflets; spikes of flowers somewhat cylindrical, on peduncles, which are twice the length of the leaves; legumes ovate, acute, pubescent, 4-seeded. *Æ. F.* Native of the Levant. D. C. astr. no. 43. t. 18. f. 1. Flowers small, of a dirty-white colour.

*Madwort-like Milk-Vetch*. Pl.  $\frac{1}{4}$  foot.

12 *A. LASIOGLÖTTIS* (Stev. in Bieb. suppl. 486.) plant ascending, hoary from adpressed hairs; stipulas concrete, opposite the leaves; spikes of flowers capitate, on long peduncles; vexillum elongated, emarginate; legumes rather ovate-globose, acute, woolly. *Æ. F.* Native of Caucasus, in stony, exposed places. Flowers purple. Allied to *A. onobrychioides*.

*Woolly-tongued Milk-Vetch*. Pl. ascending.

13 *A. LEONTINUS* (Jacq. icon. rar. 1. t. 153.) plant diffuse, suffrutescent at the base, clothed with hairs, which are fixed by their centre; stipulas concrete, but usually free at length; leaves with 6-12 pairs of ovate leaflets; flowers disposed in heads; peduncles trigonal, longer than the leaves; legumes ovate, villous. *Æ. H.* Native of Austria and Switzerland, on mountains. D. C. astr. no. 20. Lodd. bot. cab. 432. Flowers blue. Vexillum a little longer than the wings.

*Lion's-tail Milk-Vetch*. Fl. May, June. Clt. 1816. Pl. diff.

14 *A. UNIFOLIUS* (Lher. stirp. 158.) plant decumbent, suffrutescent, hoary from villi; stipulas concrete, opposite the leaves; leaves with from 11-14 pairs of oblong, obtuse leaflets; racemes pedunculate, length of leaves; legumes erect, compressed, villous. *Æ. F.* Native of Peru and Chili. D. C. astr. no. 9. t. 10. Calyxes rather bladdery, clothed with adpressed, black down. Flowers purplish.

*Single-propped Milk-Vetch*. Pl. decumbent.

15 *A. PROCUMBENS* (Hook. in Beech. voy. p. 18.) plant clothed with hirsute tomentum in every part; stems prostrate, branched; stipulas concrete; leaves with 11-14 pairs of elliptic, retuse leaflets; peduncles racemose, longer than the leaves; wings of flowers not half so long as the keel; legumes, in an immature state, linear, hairy, and reflexed. *Æ. F.* Native of Chili, about Concepcion. Flowers pale-purple.

*Procumbent Milk-Vetch*. Pl. procumbent.

16 *A. BIDENTATUS* (H. B. et Kunth, nov. gen. amer. 6. p. 493. t. 584.) plant ascending and somewhat pubescent; stipulas joined together to the middle; leaves with from 9-11 pairs of linear-oblong leaflets, which are emarginately bidentate at the apex; racemes roundish, pedunculate, longer than the leaves. *Æ. S.* Native of South America. Very like *A. unifolius*. Flowers pale-purple.

*Bidentate-leaftletted Milk-Vetch*. Pl. ascending.

17 *A. GARBANCILLO* (Cav. icon. 1. t. 85.) plant erect, suffrutescent, and rather villous; stipulas concrete, opposite the leaves; leaflets 10-12 pairs, oblong, obtuse; racemes pedunculate, longer than the leaves; legumes inflated, pilose.  $\mathfrak{H}$ . S. Native of Peru, in the valley of Canta. Flowers pale violet. The plant is said to be noxious to cattle. *Garbancillo* is the vernacular name of the plant in Peru. Calyx covered with black hairs.

*Garbancillo* Milk-Vetch. Shrub  $1\frac{1}{2}$  foot.

18 *A. DONIA'NUS* (D. C. prod. 2. p. 283.) plant prostrate, beset with a few scattered adpressed hairs; leaves with 8-10 pairs of oval, alternate, mucronulate leaflets, which are pubescent beneath, but when young silky; stipulas connate; peduncles axillary, few-flowered, twice the length of the leaves; legumes subulate, silky.  $\mathfrak{H}$ . II. Native of Nipaul, in Gosaingsthan. Flowers purple, having a broad vexillum. Root long, thick, and woody, dividing into many arms at the base. *A. macrorhizus*, D. Don, prod. fl. nep. 245.

*Don's* Milk-Vetch. Fl. Ju. Jul. Clt. 1818. Pl. pr.

19 *A. ARENARIUS* (Lin. spec. 1069.) plant diffuse, tomentose from white adpressed down; stipulas concrete, opposite the leaves; leaflets linear-obtuse; peduncles few-flowered, rather shorter than the leaves; legumes stipitate, rather tumid, tomentose, thrice the length of the breadth.  $\mathfrak{H}$ . II. Native of Denmark and Sweden, in sandy places. Retz. obs. 2. no. 73. p. 3. t. 3. D. C. astr. no. 1. Corolla blue. The stems are erect, according to Retzius, but according to Willdenow and Linnaeus they are prostrate. Root creeping.

*Sand* Milk-Vetch. Fl. June, July. Clt. 1800. Pl.  $\frac{1}{2}$  foot.

20 *A. BAYONNE'NSIS* (Lois. fl. gall. 247.) plant diffusely-procumbent, somewhat tomentose from white, adpressed down; stipulas concrete, opposite the leaves; peduncles 4-6-flowered, about equal in length to the leaves; legumes almost sessile, rather tumid, tomentose, twice the length of the breadth.  $\mathfrak{H}$ . II. Native of the west of France, in sand by the sea-coast, at Bayonne. D. C. fl. fr. suppl. 573. *A. Austriacus*, Thore, but not of Lin. Flowers bluish-purple.

*Bayonne* Milk-Vetch. Fl. July, Aug. Clt. 1816. Pl. pr.

21 *A. VERRUCOSUS* (Moris, elench. sard. p. 12.) plant pilose and decumbent; stipulas concrete, opposite the leaves, lanceolate-subulate; leaves with 10-12 pairs of ovate-oblong leaflets; racemes longer than the leaves, many-flowered; legumes arched, oblong, acuminate, rather mucronulate, pilose.  $\odot$ . II. Native of Sardinia. Flowers purple.

*Warted-podded* Milk-Vetch. Pl. decumbent.

22 *A. MACROPTERUS* (D. C. prod. 2. p. 283.) plant erect and smoothish; young stipulas concrete and opposite the leaves, but at length becoming free; leaflets linear-lanceolate, acute; peduncles 2 or 3 times the length of the leaves; flowers nodding, disposed in interrupted spikes; wings much longer than the keel, and about equal in length to the vexillum; legumes oval-linear, straight, glabrous, apiculated by the style, hardly double the length of the calyx.  $\mathfrak{H}$ . II. Native of Dahuria and Siberia. *Astragalus* and *Oxytropis macroptera*, Fisch. in litt. but there is no mucrone on the keel to be seen. Flowers purple.

*Long-winged* Milk-Vetch. Pl. 1 foot.

23 *A. VAGINATUS* (Pall. astr. no. 49. t. 36.) plant erect, pubescent; stipulas concrete, opposite the leaves; leaflets linear-lanceolate, acute; peduncles longer than the leaves; flowers drooping, disposed in dense spikes; legumes linear, straight.  $\mathfrak{H}$ . H. Native of Siberia, at the Uba, Jenesees, and Baikal. Flowers of a whitish-purple colour, or white and purple mixed. This species is very nearly allied to *A. versicolor*, and probably only the same. The plant is also a native of North America.

*Sheathed-stipuled* Milk-Vetch. Pl. 1 foot.

24 *A. VERSICOLOR* (Pall. astr. no. 48. t. 35.) plant erect and glabrous; stipulas concrete, opposite the leaves; leaflets linear,

acute; peduncles bearing a crowded spike of flowers each, which is longer than the leaves; flowers drooping; legumes triquetrous, erect, glabrous.  $\mathfrak{H}$ . II. Native of eastern Siberia, on rocks. Flowers pale-blue at first, but at length changing to a deeper blue. It is probably not distinct from *A. vaginatus*.

*Partly-coloured-flowered* Milk-Vetch. Pl.  $\frac{1}{2}$  to 1 foot.

25 *A. TAURI'CUS* (Pall. astr. no. 51. t. 38. exclusive of the synonymes) plant spreading and tufted, clothed with adpressed silky down; leaflets linear, acute; stipulas membranous, concrete, opposite the leaves; peduncles spicate, thrice the length of the leaves; legumes ovate, acute, 2-4-seeded.  $\mathfrak{H}$ . H. Native of Tauria, in gravelly or chalky places. Flowers purple, varying to white, ex Bieb. taur. 2. p. 192. *Oxytropis Tauricus*, Pers. ench. exclusive of the synonymes. *A. cretæus*, Pall. ined. taur.

*Taurian* Milk-Vetch. Fl. Ju. Jul. Clt. 1826. Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  ft.

$\S$  2. *Dissitiflora* (from *dissitus*, distant, and *flos*, a flower; in reference to the flowers being distant in the racemes). D. C. prod. 2. p. 284. *Stipulas distinct, not adhering to the petiole. Flowers purplish or white, distant in the racemes. Legumes straight.*

26 *A. AUSTRIACUS* (Lin. spec. 1070.) plant diffusely procumbent; leaflets glabrous, linear, truncately-emarginate; racemes pedunculate, longer than the leaves; wings of corolla bifid; legumes somewhat triquetrous, pendulous.  $\mathfrak{H}$ . II. Native of Spain, Dauphiny, Austria, Italy, Tauria, in dry exposed places, and of Russia, on the banks of the Volga. Jacq. austr. 195. Vind. 263. D. C. astr. no. 1. *A. dichópterus*, Pall. astr. t. 39. Allied to *Oxytropis dichóptera*. Flowers with a blue-vexillum, but the rest purple.

*Austrian* Milk-Vetch. Fl. May, June. Clt. 1640. Pl. diff.

27 *A. OLÓPTERUS* (D. C. prod. 2. p. 284.) plant diffuse; leaves with 6-7 pairs of linear, glabrous, entire, acutish leaflets; racemes pedunculate, twice or thrice the length of the leaves; wings of corolla obtuse.  $\mathfrak{H}$ . H. Native of the Altaian mountains, and in the Kirghisean steppe. *A. Austriacus*, Fisch. in litt. The plant is very like the *A. Austriacus*, but differs in the wings of the corolla being entire; also like *A. melilotoides*, but differs from it in the leaves having many pairs of leaflets. The flowers are pale, according to the dried specimen.

*Entire-winged* Milk-Vetch. Fl. Ju. Jul. Clt. 1817. Pl. diff.

28 *A. MELILOTIDES* (Pall. itin. ed. gall. t. 33. f. 1. and 2. astr. t. 41.) plant erect, glabrous; leaflets 5, oblong, emarginate; racemes pedunculate, thrice the length of the leaves; wings of corolla entire; legumes erect, ovate, didymous, 2-seeded, wrinkled.  $\mathfrak{H}$ . II. Native of Siberia, Altaia, Dahuria, and China. D. C. astr. no. 37. Flowers purple.

*Melilot-like* Milk-Vetch. Pl. 2 to 3 feet.

29 *A. SULCATUS* (Lin. spec. 1065.) plant erect, glabrous; stem furrowed; leaflets linear-lanceolate; racemes pedunculate, longer than the leaves; wings of corolla entire; legumes erect, rather triquetrous, half bilocular.  $\mathfrak{H}$ . II. Native of Siberia, in grassy places, and the Tartarian desert. Jacq. hort. vind. t. 40. D. C. astr. no. 35. *Tium lineare*, Moench. *A. leptostachys*, Pall. astr. t. 40. but not of Willd. Flowers pale-violet but with a white keel, tipped with brown.

*Furrowed-stemmed* Milk-Vetch. Fl. July. Clt. 1783. Pl. 2 to 3 feet.

30 *A. CRA'CCA* (D. C. astr. no. 2. t. 9.) plant diffuse; leaflets oval-oblong, emarginate, pubescent; racemes pedunculate, about equal in length to the leaves; wings of corolla entire; legumes pendulous, stipitate, ovate-oblong, compressed, half-bilocular.  $\mathfrak{H}$ . G. Native of Peru.

*Cracca-like Milk-Vetch.* Pl. diffuse.

31 *A. PROSTRATUS* (Hook. in Beech. voy. p. 18.) plant diffuse; leaflets pubescent, obtuse; stipulas concrete, but free from the petiole; racemes pedunculate, much longer than the leaves; flowers loose, almost sessile; calyxes clothed with black pubescence.  $\mathcal{A}$ .  $\mathcal{G}$ . Native of Chili, about Conception. Flowers purple.

*Prostrate Milk-Vetch.* Pl. prostrate.

32 *A. GRACILIS* (Nutt. gen. amer. 2. p. 100.) plant erect, slender, pubescent; leaflets oblong-linear, remote; racemes pedunculate, longer than the leaves; legumes very short, drooping, elliptic-ovate, rather triquetrous, pubescent, 1-celled, usually containing 4 seeds.  $\mathcal{A}$ . II. Native of North America, on the plains on the banks of the Missouri. *A. tenellus*, Pursh. fl. amer. sept. 2. p. 473. *Ervum multiflorum*, ibid. p. 739. *Dalea parviflora*, ibid. p. 474. according to Nuttall. *Psoralea parviflora*, Poir. suppl. 4. p. 590. Flowers pale purple.

*Slender Milk-Vetch.* Fl. June, July. Clt. 1821. Pl. 2 ft.

33 *A. FLEXUOSUS* (Doug. mss.) plant erect, flexuous, downy in a young state; stipulas distinct; leaflets distant, linear, obtuse, beset with close-pressed hairs beneath; flowers distant, racemose; calyx smoothish; bracteas not much longer than the pedicels.  $\mathcal{A}$ . II. Native of North America, near the Columbia river. Flowers purple. Plant with the habit of *Vicia cracca*.

*Var.  $\beta$ , alba* (Doug. mss.) flowers white.

*Flexuous-stemmed Milk-Vetch.* Pl. 1 foot.

34 *A. INFLEXUS* (Doug. mss.) plant white and woolly; stems flexuous; stipulas distinct; leaves with numerous pairs of oblong-lanceolate leaflets; racemes pedunculate, longer than the leaves; flowers remote; bracteas subulate, longer than the tube of the calyx; legumes curved upwards, very woolly.  $\mathcal{A}$ . II. Native of North America, on the banks of the Columbia river. Flowers large, purple.

*Inflexed-podded Milk-Vetch.* Pl. 1 foot.

35 *A. COLLINUS* (Doug. mss.) plant puberulous, erect; stipulas joined? leaves with numerous pairs of obovate-lanceolate emarginate leaflets; racemes on long peduncles; flowers distant; bracteas subulate, twice the length of the pedicels; legumes straight, between terete and compressed.  $\mathcal{A}$ . II. Native of North America, near the Columbia river. Flowers purple.

*Hill Milk-Vetch.* Pl. 1 to 2 feet.

36 *A. SUCULENTUS* (Rich. in Frankl. trav. p. 226.) plant prostrate, pubescent; leaflets 21-25, oblong-obovate, slightly emarginate; stipulas distinct; racemes shorter than the leaves; flowers remote; bracteas ovate, acute, longer than the pedicel; calyx beset with black hairs.  $\mathcal{A}$ . II. Native of North America, in the vicinity of the Saskatchewan river, and in the Arctic region. Lindl. bot. reg. 1324. Flowers large, purplish, with an oblong vexillum.

*Succulent Milk-Vetch.* Fl. June. Clt. 1826. Pl. prostrate.

37 *A. SUBULATUS* (Bieb. fl. taur. no. 1480. but not of Desf.) plant diffuse and hoary from white pili; leaflets linear; racemes pedunculate, loose, longer than the leaves; the lower flowers remote; legumes subulate, triquetrous, rather arched, erectish, 5 times the length of the calyx.  $\mathcal{A}$ . II. Native of Tauria and Siberia, in fields. *A. subuliformis*, D. C. astr. no. 33.

*Var.  $\alpha$ , major* (D. C. prod. 2. p. 284.) flowers approximate, purple. Pall. astr. t. 20.

*Var.  $\beta$ , macilentus* (D. C. l. c.) flowers fewer, remote, and purple. Pall. astr. t. 20.

*Var.  $\gamma$ , Tartariensis* (D. C. l. c.) flowers fewer, and cream-coloured. Native of Caucasus, on the banks of the Volga and the Don. Perhaps a distinct species.

*Subulate-podded Milk-Vetch.* Fl. Ju. Jul. Clt. 1820. Pl. dif.

38 *A. CORNICULATUS* (Bieb. pl. ross. cent. 1. t. 45. ex suppl. fl. taur. 492.) plant procumbent, suffruticose, hoary, and pilose;

leaflets linear; peduncles longer than the leaves, few-flowered; flowers umbellate; legumes subulate, triquetrous, rather arched, and much spreading.  $\mathcal{A}$ .  $\mathcal{h}$ . H. Native of Bessarabia, about Odessa, and of the south of Podolia. Flowers purple.

*Horned-podded Milk-Vetch.* Pl. procumbent.

39 *A. CERATOIDES* (Bieb. suppl. 492.) plant depressed, clothed with silky villi; leaflets oblong-elliptic; peduncles longer than the leaves; racemes somewhat capitate; legumes subulate, triquetrous, erect, 4-times longer than the calyx, clothed with adpressed bristles.  $\mathcal{A}$ . H. Native of Siberia, on the Altaian mountains. *A. subulatus Altaicus*, Pall. astr. no. 27. t. 20. A. Flowers purple.

*Horn-like-podded Milk-Vetch.* Pl. depressed.

40 *A. MACROLOBUS* (Bieb. suppl. 493.) plant depressed, clothed with white adpressed hairs; leaflets oblong-elliptic; peduncles rather longer than the leaves; racemes somewhat capitate; legumes subulate, triquetrous, erect, beset with adpressed bristles, thrice the length of the calyx.  $\mathcal{A}$ . H. Native of Siberia, on the Altaian mountains, and on the banks of the Yenesee, in the Kirghisean-steppe. Flowers white.

*Long-podded Milk-Vetch.* Pl. depressed.

41 *A. VIRGATUS* (Pall. astr. t. 18. exclusive of the synonymes,) plant erect, suffruticose, rather canescent; leaves with about 6 pairs of linear-lanceolate acute leaflets; racemes spicate, much elongated; the lower flowers very remote; legumes oblong, triquetrous, twice the length of the calyx.  $\mathcal{h}$ .  $\mathcal{A}$ . II. Native of Hungary, Tauria, Tartary, at the Volga, and at the Caspian sea, in sandy places. *A. varius*, Gmel. jun. trav. 2. p. 116. t. 17. D. C. astr. no. 34. *A. virgatus*, Bieb. fl. taur. and suppl. no. 465. Flowers purple.

*Var.  $\beta$ , Uralensis* (D. C. prod. 2. p. 285.) stems shorter than the peduncles; racemes few-flowered.  $\mathcal{h}$ .  $\mathcal{A}$ . II. Native of the Ural mountains. *A. subulatus, Uralensis*, Pall. astr. t. 20. C. ex Bieb. suppl. 493. Perhaps a proper species.

*Twiggy Milk-Vetch.* Fl. May, Aug. Clt. 1806. Pl. 1 to 3 feet.

42 *A. HYRCANUS* (Pall. astr. no. 29. t. 22.) plant erect, suffruticose, pubescent; leaves with 3 pairs of linear acute leaflets; racemes usually 5-flowered, hardly longer than the leaves; legumes oblong, mucronate, villous, twice the length of the calyx.  $\mathcal{A}$ .  $\mathcal{h}$ . II. Native on the shores of the Caspian sea, at Derbent. Flowers purple. Perhaps only a variety of *A. virgatus* according to Bieberstein.

*Hyrcanian Milk-Vetch.* Pl. 1 to 2 feet.

43 *A. BRACHYLOBUS* (D. C. prod. 2. p. 285.) plant erectish; shrubby at the base, clothed with adpressed silky white down; leaves with 2-3 pairs of linear acute leaflets; racemes pedunculate, much longer than the leaves, 6-8-flowered; legumes oblong, pubescent, mucronate by the style, hardly longer than the calyx.  $\mathcal{h}$ . H. Native of Siberia, at Lake Inderskoi. Flowers purple? Allied to *A. virgatus* according to Fischer. Leaflets 12-15 lines long.

*Short-podded Milk-Vetch.* Pl. 1 foot.

44 *A. ANNUUS* (D. C. astr. no. 25.) plant rather diffuse, and rather glabrous; leaflets linear; racemes longer than the leaves; flowers spreading; vexillum twice the length of the wings.  $\odot$ . II. Native country as well as the legumes unknown. Perhaps belonging to a different section of the genus.

*Annual Milk-Vetch.* Pl. diffuse.

45 *A. BIFLORUS* (Viv. fl. lyb. 44. t. 20. f. 1.) plant erect, clothed with canescent hairs; stipulas very short; leaves with 5-6 pairs of elliptic leaflets; peduncles longer than the leaves, usually bearing only 2 flowers; calyx covered with stiff black hairs.  $\odot$ . II. Native of Cyrenaica. Flowers blue. The legume being unknown, the place which the plant should occupy in the genus is doubtful.

*Two-flowered Milk-Vetch.* Pl.  $\frac{1}{2}$  to 1 foot.

§ 3. *Onobrychoidei* (from *onobrychis*, *saintfoin*, and *idea*, like. The plants contained in the division agree with *Saintfoin* in habit). D. C. prod. 2. p. 285. *Stipulas distinct, and free from the petioles. Flowers purplish, disposed in dense spikes or heads. Vexillum of flowers linear and elongated. Legumes straight, rarely falcate. Roots perennial.*

\* *Legumes curved.*

46 A. LEPTOPHYLLUS (Desf. atl. 2. p. 188. t. 207.) plant procumbent, suffrutescent, and rather pubescent; leaflets obcordate; racemes longer than the leaves; legumes pendulous, falcate, compressed, when young pubescent.  $\mathcal{U}$ . II. Native of Barbary, on the mountains. A. Tunetanus, Willd. spec. 3. p. 1277. Flowers white.

*Slender-leaved Milk-Vetch.* Fl. June, July. Clt. 1811. Pl. procumbent.

47 A. ORNITHOPODIODES (Lam. dict. 1. p. 312.) plant suffrutescent, tufted and diffuse, hoary and villous; leaflets ovate; racemes longer than the leaves; legumes pendulous, falcate, compressed.  $\mathcal{U}$ . H. Native of Armenia. Flowers yellowish. D. C. astr. no. 4.

*Ornithopus-like Milk-Vetch.* Pl. diffuse.

48 A. DAHURICUS (D. C. prod. 2. p. 285.) plant herbaceous, erect, pilose; stipulas lanceolate-subulate; leaflets oblong, mucronate, 7-9 pairs; racemes longer than the leaves; legumes erect, incurved, linear, compressed, rather pilose.  $\mathcal{U}$ . II. Native on the banks of rivers from Dauria to China. *Galèga Dahurica*, Pall. itin. 3. append. no. 107. t. W. f. 1. ed. gall. append. no. 369. t. 81. f. 3. Flowers purple. The teeth of the calyx are subulate, as in *Galèga*, but the stamens are diadelphous, and the legumes are bilocular.

*Dahurian Milk-Vetch.* Fl. July. Clt. 1822. Pl. 1 to 2 feet.

49 A. LENTIGINOSUS (Dougl. mss.) plant smooth, prostrate; stipulas membranous, distinct; leaflets obovate-roundish; racemes about the length of the leaves; legumes smooth, inflated, curved at the end, and ending in a long beak.  $\mathcal{U}$ . II. Native of North West America, on the Blue mountains. Flowers apparently purple.

*Freckled Milk-Vetch.* Pl.  $\frac{3}{4}$  foot.

50 A. STEVENIANUS (D. C. prod. 2. p. 285.) plant erect, glabrous, slender, few-leaved; leaflets linear, distant, 4 or 5 pairs; spikes pedunculate, few-flowered, longer than the leaves; flowers rather distant; legumes linear, elongated, falcate, slender, acute, and glabrous.  $\mathcal{U}$ . H. Native of Iberia, Caucasus, and Asia Minor. A. gracilis, Stev. ined. but not of Nutt. Flowers purple, almost like those of *A. onobrychis*, but the habit of the plant is that of *A. varius*.

*Steven's Milk-Vetch.* Pl. 1 foot.

\* \* *Legumes straight.*

51 A. MACROSTACHYUS (D. C. astr. no. 38. t. 15.) plant shrubby, erect, pubescent; leaves with about 12 or 14 pairs of linear leaflets; spikes pedunculate, elongated, many-flowered, much longer than the leaves; vexillum longer than the wings; legumes ovate, compressed, hairy.  $\mathcal{U}$ . II. Native of Armenia. A. hedysaroides, Willd. spec. 3. p. 1264. Pers. ench. 2. p. 337. no. 46. and *Oxytropis hedysaroides*, Pers. ench. 2. p. 334. no. 44. Calyx tubular, pilose. Flowers purple.

*Long-spiked Milk-Vetch.* Pl.  $\frac{1}{2}$  foot.

52 A. LINEARIFOLIUS (Pers. ench. 2. p. 336.) plant erect, pubescent; leaflets linear, acute, about 10 or 12 pairs; racemes much longer than the leaves; vexillum broad, twice the length of the wings.  $\mathcal{U}$ . II. Native of Siberia. Sweet, fl. gard. t. 73. A. *Onobrychis angustifolius*, D. C. astr. no. 24. A. tenuifolius, Lin. spec. 1065. Flowers purple.

VOL. II.

*Linear-leafletted Milk-Vetch.* Fl. July, Aug. Clt. 1780. Pl. 1 foot.

53 A. PECTINATUS (Dougl. mss.) plant erect, pubescent; leaflets filiform; racemes dense-flowered, pedunculate, longer than the leaves; bractees a little longer than the pedicels.  $\mathcal{U}$ . H. Native of North America, in the pastures of the Saskatchewan, &c. *Phaca pectinata*, Hook. fl. bor. amer. 141. t. 54. Flowers large, purple.

*Pectinated-leaved Milk-Vetch.* Pl. 1 foot.

54 A. ONOBRYCHIS (Lin. spec. 1070.) plant diffuse or erect, pubescent; leaves with 7-16 pairs of oblong leaflets; spikes of flowers oblong-ovate, pedunculate, longer than the leaves; vexillum linear, twice the length of the wings; legumes ovate, triquetrous, rather villous, erect, twice the length of the calyx, ending in a straight point; cells 4-seeded.  $\mathcal{U}$ . II. Native of Europe and Siberia. D. C. astr. no. 24. Bieb. fl. taur. no. 1482. Flowers purple. An elegant plant. Of all the varieties there are white flowers.

*Var. a, alpinus* (D. C. prod. 2. p. 286.) plant dwarf; leaflets linear; spikes ovate.  $\mathcal{U}$ . H. Native of Austria. Jacq. fl. austr. t. 38. Plant procumbent.

*Var. b, Moldavicus* (D. C. l. c.) plant dwarf; leaflets ovate-oblong, glabrous; spikes of flowers ovate.  $\mathcal{U}$ . II. Native of Moldavia. Plant procumbent.

*Var. c, microphyllus* (Bess. in litt. D. C. l. c.) plant dwarf; leaflets linear; spikes of flowers ovate-oblong.  $\mathcal{U}$ . H. Native of Podolia. Plant procumbent.

*Var. d, major* (D. C. l. c.) plant erect; leaflets ovate or oblong; spikes of flowers oblong.  $\mathcal{U}$ . H. Native of Siberia. A. *onobrychis stipulaceus et maximus*, D. C. astr. no. 24. Gmel. sib. 4. t. 21.

*Saintfoin-like Milk-Vetch.* Fl. June, July. Clt. 1610. Pl.  $1\frac{1}{2}$  foot, or procumbent.

55 A. ADPERCUS (Bieb. fl. taur. 2. p. 195. plant. ross. cent. 2. t. 80.) plant diffuse and hoary; leaves with 5-10 pairs of elliptic small leaflets; spikes short, pedunculate, longer than the leaves; vexillum much longer than the wings; legumes ovate-oblong, rather villous, ending in a long oblique acumen.  $\mathcal{U}$ . II. Native of Caucasus, among broken rocks. Flowers purple. Very like the preceding species.

*Hooked-podded Milk-Vetch.* Fl. June, July. Clt. 1819. Pl. diffuse.

56 A. FLACCIDUS (Bieb. fl. taur. 2. p. 196.) plant procumbent and villous; leaves with 8 or 10 pairs of elliptic, somewhat emarginate leaflets; spikes few-flowered, pedunculate, about equal in length to the leaves; vexillum much longer than the wings; legumes triquetrous, prismatic, erect, acute, hairy.  $\mathcal{U}$ . II. Native of Iberia, very common. A. hybridus, Gmel. trav. 1. t. 18. ? A. *vimineus* var. Pall. astr. no. 28. Flowers purple. Legume bent downwards at the apex.

*Flaccid Milk-Vetch.* Pl. procumbent.

57 A. VIMINEUS (Pall. astr. no. 28. t. 21.) plant erect, suffrutescent; leaves with 4-6 pairs of lanceolate acute leaflets; spikes somewhat capitate, pedunculate, longer than the leaves; vexillum much longer than the wings; legumes spreading; oblong-lanceolate, villous, apiculated by the style.  $\mathcal{U}$ . II. Native of Siberia, Iberia, and about Odessa. A. cornutus, Pall. itin. 2. app. p. 499. no. 122. A. *Odessanus*, Bess. enum. no. 944. ex cont. 2. no. 1575. Stems glabrous. Leaves beset with adpressed pubescence. Calyx clothed with black hairs. Corolla purple? Legume clothed with white hairs.

*Twiggy Milk-Vetch.* Fl. June, Aug. Clt. 1816. Pl. 1 foot.

58 A. FRUTICOSUS (Pall. astr. no. 26. t. 19. but not of Forsk.) plant shrubby, erect; leaves with 8-10 pairs of linear-lanceolate acute leaflets; spikes capitate, few-flowered, pedunculate, longer than the leaves; vexillum much longer than the wings;

L 1

legumes erect, oblong-lanceolate, villous, apiculated by the style.  $\frac{1}{2}$  F. Native of Eastern Siberia, and beyond the Baikal. D. C. astr. no. 27.—Gmel. sib. 4. t. 24. f. A. Flowers white, tipped with purple. Very like the preceding species.

*Shrubby Milk-Vetch.* Fl. June, July. Clt. 1804. Sh. 1 ft.

59 A. ARBUSCULA (Pall. astr. no. 24. t. 17.) plant erect, shrubby; leaves with 3 pairs of linear acute leaflets; spikes of flowers capitate, pedunculate, twice the length of the leaves; vexillum much longer than the wings; legumes spreading, elongated, linear, channelled on the back, clothed with adpressed pubescence.  $\frac{1}{2}$  F. Native of Siberia, in the Kirghisean steppe. Flowers purple. Habit of the two preceding species.

*Little-tree Milk-Vetch.* Shrub.

60 A. SUFFRUTICOSUS (D. C. astr. no. 5. exclusive of the synonymes,) plant diffuse, suffruticose, villous; leaflets ovate-oblong, 7-10-pairs; spikes capitate, few-flowered, pedunculate, about equal in length to the leaves; vexillum a little longer than the wings; calyx rather inflated and villous.  $\frac{1}{2}$  F. Native of Siberia, beyond the Baikal. Flowers purple. Perhaps this species belongs to a different section.

*Suffruticose Milk-Vetch.* Shrub.

61 A. ABORIGINORUM (Richards. in Frankl. journ. append. p. 746.) plant suffruticose, erect; leaves with 5 pairs of lanceolate-linear hoary-pubescent leaflets; racemes axillary, loose, exceeding the leaves.  $\frac{1}{2}$  H. Native of Arctic America. Flowers white or bluish; the keel decidedly blue. The roots are long and yellow like liquorice. The Crees and Stone Indians gather them in the spring as an article of food.

*Aborigin's Milk-Vetch.* Shrub 1 foot.

62 A. ADSURGENS (Pall. astr. no. 44. t. 31.) plant ascending, smoothish; leaves with 11-12 pairs of lanceolate acute leaflets; stipulas acuminate, length of leaves; spikes of flowers oblong, pedunculate, longer than the leaves; vexillum longer than the wings; legumes oblong, terete, and somewhat tetragonal, sulcate on the back, apiculated by the style, erect, clothed with adpressed pubescence.  $\frac{1}{2}$  H. Native of Siberia beyond the Baikal. Flowers bluish purple.

*Var.  $\beta$ , prostratus* (Fisch. hort. gor.) stems prostrate.  $\frac{1}{2}$  H. Native of Siberia about Irkutsk.

*Assurgent Milk-Vetch.* Fl. June, July. Clt. 1818. Pl. asc.

63 A. LAXMANNI (Jacq. hort. vind. 3. p. 37.) plant erect or diffuse, smoothish; leaves with 11-13 pairs of oblong-lanceolate leaflets; spikes of flowers pedunculate, oblong, longer than the leaves; vexillum much longer than the wings; legumes oblong, trigonal, mucronate, having a furrow on the back.  $\frac{1}{2}$  H. Native of Siberia and North America, on the plains of the Missouri river. Flowers pale-purple or pale-blue. A. Laxmanni of Pall. astr. t. 30. differs in its more rigid habit. The American plant appears to be upright. Jacquin's one is procumbent.

*Laxmann's Milk-Vetch.* Fl. July, Aug. Clt. 1804. Pl.  $1\frac{1}{2}$  foot or procumbent.

64 A. AGRESTIS (Dougl. mss.) stem erect, smooth; leaflets ovate-lanceolate, obtuse, beset with adpressed hairs; peduncles elongated, longer than the leaves; spikes of flowers capitate; calyx villous; bractæ lanceolate, not half so long as the calyx.  $\frac{1}{2}$  H. Native of North America, near the Columbia river in fields. Flowers purple.

*Field Milk-Vetch.* Pl. 1 foot.

65 A. DORYENIODES (Dougl. mss.) plant erect, densely clothed with hoary silky villi; leaflets obovate-linear, obtuse; calyx smooth; racemes longer than the leaves.  $\frac{1}{2}$  H. Native of North America, near the Columbia river. Flowers purple. An elegant plant.

*Doryenium-like Milk-Vetch.* Pl. 1 foot.

66 A. MICROCARPUS (D. C. astr. no. 29.) plant erect, glabrous; leaves with 10-12 pairs of elliptic leaflets; spikes of

flowers capitate, pedunculate, equal in length to the leaves; vexillum oblong, a little longer than the wings; legumes ovate, compressed, pubescent, rather acute.  $\frac{1}{2}$  H. Native of Siberia, in plains near the river Obi. Flowers purple.

*Small-fruited Milk-Vetch.* Pl. 1 foot.

67 A. BARBATUS (Lam. dict. 1. p. 314.) plant erect, clothed with canescent hairs; leaves with 6-8 pairs of linear-lanceolate leaflets; spikes of flowers ovate, on short peduncles; teeth of calyx subulately-filiform, longer than the corolla, clothed with stiff villi; vexillum linear, much longer than the wings.  $\frac{1}{2}$  H. Native of Armenia. D. C. astr. no. 12. A. hispidus, Labill. syr. dec. 1. t. 8. Flowers purple.

*Bearded Milk-Vetch.* Pl.  $\frac{1}{2}$  foot.

68 A. LABRADORICUS (D. C. prod. 2. p. 287.) plant procumbent, clothed with minute pubescence; leaflets ovate; spikes of flowers pedunculate; legumes secund, straight, acuminate at both ends, pendulous.  $\frac{1}{2}$  H. Native of the north of Canada and of Labrador. A. secundus, Michx. fl. bor. amer. 2. p. 67. but not of D. C. Flowers of a deep purple-colour. Perhaps belonging to a different section.

*Labrador Milk-Vetch.* Pl. procumbent.

69 A. MISSOURIENSIS (Nutt. gen. amer. 2. p. 99.) plant almost stemless, rather diffuse, clothed with canescent villi; stipulas ovate; leaves with 5-10 pairs of small obovate-elliptic leaflets; spikes of flowers capitate, standing on peduncles, which are a little longer than the leaves; calyx covered with black hairs; legumes oblong, acuminate, transversely-dilated, nearly glabrous, half-bilocular.  $\frac{1}{2}$  H. Native of Upper Louisiana, on hills about the Missouri. Oxýtropis argentatus, Pursh, fl. sept. amer. 2. p. 473. exclusive of the synonymes. Flowers purple, but there is a variety with white flowers also. Perhaps belonging to a different section.

*Missouri Milk-Vetch.* Pl.  $\frac{1}{2}$  foot.

70 A. CARYOCARPUS (Ker. bot. reg. t. 176.) plant having numerous, prostrate, assurgent stems, rising from the same root, clothed in every part with hoary-silky down; stipulas ovate, acute; leaves with 9-12 pairs of elliptic leaflets; peduncles shorter than the leaves; racemes loose-flowered; legumes nut-formed, inflated, fleshy, mucronate, glabrous, many-seeded.  $\frac{1}{2}$  H. Native of Louisiana. A. crassicaerpus, Fras. cat. 1813. A. carnosus, Nutt. gen. amer. 2. p. 100. but not of Pursh. Flowers of a pale-violet colour. Perhaps belonging to a different division of the genus.

*Nut-fruited Milk-Vetch.* Fl. June, July. Pl. prostrate.

§ 4. *Sesàmei* (Sensen is the Arabic name of some species). D. C. prod. 2. p. 287. Stipulas distinct, not adhering to the petiole. Flowers purplish, disposed in dense spikes or heads. Legumes straight. Roots annual.

71 A. PENTAGLÓTTIS (Lin. mant. 274.) plant diffusely-procumbent, rather villous; stipulas ovate; leaves with 4-9 pairs of obovate retusely-emarginate leaflets; peduncles rather longer than the leaves; legumes half-ovate, somewhat triquetrous, echinated with tubercles, which are usually piliferous, disposed in heads; cells 1-celled.  $\odot$  H. Native of Spain and Barbary, on hills. D. C. astr. no. 16. Cav. icon. t. 188. A. cristatus, Gouan. ill. 59. A. echinatus, Lam. A. procumbens, Mill. A. dasyglóttis, Pall. Flowers blue and white.

*Five-tongued or Five-podded Milk-Vetch.* Fl. Ju. Jul. Pl. pr.

72 A. GLAUX (Lin. spec. 1097.) plant procumbent, clothed with canescent villi; stipulas ovate-lanceolate; leaves with 8-13 pairs of small, oblong, acutish leaflets; peduncles longer than the leaves; vexillum linear; legumes erect, ovate, triquetrous, mucronate, villous, disposed in heads; cells 1-seeded.  $\odot$  H. Native of Spain and the south of France, in arid places. D. C. astr. no. 22.—Clus. hist. 2. p. 242. with a figure. Allied to the smaller

variety of *A. hypoglôttis*, but differs in the stipulas being free, not connate. Flowers purplish.

*Milwort Milk-Vetch.* Fl. June, July. Clt. 1596. Pl. procumbent.

73 *A. OXYGLÔTTIS* (Stev. in Bieb. fl. taur. 2. p. 102.) plant diffuse, puberulous; stipulas subulate; leaves having 5-9 pairs of oblong emarginate leaflets; peduncles length of leaves, or rather shorter; legumes sulcate, acute, rather hoary, disposed in stellate heads; cells 6-seeded. ☉. H. Native of Tauria, on hills about Sudak. *A. sesàmæus*, Pall. astr. no. 104. exclusive of the synonymes. Flowers unknown, but probably blue.

*Sharp-tongued or Sharp-podded Milk-Vetch.* Fl. June, July. Clt. 1817. Pl. diffuse.

74 *A. PSILOGLÔTTIS* (Stev. in litt. D. C. prod. 2. p. 288.) plant diffuse or rather procumbent; stipulas linear-subulate; leaflets cuneated, emarginate, 6 or 8 pairs, smoothish; peduncles one-half shorter than the leaves, and are, as well as the stems, hoary; legumes spreading, crowded, furrowed, acute, glabrous; cells 3-4-seeded. ☉. H. Native about Astracan. Flowers probably purplish. Perhaps this and the preceding species are referrible to division six, *Annulâres*.

*Smooth-tongued or Smooth-podded Milk-Vetch.* Pl. spread.

75 *A. CRUCIATUS* (Link. enum. 2. p. 256.) plant procumbent, hoary, and villous; stipulas lanceolate; leaves with 6-8 pairs of oblong-linear acutish leaflets; peduncles a little shorter than the leaves; legumes between terete and compressed, dilated at the base, clothed with adpressed villi, and disposed in stellate heads; cells 5-7-seeded. ☉. H. Native of Egypt and Siberia. *A. stëlla*, Bieb. fl. taur. 2. p. 191. ex Fisch. in litt. Flowers violaceous?

*Cross-podded Milk-Vetch.* Fl. June, July. Clt. 1820. Pl. procumbent.

76 *A. STËLLA* (Gouan. ill. 50.) plant diffusely procumbent, clothed with hoary villi; stipulas lanceolate; leaves with 8-10 pairs of elliptic-oblong leaflets; peduncles length of leaves or shorter; legumes almost terete, furrowed on the back, mucronate, hairy, at first in a head, but at length becoming stellately disposed; cells 5-10-seeded. ☉. H. Native of the south of France and of the north of Africa, in arid places. D. C. astr. no. 7.—Lob. icon. 2. t. 83. Flowers bluish-purple. There is a variety of this plant with acute leaflets.

*Star-podded Milk-Vetch.* Fl. Jul. Aug. Clt. 1658. Pl. pr.

77 *A. TRIBULOIDES* (Delill. ill. fl. ægypt. p. 22.) plant diffusely procumbent, or almost stemless, clothed with hoary villi; stipulas lanceolate; leaves with 7-9 pairs of elliptic-oblong leaflets; heads of flowers axillary, sessile; legumes nearly terete, hairy, furrowed on the back, disposed in stellate heads; cells 5-7-seeded. ☉. H. Native of Egypt, in deserts. Perhaps distinct from *A. tribuloides* of Roth. in Horn. hort. hafn. 2. p. 703. Flowers purplish.

*Caltrop-like Milk-Vetch.* Fl. June, Jul. Clt. 1817. Pl. pr.

78 *A. SESA'MEUS* (Lin. spec. 1068.) plant diffuse, villous, and rather canescent; stipulas lanceolate; leaves with 9-10 pairs of elliptic, emarginate leaflets; heads of flowers axillary, sessile; legumes erect, nearly terete, acuminate, villous, furrowed on the back, disposed in heads; cells 7-8-seeded. ☉. H. Native of the south of Europe and the north of Africa. D. C. astr. no. 8. *A. stellatus*, Riv. tetr. irr. t. 106.—Garid. aix. t. 12. Flowers bluish purple.

*Sesame-like Milk-Vetch.* Fl. June, Jul. Clt. 1816. Pl. diff.

§ 5. *Vesicari* (from *vesica*, the bladder; in reference to the calyxes in all the species contained in this division being inflated). D. C. prod. 2. p. 288. *Stipulas distinct, not adhering to the petiole. Flowers purplish or white. Calyxes bladdery.*

79 *A. LINEATUS* (Lam. dict. 1. p. 314.) plant diffusely pros-

trate, clothed with villous pubescence; leaves with 8-10 pairs of elliptic-oblong leaflets; peduncles longer than the leaves; calyxes bladdery, rather villous, lined, and contracted at the mouth, inclosing the legume, which is pilose. ☉. H. Native of the Levant. Vahl. symb. 1. p. 59. D. C. astr. no. 14. t. 11. f. 1. Flowers purplish.

*Lined-calyxed Milk-Vetch.* Pl. prostrate.

80 *A. MEGALANTHUS* (D. C. astr. no. 58. t. 20.) plant diffuse, rather hoary from adpressed down; leaflets oblong-elliptic; peduncles shorter than the leaves; calyxes inflated, clothed with black adpressed down; legumes very hairy, length of calyx. ♀. H. Native of Siberia, about Zmeof. *Cajanus megalanthus*, Spreng. Flowers large, pale. Stipulas sometimes joined together at the very base. Said to be nearly allied to *A. unifolius*.

*Large-flowered Milk-Vetch.* Pl. diffuse.

81 *A. VESICARIUS* (Lin. spec. 1071.) plant diffusely procumbent, hoary from adpressed silky down; leaves with 5-7 pairs of elliptic leaflets; peduncles longer than the leaves; calyx bladdery, clothed with black adpressed down, and long white spreading hairs; legumes hairy, a little longer than the calyx. ♀. H. Native of the south of France, Hungary, and Tauria, in rugged exposed places. Vill. dauph. t. 42. f. 1. D. C. astr. no. 15. Alf. pedem. no. 1269. t. 80. f. 1. *A. albidus*, Walld. et. kit. pl. hung. 1. t. 40. *A. glaucus*, Bieb. fl. taur. 2. p. 186. *A. dealbatus*, Pall. astr. t. 23. f. 1. Flowers having the vexillum purple, the wings yellow, and the keel white, tipped with yellow, rarely with all the petals cream-coloured.

*Bladdery-calyxed Milk-Vetch.* Fl. July, Aug. Clt. 1737. Pl. diffuse.

82 *A. ALBICAULIS* (D. C. astr. no. 59. t. 21.) plant tufted and erectish, suffruticose at the base, canescent from adpressed down; leaves with 3-4 pairs of ovate leaflets; peduncles a little longer than the leaves; calyxes bladdery, clothed with adpressed black down; legumes hairy, ovate, compressed. ♀. H. Native of Russia, between the Volga and the Don, at Sarepta, also of Caucasus and Tauria. *A. dealbatus*, Pall. astr. no. 30. t. 23. f. 2 and 3. Willd. spec. 3. p. 1263. Bieb. fl. taur. no. 1463. *Oxytropis dealbatus*, Pers. Flowers white or pale yellow.

*White-stemmed Milk-Vetch.* Pl.  $\frac{1}{2}$  foot.

83 *A. ARGENTUS* (Bertol. ined. ex Vis. pl. dalm. in bot. zeit. p. 18.) plant silky; stems diffusely procumbent, herbaceous, permanent at the base; peduncles terminal, very long, and loosely racemose; leaves with 5-7 pairs of linear leaflets; stipulas distinct; wings entire, shorter than the vexillum; legume straight, terete, acuminate. ♀. H. Native of Dalmatia. Nearly allied to *A. vesicarius* but differs in the legumes being terete and silky.

*Silvery Milk-Vetch.* Pl. procumbent.

§ 6. *Annulâres* (from *annularis*, of a ring; in reference to the shape of the legumes which are twisted into the form of a ring). D. C. prod. 2. p. 289. *Stipulas distinct, not adhering to the petiole. Flowers purplish or white. Legumes arched. Roots annual.*

84 *A. NUTTALLIANUS* (D. C. prod. 2. p. 289.) plant decumbent; leaflets elliptic, emarginate; peduncles 2-flowered, longer than the petioles; legumes falcate, having 2 keels, glabrous; seeds truncate. ☉. ? ♂. ? ♀. ? H. Native of North America, in plains at Rod river. *A. micranthus*, Nutt. in journ. sc. nat. philad. 1821. p. 122. but not of Desv. Stem a span long. Flowers blue.

*Nuttall's Milk-Vetch.* 11. June, July. Clt. 1822. Pl. dec.

85 *A. CYMBECARROS* (Brot. fl. lus. 2. p. 167. phyt. p. 143. t. 59.) plant herbaceous, procumbent, rather pilose; leaflets orbiculate, cuneated; peduncles length of leaves; legumes gla-

brous, warted, beaked, arched, and most tumid at the base.  $\odot$ . H. Native of Portugal, in barren sandy places. Corolla sometimes white and sometimes purple.

*Boat-fruited Milk-Vetch*. Fl. June, Jul. Clt. 1800. Pl. pr.

86 *A. STRIATELLUS* (Bieb. fl. taur. 2. p. 189.) plant diffuse, glabrous; leaflets cuneiform, somewhat emarginate; peduncles 3-flowered, shorter than the leaves; legumes ovate-oblong, tumid, glabrous, deflexed, a little arched.  $\odot$ . H. Native of Tauria, about Sudak. Bieb. pl. ross. cent. 1. t. 20. ex suppl. no. 1472. Corolla blue or white. Vexillum hardly longer than the wings, and obtuse keel.

*Striped Milk-Vetch*. Pl. diffuse.

87 *A. ANNULARIS* (Forsk. ægypt. 139.) plant diffuse, clothed with cinereous villi; leaflets few, obovate; peduncles few-flowered, length of leaves; young legumes straight, subulate, pubescent, adult ones glabrous, spotted, resupinate and arched.  $\odot$ . H. Native of Egypt. D. C. astr. append. no. 6. t. 7. *A. maculatus*, Lam. dict. 1. p. 316. *A. subulatus*, Desf. fl. atl. 2. p. 186. but not of Pall. Flowers small, rose-coloured.

*Angular-podded Milk-Vetch*. Fl. June, July. Clt. 1800. Pl. diffuse.

88 *A. TRIMORPHUS* (Viv. fl. lyb. p. 44. t. 10. f. 2.) plant erect, and clothed with canescent hairs; lower leaves with 1-3 leaflets, upper ones impari-pinnate, with a few pairs of elliptic-oblong, acute leaflets; peduncles 2-3-flowered, a little longer than the leaves; legumes cylindrical, incurved, clothed with adpressed villi.  $\odot$ . H. Native on the shores of Lybia, in the Great Syrtis. Flowers purple.

*Three-formed Milk-Vetch*. Fl. Ju. Jul. Clt. 1827. Pl.  $\frac{1}{2}$  ft.

89 *A. HISPIDULUS* (D. C. astr. no. 30. t. 13.) plant tufted and rather diffuse, pilose; leaflets elliptic-oblong; peduncles few-flowered, length of leaves; legumes slender, erect, hispid, when young they are straight, but when mature they are arched.  $\odot$ . H. Native of Egypt, in the desert. Flowers pale, with the vexillum elongated.

*Hispid-podded Milk-Vetch*. Pl.  $\frac{1}{4}$  foot.

90 *A. SCORPIOIDES* (Pouff. in Willd. spec. 3. p. 1280.) plant erectly-spreading, pubescent; leaflets oblong, obtuse, emarginate; stipulas lanceolate; flowers axillary, 1-2, almost sessile; legumes hooked, subulate, pubescent.  $\odot$ . H. Native of Spain, about Madrid. *A. subbiflorus*, Lag. Flowers blue. This plant, when growing in a dry place, hardly exceeds an inch in height, but when growing in moist rich places it rises to a foot. Perhaps not distinct from *A. canaliculatus*, of Willd. enum. suppl. 52.

*Scorpion-like-podded Milk-Vetch*. Fl. June, July. Clt. 1816. Pl. 1 inch to 1 foot.

91 *A. MAREOTICUS* (Delil. fl. ægypt. 113. t. 39. f. 3.) plant diffusely-prostrate, rather hispid; leaflets obovate, emarginate; peduncles 3-4-flowered, shorter than the leaves; legumes hooked and arched, almost cylindrical, glabrous, furrowed on the back, almost bilocular.  $\odot$ . H. Native about Alexandria, and in the Marcotic marsh. Flowers lilac.

*Marcotic Milk-Vetch*. Fl. June, July. Clt. 1817. Pl. pr.

92 *A. CORRUGATUS* (Bert. amœn. 38. rar. dec. 3. p. 33.) plant erectly-spreading, rather pubescent; leaflets oblong-cuneate, emarginately bidentate at the apex; peduncles usually 1-flowered, about equal in length to the leaves; legumes arched, furrowed on the back, quite smooth, transversely and reticulately wrinkled.  $\odot$ . H. Native of Egypt. *A. cruentus*, Balb. cat. taur. append. 1. p. 8. *A. crenatus*, Schultes, obs. 186. Flowers blue or purplish.

*Wrinkled-podded Milk-Vetch*. Pl.  $\frac{1}{2}$  foot.

93 *A. RETICULATUS* (Bieb. suppl. fl. taur. 491.) plant diffuse and glabrous; leaflets oblong-cuneate and emarginate; peduncles usually 5-flowered, shorter than the leaves; legumes hooked,

subulate, furrowed on the back, quite smooth, transversely and reticulately veined.  $\odot$ . H. Native of Middle Iberia, at Sarepta. Flowers blue. A very small plant.

*Reticulated-podded Milk-Vetch*. Fl. June, July. Clt. 1828. Pl.  $\frac{1}{8}$  foot.

94 *A. CANALICULATUS* (Willd. enum. suppl. 52.) stems erect; leaflets oblong, retuse; stipulas ovate; flowers axillary, solitary, nearly sessile; legumes hooked, profoundly channelled on the back.  $\odot$ . H. Native of Europe. Flowers white.

*Channelled Milk-Vetch*. Fl. June, July. Clt. 1816. Pl. 1 to 2 feet.

SERIES II. *OCHROLEUCI* (from *ωχρος*, *ochros*, yellow, and *λευκος*, *leucos*, white; the colour of the flowers is between white and yellow, that is cream coloured). D. C. prod. 2. p. 290. Stipulas free from the petiole. Flowers cream-coloured.

§ 7. *Bucerates* (from *βους*, *bous*, an ox, and *κερας*, *keras*, a horn; in reference to the form of the pods). D. C. prod. 2. p. 290. Stipulas neither adhering to the petioles nor together. Flowers cream-coloured. Legumes usually arched. Roots annual.

95 *A. CONTORTUPPLICATUS* (Lin. spec. 1068.) plant procumbent, villously-pubescent; leaflets obovate, emarginate; racemes pedunculate, 4-times shorter than the leaves; legumes contortuplicate, channelled on the back, villous.  $\odot$ . H. Native of Siberia, Tauria, and Hungary, in grassy places. Pall. astr. t. 79.—Gmel. sib. 4. t. 28. D. C. astr. no. 29.—Buxb. cent. 3. p. 22. t. 39. Flowers pale yellow. This plant varies wonderfully in size, according to the soil in which it grows.

*Contortuplicate-podded Milk-Vetch*. Fl. July, Aug. Clt. 1783. Pl. procumbent.

96 *A. TRIMESTRIS* (Lin. spec. 1073. but not of Bieb.) plant diffuse, villously-pubescent; leaflets elliptic, emarginate; peduncles 2-5-flowered, a little shorter than the leaves; legumes hooked, subulate, rather pubescent, broadly furrowed on the back, and 2-keeled.  $\odot$ . H. Native of Egypt and the island of Scio. Jacq. hort. vind. 174. D. C. astr. no. 50. *A. membranaceus*, Moench. *A. hamosus*  $\beta$ , Pall. Flowers pale yellow.

*Three-Monthly Milk-Vetch*. Fl. Ju. July. Clt. 1777. Pl.  $\frac{1}{2}$  ft.

97 *A. HAMOSUS* (Lin. spec. 1067.) plant diffuse, pubescent; leaflets cuneate, emarginate, glabrous above; peduncles usually 6-flowered, shorter than the leaves; legumes hooked, furrowed on the back, almost terete, subulate at the apex, when young pubescent, but when adult smooth.  $\odot$ . H. Native of dry exposed places, from Spain to Tauria, and of Mauritania. Gart. fruct. t. 154. D. C. astr. no. 51.—Moris. oxon. sect. 2. t. 9. f. 10. *A. Austriacus*, Delarb. *A. buceras*, Willd. enum. suppl. p. 51. according to Link. and Fischer. The plant is either prostrate or diffuse, and the peduncles bear from 2-8 flowers; they are pale-yellow. It goes commonly under the name of caterpillars in the gardens, in reference to the shape of the pods.

*Var.  $\beta$ , macrocarpus* (D. C. prod. 2. p. 290.) plant decumbent or erect; peduncles equal in length to the leaves. Led. hort. dorp. p. 23. Legumes 3-times larger than those of the species.

*Hooked-podded Milk-Vetch*. Fl. June, Aug. Clt. 1640. Pl. diffuse.

98 *A. AGICERAS* (Willd. enum. suppl. 52.) plant diffuse and pubescent; leaflets elliptic, emarginate; stipulas lanceolate, acuminate; racemes 8-10-flowered, pedunculate, twice or thrice shorter than the leaves; legumes hooked, compressed at the apex, somewhat pubescent, channelled on the back.  $\odot$ . H. Native country unknown. Flowers pale yellow. Sometimes the plant is erect.

*Goat's-horn-podded Milk-Vetch*. Fl. June, Jul. Clt. 1818. Pl. 1 foot or diffuse.

99 *A. BRACHY CERAS* (Ledeb. cat. hort. dorp. 1822. p. 3.) plant procumbent; leaflets elliptic, mucronate; stipulas ovate; racemes pedunculate, shorter than the leaves; legumes nearly erect, incurved, subulate. ☉. H. Native of the North of Persia, and probably of the south of Tauris. *A. triméstris*, Bieb. fl. taur. 2. p. 190. Legumes much shorter than those of *A. hamdani*, and the plant is also much smaller. Flowers pale yellow.

*Short-horned or podded Milk-Vetch.* Fl. June, July. Clt. 1828. Pl. procumbent.

100 *A. GENICULATUS* (Desf. atl. 2. p. 186. t. 205.) plant diffuse, hoary from villi; stipulas lanceolate; leaves with 5-8 pairs of oblong-elliptic leaflets; peduncles shorter than the leaves, when bearing the fruit they are deflexed; legumes depressed, trigonal, mucronate, a little arched, channelled on the back, hairy. ☉. H. Native of Barbary, near Mascar on hills. D. C. astr. no. 52. Flowers pale yellow.

*Jointed Milk-Vetch.* Pl. diffuse.

101 *A. TUBERCULOSUS* (D. C. astr. no. 60. t. 22.) plant erect, hispid at the apex; stipulas lanceolate; leaflets obovate, emarginate, about 11-12 pairs; racemes pedunculate, longer than the leaves; legumes depressed, ending each in a long mucrone, arcuately hooked upwards, tubercular, and puberulous. ☉. ? H. Native of Syria and Cappadocia. The fruit of the Cappadocian plant is much larger than those of the Syrian one. Flowers pale yellow.

*Tubercular-fruited Milk-Vetch.* Pl. 1 foot.

102 *A. EPIGLOTTIS* (Lin. mant. 274.) plant procumbent, clothed with hoary villi; stipulas lanceolate, and are, as well as the calyxes, clothed with black villi; leaves with 6-7 pairs of oblong-linear leaflets; spikes of flowers capitate, on very short peduncles; legumes depressed, somewhat cordate, acuminate, with somewhat replicate margins, spreading, and pubescent. ☉. H. Native of Spain, Barbary, the Levant, and south of France. D. C. astr. no. 56.—Herm. lugd. bot. p. 77. Riv. tetr. 109. f. 1. Flowers pale yellow.

*Var. β, asperulus* (D. C. prod. 2. p. 291.) stems rather rigid, and rough. ☉. H. Native of Spain, on hills about St. Philip. *A. asperula*, Dufour, ann. gen. sc. 7. p. 295.

*Sword-tongued or Sword-podded Milk-Vetch.* Fl. June, July. Clt. 1737. Pl. procumbent.

103 *A. TRIANGULARIS* (D. C. prod. 2. p. 291.) stem erect, smoothish, trigonal; stipulas membranous, acuminate, villous; leaves with 8-10 pairs of elliptic-oblong, obtuse, emarginate leaflets; spikes of flowers pedunculate, longer than the leaves; legumes pendulous, triquetrous, few-seeded, straight, incompletely 2-celled. ☉. H. Native country unknown. *Phaca triangularis*, Zea in Horn. hort. bafn. suppl. 63. Flowers pale yellow.

*Triangular-stemmed Milk-Vetch.* Fl. July, Aug. Clt. 1818. Pl.  $\frac{3}{4}$  foot.

104 *A. BæTICUS* (Lin. spec. 1068.) plant procumbent, pubescent; stipulas membranous, ovate, acuminate; leaves with 10-15 pairs of obovate retuse leaflets; spikes of flowers on very short peduncles; legumes erect, triquetrously-prismatic, glabrous, straight, but hooked at the apex. ☉. H. Native of Spain, Barbary, Sicily, and the Levant. *A. micinatus*, March. *A. triangularis*, Munt. phyt. t. 110.—Riv. tetr. irr. t. 105.—Bocc. sic. t. 4. Flowers pale yellow. The plant under this name in the gardens is erect; it is therefore perhaps the preceding species. In Hungary the seeds are roasted, ground, and used as a substitute for coffee.

*Bætian Milk-Vetch.* Fl. June, Aug. Clt. 1759. Pl. proc.

§ 8. *Synochreàti* (from *συν*, *syn*, together, and *ωχρος*, *ochros*, yellow; the stipulas are joined together, and the flowers are yellow). D. C. prod. 2. p. 291. *Stipulas free from the petiole, but joined together.* Flowers cream-coloured. Root perennial.

105 *A. EMARGINATUS* (D. C. astr. no. 47.) plant almost stemless and ascending, clothed with somewhat tomentose villi; stipulas membranous, concrete; leaves with 20-25 pairs of ovate emarginate leaflets; spikes of flowers ovate, dense, on radical peduncles or scapes, which are much longer than the leaves; legumes roundish, hairy. ♀. H. Native of the Levant. Flowers pale yellow.

*Var. α, densifolius* (Lam. dict. 1. p. 317.) leaflets small, much crowded. Rauw. hodæp. 123. t. 29.

*Var. β, Billardièrii* (D. C. l. c.) leaflets larger, and rather distant. *A. emarginatus*, Labill. syr. dec. 1. p. 19. t. 9.

*Emarginate-leafletted Milk-Vetch.* Fl. June, July. Clt. 1825. Pl.  $\frac{1}{4}$  foot.

106 *A. CAPITATUS* (Lin. spec. 1064.) plant caulescent, erect; leaflets emarginate; spikes capitate, on elongated peduncles. ♀. H. Native of the Levant. Flowers purple.

*Capitate-flowered Milk-Vetch.* Fl. July, Aug. Clt. 1759. Pl. 1 foot.

107 *A. FRAGRANS* (Willd. spec. 3. p. 1294.) plant procumbent, and almost stemless, glabrous; stipulas concrete, marcescent; leaves with 8-10 pairs of elliptic acute leaflets, which are pubescent beneath; peduncles about equal in length to the leaves; spikes of flowers ovate; bractæas ovate, membranous; legumes glabrous. ♀. H. Native of Cappadocia. *A. glaber*, D. C. astr. no. 44. but not of Michx. *A. orientalis minimus foliis vicie et floribus ex viridi-flavescentibus odoratissimis*, Tourn. cor. 29. Flowers greenish yellow.

*Fragrant Milk-Vetch.* Pl. procumbent, an inch long.

108 *A. MICROPHYLLUS* (Lin. spec. 1067. ? Willd. spec. 3. p. 1277.) plant diffuse, smoothish; lower stipulas free, upper ones concrete; leaves with 15-18 pairs of puberulous leaflets, the lower ones oblong and emarginate, the upper ones linear and retuse; peduncles longer than the leaves; legumes erect, crowded in spikes, inflated, ovate, hairy. ♀. H. Native of Siberia in pastures; also of Thuringia and Hercynia, if the synonyme of Willd. be rightly attached. The fruit is that of *A. cicer*, but the leaves and stipulas are different. Flowers pale yellow. The specimen in the Linnean herbarium is pubescent, with 6-7 pairs of roundish emarginate leaflets.

*Small-leaved Milk-Vetch.* Fl. June, July. Clt. 1773. Pl. 1 foot long, diffuse.

109 *A. SEMIBILOCLARIS* (D. C. astr. no. 61. t. 23.) plant erect, rather ascending, smoothish; lower stipulas concrete, upper ones distinct; leaves with 9-11 pairs of elliptic-oblong acute leaflets; peduncles longer than the leaves; legumes erect, disposed in heads, oblong-triquetrous, half-bilocular. ♀. H. Native of Siberia, about Zincof. Flowers pale yellow.

*Half-bilocular-podded Milk-Vetch.* Fl. July, Aug. Clt. 1804. Pl. 1 foot.

110 *A. RESUPINATUS* (Bieb. fl. taur. suppl. p. 193.) plant with short diffuse stems, and clothed with adpressed pubescence in every part; stipulas concrete; leaves with 5-10 pairs of elliptic acutish leaflets; peduncles about equal in length to the leaves; legumes oblong, nearly terete, arched, resupinate, and rather pilose. ♀. H. Native of middle Iberia. *A. physodes* var. *perpusilla*, Bieb. fl. taur. 2. p. 198. Flowers pale yellow.

*Resupinate-podded Milk-Vetch.* Pl.  $\frac{1}{4}$  foot.

111 *A. REPTANS* (Willd. hort. berl. 2. t. 88.) plant procumbent, creeping, glabrous; some of the stipulas concrete, and others free; leaves with 12-13 pairs of linear, lanceolate, obtuse, mucronate leaflets; raceme pedunculate, hardly shorter than the leaves; legumes lanceolate, pubescent, half-bilocular. ♀. G. Native of Mexico. Flowers white. Allied to *A. odoratus*, according to Link. There is a specimen in the Lambertian herbarium, which agrees with this in every particular, but the leaves

are hairy on the under surface, and the peduncles are equal in length to the leaves.

• *Creeping Milk-Vetch*. Fl. Ju. Jul. Clt. 1818. Pl.  $\frac{1}{2}$  creeping.

112 *A. ODORATUS* (Lam. dict. 1. p. 311.) plant erect, and rather ascending, pubescent; stipulas concrete; leaves with 11-14 pairs of oblong acute leaflets; peduncles length of leaves; bracteas smaller than the calyx; legumes oblong, terete, glabrous, spreadingly reflexed.  $\mathcal{U}$ . H. Native of the Levant. D. C. astr. no. 67. t. 24. Habit of *A. uliginosus*, but differs in the stipulas being concrete. Flowers pale yellow, sweet-scented.

*Sweet-scented-flowered Milk-Vetch*. Fl. June, July. Clt. 1820. Pl.  $\frac{1}{2}$  foot.

113 *A. STIPULATUS* (D. Don, prod. fl. nep. p. 246. and in bot. mag. 2380.) plant erect, glabrous; stipulas concrete, foliaceous, large; leaves with 8-16 pairs of oval-oblong, or obovate mucronulate leaflets; peduncles about the length of the leaves; flowers disposed in loose spikes, at first erect, but at length drooping; legumes compressed, stipitate, glabrous, drooping.  $\mathcal{U}$ . H. Native of Upper Nipaul at Corasan. Corolla greenish-white, tinged with red. *A. lanceolatus*, Hamilt. in herb. Lamb. *Coronilla stipulata*, ibid. Habit of *A. glycyphyllos*. Stipulas 2 inches long, and half an inch broad.

*Large-stipuled Milk-Vetch*. Fl. June, July. Clt. 1822. Pl. 2 to 3 feet.

114 *A. MUCRONATUS* (D. C. astr. no. 68. t. 25.) plant erect, rather pubescent; stipulas concrete, lanceolate; leaves with 7-17 pairs of oblong-elliptic mucronate leaflets; peduncles length of leaves; legumes compressed, arched, channelled on the back, when young pubescent.  $\mathcal{U}$ . H. Native of the Levant. *A. orientalis altissimus*, &c. Tourn. cor. p. 29. Flowers yellow.

*Mucronate-leafletted Milk-Vetch*. Fl. June, Aug. Pl. 2 to 3 ft.

115 *A. FRAXINIFOLIUS* (D. C. astr. no. 71.) plant erect, smoothish; stipulas concrete, marcescent; leaves with 6-7 pairs of ovate acuminate leaflets, which are pubescent beneath; peduncles shorter than the leaves; legumes pendulous, subulate, triquetrous, sessile, a little arched and glabrous.  $\mathcal{U}$ . H. Native of the Levant. Tourn. cor. 29. Flowers yellow. Like *A. stipulatus* and *A. glycyphyllos*.

*Ash-leaved Milk-Vetch*. Pl. 2 to 3 feet.

§ 9. *Ciceroidei* (from *cicer*, the chick-pea, and *idea*, similar; plant similar to the chick-pea in habit). D. C. prod. 2. p. 292. *Stipulas neither adhering to the petioles nor to each other, Flowers cream-coloured, disposed in pedunculate spikes. Roots perennial. Legumes sessile.*

116 *A. GLYCYPHYLLUS* (Lin. spec. 1067.) plant prostrate, glabrous; stipulas ovate-lanceolate, entire; leaves with 4-5-7 pairs of oval, bluntish, smooth leaflets; peduncles shorter than the leaves; spikes of flowers ovate-oblong; legumes almost terete, obscurely triangular, with a slight longitudinal furrow, curved upwards, pointed, smooth, and even.  $\mathcal{U}$ . H. Native of Europe and Siberia. In Britain in woods, thickets, borders of fields, or on the sides of hills, on a chalky or gravelly soil. Smith, engl. bot. t. 203.—Riv. tetr. irr. t. 103. Flowers sulphur-coloured. The leaves have at first a sweetish taste, soon changing on the palate to a nauseous bitter. Cattle are not fond of them, nor is this plant applied to any agricultural use.

*Sweet-leaved or Liquorice-Vetch*. Fl. June, July. Britain. Pl. prostrate, 2 to 3 feet long.

117 *A. GLYCYPHYLOIDES* (D. C. prod. 2. p. 292.) plant procumbent, pubescent; stipulas oblong, leafy, rather stipitate; leaves with 7 pairs of oval leaflets; peduncles shorter than the leaves; spikes of flowers ovate; flowers secund; calyx acutely 5-toothed; legumes spreading, disposed in something like a spike, subulate, triquetrous, straight, glabrous.  $\mathcal{U}$ . H. Native of Iberia. Flowers pale yellow.

*Glycyphyllus-like Milk-Vetch*. Fl. June, July. Clt. 1818. Pl. prostrate.

118 *A. SECUNDUS* (D. C. astr. no. 55.) plant procumbent, glabrous; stipulas ovate-oblong, with pubescent margins, and are, as well as the bracteas, leafy; leaves with 4-5-pairs of ovate leaflets; peduncles longer than the leaves; flowers secund, spreading; calyx truncate; legumes stipitate, compressed, oblong, glabrous.  $\mathcal{U}$ . H. Native of the south of Siberia. Flowers pale yellow. Allied to *A. glycyphyllos*.

*Secund-flowered Milk-Vetch*. Pl. prostrate.

119 *A. SERICEUS* (D. C. astr. no. 45.) plant almost stemless and suffrutescent, clothed with silky pubescence; stipulas lanceolate; leaves with 11-13 pairs of oblong-elliptic leaflets; peduncles a little longer than the leaves; spikes capitate; legumes ovate, silky, acute from the style.  $\mathcal{U}$ . H. Native of the Levant. *A. orientalis minimus flore glomerato virescente*. Tourn. cor. 29. Flowers greenish yellow.

*Silky Milk-Vetch*. Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

120 *A. STRIGULOSUS* (H. B. et Kunth, nov. gen. amer. 6. p. 494.) stems herbaceous, procumbent, clothed with strigose pubescence, as well as the under side of the leaves, but they are glabrous above; leaves with 9-10 pairs of oblong obtuse leaflets; stipulas ovate-oblong, acuminate; racemes cylindrically oblong, on long peduncles; calyx beset with black strigæ.  $\mathcal{U}$ . H. Native of Mexico, in temperate parts. Flowers pale-yellow. Perhaps belonging to a different division.

*Strigose Milk-Vetch*. Pl. procumbent.

121 *A. KAHNRIUS* (D. C. prod. 4. p. 292.) plant diffuse, tomentose; stipulas broad, short, acute; leaves having 5-7 pairs of orbicular leaflets; peduncles length of leaves; flowers disposed in spicate racemes, erect; calyx when in fruit inflated; legumes stipitate, ovate, smooth.  $\mathcal{U}$ . F. Native of Egypt, between Cairo and Souda. *A. longiflorus*, Delil. fl. ægypt. 112. t. 39. f. 2. but not of Pall. Flowers pale yellow.

*Cairo Milk-Vetch*. Pl. diffuse.

122 *A. PERGRINUS* (Vahl. symb. 1. p. 57.) plant diffuse, clothed with hairy tomentum; stipulas lanceolate; leaves having 11-13 pairs of obovate emarginate leaflets; peduncles length of leaves or shorter than them; flowers disposed in spikes, lower ones remote; legumes somewhat triquetrous, a little arched, hairy.  $\mathcal{U}$ . H. Native of Egypt. D. C. astr. no. 72. t. 27. Flowers pale-yellow. There is a variety of this plant with fewer flowers, which are sessile in the axils of the leaves.

*Foreign Milk-Vetch*. Pl. diffuse.

123 *A. DEPRESSUS* (Lin. spec. 1073.) plant almost stemless or diffuse, clothed with canescent pubescence; stipulas ovate, membranous; leaflets 9-11 pairs, obovate; peduncles shorter than the leaves; legumes terete, depressed, straight, drooping, glabrous.  $\mathcal{U}$ . H. Native of the south of Europe, in rugged exposed places, and on mountains. All. ped. no. 1277. t. 19. f. 3. D. C. astr. no. 48. Lodd. bot. cab. 680. Flowers cream-coloured. *A. helminthocarpus*, Vill. mosp. 42. t. 25. f. 2. dauph. 3. p. 456. t. 42. f. 2. but Villars describes his plant as having no peduncle, the leaflet hoary, cut at the apex, and the legume oblong-elliptic and thickening.

*Depressed Milk-Vetch*. Fl. June, July. Clt. 1772. Pl. depressed.

124 *A. LEUCOPHYLLUS* (Smith, in Lin. trans. 1. p. 252.) plant prostrate, clothed with canescent villi; stipulas ovate, trapezoid, membranous; leaves with 12-14 pairs of obcordate leaflets; peduncles shorter than the leaves; legume terete, depressed, acute, deflexed, glabrous.  $\mathcal{U}$ . H. Native country unknown. Very like the preceding species, but the flowers are nearly white at first, but at length changing to a dirty purplish colour.

*Dusky-flowered Milk-Vetch*. Fl. May, Aug. Clt. 1777. Pl. prostrate.

125 *A. GLABER* (Michx. fl. bor. amer. 2. p. 66. but not of D. C.) plant low and smoothish; leaves with 10-11 pairs of elliptic-oblong, obtuse or emarginate leaflets; peduncles longer than the leaves; flowers disposed in racemose spikes; legumes distant, spreading, depressed, incurved. *℥. H.* Native of Georgia and South Carolina, in sandy woods. Flowers white.

*Smooth Milk-Vetch.* Pl.  $\frac{1}{2}$  to 1 foot.

126 *A. CÏCER* (Lin. spec. 1067.) plant diffusely procumbent, rather pubescent; stipulas lanceolate; leaves with 10-13 pairs of elliptic-oblong mucronate leaflets; peduncles longer than the leaves; flowers disposed in spike-like heads; legumes inflated, hairy, mucronate. *℥. H.* Native of Europe, in mountain meadows and hedges. D. C. astr. no. 67. var. *α.* Jacq. austr. 3. t. 251.—All. pedem. no. 1266. t. 41. f. 2.—Riv. tetr. irr. t. 108.—Moris. oxon. sect. 2. t. 9. f. 9. Corolla pale-yellow.

*Chick-pea Milk-Vetch.* Fl. July, Aug. Clt. 1570. Pl. proc.

127 *A. ULIGINOSUS* (Lin. spec. 1066.) plant erect, somewhat diffuse, and rather pubescent; stipulas membranous, lanceolate, acuminate; leaves with 10-11 pairs of elliptic oblong leaflets; peduncles about equal in length to the leaves; flowers disposed in spikes; bracteas about equal in length to the calyx; legumes rather reflexed, terete, glabrous, with a longitudinal furrow on the back. *℥. H.* Native of Siberia, in rather humid meadows. Pall. astr. t. 26. D. C. astr. no. 66.—Gmel. sib. 4. t. 17, 18. Flowers pale yellow, the top of the keel violet-coloured.

*Bog Milk-Vetch.* Fl. July, Aug. Clt. 1772. Pl. diffuse.

128 *A. MICRANTHUS* (Desv. journ. bot. 1814. 1. p. 78. but not of Nutt.) plant diffuse, rather pubescent; stipulas ovate, acute; leaves having 11-12 pairs of elliptic, obtuse leaflets; peduncles twice the length of the leaves; flowers disposed in spikes; bracteas shorter than the calyx; legumes deflexed, somewhat trigonal, smoothish. *℥. H.* Native country unknown. Flowers pale yellow.

*Small-flowered Milk-Vetch.* Fl. June, July. Clt. 1800. Pl. diffuse.

129 *A. CANADENSIS* (Lin. spec. 1066.) plant erectish, rather pubescent; stipulas lanceolate, acuminate; leaves having 10-12 pairs of elliptic-oblong, bluntish leaflets; peduncles about equal in length to the leaves; flowers disposed in spikes; bracteas shorter than the calyx; legumes erect, oblong, terete, glabrous. *℥. H.* Native of North America, from Canada to Carolina. D. C. astr. no. 65. Dodart. icon. t. 65.—Dill. elth. 46. t. 39. f. 45. Corolla yellow. Root creeping.

*Canada Milk-Vetch.* Fl. July. Clt. 1732. Pl. 2 to 3 feet.

130 *A. CAROLINIANUS* (Lin. spec. 1066.) plant erect, glabrous; stipulas ovate, acuminate; leaves with 20 pairs of oblong leaflets, which are pubescent beneath; peduncles longer than the leaves; flowers disposed in spikes; bracteas length of pedicels; legumes erect, ovate, tumid, beaked. *℥. H.* Native of Virginia and Carolina, on mountains.—Dill. elth. t. 39. f. 45. Flowers pale yellow.

*Carolinian Milk-Vetch.* Fl. Jul. Aug. Clt. 1732. Pl. 2 to 3 ft.

131 *A. FALCATUS* (Lam. dict. 1. p. 310. but not of Desf.) erect, rather pubescent; stipulas lanceolate, acuminate; leaves having 16-20 pairs of elliptic-oblong, acute leaflets; peduncles rather longer than the leaves; legumes pendulous, rather trigonal, acute, falcate, glabrous, disposed in racemes. *℥. H.* Native of Siberia, in wet, grassy places. Pall. astr. t. 31. D. C. astr. no. 70. t. 26. *A. virescens*, Ait. hort. kew. 3. p. 73. *A. Isétensis*, Hortul. Flowers greenish yellow.

*Falcate-podded Milk-Vetch.* Fl. Ju. Jul. Clt. ? Pl. 1 to 2 ft.

132 *A. FALCIFORMIS* (Desf. amend. atl. D. C. astr. no. 69.) plant erect, glabrous; stipulas lanceolate, acuminate; leaves with 10-15 pairs of elliptic, obtuse, leaflets; peduncles rather shorter than the leaves; legumes compressed, drooping, falcate, rather stipitate. *℥. H.* Native of Algiers, at the foot of

Mount Atlas. *A. falcatus*, Desf. fl. atl. 2. p. 188. t. 206. Flowers pale yellow or greenish yellow.

*Falciform-podded Milk-Vetch.* Fl. June, July. Clt. 1816. Pl. 2 feet.

133 *A. ASPER* (Jacq. icon. rar. 1. t. 152.) plant erect, straight, rough from hairs, which are fixed by their centre; stipulas linear-lanceolate; leaves with 12-15 pairs of lanceolate leaflets; peduncles much longer than the leaves; flowers spicate, erect; legumes oblong, triquetrous, acuminate, clothed with adpressed pubescence. *℥. H.* Native of Siberia, Tauria, Caucasus, Hungary, &c. D. C. astr. no. 63. *A. chloranthus*, Pall. astr. no. 34. t. 25. Flowers greenish yellow, tipped with orange.

*Rough Milk-Vetch.* Fl. Jul. Aug. Clt. 1796. Pl. 3 to 4 ft.

134 *A. CHLOROSTACHYS* (Lindl. mss.) this plant comes very near *A. stipulatus* and *A. galegiformis*, both in habit and character. It is cultivated in the English gardens, but we have not been able to procure a specimen, and therefore the description remains a desideratum. *℥. H.* Native of Nipaul. Flowers greenish-yellow. *A. malachophyllus*, Hort.

*Green-spiked Milk-Vetch.* Fl. Sept. Oct. Clt. 1824. Pl. 3 to 5 feet.

135 *A. PALLESCENS* (Bieb. fl. taur. suppl. p. 489.) plant ascending, canescent; stipulas lanceolate; leaves with 5-6 pairs of linear-elliptic leaflets; peduncles much longer than the leaves; flowers disposed in spicate racemes, rather distant; legumes erect, oblong, and somewhat triquetrous, clothed with adpressed pubescence, acuminate, mucronate. *℥. H.* Native of Siberia, between the Don and the Volga. Flowers cream-coloured. This plant would have been brought into the division *Dissitiflora*, if it had not been for the colour of the flowers.

*Pale-flowered Milk-Vetch.* Fl. Ju. Jul. Clt. 1818. Pl. asc.

§ 10. *Galegiformes* (from *Galgga*, goats'-rue, and *fôrma*, form; plants with the habit of Goats'-rue, *Galgga*). D. C. prod. 2. p. 294. *Stipulas neither adhering to the petiole nor to each other. Flowers cream-coloured or white. Legumes stipitate.*

136 *A. CHINENSIS* (Lin. fil. dec. 1. t. 3.) plant erect, glabrous; leaves with 12-13 pairs of elliptic-oblong leaflets; peduncles longer than the leaves; flowers pendulous, racemose; legumes ovate, inflated, hardly mucronate. *℥. H.* Native of China. Flowers pale yellow, but finally become white.

*China Milk-Vetch.* Fl. Jul. Aug. Clt. 1795. Pl. 2 to 4 ft.

137 *A. GALEGIFORMIS* (Lin. spec. 1066.) plant erect, glabrous; leaves with 12-13 pairs of elliptic-oblong leaflets; peduncles longer than the leaves; flowers pendulous, racemose; legumes triquetrous, mucronate at both ends. *℥. H.* Native of Siberia, and Iberia. Pall. astr. no. 38. t. 29. D. C. astr. no. 61. Flowers pale yellow.

*Goats'-rue-formed Milk-Vetch.* Fl. June, July. Clt. 1729. Pl. 3 to 5 feet.

138 *A. DRUMMONDI* (Dougl. in Hook, fl. bor. amer. p. 153. t. 57.) plant glabrous; stems flexuous; leaves with 10-12 pairs of ovate-lanceolate, obtuse, mucronate leaflets; bracteas subulate, about the length of the pedicels, or perhaps longer; peduncles a little longer than the leaves, pubescent as well as the petioles, and under side of the leaves as well as the calyxes. *℥. H.* Native of North America. Flowers yellow. Like *A. galegiformis*.

*Drummond's Milk-Vetch.* Pl. 2 feet.

139 *A. SUCCUMBENS* (Dougl. mss.) plant strong and very villous; stems flexuous; leaflets obovate, obtuse; stipulas broad, triangular; bracteas subulate, about the length of the tube of the calyx; racemes about the length of leaves. *℥. H.* Native of North America, on the barren grounds of the Columbia. Flowers apparently yellow. Legumes flat, smooth.

*Crouching Milk-Vetch.* Pl. 1 foot.

140 *A. RACEMOSUS* (Pursh, fl. sept. Amer. p. 740.) plant erect, rather pubescent; leaves with 10 pairs of lanceolate leaflets; peduncles longer than the leaves; racemes dense-flowered; legumes pendulous, inflated, triquetrous.  $\mathcal{U}$ . H. Native of Upper Louisiana. *A. galegoides*, Nutt. gen. amer. 2. p. 100. Flowers white. Plant disagreeably scented.

*Racemose-flowered Milk-Vetch.* Pl. 2 to 3 feet.

141 *A. PTEROSTYLIS* (D. C. prod. 2. p. 294.) plant almost erect, glabrous; leaves with 6-7 pairs of elliptic, emarginate leaflets; peduncles longer than the leaves; flowers erect, racemose; legumes pendulous, ovate, depressed, reticulately veined.  $\mathcal{U}$ .? S. Native of New Holland, on the eastern coast, and the island of Timor. The cauline stipulas are distinct, and deeply bi or tridentate. The style is compressed, ensiform, and bearded at the apex on the upper side. Legume on a short stipe, with the cells 2-seeded. Perhaps this plant will constitute a new genus.

*Winged-styled Milk-Vetch.* Pl. 1 foot.

§ 11. *Alopecuroides* (from  $\alpha\lambda\omega\pi\eta\zeta$ , *alopez*, a fox, *oura*, *oura*, a tail; and  $\epsilon\iota\delta\omicron\varsigma$ , *eidos*, form; in reference to the shape of the spikes of flowers, which has been likened to a fox's tail). D. C. prod. 2. p. 294. Stipulas not adhering to the petioles. Stems erect, straight. Flowers yellow, disposed in thick dense spikes, which are either sessile, or on very short peduncles, in the axils of the leaves.

142 *A. ALOPECIAS* (Pall. astr. p. 12. t. 9.) plant erect; leaflets elliptic, villous; stipulas lanceolate; spikes sessile, cylindrical, almost the length of the leaves; tube of calyx woolly, somewhat globose, with the segments subulate, and rather longer than the corolla.  $\mathcal{U}$ . H. Native of Siberia, at Lake Alagul, in the Songarian desert. Flowers pale yellow.

*Fox-tail-spiked Milk-Vetch.* Fl. Jul. Aug. Clt. 1800. Pl. 3 ft.

143 *A. MAXIMUS* (Willd. spec. 3. p. 1258.) plant erect; leaflets lanceolate, pubescent; stipulas oblong-lanceolate; spike sessile, cylindrical, nearly terminal; teeth of calyx capillary, woolly, shorter than the corolla.  $\mathcal{U}$ . H. Native of America. Flowers yellow. Very like the next species.

*Largest Milk-Vetch.* Fl. June, July. Clt. ? Pl. 2 to 3 ft.

144 *A. ALOPECUROIDES* (Lin. spec. 1064. Mill. fig. t. 28.) plant erect; leaflets ovate-lanceolate, pubescent; stipulas ovate-lanceolate, acuminate; spikes of flowers ovate-oblong, stalked; calycine segments setaceous, shorter than the tube, but about equal in length to the corolla.  $\mathcal{U}$ . H. Native of Siberia. *A. alopecuroides* and *A. alopecurus*, D. C. astr. no. 66. and 67. *A. alopecurus*, Pall. astr. t. 8. Flowers yellow.

*Fox-tail-like-spiked Milk-Vetch.* Fl. June, July. Clt. 1737. Pl. 2 to 3 feet.

145 *A. NARBONENSIS* (Gouan. ill. 49. Pall. astr. t. 10.) plant erect, villous; stipulas lanceolate; leaflets oblong-linear; spikes of flowers somewhat globose; calycine teeth setaceous, shorter than the corolla, but about the same length as the tube.  $\mathcal{U}$ . H. Native about Narbonne and Madrid. Flowers yellow.

*Narbonne Milk-Vetch.* Fl. Ju. Jul. Clt. 1789. Pl. 2 to 3 ft.

146 *A. PONTICUS* (Pall. astr. p. 14. t. 11.) plant erect; stem rather villous; leaflets oblong, smoothish; stipulas lanceolate; spikes of flowers sessile, almost globose, when in fruit ovate; segments of the calyx linear, much shorter than the tube and the corolla.  $\mathcal{U}$ . H. Native of Tauria and Bessarabia. Flowers yellow. In the specimen sent under this name to De Candolle, by Steven from Tauria, the leaflets are not emarginate, nor the teeth of the calyx ovate, as described by Willdenow.

*Pontic Milk-Vetch.* Fl. July, Aug. Clt. 1820. Pl. 2 feet.

147 *A. VULGINES* (Willd. spec. 3. p. 1259.) plant erect; stem glabrous; leaflets obovate, obtuse, or emarginate, rather velvety; spikes of flowers nearly globose, on very short peduncles; teeth

of calyx setaceous, length of tube, but a little shorter than the corolla.  $\mathcal{U}$ . H. Native about Astracan, and in the sand of the Caspian desert, as well as of the desert of Kuma. *A. alopecuroides*, Pall. astr. p. 9. t. 7. Flowers pale yellow.

*Fox Milk-Vetch.* Fl. June, July. Clt. 1815. Pl. 2 to 3 ft.

148 *A. MACROCEPHALUS* (Willd. spec. 3. p. 1260.) plant erect; stem glabrous; leaflets oblong-elliptic, glabrous; stipulas large, acuminate; spikes of flowers globose, pedunculate; teeth of calyx subulate, length of tube, but shorter than the corolla.  $\mathcal{U}$ . H. Native of Iberia, on hills, and of Galatia, in fields. Bieb. fl. taur. 2. p. 183. *A. orientalis*, Pers.? Flowers yellow.

*Large-headed Milk-Vetch.* Pl. 3 to 4 feet.

149 *A. OBTUSIFOLIUS* (D. C. prod. 2. p. 295.) plant erect; stem and leaves clothed with velvety villi; leaflets broadly obovate, very obtuse; stipulas narrow-lanceolate; spikes globose, containing about 8 or 10 flowers, pedunculate; calycine teeth subulate, length of tube, but shorter than the corolla.  $\mathcal{U}$ . H. Native of the Levant, between Mossul and Bagdad. Leaflets 11-15, never more, by which it is easily distinguished from all the other species of this division.

*Obtuse-leaved Milk-Vetch.* Pl. 2 to 3 feet.

§ 12. *Christiani* (so called from the similarity of the species to *A. Christianus* of Lin., which is called by Dioscorides *Christiana-radix* or *Christian-root*; in reference to the country in which it grows wild). D. C. prod. 2. p. 295. Stipulas adnate to the petiole, but not joined together. Flowers cream-coloured, disposed in glomerate, almost sessile racemes in the axils of the leaves.

150 *A. MACROCARPUS* (D. C. astr. no. 73. t. 28. but not of Pall.) plant erect, hairy; stipulas lanceolate; leaves with 11-14 pairs of ovate-oblong leaflets; flowers glomerate, almost sessile, axillary; legumes inflated; ovate-globose, mucronate, glabrous, large.  $\mathcal{U}$ . H. Native of the Levant. Flowers pale yellow.

*Long-fruited Milk-Vetch.* Pl. 2 to 3 feet.

151 *A. SIEVERSII* (Pall. astr. no. 18. t. 12.) plant erect, rather hairy; stipulas ovate-lanceolate, acuminate; leaves having 10-12 pairs of ovate-oblong leaflets; flowers glomerate, almost sessile, axillary; legumes inflated, ovate-globose, mucronate, callous, tomentose.  $\mathcal{U}$ . H. Native of the south of Siberia, at the river Ultehaar. Flowers pale yellow.

*Sievers's Milk-Vetch.* Pl. 2 to 3 feet.

152 *A. CHRISTIANUS* (Lin. spec. 1064.) plant erect, hairy; stipulas membranous, lanceolate, acuminate; leaves with 12-24 pairs of elliptic-orbicular leaflets; flowers glomerate, sessile in the axils of all the leaves; legumes ovate, wrinkled, glabrous.  $\mathcal{U}$ . H. Native of Judea, and between Aleppo and Mossul, and of Armenia. Tour. voy. 2. p. 254. with a figure. *A. floridus*, Scop. ins. 2. p. 108. Flowers yellow.

*Christian Milk-Vetch.* Fl. Jul. Clt. 1737. Pl. 2 to 3 ft.

153 *A. TOMENTOSUS* (Lam. dict. 1. p. 312.) plant erect, clothed in every part with soft tomentum; stipulas lanceolate; leaves with 20-25 pairs of ovate-orbicular, somewhat emarginate leaflets; flowers glomerate, almost sessile in the axils of the leaves; legumes oblong, terete, acuminate, callous, hairy.  $\mathcal{U}$ . H. Native of Egypt. D. C. astr. no. 80. t. 29. *A. fruticosus*, Forsk. ægyp. 139. Flowers yellow.

*Tomentose Milk-Vetch.* Fl. July. Clt. 1800. Pl. 1½ foot.

154 *A. SIEBERI* (D. C. prod. 2. p. 295.) stem erect, clothed with hoary, silky, adpressed hairs; stipulas membranous, acuminate; leaves having 20-25 pairs of elliptic, obtuse leaflets, when young clothed with canescent villi; flowers axillary, almost sessile; legumes triquetrous, acuminate, pubescent.  $\mathcal{U}$ .?  $\mathcal{U}$ .? F. Native of Egypt. *A. trigonus*, Sieb. pl. exsic. but not of D. C. Flowers pale-yellow. Allied to the preceding

species, and like it having the petioles permanent, and therefore falls into section *Tragacanthæ*.

SERIES III. *TRAGACANTHA* CEI (from *τραγος*, *tragos*, a goat, and *ακανθα*, *akantha*, a spine; in reference to the similarity of the species to *A. tragacantha*, which is vulgarly called goat's-thorn). D. C. prod. 2. p. 295. Stipulas adnate to the petioles. The petioles are permanent, and at length become hardened spines.

§ 13. *Tragacanthæ* (see series for derivation). D. C. l. c. *Petioles permanent, becoming as hard as spines. Stipulas adnate to the petioles.*

\* *Flowers sessile in the axils of the leaves.*

155 *A. TRIGONUS* (D. C. astr. no. 81.) flowers axillary, sessile, solitary, concealed under the stipulas; legumes trigonal, acuminate, hoary from pubescence; leaflets with 6-7 pairs of leaves, which are clothed with hoary wool. *h. F.* Native of Egypt. Flowers yellowish.

*Trigonal-fruited Goat's-Thorn.* Shrub  $\frac{1}{2}$  to 1 foot.

156 *A. CRYPTOCAEPUS* (D. C. astr. no. 82.) flowers solitary, axillary, latent; legumes ovate, hairy, 2-seeded; leaves having 4-6 pairs of linear leaflets, which are as well as the stipulas quite glabrous. *h. F.* Native of Armenia. *Trag. orientalis humillima foliis viciæ*, &c. Tourn. cor. 29. Flowers pale yellow?

*Hidden-fruited Goat's-Thorn.* Shrub  $\frac{1}{2}$  foot.

157 *A. BARBA JÖVIS* (D. C. astr. no. 83.) flowers solitary, latent; calyxes 5-parted, very villous; legumes ovate, glabrous, almost 1-celled, 1-2-seeded; leaves having 3-5 pairs of oblong, acute, hoary-tomentose leaflets. *h. F.* Native of Armenia. *Trag. orientalis humillima argentea*, &c. Tour. cor. 29. *Tragacantha argentea*, Mill. Corolla purplish?

*Jupiter's-beard Goat's-Thorn.* Shrub  $\frac{1}{2}$  to  $\frac{1}{2}$  foot.

158 *A. MICROCEPHALUS* (Willd. spec. 3. p. 1332.) flowers axillary, sessile, somewhat capitate; calyxes woolly, 5-cleft; leaves having 4 pairs of lanceolate, hoary, mucronate leaflets. *h. F.* Native of Armenia.

*Small-headed Goat's-Thorn.* Shrub  $\frac{1}{2}$  foot.

159 *A. ERIOCAULOS* (D. C. astr. no. 84.) flowers axillary, solitary, latent; calyxes usually hardly 5-cleft; leaves with 4-5 pairs of oblong acute leaflets, which are woolly, as well as the stems. *h. F.* Native of Armenia. *Trag. orientalis foliis incanis caule et ramulis tomentosus*, Tourn. cor. 29. Corolla cream-coloured? Legume unknown.

*Woolly-stemmed Goat's-Thorn.* Shrub  $\frac{1}{2}$  foot.

160 *A. CAUCASICUS* (Pall. astr. p. 2. t. 2.) flowers 2-3-together, axillary, sessile; calyxes 5-cleft, clothed with woolly villi; legumes 1-celled, 4-seeded; leaves having 5-7 pairs of oblong-linear leaflets, which are clothed with hoary tomentum. *h. H.* Native of Caucasus, on barren rocks. Flowers white (Bieb.), cream-coloured (Pall.). Stipulas when young clothed with white tomentum, but at length becoming glabrous. Bieb. fl. taur. 2. p. 205. Willd. spec. 3. p. 1331. exclusive of the synonyme of Tournefort.

*Caucasian Goat's-Thorn.* Fl. June, July. Clt. 1824. Sh.  $\frac{1}{2}$  ft.

161 *A. GUMMIFER* (Labill. journ. phys. 1790. p. 46. with a figure,) flowers 3-5-together, axillary, sessile; calyxes 5-cleft, and are, as well as the legumes, woolly; leaves having 4-6 pairs of oblong-linear glabrous leaflets. *h. F.* Native of Mount Lebanon. Flowers yellow, rising from the axils of all the leaves, as well as in the preceding species, and therefore they appear in something like a spike. Gum tragacanth flows from this plant, but more sparingly than from *A. verrus*. D. C. astr. no. 85. exclusive of the synonyme of Tournefort.

VOL. II.

*Goat-bearing Goat's-Thorn.* Fl. June, July. Sh.  $\frac{1}{2}$  to 1 ft. 162 *A. VERUS* (Oliy. voy. 3. t. 44.) flowers 2-5-together, axillary, sessile; calyxes tomentose, obtusely 5-toothed; leaves having 8-9 pairs of linear hispid leaflets. *h. F.* Native of the Levant. *A. gummifer* var.  $\beta$ , hispidulus, D. C. astr. no. 85.

Young stipulas clothed with silky villi, adult ones glabrous. According to Olivier, a traveller in the Levant, the greater part of the gum-tragacanth which is imported into Europe is obtained from this plant. *Tragacanth* exudes from it naturally from July to September, either from wounds made in the shrub by animals, or from fissures occasioned by the force of the juice during the great heats of summer. According as the juice is more or less abundant, tragacanth exudes in twisted filaments, which sometimes assume the form of a small worm, elongated, rounded, and compressed, rolled up upon itself or twisted. The finest and purest tragacanth assumes this form. It is almost transparent whitish, or of a yellowish white. It also exudes in large tears, which preserve more or less of a vermicular form. This is more of a reddish colour, and more contaminated with impurities. The quantity of tragacanth furnished by Persia is very considerable. Much is consumed in that country in the manufacture of silk, and the preparation of comfits. It is exported to India, Bagdad, and Bussorah. Russia also gets some by way of Bakou. *Tragacanth*, though generally called a gum, differs very much from gum Arabic in its properties. It is opaque, white, difficultly pulverizable, unless when thoroughly dried, and the mortar heated, or in frost, and it cannot be said to be properly soluble in water, for it absorbs a large quantity of that fluid, and increases in bulk. It is totally insoluble in alcohol. Its mucilage differs from that of gum-Arabic in being precipitated by the superacetate of lead and oxymuriate of tin, and not by silicized potass, or the oxymuriate of iron. In pharmacy tragacanth is employed for forming powders into troches, and rendering them tough cohesive substances, by heating them with mucilage of tragacanth, and then drying the mass. For electuaries it is improper, as it renders them slimy on keeping. It is also an improper adjunct to active powders, as it swells up on attempting to mix them with water. It is a demulcent, and may answer the purposes of gum-arabic, being better adapted for allaying tickling cough, and sheathing the fauces in catarrhal affection, owing to its great viscosity.

*True Tragacanth or Goat's-Thorn.* Shrub  $\frac{1}{2}$  to 3 feet.

163 *A. SETIFERUS* (D. C. prod. 2. p. 296.) flowers and leaflets unknown, but the last fall very soon off the plant; there are fascicles of silky bristles, rising from the axils of the spines. *h. F.* Native of the Levant. This species is hardly known, but from the habit it is allied to the preceding plant, but it differs from it in having axillary fascicles of bristles.

*Bristle-bearing Goat's-Thorn.* Shrub  $\frac{1}{2}$  foot.

164 *A. ERIANTHUS* (Willd. spec. 3. p. 1332.) flowers axillary, sessile, aggregate; calyxes globose, woolly; leaves with 5 pairs of oblong, acute, glabrous leaflets. *h. F.* Native of Armenia. Petioles yellowish.

*Woolly-flowered Goat's-Thorn.* Shrub  $\frac{1}{2}$  foot.

165 *A. BREVILOBUS* (D. C. astr. no. 89. t. 31.) flowers axillary, sessile, somewhat capitate; calyx 5-cleft, rather longer than the corolla, having woolly, plumose, filiform lobes; leaves with 6-7 pairs of lanceolate villous leaflets. *h. F.* Native of Armenia. Lodd. bot. cab. 1388. *Trag. orientalis foliis angustissimis, flore purpurascens*, Tourn. cor. 29. *A. eriocéphalus*, Willd. spec. 3. p. 1333. Flowers purple.

*Var.  $\beta$ , glaber* (D. C. l. c.) leaflets longer and glabrous. *h. F.* Native of Persia. Perhaps a distinct species.

*Short-flowered Goat's-Thorn.* Fl. May, Jul. Clt. 1826. Sh.  $\frac{1}{2}$  ft.

166 *A. AUREUS* (Willd. act. berl. 1794. p. 29. t. 1. f. 3.) flowers axillary, sessile, disposed in globose heads; calyx 5-

M m

parted, with plumose segments, shorter than the corolla; leaves with 5-6 pairs of oblong-linear smoothish leaflets. *h. F.* Native of Armenia. D. C. astr. no. 90. t. 32. f. 1. *Trag. orientalis humilis floribus luteis dense congestis, &c.* Tour. cor. 29. Flowers yellow.

*Golden-flowered Goat's-Thorn.* Shrub  $\frac{1}{2}$  foot.

167 *A. PLUMOSUS* (Willd. spec. 3. p. 1333.) flowers axillary, sessile, aggregate; calyx cleft into 5 parts beyond the middle; lobes filiform, bearded, plumose, shorter than the corolla; leaflets elliptic-lanceolate, ending each in a spine-like mucrone, and clothed beneath with adpressed silky villi. *h. F.* Native of Galatia (Willd.). Troade (Oliv.). Flowers purple. Very like the two preceding species, but differs from them in the form of the leaflets.

*Feathery-calyxed Goat's-Thorn.* Shrub  $\frac{1}{2}$  foot.

168 *A. COMPACTUS* (Willd. in act. berl. 1794. p. 29. t. 1. f. 1.) flowers axillary, sessile, 4-5, aggregate; calyx 5-parted; the lobes filiform, and bearded with wool, shorter than the corolla; leaves with 4-5 pairs of oblong, mucronate, hoary-villous leaflets. *h. F.* Native of Armenia and Caucasus. D. C. astr. no. 86. t. 32. f. 2. Bieb. fl. taur. suppl. p. 500. *A. pycnophyllus*, Stev. in soc. mosq. 4. p. 57. Flowers white.

*Compact Goat's-Thorn.* Shrub  $\frac{1}{2}$  foot.

169 *A. ARNACANTHA* (Bieb. fl. taur. 2. p. 205.) flowers axillary, 2-3-together; calyx 5-parted, with setaceous woolly segments, which are shorter than the corolla; leaflets lanceolate, ending each in a spiny mucrone, and clothed with hoary hairs. *h. F.* Native of Tauria and Caucasus, on barren hills. *A. Poterium*, Pall. astr. p. 1. t. 1. but not of Vahl. *A. compactus* var.  $\beta$ , D. C. Willd. Flowers flesh-coloured. The legume is 1-celled according to Pallas.

*Lamb's-Thorn.* Shrub  $\frac{1}{2}$  foot.

170 *A. OLEAFOLIUS* (D. C. astr. no. 87.) flowers axillary, sessile, disposed in globose whorls around the branches; calyx 5-cleft, woolly, villous; leaves with 6-10 pairs of oblong, glaucescent, smoothish leaflets. *h. F.* Native of the Levant. *Trag. orientalis foliis olæ, &c.* Tourn. cor. 29. *A. pugniiformis*, Willd. spec. 3. p. 1334. but not of Lher. Flowers yellowish.

*Olive-leaved Goat's-Thorn.* Shrub  $\frac{1}{2}$  foot.

171 *A. LONGIFOLIUS* (Lam. dict. 1. p. 322.) flowers axillary, sessile, disposed in somewhat globose whorls; calyx 5-parted, woolly, a little shorter than the corolla; leaves with 9-12 pairs of oblong glabrous leaflets, each ending in a spine-like mucrone. *h. F.* Native of Armenia. D. C. astr. no. 88. t. 30. *A. pugniiformis*, Lher. stirp. 170. *Trag. orientalis*, Pocock, trav. 3. t. 88.

*Long-leaved Goat's-Thorn.* Shrub  $\frac{1}{2}$  to 1 foot.

172 *A. DENUATUS* (Stev. mem. mosq. 4. p. 57.) flowers axillary, sessile, glomerate; calyx 5-parted, with setaceous woolly lobes; leaves with 7 pairs of lanceolate, mucronate, green, pubescent leaflets. *h. F.* Native of Eastern Caucasus, on the higher mountains. Bieb. fl. taur. suppl. p. 501. Corolla small, with the vexillum striated. Young leaves rather tomentose in winter, but becoming smooth in summer.

*Naked-leaved Goat's-Thorn.* Shrub  $\frac{1}{2}$  foot.

173 *A. PSEUDO-TRAGACANTHA* (Pall. astr. p. 3. t. 3.) flowers axillary, sessile, 7-8-together; calyxes woolly, with setaceous lobes, which are longer than the tube; leaves with 8-9 pairs of oblong, acutish, awnless leaflets, clothed with hoary pili. *h. F.* Native of Eastern Caucasus, in subalpine places among rocks. Flowers yellowish. This plant is very like *A. aristatus*, but differs in the flowers being sessile.

*False Goat's-Thorn.* Shrub  $\frac{1}{2}$  foot.

174 *A. CRÉTICUS* (Lam. dict. 1. p. 321.) flowers axillary, sessile, aggregate; calyxes 5-parted, with setaceous plumose lobes, which are a little longer than the corolla; leaves with 5-8

pairs of oblong, acute, tomentose leaflets. *h. F.* Native of Candia, on Mount Ida. D. C. astr. no. 91. t. 33. *Trag. Crética incana, &c.* Tourn. cor. 29. Flowers purple, striped. Gum tragacanth also flows from this shrub, but very sparingly.

*Cretan Goat's-Thorn.* Shrub  $\frac{1}{2}$  to 1 foot.

175 *A. SICULUS* (Biv. giorn. palerm. no. 4. Rafin. car. p. 72.) flowers axillary, sessile, aggregate; calyx 5-parted, very villous, shorter than the corolla; leaves with 4-8 pairs of oblong acute leaflets, which when young are villous, but afterwards become glabrous. *h. F.* Native of Sicily, on high mountains, especially on Mount Etna. Flowers white, or tinged with purple (Rafinisque). *A. tragacantha*, Bern. Ucr. hort. panorm. p. 316.

*Sicilian Goat's-Thorn.* Shrub  $\frac{1}{2}$  foot.

176 *A. ECHINUS* (D. C. astr. no. 92. t. 34.) flowers axillary, sessile, twin; calyx woolly and villous, 5-toothed, shorter than the corolla; leaves with 4-5 pairs of oblong-lanceolate, acutish, hoary leaflets. *h. F.* Native of the Levant on rocks, and of Eastern Caucasus. *A. Cáspicus*, Bieb. fl. taur. 2. p. 204. suppl. 500. *A. Crétensis*, Pall. astr. p. 6. exclusive of the synonymes. Flowers white, with the vexillum striped with purple.

*Hedgehog Goat's-Thorn.* Shrub  $\frac{1}{2}$  foot.

\* \* *Flowers axillary, pedunculate.*

177 *A. ECHIORDES* (Lher. stirp. 170.) peduncles 2-flowered, shorter than the leaves; calyxes hardly pubescent, 5-toothed; leaves with 4-5 pairs of linear-lanceolate hoary leaflets. *h. F.* Native of Candia. *A. echiorides*, Willd. spec. 3. p. 1326. *A. Créticus*, Willd. acad. berol. 1794. p. 23. t. 2. f. 2. exclusive of the synonymes. Flowers white, but the vexillum is marked with red lines.

*Bugloss-like Goat's-Thorn.* Shrub  $\frac{1}{2}$  foot.

178 *A. OLYMPICUS* (Pall. astr. p. 4. t. 4.) peduncles very short; calyx ovate, tubular, silky, 5-toothed; leaves with 6 pairs of oblong, bluntish, hoary leaflets; legumes cylindrical, mucronate, twice the length of the calyx. *h. F.* Native of Armenia, on Mount Olympus. *A. leucophyllus*, Willd. spec. 3. p. 1331. Flowers white, almost sessile. Legumes distinctly pedunculate.

*Olympic Goat's-Thorn.* Shrub  $\frac{1}{2}$  to 1 foot.

179 *A. POTERIUM* (Vahl. symb. 1. p. 63.) peduncles very short, usually 2-flowered; calyx cylindrical, 5-toothed; leaves with 4-5 pairs of oblong acute leaflets, which are glabrous above and villous beneath; legumes tomentose, ovate, 1-seeded, length of calyx. *h. H.* Native of Granada, in dry places. *Poterium*, Cluss. hist. 1. p. 108. with a figure. Moris. oxon. sect. 2. t. 13. f. 2. *A. Granatensis*, Lam. dict. 1. p. 321. *A. tragacantha*  $\beta$ , Lin. spec. 1073. Flowers white. The odd leaflet usually permanent. Perhaps *A. Poterium* of Willd., a native of the Levant, is distinct from the plant of Vahl.

*Poterium-like Goat's-Thorn.* Fl. June, July. Clt. 1640. Shrub  $\frac{1}{2}$  foot.

180 *A. MASSILIENSIS* (Lam. dict. 1. p. 320. D. C. astr. no. 96.) peduncles usually 4-flowered, about equal in length to the leaves; calyxes cylindrical, with 5 short blunt teeth; leaves with 9-11 pairs of elliptic hoary leaflets. *h. H.* Native about Marseilles and Narbonne, in sandy places, as well as of Corsica and Mauritania. *A. tragacantha* var.  $\alpha$ , Lin. spec. 1073. *A. tragacantha*, Pall. astr. t. 4. f. 1, 2. Duh. arb. 2. t. 100. Woody. med. bot. 267. t. 98. Wats. dent. brit. 84.—Lob. icon. 2. t. 27.—Garid. aix. 469. t. 104, &c. Flowers white. This plant is usually grown for tragacanth, from which the gum is obtained, but it certainly produces nothing like gum tragacanth.

*Marseilles Goat's-Thorn.* Fl. May, July. Clt. 1640. Shrub  $\frac{1}{2}$  to 1 foot.

181 *A. ARISTATUS* (Lher. stirp. 170.) peduncles very short, usually 6-flowered; calyxine teeth long and setaceous; leaves with 6-9 pairs of oblong-linear, mucronate, pilose leaflets; legumes

hardly half-bilocular. *h. H.* Native of the alps of Europe and the Pyrenees. *A. sempervirens*, Lam. dict. 1. p. 320. *Phaca tragacantha*, All. pedem. 1257.—Garid. aix. t. 104. Flowers white or pale red. Peduncles usually 4-flowered.

*Awed-calyxed Goat's-Thorn.* May, Jul. Clt. 1791. Sh.  $\frac{1}{2}$  ft.

182 *A. GENARGENTEUS* (Moris. elench. sard. p. 11.) peduncles usually 5-flowered, shorter than the leaves; teeth of calyx narrow, acute, very short; leaves with many pairs of elliptic, canescent leaflets. *h. H.* Native of Sardinia, on the heights of Genargentum. Flowers cream-coloured, with the keel tipped with dark purple. Like *A. Massiliensis* and *A. aristatus*.

*Genargentum Goat's-Thorn.* Shrub  $\frac{1}{2}$  foot.

183 *A. BRACTEOLATUS* (D. C. astr. no. 102.) peduncles rather longer than the leaves, bearing ovate spikes of flowers; calyx clothed with adpressed pubescence, cylindrical, with lanceolate-subulate teeth; leaves with 7-8 pairs of oblong leaflets, which when young are clothed with silky pubescence, but at length becoming glabrous. *H. h.* Native of Galatia, on hills. *A. püngens*, Willd. spec. 3. p. 1325. *Trag. orientalis humillima se spargens, floribus spicatis*, Tourn. cor. 29. Bracteas linear-subulate. Flowers white in the dried specimens.

*Bracteolate Goat's-Thorn.* Shrub  $\frac{1}{2}$  to 1 foot.

184 *A. ANGUSTIFOLIUS* (Lam. dict. 1. p. 321.) peduncles 6-flowered, somewhat corymbose, about equal in length to the leaves; calyx cylindrical, rather villous, acutely 5-toothed; leaves with 7-9 pairs of lanceolate leaflets, glabrous in the adult state. *h. F.* Native of Armenia, Willd. act. berol. 1794. p. 25. D. C. astr. no. 98.—Tourn. cor. 29. Flowers yellow.

*Narrow-leaved Goat's-Thorn.* Shrub  $\frac{1}{2}$  foot.

185 *A. RETUSUS* (Willd. act. berol. 1794. p. 24. t. 2. f. 3. exclusive of the synonyme) peduncles 4-flowered, shorter than the leaves; calyxes clothed with adpressed, silky villi, cylindrical, 5-toothed; the teeth lanceolate; leaflets obovate, and somewhat retuse. *h. F.* Native of the Levant. Flowers reddish in a dried state. Like *A. Massiliensis*.

*Retuse-leafletted Goat's-Thorn.* Shrub  $\frac{1}{2}$  foot.

186 *A. DAMASCENUS* (D. C. prod. 2. p. 198.) peduncles 4-6-flowered, somewhat spicate, rather longer than the leaves; calyxes cylindrical, clothed with adpressed silky villi, 5-toothed, the teeth lanceolate; bracteas ovate, membranous, shorter than the tube of the calyx; leaves with 15-16 pairs of elliptic, somewhat mucronate leaflets, which are villous on both surfaces. *h. F.* Native about Damascus. Flowers white in the dried specimens. *A. retusus*, D. C. astr. no. 99. t. 35. but not of Willd.

*Damascus Goat's-Thorn.* Shrub  $\frac{1}{2}$  foot.

187 *A. LAGOPIDES* (Lam. dict. 1. p. 312. var.  $\beta$ , D. C. astr. no. 103.) spikes of flowers ovate, pedunculate, longer than the leaves; calyxes very hairy, 5-cleft, the lobes setaceous; bracteas ovate, acuminate, deciduous, membranous, longer than the tube of the calyx; leaves with 7-8 pairs of oblong leaflets, ending each in a spine-like mucrone, and clothed with adpressed villi. *h. F.* Native of Armenia. *A. lagopodioides*, Vahl. symb. 1. p. 64. Willd. in act. berol. 1794. p. 28. t. 1. f. 4. Flowers purple, spreading.

*Var.  $\beta$ , Persicus* (D. C. prod. 2. p. 299.) calyxes rather bladdery; spikes of flowers on long peduncles; flowers imbricated; leaflets broader. *h. F.* Native of Persia, between Kermancha and Amadan. Perhaps a proper species.

*Hare's-foot-like Goat's-Thorn.* Shrub  $\frac{1}{2}$  foot.

188 *A. LAGURUS* (Willd. act. berol. 1794. p. 28. t. 1. f. 2.) spikes of flowers ovate, pedunculate, longer than the leaves; calyxes very villous, at length a little inflated, 5-cleft; the segments subulate, about equal in length to the corolla; bracteas membranous, ovate, acuminate, length of flowers; leaves with 4-5 pairs of oblong-leaflets, each ending in a spine-like mucrone, and clothed with adpressed villi. *h. F.* Native of Armenia.

D. C. astr. no. 104. t. 36. *A. lagopoides*  $\alpha$ , Lam. Flowers imbricated, yellow.

*Hare's-tail-spiked Goat's-Thorn.* Shrub  $\frac{1}{2}$  foot.

189 *A. VAGINATUS* (D. C. astr. no. 105. t. 37.) spikes of flowers ovate, dense, pedunculate, longer than the leaves; calyxes at length inflated, villous, acutely 5-toothed; bracteas equal in length to the calyx; stipulas acuminate, very long, sheathing; leaves with 7-10 pairs of oblong leaflets, each ending in a spiny mucrone, and clothed with pubescence beneath. *h. F.* Native of the Levant. Flowers cream-coloured. Petioles almost unarmed.

*Sheathing-stipuled Goat's-Thorn.* Shrub  $\frac{1}{2}$  foot.

190 *A. CEPHALANTHUS* (D. C. astr. no. 106. t. 38.) flowers disposed in round pedunculate heads, 3-times longer than the leaves; calyxes clothed with silky hairs, 5-toothed; bracteas small; leaves with 7-9 pairs of oblong-linear leaflets, which are clothed with hoary, adpressed, silky villi. *h. F.* Native of Persia. Petioles almost unarmed.

*Headed-flowered Goat's-Thorn.* Shrub  $\frac{1}{2}$  foot.

191 *A. TRICHOLOBUS* (D. C. prod. 2. p. 299.) spikes of flowers ovate-roundish, pedunculate, twice or thrice longer than the leaves; calyxes a little inflated, hairy; the segments subulate, longer than the tube of the corolla; bracteas ovate, acuminate, deciduous, length of corolla; leaves with 5-6 pairs of linear leaflets, each ending in a spine-like point, and clothed with adpressed hoary villi. *h. F.* Native of the Levant. Flowers pale in the dried specimens, adult ones without the bracteas.

*Hair-lobed-calyxed Goat's-Thorn.* Shrub  $\frac{1}{2}$  foot.

192 *A. TUMIDUS* (Willd. act. berol. 1794. p. 26.) flowers usually solitary, on short peduncles; calyxes villous, inflated, contracted at the mouth, 5-toothed; leaves with 4-6 pairs of oblong leaflets, which are clothed with adpressed pubescence. *h. H.* Native of Spain, in the province of Aragon, Egypt, and the Levant, in sandy places. Russ. alepp. t. 5. *A. Rauwolfii*, Vahl. *Colutea spinosa*, Forsk. descr. Spines long. Axillary leaves small, with a few pairs of leaflets, which are about equal in length to the pedicels. Flowers pale yellow.

*Var.  $\beta$ , armatus* (D. C. prod. 2. p. 299.) leaves with 8 pairs of linear, acute leaflets. *h. F.* Native of Mauritania. *Anthyllis tragacanthoides*, Desf. fl. atl. 2. p. 150. t. 194. but not of Labill. *Ast. armatus*, Willd. spec. 3. p. 1330.

*Tumid-calyxed Goat's-Thorn.* Fl. May, July. Clt. 1816. Shrub  $\frac{1}{2}$  to 1 foot.

193 *A. TORTUOSUS* (D. C. prod. 2. p. 299.) peduncles a little longer than the leaves; flowers 3-8, distant, disposed in a kind of raceme; bracteas membranous, length of pedicels; calyxes villous, 5-toothed, cylindrical, at length a little inflated; leaves with 10 pairs of obovate, hairy, small leaflets. *h. F.* Native of the Levant, between Bagdad and Kermancha. This plant is very like *A. anthylloides*, but differs in the petioles being spiny. Flowers probably purple.

*Twisted Goat's-Thorn.* Shrub  $\frac{1}{2}$  to 1 foot.

194 *A. COLUTEOIDES* (Willd. act. berol. 1794. p. 27.) peduncles a little longer than the leaves, each bearing 4-5 distant flowers in a kind of spike; bracteas setaceous, very short; calyxes villous, inflated, 5-toothed; leaves with 15-20 pairs of obovate, small, hoary, hairy leaflets. *h. F.* Native on Mount Lebanon. Rauw. trav. 281. with a figure. *Anthyllis tragacanthoides*, Labill. dec. syr. 2. p. 16. t. 9. Flowers purple.

*Bladder-scenna-like Goat's-Thorn.* Shrub  $\frac{1}{2}$  foot.

§ 14. *Chronopodii* (from *χρονος*, *chronos*, time, and *πους ποδός*, *pous podos*, a foot; in reference to the permanent nature of the footstalks of the leaves). D. C. prod. 2. p. 299. *Petioles permanent, but never hardening into spines. The odd leaflets remaining a long time on the end of the petiole, after the lateral*

leaflets have fallen. *Stipulas* not adnate to the petioles. Stamens distinct or diadelphous, with a short sheath. Perhaps a proper genus.

195 *A. AMA'RUS* (Pall. astr. p. 8. t. 6.) plant erect, glabrous; stipulas spreading, lunate, leafy; leaves with 2-5 pairs of ovate, remote leaflets; spikes pedunculate, elongated, thinly flowered; calyx almost cylindrical; stamens distinct.  $\frac{1}{2}$  F. Native of the Caspian desert, on the gypsaceous hills called Arsagar. This plant agrees with *A. coluteoides* in the inflorescence, but differs in the calyx not being inflated, and from all the species in the stamens being distinct, but of this rare plant the fruit has not been seen.

*Bitter Milk-Vetch.* Shrub 1 foot?

196 *A. GIBBOSUS* (D. C. prod. 2. p. 300.) plant erect, canescent from adpressed villi; stipulas wanting; leaves with 8-10 pairs of remote, ovate leaflets; spikes elongated, pedunculate, thinly-flowered; calyx gibbous at the base; stamens diadelphous, joined at the base but a very little way.  $\frac{1}{2}$  F. Native between Mossul and Bagdad. Very like *A. amarus*, but very distinct, and with it will form perhaps a connecting genus to *Astragalus*.

*Gibbous-calyxed Milk-Vetch.* Shrub.

SERIES IV. *PODOCHREA'TI* (πους ποδος, *pous podos*, a foot, and *ωχρος*, *ochros*, yellow; in reference to the footstalks of leaves or petioles never hardening into spines, as those of the last series, but remaining weak and pliable, and in the flowers being usually yellow). D. C. prod. 2. p. 300. Stipulas adnate to the petioles. Petioles permanent, but never hardening into spines.

§ 15. *Anthylloides* (from *Anthyllis*, and *idea*, similar; plant resembling *Anthyllis* in habit). D. C. prod. 2. p. 300. Stipulas adnate to the petioles. Petioles unarmed. Calyxes *Uladery*, inclosing the legume.

\* Corollas yellowish, rarely purple.

197 *A. CALYCINUS* (Bieb. fl. taur. 2. p. 199. pl. cent. ross. 1. t. 9. ex suppl. p. 496.) plant stemless, rather glaucous and canescent from adpressed pili, which are fixed by their centre; leaves with from 5-13 pairs of obovate leaflets, the lower ones remote; scapes longer than the leaves; spikes of flowers oval-oblong; calyxes inflated; legumes somewhat triquetrous, acute, many-seeded.  $\frac{1}{2}$  II. Native of Caucasus and at the river Kuma. Flowers cream-coloured. Calyx sometimes beset with hairs, like those on the leaves.

*Large-calyxed Milk-Vetch.* Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

198 *A. HALICACABUS* (Lam. dict. 1. p. 320.) plant stemless, glabrous; leaves with 21-31 lanceolate-linear leaflets; scapes longer than the leaves; flowers spicate, remote; calyxes globose, bladdery; legumes hardly half-bilocular, 2-seeded.  $\frac{1}{2}$  II. Native of Armenia. Phaca vesicaria, Schreb. dec. p. 5. t. 3. Flowers yellowish. Calyxes veiny, contracted at the mouth.

*Kettle-calyxed Milk-Vetch.* Fl. Ju. Clt. 1806. Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  ft.

199 *A. PHYSALOIDES* (D. C. prod. 2. p. 300.) plant stemless, rather hairy; leaflets 5-7, ovate, obtuse, smoothish; scapes longer than the leaves; flowers rather remote, disposed in spikes; calyxes hairy, globose, bladdery.  $\frac{1}{2}$  II. Native of the Levant. Flowers yellowish. The leaves are like those of *A. calycinum*, and the flowers are like those of *A. halicacabus*.

*Winter-cherry-like-calyxed Milk-Vetch.* Pl.  $\frac{1}{2}$  foot.

200 *A. ANTHYLLOIDES* (Lam. dict. 1. p. 320. D. C. astr. no. 124. t. 42. but not of Pall.) plant almost stemless, clothed with hoary villi; leaflets 27-35, ovate; peduncles twice the length of the leaves; flowers distant on the spikes; calyxes hairy, bladdery; legumes hardly half-bilocular, 2-seeded.  $\frac{1}{2}$  H. Native of Armenia. Phaca incana, Vahl. symb. 1. p. 57. Flowers yellow. This plant is very like *A. coluteoides*, but differs in the petioles being unarmed.

*Anthyllis-like Milk-Vetch.* Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

201 *A. NUBIGENUS* (D. Don, prod. fl. nep. 245.) plant stemless; leaves with many pairs of oval, mucronulate, densely pilose leaflets; flowers solitary, almost sessile; calyxes inflated, saccate at the base; legumes nearly terete, straight, very villous.  $\frac{1}{2}$  F. Native of Nipaul, in Gosaingsthan. Root long, woody. Flowers large, yellow, with the vexillum pilose on the back.

*Cloud-born Milk-Vetch.* Fl. May. Pl.  $\frac{1}{4}$  foot.

202 *A. VULNERARIÆ* (D. C. prod. 2. p. 300.) plant almost stemless, twisted, low, hairy; leaflets 7-11-13, obovate, the terminal one sessile; peduncles hardly longer than the leaves; flowers few, capitate; calyxes hairy, reticulated, becoming at length bladdery; corolla clothed with adpressed silky villi.  $\frac{1}{2}$  H. Native of Asia Minor. Phaca halicacaba, Willd. spec. 3. p. 1254. Flowers yellowish.

*Wound-wort-like Milk-Vetch.* Pl.  $\frac{1}{2}$  foot.

203 *A. LUPULINUS* (Pall. itin. ed. gall. append. no. 877. astr. p. 17. t. 15.) plant stemless and canescent from adpressed villi, which is fixed by the centre; leaflets 9, elliptic-oblong; scapes hardly longer than the leaves; spikes dense, ovate; calyx hairy, at length bladdery; corollas glabrous; legumes half-bilocular, 2-seeded.  $\frac{1}{2}$  H. Native of Siberia, in sandy islands in the rivers Selenga and Ouda, and at Lake Baikal. Flowers cream-coloured.

*Hop Milk-Vetch.* Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

204 *A. LAGUROIDES* (Pall. itin. ed. gall. 8vo. append. no. 376. t. 91. f. 2.) plant stemless, and clothed with adpressed villi; leaflets 5-7, elliptic-oblong; scapes about equal in length to the leaves; spikes ovate, dense; calyxes hispid, at length bladdery; legumes bilocular, 2-seeded.  $\frac{1}{2}$  II. Native of Siberia, in plains about the river Selenga. *A. lagurus*, Pall. astr. p. 18. t. 16. but not of Willd. *A. laguroides*, D. C. Willd. This species is very like *A. lupulinus*, but differs in the flowers being purple.

*Hare's-tail-like Milk-Vetch.* Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

205 *A. INFLATUS* (D. C. astr. no. 13.) plant caulescent, nearly erect, glabrous; stipulas lanceolate, adnate to the petiole? leaflets 9, linear-lanceolate; spikes globose; peduncles longer than the leaves; calyxes inflated, tomentose; legumes ovate.  $\frac{1}{2}$  H. Native of Siberia, in the Kirghiscan steppe. *A. anthylloides*, Pall. astr. no. 19. t. 13. *A. anthylloides*, Pall. astr. no. 19. t. 13. but not of Lam. *A. fragiformis*, Willd. spec. 3. p. 1261. Flowers cream-coloured.

*Inflated-calyxed Milk-Vetch.* Pl.  $\frac{1}{2}$  foot.

206 *A. FOLLICULARIS* (Pall. astr. p. 19. t. 14.) plant stemless, canescent from adpressed hairs, which are fixed by their centre; leaflets 13-21, lanceolate; scapes straight, longer than the leaves; spikes cylindrical; calyxes clothed with blackish adpressed down, at length becoming bladdery.  $\frac{1}{2}$  II. Native of the Kirghiscan steppe, at the Uba, and near Salair. *A. stricta*, Sievers ex Fisch. in litt. *Oxytropis follicularis*, Pers. ench. but the carina is obtuse.

*Follicular-fruited Milk-Vetch.* Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

207 *A. MOLLIS* (Bieb. fl. taur. suppl. p. 495.) plant almost stemless and rather villous; leaflets 25-29, elliptic, obtuse, young ones hairy; scapes shorter than the leaves; flowers spicate; calyxes hairy, at length becoming bladdery, the teeth subulate; legumes very hairy, covered by the calyx.  $\frac{1}{2}$  H. Native of Iberia, on hills about Tiflis. *A. eriocarpus*, Bieb. fl. taur. 2. p. 196. but not of D. C. Flowers yellowish.

*Soft Milk-Vetch.* Pl.  $\frac{1}{2}$  foot.

208 *A. HELMI* (Fisch. in litt. D. C. prod. 2. p. 301.) plant almost stemless, canescent from adpressed bristles; leaflets 13-17, elliptic, rather mucronulate; scapes length of leaves; flowers 6-8, disposed in a kind of capitate spike; calyxes membranous, at length pubescent; legumes hairy, longer than the

calyx. 2. H. Native of the Ural mountains, at the metal mines of Woskres-Senskoï. Flowers yellow. Perhaps this plant belongs to a different section.

*Helm's Milk-Vetch.* Pl.  $\frac{1}{2}$  foot.

\* \* *Corollas white. Calyxes hardly bladdery. Perhaps this will constitute a proper section.*

209 *A. GALACTITES* (Pall. astr. p. 85. t. 65.) plant stemless, rather canescent from adpressed bristles; leaflets 11-15, oblong; flowers radical, aggregate, almost sessile; legumes minute, 2-seeded, inclosed in the calyx, which is pubescent, membranous, and rather inflated. 2. II. Native of Siberia, beyond the Baikal, and of Dahuria, in naked gravelly places. Corolla white, but becoming of a pale yellow colour on drying, and almost as long as the leaves.

*Milky-Vetch.* Pl.  $\frac{1}{4}$  foot.

210 *A. AMMODYTES* (Pall. itin. ed. gall. append. no. 372. t. 83. f. 2. astr. p. 7. t. 5.) plant prostrate, clothed with hoary down; stipulas ovate, obtuse; leaves with 2-5 pairs of ovate-leaflets; flowers axillary, rather radiant, twin, on short peduncles; calyxes cylindrical, hairy. 2. F. Native of Eastern Siberia, on sandy hills. D. C. astr. no. 91. Legume ovoid, mucronate, half-bilocular. Flowers white. Plant small. Petioles permanent and unarmed, as in division *Chronopodi*.

*Sand-viper Milk-Vetch.* Fl. May, July. Clt. 1820. Sh. pr.

§ 16. *Caprini* (from *caprinus*, of a goat; in reference to the leaves of *A. caprinus*, the ciliæ of which have been compared to a goat's beard). D. C. prod. 2. p. 301. *Stipulas adhering to the petioles at the base. Petioles unarmed. Flowers yellow. Calyxes not bladdery.*

211 *A. OVA'TUS* (D. C. astr. no. 107.) plant somewhat caulescent, procumbent, villous; leaflets 20-23, ovate; peduncles longer than the leaves; spikes of flowers ovate-oblong; bracteas and calyxes villous; legumes glabrous. 2. II. Native of Armenia. Flowers cream-coloured according to the dried specimens, ex. Tourn. cor. 28. Perhaps belonging to a different section.

*Ovate-spiked Milk-Vetch.* Pl. procumbent.

212 *A. DASYANTHUS* (Pall. astr. p. 79. t. 65. itin. ed. gall. append. no. 375. t. 85.) plant caulescent, erect, clothed with soft hairs; leaflets 21-23, elliptic, obtuse, rather mucronate; peduncles hardly shorter than the leaves; spikes of flowers ovate-roundish; calyxes villous, 5-cleft; legumes ovate-lanceolate, hairy. 2. H. Native of Siberia and Caucasus, the Ukraine, and Hungary, in sandy and calcareous fields. *A. eriocéphalus*, Waldst. et Kit. pl. rar. hung. 1. t. 46. Flowers yellow, with the vexillum pubescent.

*Thick-flowered Milk-Vetch.* Pl. 1 foot.

213 *A. MULTIVOLVIS* (D. C. prod. 2. p. 301.) plant short, caulescent and pubescent; leaflets 41-61, elliptic, obtuse at both ends; racemes pedunculate, rather loose, elongated, hardly shorter than the leaves; calyxes cylindrical, 5-toothed; corollas glabrous; legumes mucronate, velvety, twice the length of the calyx. 2. F. Native of the Levant, between Bagdad and Kermancha. Flowers 8-10, distant, yellow.

*Many-paired-leaved Milk-Vetch.* Pl.  $\frac{1}{2}$  foot.

214 *A. CAPRINUS* (Lin. spec. 1071.) plant almost stemless, erect, pubescent; leaflets 23-29, ovate-oblong, ciliated; peduncles one-half shorter than the leaves; flowers racemose, spreading; segments of the calyx subulate; corollas glabrous; legumes ovate, inflated, stipitate, sparingly pilose. 2. H. Native of Barbary and the Levant. D. C. astr. no. 109.—*Moris. oxon. 2. p. 24. f. 3.* Flowers yellow.

*Var. β, glaber* (D. C. prod. 2. p. 302.) leaflets as well as ovaries nearly smooth. 2. H. Native of Mauritania. Perhaps a proper species.

*Goat's Milk-Vetch.* Fl. June, July. Clt. 1683. Pl.  $\frac{1}{2}$  ft.

215 *A. LONGIFLORUS* (Pall. astr. p. 73. exclusive of the synonyme of Buxb. and Lin.) plant almost stemless, rather hairy; leaflets 11-13, obovate, retuse, or emarginate; racemes loose, shorter than the leaves; teeth of calyx lanceolate-subulate; corolla very long, glabrous; legumes ovate, turgid, mucronate, smooth, when young filled with pulp. 2. H. Native of the desert of Tartary and of the Volga, as well as at Lake Inderskoï. Flowers yellow. The plant from the Volga differs from the rest in the legumes being almost sessile.

*Var. α, breviscapus* (D. C. prod. 2. p. 303.) peduncles much shorter than the leaves; bracteas hardly exceeding the pedicels. Pall. astr. t. 60.—*Gmel. sib. 4. t. 27.*

*Var. β, procærior* (D. C. prod. 2. p. 302.) peduncles exceeding the leaves; bracteas thrice the length of the pedicels. Pall. astr. t. 60. β.

*Long-flowered Milk-Vetch.* Fl. June, July. Clt. 1806. Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

216 *A. UTRIGER* (Pall. astr. p. 75.) plant stemless, rather hairy; leaflets 25-35; racemes loose, much shorter than the leaves; teeth of calyx lanceolate-subulate; corollas glabrous; legumes stipitate, ovate, mucronate, hard, turgid, clothed with woolly pubescence, adult ones glabrous and 1-celled. 2. H. Native of Russia, on rocks. Flowers yellow.

*Var. α, ovatus* (Pall. astr. t. 61.) leaflets ovate; legumes large. 2. H. Native of Tauria, Tartary, and Iberia.

*Var. β, Uralensis* (Pall. astr. t. 62. f. 2. β) leaflets oblong-linear. 2. II. Native of the Ural mountains, at the river Don.

*Bladder-bearing Milk-Vetch.* Fl. Ju. Jul. Clt. 1818. Pl.  $\frac{1}{4}$  ft.

217 *A. LIGNOSUS* (D. C. astr. no. 114. t. 39.) plant somewhat caulescent, woody, grey; leaflets 49-51, oblong-linear; peduncles few-flowered, much shorter than the leaves; teeth of calyx lanceolate, subulate; corollas glabrous; legumes sessile, compressed, villous. 2. ? 2. ? II. Native of Siberia, in sandy fields impregnated with salt, at the river Irtysh. Flowers yellow.

*Woody-stemmed Milk-Vetch.* Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

218 *A. PUBIFLORUS* (D. C. astr. no. 111.) plant almost stemless, hairy; leaflets 21-27, ovate, acute; flowers almost sessile, aggregate; teeth of calyx linear-subulate; wings of corolla pubescent; ovary sessile, woolly. 2. H. Native of Siberia. Flowers yellow.

*Downy-flowered Milk-Vetch.* Pl.  $\frac{1}{2}$  foot.

219 *A. FABACEUS* (Bieb. suppl. p. 496.) plant stemless; leaflets 35-45, oblong or ovate, pilose; scapes few-flowered, much shorter than the leaves; teeth of calyx lanceolate; corollas glabrous; legumes compressed, sessile, ovate, mucronate, and quite smooth, even when young. 2. II. Native of Iberia, on hills, and of other provinces in the east. *A. tumidus*, Bieb. fl. taur. 2. p. 198. but not of Willd. Flowers yellow, drooping. Allied to *A. longiflorus* and *A. utriger*.

*Bean-like Milk-Vetch.* Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

220 *A. LANTIGERUS* (Desf. atl. 2. p. 181. t. 202.) plant stemless and clothed with soft hairs; leaflets 17-31, elliptic or oblong; flowers almost sessile, aggregate; teeth of calyx lanceolate; corollas glabrous; legumes compressed, ovate, mucronate, sessile, when young very hairy, but when in an adult state sparingly pilose. 2. H. Native of Mauritania, Egypt, Phrygia, and Iberia, in barren sandy places and on hills. Flowers yellow, sometimes pedunculate.

*Var. β, subglabratus* (D. C. prod. 2. p. 302.) leaflets almost glabrous; calyxes and petioles hairy at the base. 2. II. Native of the Levant.—*Buxb. spec. 3. p. 38. f. 2.* and hence the *A. tragacanthoides* of Willd. spec. 3. p. 1323. Flowers radical.

*Wool-bearing Milk-Vetch.* Fl. May, Jul. Clt. 1791. Pl.  $\frac{1}{4}$  ft.

221 *A. EXCAPUS* (Lin. mant. 275.) plant stemless, clothed with soft hairs; leaflets 21-27, ovate; flowers almost sessile,

aggregate; teeth of calyx long and subulate; corolla glabrous; legumes ovate, acuminate-mucronate, hairy, sessile, and rather compressed.  $\mathcal{U}$ . H. Native of Vallais, Thuringia, Austria, Hungary, and the Ukraine. Jacq. icon. rar. t. 561. Pall. astr. 64. *Astragaloides syphilitica*, Mönch. Flowers yellow. The plant is used to cure syphilis in Hungary.

*Scapeless Milk-Vetch*. Fl. May, July. Clt. 1787. Pl.  $\frac{1}{4}$  ft.

222 *A. SCHANGINIA'NUS* (Pall. astr. p. 67. t. 73.) plant somewhat caulescent and loosely lanuginose; leaflets 25-31, ovate-oblong, peduncles very short, somewhat racemose; teeth of calyx long, subulate; corollas glabrous; legumes triquetrous, acuminate, pubescent, callous.  $\mathcal{U}$ . H. Native of Siberia, at the Catunja and in the desert of the Don. Leaves about a foot long. Flowers yellow.

*Schang's Milk-Vetch*. Pl. 1 foot.

223 *A. DECLINAT'US* (Willd. spec. 3. p. 1294.) stems short, procumbent; leaflets 29-31, oblong, obtuse, and pilose; racemes few-flowered, crowded, pedunculate, one half shorter than the leaves; legumes oblong, acute, pilose.  $\mathcal{U}$ . H. Native of Armenia. *A. orientalis acaulis fere flore luteo*. Tourn. cor. 29. ex Willd. Very like *A. exscapus*. Flowers yellow.

*Declinate-stemmed Milk-Vetch*. Pl. procumbent.

224 *A. NUMMULARIUS* (Lam. dict. 1. p. 317. exclusive of the synonyms) stemless, hairy; leaflets 21-23, ovate, mucronate, or emarginate; flowers almost sessile, aggregate; teeth of calyx lanceolate-subulate; corolla glabrous; legumes compressed, ovate, mucronate, hairy.  $\mathcal{U}$ . H. Native of Candia, Syria, and Eastern Caucasus. D. C. astr. 117. t. 11. f. 2. Flowers yellow. In the same plant the leaflets are emarginate and acute.

*Money-wort Milk-Vetch*. Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

225 *A. DIFFUSUS* (Willd. spec. 3. p. 1321.) plant almost stemless, beset with cinereous hairs; leaflets 19-23, elliptic-lanceolate; flowers almost sessile, aggregate; bractes and calycine teeth setaceous, longer than the tube, and very pilose; legumes ovate, rather triquetrous, acuminate, hairy.  $\mathcal{U}$ . H. Native of Tauria, in fields adjacent to the Caucasus, and in the Caspian and Tartarian deserts. Bieb. fl. taur. 2. p. 202. *A. dolichophyllus*, Pall. astr. p. 84. t. 68. Flowers pale cream-coloured. This plant is allied to *A. testiculatus*.

*Diffuse Milk-Vetch*. Fl. May, Jul. Clt. 1820. Pl.  $\frac{1}{4}$  foot.

226 *A. HUMILIS* (Bieb. fl. taur. 2. p. 203. suppl. 498.) plant almost stemless, depressed, clothed with cinereous villi; leaflets obovate; flowers almost sessile, aggregate; calycine teeth much shorter than the tube; legumes ovate, acuminate, hairy.  $\odot$ . H. Native of Iberia. Corolla yellowish. Allied to *A. testiculatus*.

*Humble Milk-Vetch*. Pl. depressed.

227 *A. RUBRUS* (D. C. astr. no. 115.) plant almost stemless, beset with cinereous villi; leaflets 19-21, linear-oblong; flowers almost sessile, aggregate; calycine teeth about equal in length to the tube; legumes compressed, acuminate, villous, half-bilocular.  $\mathcal{U}$ . H. Native of Tartary. Flowers very pale cream-coloured. Perhaps sufficiently distinct from the following species.

*Doubtful Milk-Vetch*. Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

228 *A. BUCHTORME'NSIS* (Pall. astr. p. 76. t. 62. f. A.) plant stemless, clothed with hoary pubescence; leaflets 39-43, oblong; peduncles few-flowered, very short, declinate when in flower; calyx 5-toothed; legumes oblong-cylindrical, acuminate, callous, half-bilocular.  $\mathcal{U}$ . H. Native of Siberia at the rivers Uba, Catunja, and Buchtorm. Flowers yellow. Legume, according to Fischer  $\frac{1}{2}$  an inch long and hairy.

*Buchtorm Milk-Vetch*. Fl. May, Jul. Clt. 1818. Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  ft.

229 *A. BRACHYSTACHYS* (D. C. prod. 2. p. 303.) plant hairy-pubescent, with very short stems; leaflets 15-23, exactly and broadly ovate; peduncles shorter than the leaves; flowers dis-

posed in short spikes; calyx cylindrical, with lanceolate-subulate teeth; corollas glabrous; ovary sparingly-villous.  $\mathcal{U}$ .? h.? F. Native of the Levant, between Aleppo and Mossul. Flowers yellow. Legumes unknown.

*Short-spiked Milk-Vetch*. Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

230 *A. GLOBOSUS* (Vahl. symb. 1. p. 60.) plant stemless, clothed with hoary-silvery down; leaflets 12-16 pairs, elliptic-oblong, callous at the apex; scapes twice the length of the leaves; spikes of flowers dense, ovate-globose; bractes linear, about equal in length to the calyx.  $\mathcal{U}$ . F. Native of Armenia. D. C. astr. 120. Flowers yellow.

*Globose-spiked Milk-Vetch*. Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

231 *A. CYLINDRACEUS* (D. C. astr. 119.) plant stemless and clothed with hoary-silky down; leaves with 14 pairs of elliptic-oblong leaflets; peduncles longer than the leaves; spikes cylindrical; bractes setaceous, longer than the calyx.  $\mathcal{U}$ . F. Native of Armenia. Allied to the preceding species. Perhaps both are wrongly placed in the present section. Flowers pale-yellow.

*Cylindrical-spiked Milk-Vetch*. Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

232 *A. LANATUS* (Labill. dec. syr. 1. p. 21. t. 10. but not of Pall.) plant stemless, clothed with hoary villi; leaflets 11-23, ovate; peduncles rather shorter than the leaves; spikes of flowers ovate, dense; legumes ovate-cordate, triquetrous, compressed, acute, villous.  $\mathcal{U}$ . F. Native of Mount Lebanon. *A. Libanotis*, Willd. spec. 3. p. 1308. *A. hirsutissimus*, D. C. astr. no. 46. t. 19. Flowers yellow. Perhaps this plant belongs to another section.

*Woolly Milk-Vetch*. Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

§ 17. *Incani* (from *incanus*, hoary; aspect of plants). *D. C. prod. 2. p. 304. Stipulas adnate to the petioles, which are unarmed. Calyxes as well as legumes not bladderly. Flowers usually purple, rarely of a dirty yellow colour. Vexillum much elongated. Leaves hoary from adpressed down. Legumes perfectly bilocular.*

233 *A. MONSPESSULANUS* (Lin. spec. 1072.) plant almost stemless, clothed with hoary pubescence or almost glabrous; leaflets 21-41, ovate or lanceolate, outer ones rather the smallest; scapes exceeding the leaves; teeth of calyx long, and subulate; legumes terete, subulate, a little arched, adult ones glabrous.  $\mathcal{U}$ . H. Native of the south of Europe and Mauritania, in fields. Cam. epit. 929. with a figure. Curt. bot. mag. 219. Flowers either purple, pale, or white. Stems almost wanting when growing in a dry situation, but in rich earth or in a moist place they are elongated. Leaves hoary when the plant grows in dry exposed situations, but in a moist situation they are almost glabrous.

*Var.  $\beta$ , polygala* (D. C. prod. 2. p. 304.) spikes of flowers shorter; legumes almost glabrous, even when young; leaflets ovate-roundish, almost glabrous.  $\mathcal{U}$ . H. Native of the south of Caucasus. *A. polygala*, Pall. astr. p. 110. t. 83.

*Montpelier Milk-Vetch*. Fl. June, Aug. Clt. 1710. Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot, or prostrate.

234 *A. SANGUINOLENTUS* (Bieb. casp. 190. fl. taur. 2. p. 200.) plant stemless; leaflets elliptic, obtuse, hoary beneath; scapes declinate, longer than the leaves; legumes oblong, compressed, rather arched, glabrous, spotted with blood-colour.  $\mathcal{U}$ . H. Native of Eastern Caucasus, on dry exposed hills. *A. incanus* var. Pall. astr. 84. f. 2. *A. clavatus  $\beta$ , brevibracteatus*, D. C. astr. no. 127. Flowers yellowish green. Perhaps this species is referrible to section *Caprini*.

*Bloody-spotted-legged Milk-Vetch*. Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

235 *A. INCANUS* (Lin. spec. 1072.) plant stemless, hoary; leaflets 13-17, ovate; scapes hardly exceeding the leaves; spikes capitate; calycine teeth subulate, short; legumes nearly cylindrical, hoary from short down, incurved at the apex, and ending in a subulate mucrone, hardly 3 times the length of the calyx;

cells 5-6-seeded. *Æ. H.* Native of the south of France, in dry fields and among stones. Magn. bot. monsp. p. 32. with a figure. *A. incanus*, Pall. astr. t. 84. Flowers purplish.

*Var. β, Barrelieri* (Dufour, ann. gen. sc. 7. p. 297.) legumes hoary, at length very hard, oblong, not ovate, a little incurved, subulate; cells usually 5-seeded. *Æ. H.* Native of Spain, in the province of Valentia, on arid hills at St. Philip.

*Hoary Milk-Vetch.* Fl. June, July. Clt. 1795. Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  ft.

236 *A. INCURVUS* (Desf. atl. 2. p. 182. t. 203.) plant stemless, hoary; leaflets 17-27, elliptic; scapes longer than the leaves; spikes of flowers capitate; teeth of calyx subulate; legumes oblong, cylindrical, tapering to the base, incurved at the apex, glabrous, hardly 3-times the length of the calyx; cells 3-5-seeded. *Æ. H.* Native of Algiers, in sandy places. D. C. astr. 128. Flowers pale-purple.

*Incurved-podded Milk-Vetch.* Pl.  $\frac{1}{2}$  foot.

237 *A. CLAVATUS* (D. C. astr. no. 127. t. 44.) plant almost stemless, hoary; leaflets 11-21, roundish-ovate; scapes longer than the leaves; flowers disposed in spikes, spreading; legumes erect, glabrous, somewhat clavate, incurved at the top; cells 4-5-seeded. *Æ. H.* Native of Armenia. Flowers greenish yellow in a dried state. Perhaps the same as *A. cinereus* of Willd. spec. 3. p. 1315.

*Clavate-legged Milk-Vetch.* Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

238 *A. NUMMULARIODES* (Desf. emend. D. C. astr. no. 131.) plant stemless and hoary; leaflets 17-23, obovate; scapes longer than the leaves; flowers few, disposed in short spikes; calyxes beset with black villi, 5-toothed; legumes elliptic, ventricose, silky, hardly longer than the calyx; cells 3-seeded. *Æ. H.* Native of sandy places near Sbiba, in Tunis. *A. nummularius*, Desf. atl. 2. p. 182. t. 204. exclusive of the synonymes. *A. rotundifolius*, Willd. spec. 3. p. 1317. Flowers rose-coloured.

*Money-wort-like Milk-Vetch.* Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

239 *A. MACRORRHIZUS* (Cav. icon. 2. p. 28. t. 133.) plant stemless, hoary; leaflets 15-21, ovate, mucronulate; scapes exceeding the leaves; spikes ovate, many-flowered; flowers distinct, pedicellate; calyxes clothed with black villi, 5-toothed; legumes erect, obovate, pubescent, a little longer than the calyx, ending in a hooked acumen; cells 3-4-seeded. *Æ. H.* Native of Spain, in fields about Madrid. Flowers red. *A. montanus*, Brot. ex Steud.

*Long-rooted Milk-Vetch.* Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

240 *A. BRACHYCARPUS* (Bieb. fl. taur. 2. p. 201. cent. 2. p. 58.) plant stemless, pubescent; leaflets 15-27, oblong-elliptic; scapes longer than the leaves; spikes many-flowered, at length elongated; calyxes clothed with black and white hairs mixed; legumes erect, obovate, length of calyx, when young clothed with adpressed pubescence; cells 2-3-seeded. *Æ. H.* Native of Caucasus. Sims, bot. mag. 2335.—Buxb. cent. 3. t. 38. f. 1. ? Flowers of a dirty purple colour.

*Sharp-fruited Milk-Vetch.* Fl. Ju. July. Clt. 1820. Pl.  $\frac{1}{2}$  ft.

241 *A. GLAREOSUS* (Dougl. mss.) stems short, procumbent; plant clothed with hoary silky villi; stipulas free, permanent; leaflets numerous, obovate; peduncles or scapes bearing from 3-10 flowers at the apex; bractees lanceolate, subulate, twice the length of the pedicels. *Æ. H.* Native of North America, from the confluence of Lewis and Clarke's river with the Columbia to the Rocky mountains. Flowers large, purple. Habit of a species of *Oxytropis*. This species belongs more properly to section *Onobrychoidei* than to the present section.

*Gravel Milk-Vetch.* Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

242 *A. PURSHII* (Dougl. mss.) plant tufted, woody at the base, densely clothed with hoary-silky villi; stipulas distinct, permanent; leaflets numerous, elliptic; bractees subulate, twice the length of the pedicels; peduncles or scapes shorter than the leaves, bearing a few flowers at the apex. *Æ. H.* Native of

North-west America, on the low hills of the Spokane River. Flowers yellow. Habit of a species of *Oxytropis*. This plant belongs more properly to section *Ciceroides*.

*Pursh's Milk-Vetch.* Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

243 *A. MOLLISSIMUS* (Torrey, in ann. lyc. 2. p. 173.) plant almost stemless, erect, clothed in every part with silky down; stipulas free; leaves with 11-14 pairs of ovate-oblong mucronulate leaflets; peduncles longer than the leaves; flowers spicate, erect; legumes oblong, arched, glabrous. *Æ. H.* Native of North America, on the Platte. Flowers probably cream-coloured.

*Very-soft Milk-Vetch.* Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

244 *A. PENDULUS* (D. C. astr. no. 129.) plant stemless, hoary; leaflets 17-21, roundish; scapes longer than the leaves; flowers spreading, but at length pendulous, disposed in spikes. *Æ. F.* Native of the Levant. *A. orientalis folio subrotundo, flore purpureo magno*, Tourn. cor. 28.

*Pendulous-flowered Milk-Vetch.* Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

245 *A. ELONGATUS* (Willd. spec. 3. p. 1314.) plant stemless, hoary; leaflets 9-11, elliptic; scapes longer than the leaves; spikes of flowers elongated; flowers erect, but at length spreading; legumes pendulous, ovate, pubescent, mucronate by the style; cells 2-3-seeded. *Æ. H.* Native of Galatia. *A. Pistacia*, Rost. ined. Flowers purplish. Legumes the size and form of those of the *Pistachia-nut*. Very like *A. brachycarpus*, but differs in the fruit being pendulous.

*Elongated-spiked Milk-Vetch.* Pl.  $\frac{1}{2}$  foot.

246 *A. ANGULOSUS* (D. C. astr. no. 122. t. 45.) plant stemless, hoary; leaflets 9-13, elliptic, mucronulate; scapes longer than the leaves; spikes of flowers at length elongated; legumes ovate, somewhat trigonal, rather pendulous, pubescent, mucronate by the style, about 3-times the length of the calyx; cells 3-4-seeded. *Æ. H.* Native of the Levant. Flowers unknown.

*Angular-podded Milk-Vetch.* Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

§ 18. *Radiciſſori* (from *radix*, a root, and *flos*, a flower; in reference to the flowers and scapes rising from the roots, and not from the stems). D. C. prod. 2. p. 305. *Stipulas adhering to the petioles, which are unarmed. Calyxes not bladderly, nor ruptured above after flowering. Flowers purplish or white, with the vexillum not much elongated. Leaves not hoary. Legumes usually bladderly.*

247 *A. PHYSODES* (Lin. spec. 1073.) plant almost stemless and glabrous, but beset with a few hairs, which are fixed by their centre; leaflets 21-31; peduncles scape-like, about equal in length to the leaves or rather longer; legumes inflated, membranous, nearly globose, glabrous. *Æ. H.* Native of Siberia, in places impregnated with salt. D. C. astr. 127. Pall. astr. 71. but not of Pall. itin. Flowers purplish. Vexillum oblong. Root creeping.

*Var. α, Wolgensis* (Pall. astr. t. 58. D. C. astr. t. 48.) leaflets linear, acute; scape declinate, length of leaves. *Æ. H.* Native of Sandy Islands, at the mouth of the Volga.

*Var. β, Tauricus* (Pall. astr. t. 58. B. f. 1.) leaflets oblong; scapes exceeding the leaves; stems more conspicuous. *Æ. H.* Native of Tauria.

*Var. γ, Altaicus* (Pall. astr. t. 58. B. f. 2.) leaflets elliptic; scapes length of leaves. *Æ. H.* Native of Altai.

*Inflated-podded Milk-Vetch.* Fl. Ju. Jul. Clt. 1759. Pl.  $\frac{1}{2}$  ft.

248 *A. PALLASII* (Fisch. in litt. D. C. prod. 2. p. 305.) plant almost stemless, tufted, branched, clothed with hairy pubescence; leaflets 11-13, oblong-linear; scapes length of leaves; legumes inflated, membranous, almost globose, villous. *Æ. H.* Native of the Caspian desert, at Lake Inderskoi. *A. physodes affinis*, Pall. astr. p. 73. t. 59. *A. physodes* var.  $\delta$ , D. C. astr. no. 127. Pers. ench. 2. p. 344. Flowers purplish.

*Pallas's Milk-Vetch.* Fl. June, July. Clt. 1818. Pl.  $\frac{1}{2}$  foot.

249 *A. TESTICULATUS* (Pall. astr. p. 82. t. 67.) plant stemless, clothed with cinereous villi; leaflets lanceolate or oblong; flowers radical, almost sessile, aggregate; legumes inflated, ovate, tomentose.  $\mathcal{U}$ . H. Native in deserts and in sands at the Caspian sea, and of Tauria. Flowers flesh-coloured, but in a dried state they appear milk-coloured or yellowish. Calyxes cylindrical. Bieb. fl. taur. 2. p. 202. *A. cinereus radiceflorus*, D. C. astr. t. 40.

*Testiculate-podded Milk-Vetch.* Fl. June, July. Clt. 1818. Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

250 *A. RUPIFRAGUS* (Pall. astr. p. 86. t. 70.) plant stemless, clothed with cinereous villi; leaflets oblong, obtuse; scapes shorter than the leaves, or about equal in length to them; legumes oblong, acute, 2-celled.  $\mathcal{U}$ . H. Native of the south of Tauria, on rocks. Flowers purplish. Calyxes rather turgid.

*Var. a, exscapus* (Pall. astr. t. 70.) scapes very short or hardly any; leaflets oblong-linear.

*Var. b, caulescens* (Pall. astr. t. 70. B.) scapes length of leaves; leaflets oblong, fewer; calyxes rather bladderly.  $\mathcal{U}$ . H. Native of the Ural mountains. Perhaps a proper species.

*Broken-rock Milk-Vetch.* Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

251 *A. REDUNCUS* (Pall. astr. p. 109. t. 82.) plant almost stemless, hairy, and rather canescent; leaflets 25-35, elliptic-oblong, glabrous above; scapes a little higher than the leaves; flowers disposed in elongated spikes; legumes erect, hairy, incurved, cylindrical, hooked downwards, channelled above, 5-times the length of the calyx.  $\mathcal{U}$ . H. Native of Tauria, in sandy places at the Volga, and about Sarepta. *A. cinereus longipes*, D. C. astr. 41. Flowers purple or white.

*Var. b, brevipes* (D. C. astr. t. 41.) scapes shorter than the leaves; leaflets elliptic-ovate, fewer.  $\mathcal{U}$ . H. Growing along with the species.

*Hooked-podded Milk-Vetch.* Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

252 *A. HIRSUTUS* (Vahl. symb. 1. p. 59. D. C. astr. no. 125. t. 43.) plant stemless, clothed with hoary villi; leaflets 7-9, elliptic; scapes rather longer than the leaves; flowers capitate; calyx villous, 5-cleft, at length cleft above; legumes nearly globose, apiculated, hairy, 2-celled.  $\mathcal{U}$ . H. Native of Armenia on hills. Colour of flowers unknown.

*Hairy Milk-Vetch.* Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

253 *A. ERIOCARPUS* (D. C. astr. no. 135. t. 47. but not of Bieb.) plant stemless, villously-hairy; leaflets 21-27, elliptic, obtuse; scapes exceeding the leaves; spikes of flowers ovate; calyx villous, 5-toothed; ovary very hairy.  $\mathcal{U}$ . H. Native country unknown. Flowers purple.

*Woolly-fruited Milk-Vetch.* Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

254 *A. PYGMÆUS* (Pall. astr. 66. t. 54.) plant almost stemless, branched, prostrate; leaflets 7-9, lanceolate, small, pubescent; peduncles 1-flowered, very short; legumes oblong, inflated, pubescent.  $\mathcal{U}$ .?  $\mathcal{H}$ .? H. Native of Eastern Siberia, in the Arctic region. Flowers unknown. Perhaps only a variety of *A. pumilio*.

*Pygmy Milk-Vetch.* Pl. prostrate.

255 *A. PUMILIO* (Pall. astr. p. 67. t. 55.) plant almost stemless, with many little shoots rising from the neck; leaflets 9, lanceolate-linear, hoary, and rather pilose beneath; flowers twin, almost sessile.  $\mathcal{U}$ . H. Native of the Curil islands. Flowers large, pale violet. Calyx 5-cleft, clothed with white or brown hairs. Legumes unknown.

*Dwarf Milk-Vetch.* Pl.  $\frac{1}{4}$  foot.

256 *A. GEMINIFLORUS* (Humb. et Bonpl. pl. equin. 1. p. 126. t. 37.) plant almost stemless, branched, prostrate; leaflets 19-21, approximate, complicate, oblong, silky, small; flowers twin, almost sessile; legumes ovate, acuminate, silky, 2-seeded.  $\mathcal{U}$ . F. Native of South America, in the kingdom of Quito, in high cold places; frequent on mount Antisana. Flowers violaceous.

*Twin-flowered Milk-Vetch.* Pl.  $\frac{1}{2}$  foot, prostrate.

257 *A. UNIFLORUS* (D. C. astr. no. 141. t. 50.) plant almost stemless, branched, prostrate, glabrous; leaflets 13-17, linear, obtuse; stipulas joined; flowers almost sessile, solitary.  $\mathcal{H}$ .?  $\mathcal{U}$ . G. Native of Peru, at Huasa-Huasi. Flowers purplish.

*One-flowered Milk-Vetch.* Pl. prostrate.

† *Species not sufficiently known.*

258 *A. UNCATUS* (Lin. spec. 1072.) plant stemless and scapeless; leaves with 8-9 pairs of obcordate leaflets, each terminating in a bristle; legumes subulate, hooked, longer than the leaves.  $\odot$ . F. Native about Aleppo. *Oxytropis uncatus*, Pers. ench. 2. p. 33.? Said to be allied to *A. triméstris*. Flowers almost white.

*Hooked-podded Milk-Vetch.* Pl.  $\frac{1}{4}$  foot.

259 *A. ARCTICUS* (Willd. enum. suppl. 51.) plant stemless; leaflets ovate-lanceolate, pilose, silky beneath; scapes ascending, longer than the leaves; legumes lanceolate, a little inflated.  $\mathcal{U}$ . H. Native country unknown. Corolla shewy violet.

*Arctic Milk-Vetch.* Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

260 *A. ? OBCORDATUS* (Ell. sketch. 2. p. 227.) plant glabrous, decumbent; leaves with 7-9 pairs of small obcordate leaflets; peduncles elongated; lobes of calyx subulate.  $\mathcal{U}$ . H. Native of the south of Georgia, near St. Mary. Flowers white. Legumes unknown.

*Obcordate-leafletted Milk-Vetch.* Pl. prostrate.

261 *A. PSEUDO-CICER* (Opiz, in flora, 1821. p. 758.) plant caulescent, prostrate; leaflets glabrous, lanceolate, acute; stipulas lanceolate; racemes pedunculate, shorter than the leaves.—Native of Bohemia. *Melilotus dentata*, Waldst. et Kit. hung. ex Opiz.

*False-chick-pea Milk-Vetch.* Pl. prostrate.

262 *A. RADICANS* (Horn. hort. hafn. 2. p. 708.) stolons rooting; leaflets ovate-lanceolate; scapes nearly erect, length of leaves; flowers in ovate heads; legumes oblong, flat, glabrous.  $\mathcal{U}$ . H. Native country unknown.

*Rooting Milk-Vetch.* Pl. creeping.

263 *A. SYRIACUS* (Lin. spec. 1069.) plant pubescent, caulescent and procumbent; leaflets few pairs, linear-lanceolate; heads of flowers pedunculate, longer than the leaves; flowers reflexed; legumes ovate-oblong, tomentose, ending in a long beak.  $\mathcal{U}$ . H. Native of Syria. The plant in the Linnaean herbarium under this name certainly belongs to section *Onobrychoidei*.

*Syrian Milk-Vetch.* Pl. procumbent.

264 *A. PASTELLIANUS* (Pollin, pl. veron. 1816.) plant caulescent, diffuse, and silky; leaves with 6 pairs of linear bluntish leaflets; spikes capitate, on long peduncles; legumes ovate, silky, exceeding the calyx.  $\mathcal{U}$ . H. Native of fields about Verona, among stones on mount Pastello.

*Pastello Milk-Vetch.* Pl. diffuse.

265 *A. LUNATUS* (Pall. astr. p. 44.) plant caulescent, glabrous; leaves with usually 15 pairs of linear-lanceolate leaflets; peduncles very long, sulcated, 10-flowered; legumes triquetrous, rather lunate, erect, glabrous.  $\mathcal{U}$ . H. Native of Persia. Buxb. cent. 3. t. 36. f. 2.? *Oxytropis lunata*, Pers. ench. p. 333 According to Fischer this is a true species of *Astragalus*, intermediate between *A. falcatus* and *A. hamosus*.

*Lunate-podded Milk-Vetch.* Pl. 1 foot.

*Cult.* All the species of this genus are worthy of cultivation in every collection. The shrubby kinds, or those belonging to section *Tragacanthæ*, grow well in any light dry soil, and are increased by cuttings or seeds. The herbaceous perennial kinds thrive well in any kind of earth, though they prefer a dry light soil, and they are easily increased by dividing the plants or by seeds; the last mode is preferable, as the greater part of the species are very liable to die if even transplanted or divided at the root. The dwarfer kinds are well adapted for ornamenting rock-work, or to be grown in pots as alpine in a mixture of loam,

peat, and sand. Those marked frame require the protection of a frame or greenhouse in winter. The seeds of the annual species only require to be sown in the open border early in spring. Those species belonging to divisions *Alopecuroidei*, *Tragacanthæ*, *Incarni*, *Dissitiflori*, and *Onobrychoidei* are the most worthy of cultivation.

**CXXXII. GÜLDENSTÆDTIA** (in honour of A. Güldenstaedt, a Russian naturalist). Fisch. in litt. but not of Neck. D. C. prod. 2. p. 307.

**LIN. SYST.** *Diadélphia*, *Decándria*. Calyx bibracteate at the base, campanulate, 5-cleft, upper segments broadest. Petals 5, disposed in a papilionaceous corolla, with the vexillum entire, about the length of the wings. Keel minute. Stamens diadelphous. Legume somewhat cylindrical, 1-celled, many-seeded, filled with medulla, which vanishes at maturity, with the valves always separating in a spiral manner. Seeds reniform, small, scrobiculate. Stemless herbs, with impari-pinnate or simple leaves, that is, having the terminal leaflet only remaining, which is jointed at the top of the petiole. Scapes ascending. Flowers umbellate, red, or violaceous. Perhaps *Astrágalus Sínicus* of Lin. belongs to this genus.

1 *G. MONOPHYLLA* (Fisch. in litt. D. C. prod. 2. p. 307.) leaves simple, kidney-shaped, clothed with silky-pubescent; umbels 2-5-flowered.  $\mathcal{U}$ . H. Native of the Altaian mountains. Leaves glaucous, sometimes trifoliate. Flower purplish.

*One-leaved* Güldenstædtia. Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

2 *G. PAUCIFLORA* (Fisch. mss. D. C. prod. 2. p. 307.) leaves impari-pinnate, silky; umbels 2-3-flowered.  $\mathcal{U}$ . H. Native of the Altaian mountains, in humid meadows. *Astrágalus pauciflorus*, Pall. astr. no. 88. t. 66. B. Willd. spec. 3. p. 1319. *Astrag. biflorus*, Pall. itin. 3. p. 205.—Gmel. sib. 4. p. 54. no. 70. t. 26. f. 1. Flowers purple.

*Var.  $\beta$ , subglabrata* (D. C. prod. 2. p. 307.) leaves almost glabrous at length.  $\mathcal{U}$ . H. Native of Dahuria. *Astrágalus brevicarinatus*, D. C. astr. p. 128. t. 49. Flowers flesh-coloured. Legumes villous.

*Few-flowered* Güldenstædtia. Fl. June, July. Clt. 1827. Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

3 *G. LATIFOLIA* (Fisch. in litt.) plant hoary: leaflets 1-7, ovate, terminal one largest; legumes terete, subulate, a little incurved, clothed with adpressed pubescence.  $\mathcal{U}$ . H. Native of Persia and Armenia. *Astrágalus latifolius*, Lam. dict. 1. p. 319. D. C. astr. no. 133. t. 46. Flowers purple.

*Broad-leaved* Güldenstædtia. Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

*Cult.* See *Oxytropis* for culture and propagation, p. 253.

**CXXXIII. BISERRULA** (from *bis*, twice, and *serrula*, a little saw; in allusion to the legumes, which are toothed on both sides, giving them the appearance of a little saw). Lin. gen. no. 893. Lam. ill. t. 622. D. C. astr. no. vi. prod. 2. p. 307.

**LIN. SYST.** *Diadélphia*, *Decándria*. Calyx 5-cleft. Keel obtuse. Stamens diadelphous. Legume flat, 2-celled, having the valves carinately compressed, and sinuately-toothed on the back.—A diffuse pubescent herb, with impari-pinnate leaves, having many pairs of orbiculate leaflets. Peduncles shorter than the leaves. Spikes ovate. Flowers small, blue, or purple.

1 *B. PELÉCINUS* (Lin. spec. 1073. Gisek. icon. fasc. 1. t. 17.)  $\odot$ . H. Native of the south of Europe, and the north of Africa, in waste places and cornfields. Lam. ill. f. 22. *Pelécinus vulgaris*, Tourn. inst. 417. t. 234.

*Corn-weed* Biserrula. Fl. July, Aug. Clt. 1640. Pl.  $\frac{1}{2}$  to 1 ft.

*Cult.* The seeds of this plant only require to be sown in the open border in spring.

### Tribe III.

**HEDYSA'REÆ** (plants agreeing with *Hedysarum* in some important characters). D. C. legum. mem. vii. prod. 2. p. 307. Embryo with the radicle bent back upon the edge of the cotyledons (f. 21. c. f.). Corolla papilionaceous (f. 42. b.). Stamens rarely free, but usually monadelphous (f. 43. c.) or diadelphous, 9 joined together, and one free (f. 44. d.), or 5 in each bundle. Legumes dividing transversely into 1-seeded cells or joints (f. 41. e.). Cotyledons flat, changing into leaves at the time of germination. This tribe is very natural, and easily distinguished from the rest by the legumes being divided transversely into joints, unless in the following genera, *Onobrychis*, *Eleiötis*, and *Lespedeza*, which have only 1-celled, 1-seeded legumes, and in a few others, which have the legumes divided into transverse cells from membranous or spongy dissepiments, but not separating into joints.

**SUBTRIBE I. CORONILLEÆ** (plants agreeing with *Coronilla* in some characters). D. C. prod. 2. p. 308. Flowers disposed in umbels (f. 41. b. f. 42. b.). Legumes terete (f. 41. c.) or compressed. Stamens diadelphous, 9 joined and 1 free.

**CXXXIV. SCORPIURUS** (from *σκορπιος*, *scorpius*, a scorpion, and *οὐρα*, *oura*, a tail; in reference to the twisted form of the legumes). Lin. gen. 876. Gært. fruct. 2. t. 155. D. C. prod. 2. p. 308.—*Scorpioides*, Tourn. inst. 226.—*Scorpius*, Lois. fl. gall. Mœnch.

**LIN. SYST.** *Diadélphia*, *Decándria*. Calyx 5-cleft, with equal acute lobes. Corolla with a 2-edged keel. Stamens diadelphous, the 5 longest dilated a little under the anthers. Ovary sulcated. Style filiform, acute. Legume revolute, rather spiral, constantly of 3-6 1-seeded joints, which are furrowed lengthwise, with the nerves usually prickly or muricated. Embryo replicate. Cotyledons linear.—Annual herbs, with membranous linear-lanceolate stipulas, simple entire leaves, which taper into the petiole, axillary 1-4-flowered peduncles, which are longer than the leaves, and yellow, rarely purple flowers.

1 *S. LÆVIGATA* (Smith, fl. græc. t. 718. ex prod. 2. p. 81.) legumes glabrous, with ribs unarmed.  $\odot$ . H. Native of the islands in the Archipelago of Europe. *S. bupleuri-folio siliquis lævibus*, Tourn. inst. 402. Flowers yellow. Perhaps only a variety of *S. muricata*.

*Smooth-podded* Caterpillar. Fl. June, July. Clt. 1818. Pl. prostrate.

2 *S. MURICATA* (Lin. spec. 1050.) legumes glabrous, with the inner ribs unarmed, and the outer ones muricated with minute bluntish tubercles.  $\odot$ . H. Native of the region of the Mediterranean, in fields.—Moris. oxon. sect. 2. t. 11. f. 4. *S. echinata*  $\alpha$ , Lam. dict. 726. Peduncles 2-flowered. Flowers yellow.

*Muricated-podded* Caterpillar. Fl. June, July. Clt. 1640. Pl. trailing.

3 *S. SULCATA* (Lin. spec. 1050.) legumes glabrous; inner ribs smooth, 4 outer ones bearing stiff distant prickles, which are hooked at their apex.  $\odot$ . H. Native of the region of the Mediterranean, in fields. Gært. fruct. 2. t. 155. Desf. atl. 2. t. 4. *S. echinata*  $\beta$ , Lam. dict. 1. p. 726. Peduncles usually 3-flowered. Flowers yellow.

*Furrowed-podded* Caterpillar. Fl. June, July. Clt. 1596. Pl. prostrate.

4 *S. SUBVILLOSA* (Lin. spec. 1050.) legumes glabrous, the inner ribs naked, but 6 or 8 of the outer ones bear stiff, crowded prickles, which are a little hooked at the apex.  $\odot$ . H. Native along with the preceding species. *S. echinata*  $\gamma$ , Lam. dict. 1. p. 726.—Moris. hist. sect. 2. t. 11. f. 2. Legumes thicker, and more revolute than those of *S. sulcata*. Flowers yellow. Plant rather villous. Peduncles usually 4-flowered.

• N n

*Sub-villous Caterpillar.* Fl. Ju. July. Clt. 1731. Pl. proc.

5 *S. ACUTIFOLIA* (Viv. fl. lyb. p. 43. t. 19. f. 4.) legumes clothed with short hairs, having the inner ribs naked, and 6 or 8 of the outer ones bearing crowded, stiff, very short prickles. ☉. H. Native of Cyreniaca, in sandy places, and of Corsica, about Bonifacio. Flowers yellow.

*Acute-leaved Caterpillar.* Fl. Ju. July. Clt. 1825. Pl. proc.

6 *S. VERMICULATA* (Lin. spec. 1050.) legumes glabrous, with the inner ribs almost obsolete, but the 10 outer ones bear crowded stipitate tubercles, which are obtusely dilated at the apex. ☉. H. Native of the region of the Mediterranean, in corn-fields. Moris. hist. sect. 2. t. 11. f. 3. Gärtn. fruct. 2. p. 155. Flowers yellow, but with the vexillum streaked with red, solitary on the peduncles. Legumes thick.

*Vermicular-podded Caterpillar.* Fl. June, July. Clt. 1621. Pl. prostrate.

7 *S. PURPUREA* (Desf. atl. 2. p. 174.) stem and leaves hairy; peduncles 1-flowered; legumes covered all over with very short tubercles. ☉. H. Native of Algiers. Flowers purple. Plant with the habit of the preceding species.

*Purple-flowered Caterpillar.* Fl. June, July. Pl. trailing.

*Cult.* These plants are preserved in gardens more for the oddness of the shape of their pods than for their beauty, and being all hardly annuals the seeds of them only require to be sown in the open border in spring, where they are intended to remain, and thinned afterwards if they rise too thick.

CXXXV. CORONILLA (from *corona*, a crown; in reference to the disposition of the flowers in heads or umbels at the tops of the peduncles). Neck. elem. no. 1319. Lam. ill. t. 630. D. C. prod. 2. p. 309.—Coronilla species of Lin. and others.

LIN. SYST. *Diadéphia*, *Decandria*. Calyx campanulate, short, 5-toothed (f. 41. a.), the 2 superior teeth approximate, and joined together higher up than the rest. Claws of petals usually longer than the calyx. Carina acute. Stamens diadelphous. Legume nearly terete, slender, at length separating into oblong 1-seeded joints (f. 41. c.). Seeds ovate or cylindrical (f. 41. f.).—Shrubs or herbs, with impari-pinnate leaves, and axillary peduncles, bearing at their tops umbels of pedicellate flowers.

SECT. I. *E'MERUS* (from *ημερος*, *emerus*, pure, agreeable; the shrub is very pretty). Tourn. inst. t. 418. Desv. journ. bot. 3. p. 121. t. 4. f. 9. D. C. prod. 2. p. 309. Legume nearly terete, separating into joints slowly and obscurely, but decidedly. Claws of petals 3 times the length of the calyx. Flowers yellow.

1 *C. E'MERUS* (Lin. spec. 1046.) shrubby, glabrous; stipulas small; leaflets 5-7, obovate; peduncles 3-5-flowered. ♀. H. Native of middle and south Europe, and of Tauria, in hedges, and among bushes. Sims, bot. mag. 445. *E'merus major*, Mill. fig. t. 132. f. 1. and minor, f. 2. *C. pauciflora*, Lam. fl. fr. Flowers yellow.

*Agreeable Coronilla or Scorpion-Senna.* Fl. April, June. Clt. 1596. Shrub 3 to 4 feet.

SECT. II. *CORONILLA* (see genus for derivation). Tourn. inst. t. 419. Desv. journ. bot. 3. p. 119. t. 4. f. 3. Legume rather compressed, evidently separating into joints (f. 41. e.). Claws of petals hardly longer than the calyx.

\* *Flowers yellow.*

2 *C. JU'NCEA* (Lin. spec. 1047.) shrubby, glabrous; stipulas small; leaflets 3-7, linear-lanceolate, obtuse, rather fleshy, lower ones remote from the stem; umbels 5-7-flowered. ♀. H. Native of the south of France. Ker. bot. reg. 820. Lodd. bot. cab. 235.—Barrel. icon. t. 133.—J. Bauh. hist. 1. p. 2. t. 383. f. 2. Branches rush-like, terete, almost naked, slender. Flowers bright yellow.

*Rushy-branched Coronilla.* Fl. June, July. Clt. 1656. Shrub 2 to 3 feet.

3 *C. STIPULARIS* (Lam. dict. 2. p. 120.) shrubby, glabrous; stipulas roundish, large, deciduous; leaflets 7-9, obovate, mucronate, glaucous, lower ones remote from the stem; umbels 6-8-flowered. ♀. F. Native of the south of Italy, in Goat's Island, in Sicily near Palermo, and probably of Spain. *C. orbicularis*, Moench. *C. Valentina*, Lin. spec. 1047. exclusive of the synonyme of Clusius, and therefore the name. Curt. bot. mag. 185. *C. Hispanica*, Mill. dict. no. 4. ? Flowers deep yellow, very fragrant at night.

*Large-stipuled Coronilla.* Fl. Mar. Nov. Clt. 1596. Sh. 3 ft.

4 *C. PENTAPHYLLA* (Desf. atl. 2. p. 171.) shrubby, glabrous; stipulas ovate, mucronate, deciduous; leaflets 5-7, cuneiform, mucronate, usually emarginate; umbels 10-20-flowered. ♀. F. Native of Algiers on hills. Mill. fig. t. 289. f. 2. ?

*Five-leafletted Coronilla.* Fl. June, July. Clt. 1700. Shrub 2 to 4 feet.

5 *C. ARGE'NTEA* (Lin. spec. 1048.) shrubby; leaflets 11, silky, terminal one largest. ♀. F. Native of Candia. Mill. fig. t. 289. f. 1. ? ex Ait. hort. kew. 4. p. 332. This is a very doubtful plant. Flowers beautiful yellow, sweet-scented.

*Silvery Coronilla.* Fl. May, June. Clt. 1664. Sh. 2 feet.

6 *C. GLAU'CA* (Lin. spec. 1047.) shrubby, glabrous; stipulas small, lanceolate; leaflets 5-7, obovate, very obtuse, glaucous, lower ones remote from the stem; umbels 7-8-flowered. ♀. F. Native of France about Narbonne, and of Sicily, and probably of Spain. Curt. bot. mag. t. 13. Mill. fig. 289. f. 1. Flowers beautiful yellow, fragrant in the day time, but scentless at night.

*Glaucous Coronilla.* Fl. May, Sept. Clt. 1722. Sh. 2 to 4 ft.

7 *C. MINIMA* (Lin. spec. 1048.) suffruticose, procumbent, glabrous; stipulas concrete, small, opposite the leaves, bidentate at the apex, the upper ones largest, membranous, and deciduous; leaflets 7-13, ovate-roundish, obtuse or retuse, lower ones remote from the stem; umbels 7-8-flowered; legume 4-winged, toothed. ♀. H. Native of the southern parts of Europe, on the lower mountains in sandy places. Jacq. fl. austr. t. 271. D. C. fl. fr. 4. p. 608. Sims, bot. mag. 2178.—J. Bauh. hist. 2. p. 351. f. 2. Flowers yellow, sweet-scented. Plant erect or prostrate, evergreen. (f. 41.)

*Least Coronilla.* Fl. June, July. Clt. 1658. Pl. prostrate or  $\frac{1}{2}$  foot.

8 *C. VAGINA'LIS* (Lam. dict. 2. p. 121.) plant suffruticose, prostrate; stipulas concrete, large; leaflets roundish; legumes 4-winged, toothed. ♀. H. Native of the southern parts of Europe, on the lower mountains. Flower yellow. This species is usually confused with *C. minima*.

*Sheathing-stipuled Coronilla.* Pl. prostrate.

9 *C. CORONA'TA* (Lin. spec. 1048.) plant suffruticose, erect, or ascending, glabrous; stipulas concrete, small, opposite the leaves, bidentate at the apex; leaflets 5-11, obovate, rather mucronate, glaucous, lower ones approximating the stem; umbels many-flowered; legumes compressed, tetragonal, erect. ♀. H. Native of the southern parts of Europe, in arid places. Jacq. austr. 1. t. 95. D. C. fl. franc. 4. p. 608. but not of Bieb. nor Sims. *C. Clusii*, Dufour, ann. ec. phys. 7. p. 307. *C. Valentina*, Lam. fl. fr. 2. p. 663. but not of Lam.—Clus. hist. 1. p. 98. f. 2. (fig. 41.)

FIG. 41.

*Crown-flowered Coronilla.* Fl. July, Aug. Clt. 1776. Pl. 1 to 2 feet.

10 *C. MONTANA* (Scop. carn. ed. 2. p. 912. t. 44.) plant herbaceous, erect, glabrous; stipulas concrete, opposite the leaves, oblong, emarginate, deciduous; leaflets 7, ovate, mucronate, rather glaucous, lower ones approximating the stem; umbels 15-20-flowered.  $\mathcal{U}$ . H. Native of Germany, Carniola, and Switzerland, on the mountains. *C. coronata*, Bieb. fl. taur. 1434. Sims, bot. mag. 907.—Riv. tetr. t. 207. (f. 41.)

*Mountain Coronilla.* Fl. Ju. July. Clt. 1776. Pl. 1 to 1½ ft.

11 *C. IBERICA* (Bieb. fl. taur. 2. p. 173.) plant herbaceous, prostrate, glabrous; stipulas distinct, membranous, orbicular, denticulated; leaflets 9-11, obcordate, ciliated; umbels 7-8-flowered; legumes tetragonal, incurved.  $\mathcal{U}$ . H. Native of Iberia and Cappadocia. Willd. spec. 3. p. 1152. Sweet, fl. gard. 25. Lodd. bot. cab. 789. *C. orientalis*, Mill. Flowers large, yellow. Root creeping.

*Iberian Coronilla.* Fl. July, Aug. Clt. 1822. Pl. ascending.

12 *C. SQUAMATA* (Cav. icon. t. 155.) plant herbaceous, erect; stipulas lanceolate-ovate, membranous, somewhat ciliated; leaflets 9-11, obovate, pubescent, lower ones remote from the stem; umbels 7-8-flowered; legumes scurfy from scales.  $\mathcal{U}$ . H. Native of Spain, near the town of Lamota del Cuervo. Flowers yellow.

*Scaly-podded Coronilla.* Fl. June, July. Clt. 1820. Pl. ½ foot.

13 *C. PARVIFLORA* (Willd. spec. 3. p. 1155.) plant herbaceous, much branched, rather scabrous from reflexed stiff hairs; leaflets 9, cuneate, emarginate, glabrous; stipulas ovate, very minute; umbels 5-flowered; peduncles longer than the leaves; legumes terete, arched.  $\mathcal{U}$ . H. Native of Candia and Tauria, on exposed hills. *C. Crética herbacea*, &c. Tourn. cor. 44. *C. Valentina*, Pall. ined. Bieb. fl. taur. 2. p. 173. Very like *C. Crética*, but differs in the flowers being yellow.

*Small-flowered Coronilla.* Pl. ¼ foot.

\* \* Flowers purple, pink, or white.

14 *C. VIMINALIS* (Salisb. par. t. 13. Ait. hort. kew. ed. 2. vol. 4. p. 331.) suffruticose; stipulas ovate, membranous, soon falling off; leaflets 13-21, obovate, retuse, mucronate, glaucous, lower ones approximating the stem; umbels 6-10-flowered.  $\mathcal{U}$ . H. Native of Mogodor. Branches hardly angular. Flowers large, pale, having the vexillum lined with red lengthwise, changing from pale to deeper purple.

*Twiggy Coronilla.* Fl. May, Nov. Clt. 1798. Sh. 2 to 4 ft.

15 *C. CRÉTICA* (Lin. spec. 1048.) plant herbaceous, ascending, glabrous; stipulas small, acute; leaflets 11-13, cuneate, retuse, the lower ones remote from the stem; umbels 3-6-flowered.  $\odot$ . H. Native of Candia, Tauria, and Italy, on hills. Flowers white, having the vexillum streaked with red, and the keel dark purple. Jacq. hort. vind. t. 25. *C. parviflora*, Mænench. *Astrolobium Créticum*, Desv.

*Cretan Coronilla.* Fl. June, July. Clt. 1731. Pl. ascending.

16 *C. VARIA* (Lin. spec. 1048.) plant herbaceous, diffuse, flexuous, glabrous; stipulas distinct, lanceolate; leaflets 9-13, oblong, elliptic, mucronate, lower ones approximating the stem; umbels 16-20-flowered; legumes angular, very long, straight.  $\mathcal{U}$ . H. Native of Europe and Tauria, in fields and meadows. Curt. bot. mag. 258. Mill. fig. t. 106.—Clus. hist. 2. p. 237. f. 2. *Astragalus glaucoïdes*, Gmel. itin. 1. t. 21. ex Bieb. Flowers pink, rarely white, at length drooping. Root creeping. This plant was formerly proposed to be cultivated as a proper food for cattle; and it was found that it grew very readily, and might be very beneficial to the farmer. In a good soil the stems will grow even 5 feet long, and be tender their whole length, so that a small spot of ground will supply a considerable quantity of food.

der, especially in dry seasons. Horses and cows seem to eat it greedily. However, Mr. Curtis remarks that its bitterness will be an objection to its being cultivated for cattle.

*Various-flowered Coronilla.* Fl. June, Nov. Clt. 1640. Pl. diffuse.

17 *C. GLOBOSA* (Lam. dict. 2. p. 122.) herbaceous, glabrous; stipulas small, acute; leaflets oblong-elliptic, 11-13, obtuse, lower ones distant from the stem; umbels globose, 20-30-flowered; legumes pendulous.  $\mathcal{U}$ . H. Native of Candia in fields. *C. Crética herbacea flore magno candido*, Tourn. cor. 44. Flowers pink or white. Perhaps only a variety of *C. varia*.

*Globose-flowered Coronilla.* Fl. July, Nov. Clt. 1800. Pl. diffuse.

† *Doubtful species.*

18 *C. ? SCA'NDENS* (Lin. spec. 1048.) stem scandent, flaccid; leaflets 5, ovate; peduncles axillary, twin, 1-flowered, prickly; legumes terete, articulated, glabrous.—Native of South America. —Plum. ed. Burm. t. 107. f. 3. Perhaps a species of *Poirétia*. Flowers large, pale yellow.

*Climbing Coronilla.* Pl. cl.

19 *C. MULTIFLORA* (D. C. prod. 2. p. 310.) plant suffruticose, glabrous; stipulas small, lanceolate; leaflets 7-9, oblong-cuneate, obtuse, lower ones approximating the stem; umbels 15-20-flowered.  $\mathcal{U}$ . F. Native of Spain. Branches terete, spreading, flexuous. Flowers pale, perhaps yellow, perhaps white.

*Many-flowered Coronilla.* Shrub 1 to 2 feet.

20 *C. HIRSU'TA* (D. C. prod. 2. p. 310.) stem herbaceous, erect, clothed with white hairs, as well as the peduncles and leaves; leaves with 6-8 pairs of oval obcordate leaflets; stipulas leafy, roundish-cordate; peduncles longer than the leaves; umbels globose, 8-12-flowered; calyx beset with black hairs.  $\mathcal{U}$ . G. Native of the Cape of Good Hope. *Coronilla argentea*, Burm. cap. 22. Thunb. fl. cap. 592.? Legume unknown.

*Hairy Coronilla.* Pl. 1 foot.

*Cult.* All the species of *Coronilla*, both shrubby and herbaceous, are worthy of cultivation in every collection, for the beauty of their flowers, as well as for the neatness of their herbage. The hardy shrubby kind, *C. Emericus*, is very proper for the front of shrubberies. It thrives in any kind of soil, and flowers the greater part of the year. Ripened cuttings of it root freely if planted in autumn in the open ground. The frame and greenhouse shrubby kinds are beautiful plants of easy culture; they grow best in a mixture of loam and peat, and cuttings of them strike readily in sand under a hand-glass; they may be turned out into the open border in spring, where they will make shewy bushes and flower all the summer, and if the winters are not very severe they will live with very little protection. The hardy perennial herbaceous kinds are most handsome when cultivated in pots, and placed among other alpine plants. *C. varia globosa* and *Iberica* are very hardy, but become troublesome if planted in the open ground, as their roots run so much as to injure every other plant near them, and they are afterwards difficult to eradicate. *C. coronata minima* and *montana* are well adapted for rock-work, but do not long exist in such a situation, as they are apt to be killed in severe winters. The annual species, *C. Crética*, requires the treatment of other hardy annuals.

CXXXVI. ASTROLOBIMUM (from *αστρον*, *astron*, a star, and *λοβος*, *lobos*, a pod; in reference to the disposition of the pods like the rays of a star). Desv. journ. bot. 3. p. 121. t. 4. f. 10. D. C. prod. 2. p. 311.—Ornithopus species of Lin. and others.

Lin. syst. *Diadelphia*, *Decandria*. Calyx bractless, tubular, nearly equally 5-toothed. Keel of corolla small, compressed. Stamens diadelphous. Legume nearly terete, constantly com-

posed of numerous 1-seeded, indehiscent, cylindrical joints, which are truncate at both ends.—Smooth European herbs, with impari-pinnate leaves. Stipulas wanting or very small, when present they are joined in one, opposite the leaves, and therefore bidentate at the apex. Flowers yellow, capitate, destitute of the bractea to the head of the flowers.

1 *A. EBRACTEATUM* (D. C. prod. 2. p. 311.) peduncles about equal in length to the leaves, bractless at the apex; leaves all pinnate; leaflets elliptic-oblong, many-pairs, equal in size and shape, lower ones distant from the stem; legumes terete, arched. *⊙. H.* Native of Portugal, Spain, south of France, and Italy, in gravelly places. *Ornithopus levigatus*, Smith in Rees' cycl. no. 3. *Ornith. exstipulatus*, Thore, chl. land. 311. *O. ebracteatus*, Brot. fl. lus. 2. p. 159. *Scorpiurus pinnatus*, Mill. dict. no. 5. ? *O. nudiflorus*, Lag. varied. esp. 2. p. 40. *O. durus*, D. C. fl. fr. no. 4039. but not of Cav. *O. pygmaeus*, Viv.—*Dalech. hist.* 1. p. 487. f. 1. Flowers small, yellow.

*Bractless Star-Vetch.* Fl. June, July. Clt. 1700. Pl. pros.

2 *A. DUTRUM* (D. C. prod. 2. p. 311.) peduncles a little longer than the leaves, almost bractless at the apex; stipulas concrete, sheathing; lower leaves simple, the rest pinnate, with few pairs of obcordate leaflets, the lower ones approximating the stem; legumes arched, rather tetragonal. *⊙. H.* Native of Spain, about Valentia and Madrid in bushy places, and of Portugal in vineyards. *Ornithopus durus*, Cav. icon. 1. p. 31. t. 41. *O. heterophyllus*, Brot. phyt. t. 67. fl. lus. 2. p. 160. Flowers yellow.

*Hard-podded Star-Vetch.* Fl. Ju. July. Clt. 1816. Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

3 *A. REPANDUM* (D. C. prod. 2. p. 311.) peduncles a little shorter than the leaves, bractless at the apex; stipulas concrete, sheathing; lower leaves simple, ovate, and emarginate, upper ones pinnate; leaflets oblong, lower ones roundish, approximating the stem; legumes rather nodose, a little incurved. *⊙. H.* Native of Barbary in fields towards Lacalle. *Ornithopus repandus*, Lam. ill. t. 631. f. 4. Poir. dict. 4. p. 620. *O. lotoides*, Viv. Flowers yellow.

*Repand-podded Star-Vetch.* Fl. June, July. Clt. 1805. Pl. prostrate.

4 *A. SCORPIOIDES* (D. C. prod. 2. p. 311.) peduncles longer than the leaves, bractless; stipulas concrete, sheathing; leaves trifoliate; lower leaflets small, roundish, approximating the stem, terminal one large, oval; legume a little incurved, rather nodose. *⊙. H.* Native of the south of Europe, in corn-fields. *Ornithopus scorpioides*, Lin. spec. 1049. Cav. icon. t. 37. *Ornithopus trifoliatus*, Lam. fl. fr. 2. p. 659. *Ornithopodium scorpioides*, All. *Ornithopodium triphyllum*, Mærch. Flowers yellow.

*Scorpion-like-podded Star-Vetch.* Fl. June, July. Clt. 1506. Pl.  $\frac{1}{4}$  foot.

*Cult.* The seeds of these plants only require to be sown in the open border in spring.

CXXXVII. ORNITHOPUS (from *ορνις ορνιθος*, *ornis ornithos*, a bird, and *πους, pous*, a foot; the legumes are like the claws of a bird, and are disposed somewhat in the same manner). Desv. journ. bot. 3. p. 121. t. 5. f. 14. D. C. prod. 2. p. 311.—*Ornithopus* species Lin. and others. Lam. ill. t. 631.—*Ornithopodium*, Tourn. inst. t. 224. Mærch. meth.

LIN. SYST. *Diadelphia, Decandria*. Calyx tubular, almost equally 5-toothed, bracteate. Keel of corolla small, compressed. Stamens diadelphous. Legume compressed, with many 1-seeded indehiscent joints, which are truncate at both ends, but having parallel margins.—European, villous, annual herbs, with impari-pinnate leaves, small stipulas which are aduate to the petioles, axillary peduncles, bearing a few-flowered umbel at the

top of each. Flowers small, white or rose-coloured. All the species have a pinnate bractea under each head of flowers.

1 *O. COMPRESSUS* (Lin. spec. 1049.) peduncles shorter than the leaves; leaves villous, upper ones having the lower pair of leaflets approximating the stem; legumes compressed, pubescent, wrinkled, incurved at the apex; the joints oval. *⊙. H.* Native of the south of Europe and the north of Africa, in sandy places. Berg. phyt. t. 191. *Ornithopodium compressum*, All. ped. no. 1245. Flowers small, yellow.

*Compressed-podded Bird's-foot.* Fl. June, July. Clt. 1731. Pl. prostrate.

2 *O. PERPUSILLUS* (Lin. spec. 1049.) peduncles longer than the leaves; leaves rather villous, upper ones having the lower pair of leaflets approximating the stem; legumes rather compressed, glabrous, curved upwards, the joints elliptic, moderately compressed. *⊙. H.* Native of every part of Europe and the North of Africa, on heaths and gravelly pastures; plentiful in Britain. Smith, engl. bot. 369. Oed. fl. dan. 307. Curt. lond. 6. t. 53. Flowers small, usually 2-3 or 5 in a head, having the vexillum and wings white, and beautifully veined with crimson, and the keel green.

*Var. β, nodosus* (Mill. dict. no. 2.) root bearing ovoid tubercles; legumes pubescent. *⊙. H.* Native of Europe, in several parts of Britain and of France, very common about Paris. The tubercles, which are said to be on the roots of this variety, are to be found on the roots of almost all leguminous plants, which arise from morbid excrecences.

Common or *Very small Bird's-foot.* Fl. May, July. Britain. Pl. prostrate.

3 *O. SATIVUS* (Brot. fl. lus. 2. p. 160.) peduncles longer than the leaves; leaflets pubescent; oval in the lower leaves, and lanceolate in the superior ones, the lower pairs approximating the stem; legumes hardly arched, with roundish compressed knots. *⊙. H.* Native of Portugal and other parts of the south of Europe, in rather wet sandy places and meadows. *O. roseus*, Dufour. in litt. *O. perpusillus β*, intermedium, Roth. fl. germ. 2. p. 215. *Ornithopodium majus*, C. Baul. pin. 350. Ger. emac. 1241. f. 3.—Moris. hist. sect. 2. t. 10. f. 13. Flowers white and red, mixed.

*Cultivated Bird's-foot.* Fl. May, July. Clt. 1818. Pl. pr.

*Cult.* The seeds of these plants only require to be sown in the open ground, in spring. None of the species are worth cultivating, except in botanical gardens.

CXXXVIII. HIPPOCREPIS (from *ἵππος*, *hippos*, a horse, and *κρητις*, *krepis*, a shoe; in reference to the shape of the recesses of the pods, which are curved in such a manner as to give them a likeness to a horse's shoe). Lin. gen. 885. Lam. ill. t. 630. D. C. prod. 2. p. 312. *Ferrum-equinum*, Tourn. inst. t. 225.

LIN. SYST. *Diadelphia, Decandria*. Calyx 5-cleft (f. 42. a.) with the lobes equal and acute. Carina of corolla 2-edged (f. 42. b.). Stamens diadelphous. Style filiform, acute. Legume having numerous, 1-seeded joints, curved (f. 42. c.), hence the upper side of the legume appears as if it were cut, from having numerous rounded recesses. Seeds cylindrical or compressed, oblong, curved, fixed to the middle part of the joint, and therefore the umbilicus is in the middle of the curve.—Herbs or subshrubs, with impari-pinnate leaves and yellow flowers, which are sometimes solitary and axillary, sometimes sessile, but usually disposed in umbels on the tops of the axillary peduncles.

§ 1. *Roots perennial. Legumes sinuated, with the joints curved, forming a broad open recess between each pair.*

1 *H. BALEARICA* (Jacq. misc. 2. p. 305. icon. rar. 1. p. 149.) shrubby, erect; peduncles longer than the leaves, bearing an

umbel of flowers at the apex; legumes glabrous, a little arched. *h. F.* Native of the Island of Minorca. Lam. ill. 620. f. 2. Curt. bot. mag. t. 427. Leaves and calyxes either glabrous or pilose.

*Minorca* Horse-shoe-Vetch. Fl. May, Ju. Clt. 1776. Sh. 1 to 2 ft.

2 *H. comosa* (Lin. spec. 1050.) stem herbaceous, prostrate; peduncles longer than the leaves, bearing an umbel of flowers at the apex; legumes arched, sinuated on both margins, rough from minute prominent tubercles. *u. H.* Native of Europe, in Germany, Italy, France, Austria, Britain, in calcareous soils; plentiful in Kent, Cambridgeshire, and Berkshire, and in most chalk countries, as well as of the north of Africa. Smith, engl. bot. t. 31. Jacq. austr. 5. t. 431. Riv. tetr. 97. *H. perennis*, Lam. fl. fr. 2. p. 657. Leaflets 7-11, obovate, obtuse, very minutely mucronate. Legumes with their joints neither dilated nor bordered. (fig. 42.)

*Tufted* Horse-shoe-Vetch. Fl. April, Aug. Brit. Pl. pr. 3 *H. HELVETICA* (G. Don, in Loud. hort. brit. p. 308.) stems herbaceous, procumbent; peduncles longer than the leaves, bearing an umbel of flowers at the apex; legumes compressed, curved, smooth; leaflets 9-11, obovate, obtuse, mucronate. *u. H.* Native of Switzerland. *H. comosa*, Schleich. Legume broad, arched. An elegant plant, much larger in every part than the last species.

*Swiss* Horse-shoe-Vetch. Fl. May, Aug. Clt. 1819. Pl. pr.

4 *H. GLAUCA* (Ten. fl. neap. 2. p. 165. t. 69.) stems herbaceous, ascending; leaves glaucous; peduncles longer than the leaves, bearing an umbel of flowers at the apex; legumes arched, rather scabrous, constantly of 5 joints. *u. H.* Native of Naples, on the rocks of Magella. Calyx pubescent. Allied to *H. comosa*.

*Glaucous* Horse-shoe-Vetch. Fl. May, Jul. Clt. 1819. Pl. asc.

## § 2. Roots annual. Legumes with roundish recesses.

5 *H. SCABRA* (D. C. prod. 2. p. 312.) peduncles twice the length of the leaves, bearing an umbel of flowers at the apex; legumes arched, scabrous at the seeds, the rest clothed with a kind of lepidotod pubescence. *o. H.* Native of Spain, in the kingdom of Murcia, near the city. Style long, compressed, permanent at the top of the legumes.

*Scabrous-podded* Horse-shoe-Vetch. Pl. prostrate.

6 *H. BICONTORTA* (Lois. not. in ann. soc. Lin. par. vol. 4. 1827.) stem branched, spreading; leaflets linear; peduncles length of leaves, usually bearing 3 flowers at the apex; legumes scabrous, twisted into a double circle. *o. H.* Native of Montpellier.

*Twice-twisted-podded* Horse-shoe-Vetch. Pl. spreading.

7 *H. MULTISILIQUOSA* (Lin. spec. 1050.) peduncles a little shorter than the leaves, 2-4-flowered; legumes quite smooth, circularly incurved. *o. H.* Native of Spain, Italy, south of France, and Barbary, in exposed stony or sandy places. Mill. fig. 278. f. 2. *Ferrum equinum polyceratum*, Col. cephr. p. 300. with a figure. *F. multiflorum*, Moench. meth. 119. Plant smooth.

*Many-podded* Horse-shoe-Vetch. Fl. Ju. Aug. Clt. 1683. Pl. pr.

8 *H. MONOCARPA* (Bieb. fl. taur. suppl. p. 480.) flowers axillary, almost sessile, solitary; legumes quite glabrous. *o. H.* Native of Eastern Caucasus, on hills about Schamachi. *H. unisiliquosa*, Bieb. fl. taur. 2. p. 174. exclusive of the synonyms.

FIG. 42.

*One-fruited* Horse-shoe-Vetch. Fl. June, Aug. Clt. 1824. Pl. prostrate.

9 *H. UNISILIQUOSA* (Lin. spec. 1050.) flowers axillary, sessile, solitary; legumes a little incurved, hairy in the middle part of the joints. *o. H.* Native of the south of Europe, Barbary, and the Levant, in exposed stony places. Lam. ill. t. 630. f. 3. Mill. fig. 278. f. 1. *Ferrum equinum vulgare*, Col. cephr. p. 300. with a figure. *F. uniflorum*, Moench. meth. 119.

*One-podded* Horse-shoe-Vetch. Fl. June, July. Clt. 1570. Pl. prostrate.

10 *H. CILIATA* (D. C. prod. 2. p. 313.) peduncles rather shorter than the leaves; legumes arched, hispid at the seeds, and ciliated on one side. *o. H.* Native of Spain and Italy.

*Var. a*; peduncles 4-6-flowered. *o. H.* Native of Spain, near Aranjuez. *H. ciliata*, Willd. berl. mag. nat. ges. 1808. p. 173.

*Var. b*; peduncles 3-flowered. *o. H.* Native of Spain, in the provinces of Granada and Murcia. *H. annua*, Lag. nov. spec. 23. p. 299.

*Var. g*; peduncles 2-flowered. *o. H.* Native of Italy, about Naples, as well as of Sicily and Tauria. *H. dicarpa*, Bieb. suppl. 480.

*Ciliated-podded* Horse-shoe-Vetch. Fl. June, July. Clt. 1818. Pl. prostrate.

11 *H. BIFLORA* (Spreng. pug. 2. p. 73.) peduncles very short, 2-flowered; legumes minutely ciliated on both margins. *o. H.* Native country unknown. Flowers twin, axillary, almost sessile, but the peduncles becomes elongated after flowering. Cilix of legume very short.

*Two-flowered* Horse-shoe-Vetch. Fl. June, July. Clt. 1816. Pl. prostrate.

*Cult.* All the species of this genus are worthy of cultivation in every garden, on account of their neatness and beauty. The *H. Balearica* is the only species which requires protection in a greenhouse in winter. It thrives in a mixture of loam and peat, and cuttings of it strike root readily under a hand-glass. The perennial herbaceous kinds are well fitted for ornamenting rock-work or banks: they are propagated by dividing at the root or by seeds. The annual species are also well fitted for rock-work, where their seeds should be sown early in spring.

CXXXIX. SECURIGERA (from *securis*, a hatchet, and *gero*, to bear; in reference to the form of the pods). D. C. fl. fr. 4. p. 609. prod. 2. p. 313. Securidaca, Tourn. inst. t. 224. Lam. ill. t. 629. but not Lin.—Bonaveria, Scop. Neck. clem. no. 1320. Desv. journ. vol. 3. p. 60. t. 4. f. 7.—Securilla, Pers. ench. 2. p. 314.

LIN. SYST. *Diadelphia, Decandria*. Calyx short, bilabiate, lower lip 3-parted, upper one bidentate. Claws of petals rather longer than the calyx. Keel acute. Stamens diadelphous. Legume compressed, flat, with rather prominent sutures, the seeds separated by spongy substance, not articulated, linear, ending in a long beak at the apex. Seeds 8-10, compressed. Herb, with the habit of *Coronilla*.

1 *S. CORONILLA* (D. C. l. c.). *o. H.* Native of the south of Europe, from Spain to Tauria. *Coronilla securidaca*, Lin. spec. 1048. *Securidaca lutea*, Mill. dict. no. 1. fig. 232. *Securidaca legitima*, Gärtn. fruct. 2. t. 153. Flowers yellow, 3 or 4 in an umbel.

*Coronilla-like* Hatchet-Vetch. Fl. July, Aug. Cl. 1562. Pl. prostrate.

*Cult.* The seeds of this plant only require to be sown in the open ground in any kind of soil.

SUBTRIBE II. EUHEDISAREÆ (plants agreeing with *Hedysarum* in important characters). D. C. prod. 2. p. 313. Flowers

disposed in racemes (f. 43. g. f. 44. c.). Legumes compressed (f. 43. i. f. 44. g.).

**CXL. DIPHACA** (from *dis*, twice, and *φακη*, *phake*, a lentil or pea; in reference to the pods being composed of 2 1-seeded joints). Lour. coch. p. 454. D. C. prod. 2. p. 313.

**LIN. SYST.** *Diadelphia*, *Decandria*. Calyx 5-cleft, permanent, propped by 2 lanceolate bracteas, the lowest lobe longest. Corolla papilionaceous. Keel of 2 distinct petals. Stamens joined into 2 5-anthered bundles. Carpels 2, 1-styled. Legume compressed, straight, articulated; joints striated, 1-seeded. This genus is allied to *Dalbergia* and *Æschinómene*, in the stamens being equally diadelphous, but the fruit is articulated as in *Hedysarum*, and the plant is therefore placed in the same tribe.

1 D. COCHINCHINENSIS (Lour. l. c.). 2. G. Native of Cochinchina, China, and the Moluccas, where it is cultivated in gardens. *Dalbergia diphaca*, Pers. ench. 2. p. 276.—Rumph. amb. 3. p. 200. t. 128. according to Loureiro. Leaves imparipinnate. Peduncles 2, axillary, 1-flowered. Flowers white.

*Cochin-china* Diphaca. Shrub 8 feet.

*Cult.* To be treated as other greenhouse plants.

**CXLI. PICTETIA** (in honour of Charles Pictet, a celebrated French physician, author of *Traite des Assolemens*, 1 vol. 8vo. Geneva, 1788.). D. C. in ann. sc. nat. 4. jan. 1825. p. 93. legum. mem. vii. prod. 2. p. 314.

**LIN. SYST.** *Diadelphia*, *Decandria*. Calyx furnished at the base with 2 caducous bracteoles, campanulate, 5-cleft, 2 superior lobes obtuse and shorter than the others, 3 inferior ones acuminate and somewhat spinose. Vexillum of corolla roundish, complicated. Keel obtuse, a little shorter than the wings. Stamens diadelphous. Style filiform, glabrous. Legume stipitate, compressed, few-seeded, sometimes continuous, having the seeds separated by a kind of spongy substance, sometimes articulated, the joints 1-seeded, but some of them are abortive, never striated nor warted. Seeds compressed, flat, ovate, rather truncate at the base. Cotyledons flat, green. Radicle lying above the commissure formed by the cotyledons.—Quite glabrous American shrubs, having the cauline stipulas usually spinose-cent, rarely unarmed. Leaves impari-pinnate, the leaflets exstipellate, having the middle nerve of each drawn out in a spine-like mucrone. Flowers axillary, disposed in loose racemes or solitary, yellow, the pedicels jointed at the apex, and bibracteolate; bracteoles caducous.

1 P. SQUAMATA (D. C. l. c. t. 47. f. 3.) leaves with 7-10 pairs of orbicular leaflets, each leaflet ending in a long spine-like mucrone, having the lateral veins hardly evident; stipulas spinose, erect; scales at the base of the branchlets, imbricated, and rather spinose; racemes loose, 3-7-flowered. 2. S. Native of the island of St. Thomas, by the sea-side. *Robinia squamata*, Vahl. symb. 3. p. 88. t. 69. *Robinia squamosa*, Poir. dict. 6. p. 224. *Caragana spinosa*, Rich. herb. Pedicels distant, elongated, nearly opposite. Flowers yellow. Legumes unknown.

*Scaly-branched* Pictetia. Fl. June, Jul. Clt. 1824. Sh. 6 ft.

2 P. ARISTATA (D. C. legum. mem. vii. t. 47. f. 5.) leaves with 7-10 pairs of obovate-orbicular, usually alternate leaflets, each leaflet ending in a long straight spine-like mucrone, having the lateral nerves prominent; stipulas spinose, spreading; racemes loose, 3-7-flowered. 2. S. Native of St. Domingo, Santa Cruz, and Krabben Island. *Æschinómene aristata*, Jacq. hort. schœnbr. t. 237. *Poirétia aristata*, Desv. journ. bot. 3. p. 122. Flowers yellow. Legume of 3-4 joints. Very like the preceding species.

*Arched-leafletted* Pictetia. Fl. June, July. Clt. 1816. Sh. 5 to 10 feet.

3 P. OBCORDATA (D. C. l. c. t. 47. f. 1. prod. 2. p. 314.)

leaves with 10-12 pairs of nearly opposite obcordate leaflets, each leaflet ending in a short, recurved, spine-like mucrone; stipulas ovate-lanceolate, unarmed. 2. S. Native of St. Domingo. Racemes few-flowered. Legumes oblong, compressed, and perhaps 1-celled and 1-seeded from abortion, each standing on a longish stipe. Flowers unknown, but most probably yellow.

*Obcordate-leafletted* Pictetia. Shrub 3 to 6 feet.

4 P. JUSSIEI (D. C. l. c.) leaves with 3-4 pairs of alternate or opposite, oblong leaflets, each leaflet ending in a straight spine-like mucrone, the odd one longest; stipulas spinose, erect, small. 2. S. Native country unknown. *Robinia aculeata*, Juss. herb. where a specimen of it is preserved without either flower or fruit.

*Jussieu's* Pictetia. Shrub 3 to 6 feet.

5 P. DESVAUXII (D. C. l. c. t. 47. f. 4.) leaves with 1-2 pairs of approximate oblong leaflets, which taper to both ends, and terminate in a straight spine-like mucrone; stipulas spinose, straight; pedicels axillary, 1-flowered; legume linear-oblong, obtuse, continuous. 2. S. Native of St. Domingo. *Robinia spinifolia*, Desv. journ. bot. 1814. 1. p. 78. Flowers small, yellow. Legume an inch long and about 3 lines broad, 5-6-seeded.

*Desvaux's* Pictetia. Shrub 3 to 6 feet.

6 P. TERNATA (D. C. l. c. t. 47. f. 2.) leaflets 3, approximate, cuneate-oblong, terminating in a short, straight, spine-like mucrone; stipulas spinose, straight; pedicels axillary, 1-flowered; legume torulose, linear-oblong, acute. 2. S. Native of St. Domingo. *Æschinómene ternata*, Spreng. syst. in herb. Balb. Flowers yellow.

*Ternate-leaved* Pictetia. Shrub 3 to 4 feet.

*Cult.* A mixture of loam, peat, and sand will suit the species of this genus, and young cuttings will root in sand under a hand-glass, in heat.

**CXLII. ORMOCARPUM** (from *ορμος*, *ormos*, a necklace, and *καρπος*, *carpos*, a fruit; in allusion to the shape of the pods, which are jointed, and may be likened to a necklace). Beauv. fl. d'ow. 1. p. 95. Desv. journ. bot. 3. p. 122. t. 5. f. 16. D. C. prod. 2. p. 314.

**LIN. SYST.** *Diadelphia*, *Decandria*. Calyx furnished with 2 permanent bracteoles at the base, 5-cleft, somewhat bilabiate, with all the lobes acute. Corolla papilionaceous, with a broad entire vexillum, and an obtuse 2-edged keel. Stamens diadelphous. Legume stipitate, many-jointed, with the joints attenuated at both ends, usually striated and warted lengthwise, 1-seeded, distinctly separating.—Smooth shrubs, with simple leaves, having the petiole jointed at the apex, or impari-pinnate, or abruptly-pinnate leaves. Racemes short, axillary.

\* *Leaves simple, with the petiole jointed at the apex.*

1 O. VERRUCOSUM (Beauv. l. c. t. 58.) leaves simple, ovate-lanceolate, acuminate; joints of legume striated and warted. 2. S. Native of western Africa, in the kingdom of Waree. *Mullera verrucosa*, Pers. ench. 2. p. 311. Leaves 3 inches long, but hardly an inch and a half broad. Flowers red.

*Warted-podded* Ormocarpum. Shrub 3 to 6 feet.

2 O. ? SULCATUM (Beauv. l. c. in a note) leaves simple, small; joints of legume furrowed, but not warted. 2. S. Native of St. Domingo. Perhaps *Pictetia Desvauxii*. Flowers red.

*Furrowed-podded* Ormocarpum. Shrub 3 to 4 feet.

\* \* *Leaves impari-pinnate.*

3 O. SENNOIDES (D. C. prod. 2, p. 315.) leaves impari-pinnate, with 6-7 pairs of obovate, retuse mucronulate leaflets; joints of legume striated and beset with prickly tubercles. 2. S.

Native of the East Indies. *Hedysarum sennoïdes*, Willd. spec. 3. p. 1207. *O. cassioides*, Desv. l. c. Flowers red?

*Senna-like Ormocarpum*. Fl. July, Aug. Clt. 1816. Sh. 3 to 6 feet.

4 *O. coronilloïdes*; shrubby, erect, branched; leaves impari-pinnate; leaflets oblong, emarginate, glaucous; flowers lateral, pedunculate; legumes with 6-7 furrowed, glabrous joints, which taper at both ends. *h. S.* Native of the island of St. Thomas, in Guinea, on a little island in Man-of-War Bay.

*Coronilla-like Ormocarpum*. Shrub 6 feet.

\*\*\* *Leaves abruptly pinnate.*

5 *O. elegans*; shrubby, smooth except the young leaves, which are silky; leaves abruptly pinnate, with 8-10 pairs of ovate-lanceolate, mucronate leaflets; racemes axillary, not so long as the leaves; calyx smooth, slightly 5-lobed; vexillum large. *h. S.* Native of Mexico. Legumes stipitate, 3-jointed; joints tapering to both ends. Calyx permanent. Flowers purple.

*Elegant Ormocarpum*. Shrub 3 to 6 feet.

6 *O. coccinea*; shrub rather villous, with 10-16 pairs of obovate-lanceolate, obtuse, mucronate leaflets; racemes shorter than the leaves; calyx campanulate, almost truncate. *h. S.* Native of Mexico. Flowers apparently scarlet.

*Scarlet-flowered Ormocarpum*. Shrub 3 to 4 feet.

*Cult.* See *Pictëtia*, p. 278. for culture and propagation.

CXLIII. AMICIA (in honour of Joseph Baptiot Amici, a celebrated French physician). *H. B. et Kunth*, nov. gen. amer. 6. p. 511. t. 600. *D. C. prod.* 2. p. 315.—*Zygomeris*, Moc. et Sesse, fl. mex. icon. ined.

*LIN. SYST.* *Monadelphina, Decándria*. Calyx campanulate, 5-cleft, 2 upper lobes roundish, large, 2 lateral ones minute, the lowest one oblong, keeled, and concave. Corolla with an orbicular vexillum, and with the wings applied to the keel. Stamens 10, monadelphous, with the tube or sheath cleft in front. Legume linear, compressed, many-jointed, with the joints truncate at both ends.—Climbing shrubs. Branches and petioles pubescent. Leaves abruptly pinnate, with 2 pairs of leaflets, full of pellucid dots. Peduncles axillary, 5-6-flowered. Bractæas 2, orbicular, opposite, at the origin of the pedicels. Flowers yellow. This genus is nearly allied to *Poirëtia*, but is easily distinguished by the form of the calyx.

1 *A. glandulosa* (*H. B. et Kunth*, l. c.) leaflets obovate, somewhat emarginate; vexillum obcordate; legume with 5 joints. *h. S.* Native of New Granada, near Loxa.

*Glandular Amicia*. Shrub cl.

2 *A. zygomeris* (*D. C. prod.* 2. p. 315.) leaflets cuneate-obcordate, mucronate; vexillum broadly obovate, mucronate; legumes having 2 joints. *h. S.* Native of Mexico. *Zygomeris flava*, Moc. et Sesse, fl. mex. icon. ined. According to the figure there are 2 of the stamens longer than the rest.

*Two-jointed-podded Amicia*. Clt. 1826. Shrub cl.

*Cult.* See *Pictëtia*, p. 278. for culture and propagation.

CXLIV. POIRETIA (in honour of J. L. M. Poirët, a French botanist and traveller in Barbary, editor of the supplement to Lamarck's Dictionnaire de Botanique, 4 vols. 4to.). *Vent. choix.* t. 42. but not of *Gmel.* nor *Smith*, nor *Cav.* *D. C. prod.* 2. p. 315.—*Turpinia*, *Pers. ench.* 2. p. 314. but not of *Bonpl.* nor *Rafin.*

*LIN. SYST.* *Monadelphina, Decándria*. Calyx campanulate, bilabiate, upper lip somewhat bidentate, lower one tridentate. Corolla with a semi-orbicular, emarginate vexillum, thrown back from the keel, with reflexed sides; wings spreading. Stamens 8-10, monadelphous, with the tube or sheath cleft in front. Stigma capitate. Legume with 3-4, compressed, 1-seeded,

straight, truncate joints, separating at maturity.—Climbing shrubs, having the habit of *Glycine*, with abruptly pinnate leaves, bearing 2 pairs of leaflets. Stipulas distinct from the petiole. Racemes short, axillary. Flowers covered with glandular dots.

1 *P. scandens* (*Vent.* l. c.) stems climbing, glabrous; leaves with 2 pairs of obovate retuse leaflets, full of pellucid dots; racemes few-flowered, shorter than the petioles. *h. S.* Native of St. Domingo, and near Caraccas, among bushes. *H. B. et Kunth*, nov. gen. amer. 6. p. 510. *Glycine*, *Lam. ill.* t. 609. f. 2. *Turpinia punctata*, *Pers.* l. c. *P. punctata*, *Desv. journ. bot.* 3. p. 122. t. 5. f. 17. *Glycine punctata*, *Willd. spec.* 3. p. 1066.

*Climbing Poirëtia*. Clt. 1823. Shrub cl.

2 *P. psoraleoides* (*D. C. prod.* 2. p. 315.) stem erect, angular; leaves with 4 obovate leaflets, full of pellucid dots; flowers almost terminal, glomerate. *h. S.* Native of Monte Video, at the bottom of mountains. *Psoralea tetraphylla*, *Poir. suppl.* 4. p. 589. The leaves are sometimes composed of 3 or 5 leaflets from some cause or other.

*Psoralea-like Poirëtia*. Shrub 2 to 3 feet.

*Cult.* See *Pictëtia*, p. 278. for culture and propagation.

CXLV. PLANARIUM (from *planarius*, plain; in reference to the broad flat legumes). *Desv. obs. legum. in Schlecht. Linnaea.* 2. p. 511.

*LIN. SYST.* *Diadelphina, Decándria*. Calyx campanulate. Stamens diadelphous. Legume on a short stipe, compressed, 8-jointed, having a prominent longitudinal nerve in the middle of the valves.—A climbing shrub, with impari-pinnate leaves.

1 *P. latisiliquum* (*Desv.* l. c.). *h. S.* Native of Peru. *Poirëtia latisiliquosa*, *Desv. journ. bot. and D. C. prod.* 2. p. 316. *Hedysarum latisiliquosum*, *Juss. herb. Poir. dict.* 6. p. 432. Stems pubescent. Leaves with 5 oval, acute leaflets. Racemes axillary, few-flowered, longer than the petioles.

*Broad-podded Planarium*. Shrub cl.

*Cult.* See *Pictëtia*, p. 278. for culture and propagation.

CXLVI. MYRIADENUS (from *μυριος*, *myrios*, innumerable, and *αδην*, *aden*, a gland; in reference to the leaves being beset with numerous glands). *Desv. journ. bot.* 3. p. 121. t. 4. f. 11. *D. C. prod.* 2. p. 316. but not of *Cass.*

*LIN. SYST.* *Diadelphina, Decándria?* Calyx tubular, 5-toothed, and appearing as if hidden within 2 opposite bractæas. Corolla and stamens unknown. Legume constantly composed of numerous, terete, somewhat obconical, 1-seeded, indehiscent joints.—An erect smooth herb, having 4 dotted, obovate, emarginate leaflets at the top of each petiole, with very short, axillary, solitary, 1-flowered pedicels, and yellow flowers. This genus is not sufficiently known, but it appears to be nearest allied to *Poirëtia*, in the leaves being of 4 glandular leaflets.

1 *M. tetraphyllus* (*D. C. prod.* 2. p. 316.). *h. S.* Native of Jamaica.—*Sloan. jam.* 1. p. 186. t. 116. f. 3. *Ornithopus tetraphyllus*, *Lin. amœn.* 5. p. 402. *Lunan. hort. jam.* 1. p. 94. Leaflets cuneate, obtuse, or emarginate, glabrous, dotted beneath, all rising from the apex of the petiole.

*Four-leafletted Myriadenus*. Fl. Ju. Jul. Clt. 1818. Pl. 1 ft.

*Cult.* The seeds of this plant require to be sown in pots and placed on a hot-bed in spring, and when the plants are strong enough they may be removed to the stove or greenhouse, or they may remain in the frame, where they will ripen seeds.

CXLVII. ZORNIA (in honour of John Zorn, once an apothecary at Kempten in Bavaria, author of *Icones plantarum medicinalium*, 8vo. Nuremberg, 1779 and 1784). *Gmel. syst.* 1076. *Michx. fl. bor. amer.* 2. p. 76. *Desv. journ. bot.* 3. p. 124. t. 5. f. 25. *D. C. prod.* 2. p. 316.—*Anonyma*, *Walt. car.* 181.

**LIN. SYST.** *Monadelphica*, *Decandria*. Calyx campanulate, bilabiate, upper lip emarginate, lower one 3-cleft. Corolla inserted in the bottom of the tube of the calyx. Vexillum having revolute sides. Keel bifidly lunulate. Stamens monadelphous. Anthers alternately gibbose and ovate. Legume compressed, 3-5-jointed; joints nearly orbicular, usually hispid.—Glabrous herbs, full of pellucid dots. Stipulas sagittate, lower ones lanceolate, upper ones the largest, and forming girding bracteas. Leaflets 2 or 4, rising from the top of the petiole. Flowers yellow, surrounded by the large stipulas.

\* *Leaves having 2 leaflets rising from the top of each petiole.*

1 *Z. ANGUSTIFOLIA* (Smith, in Rees' cycl. no. 1.) stems diffuse; leaflets oblong-lanceolate; bracteas ovate-sagittate, 5-nerved, ciliated, shorter than the legumes, full of glandular dots; prickles of legume covered with retrograde stiff hairs. ☉. S. Native of the Mauritius and the East Indies, in sandy places.—Rheed. mal. 9. t. 82. *Z. diphylloides*, Pers. 2. p. 318. *Hedysarum diphylloides*, var. *a*, Lin. syst. 560. exclusive of the synonyme of Sloane. In some specimens of this plant the legumes are prickly their whole length, in others only at their apex.

*Narrow-leafletted Zornia*. Fl. July, Aug. Clt. 1733. Pl.  $\frac{1}{2}$  to 1 foot.

2 *Z. GLOCHIDATA* (Reichb. in Sieb. pl. exsic. seneg. no. 40.) stems erect, branched; leaflets linear; bracteas ovate-sagittate, 5-nerved, dotless, and ciliated with long hairs, a little shorter than the legumes; legume with 3-4 joints, beset with glochidate prickles, which are covered with retrograde stiff hairs. ☉. S. Native of Senegal.

*Glochidate-podded Zornia*. Fl. July, Aug. Clt. 1823. Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

3 *Z. BIARTICULATA*; stem branched; leaflets lanceolate, acute; spikes few-flowered; stipulas ovate, membranous, acute, 4-5-nerved, ciliated; legumes 2-jointed, echinate; prickles hooked at apex. ☉. S. Native of the Gold Coast, in sandy places.

*Two-jointed-podded Zornia*. Pl.  $\frac{1}{2}$  foot.

4 *Z. GRACILIS* (D. C. prod. 2. p. 316.) stems erect; leaflets oblong-lanceolate; bracteas linear-sagittate, acuminate at both ends, 5-nerved, a little ciliated, full of glandular dots; prickles of legume beset with stiff retrograde bristles. ☉. S. Native of Guiana.

*Slender Zornia*. Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

5 *Z. RETICULATA* (Smith, in Rees' cycl. no. 2.) stems erect; leaflets lanceolate, glabrous, lower ones elliptic; bracteas ovate, acute, ciliated, glandless, 5-nerved, reticulated, length of legumes; legumes pubescent, as well as furnished with a few downy prickles. ☉. S. Native of Jamaica, Cayenne, Porto Rico, and Santa Cruz. *Hedysarum diphylloides*  $\beta$ , Lin. Swartz. and Willd. *Z. diphylloides*  $\beta$ , ciliatum, Pers.

*Var.  $\beta$ , puberula* (D. C. prod. 2. p. 316.) branches pubescent at the apex; bracteas ovate-lanceolate, acuminate, longer than the legumes. ☉. S. Native of Cayenne. Perhaps a proper species. Perhaps only a variety of *Z. pubescens*.

*Reticulated-bracted Zornia*. Fl. Jul. Aug. Clt. 1800. Pl. 1 ft.

6 *Z. THYMIFOLIA* (H. B. et Kunth, nov. gen. amer. 6. p. 514.) stems diffuse, and are as well as the petioles pubescent; leaflets oblong, glabrous above, but puberulous beneath, having the margins dotted as well as the calyxes; bracteas ovate, 5-nerved, puberulous and glandular beneath; legumes rather pilose, the joints reticulated with veins.  $\frac{1}{2}$ ?  $\frac{1}{4}$ ? S. Native of Mexico, near Santa Rosa.

*Var.  $\beta$ , clandestina*; plant larger and more branched; leaves dotless; bracteas a little dotted, glabrous, ciliated. ☉. S. Native of Mexico, near Jalapa. *Z. thymifolia*, Schlecht. et Cham. in Linnæa. 5. p. 582. Perhaps a proper species.

*Thyme-leaved Zornia*. Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

7 *Z. LAEVIS* (Schlecht. et Cham. in Linnæa. 5. p. 582.) plant smooth; bracteas somewhat 7-nerved, sparingly dotted, ciliated; legumes smooth, but rather puberulous between the joints; leaflets variable, ovate, or ovate-lanceolate, acute. ☉. S. Native of Mexico, near Jalapa.

*Smooth Zornia*. Pl.  $\frac{1}{2}$  foot.

8 *Z. PUBESCENS* (H. B. et Kunth, nov. gen. amer. 6. p. 515.) stem erect, dichotomously branched, glabrous; branches and petioles clothed with villous pubescence; leaflets oblong-lanceolate, pubescent on both surfaces, and are glandless as well as the calyxes; bracteas ovate, acute, ciliated, dotted; legumes hispid and muricated, having 5-6 joints. ☉. S. Native of South America, on the banks of the river Magdalena, near Honda.

*Pubescent Zornia*. Pl. 1 to 2 feet.

9 *Z. LATIFOLIA* (D. C. prod. 2. p. 317.) plant ascending, clothed in every part with villi; bracteas ovate, acute, many-nerved. ☉. H. Native of Brazil. Leaflets ovate, 12-18 lines long and 8-9 broad, longer than the petioles. Flowers large. Legume unknown.

*Broad-leafletted Zornia*. Pl.  $\frac{1}{2}$  to  $\frac{3}{4}$  foot.

10 *Z. MARANHAMENSIS*; stems erect, branched, pubescent at the apex; leaflets lanceolate, acute; stipulas subulate; bracteas lanceolate, 3-nerved, acute, villous; legume with 3-4 hispid joints. ☉. S. Native of Maranham.

*Maranham Zornia*. Pl.  $\frac{1}{2}$  foot.

11 *Z. ZEYLONENSIS* (Pers. ench. 2. p. 318.) leaflets ovate; bracteas ovate, ciliated; legumes prickly; stem erect. ☉. S. Native of Ceylon.—Burm. zeyl. t. 50. f. 1. Pluk. alm. t. 102. f. 1. *Hedysarum conjugatum*, Willd. spec. 3. p. 1178. *H. diphylloides*, var. *Lin.* *Z. conjugata*, Smith, in Rees' cycl. no. 3.

*Ceylon Zornia*. Fl. July, Aug. Clt. 1825. Pl.  $\frac{1}{2}$  foot.

12 *Z. DICTYOCARPA* (D. C. prod. 2. p. 317.) leaflets lanceolate; bracteas ovate-sagittate, acuminate, shorter than the legumes, a little ciliated and rather glandular, hardly 5-nerved; joints of legume unarmed, glabrous, reticulated. ☉. H. Native of New Holland. Sieb. pl. exsic. nov. holl. no. 610.

*Net-fruited Zornia*. Fl. July, Aug. Clt. 1820. Pl.  $\frac{1}{2}$  foot.

\* \* *Leaves bearing 4 leaflets at the apex of each petiole.*

13 *Z. TETRAPHYLLA* (Michx. fl. bor. amer. 2. p. 76. t. 41.) leaflets 4, digitate, oblong, acuminate; bracteas glabrous, length of legumes, 5-nerved; prickles of legume rather scabrous.  $\frac{1}{4}$ . F. Native of Carolina, in sandy fields. *Anonymos bracteata*, Walt. car. 181. *Z. bracteata*, Gmel. syst. 1096. *Hedysarum tetraphyllum*, Lam. diet. 2. p. 405. but not of Thunb.

*Four-leafletted Zornia*. Fl. June, July. Clt. 1824. Pl. 1 ft.

14 *Z. CAPEENSIS* (Pers. ench. 2. p. 317.) leaflets 3-4, oblong, rather acute, dotted beneath; bracteas semisagittate at the base, but ovate at the top; legumes 4-jointed, reticulately scabrous. ☉. G. Native of the Cape of Good Hope, in the interior of the country. *Hedysarum tetraphyllum*, Thunb. nov. act. ups. 6. p. 41. t. 3. fl. cap. 595. *Z. heterophylla*, Smith, in Rees' cycl. no. 5.

*Cape Zornia*. Fl. July, Aug. Clt. 1824. Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

*Cult.* See *Myriadenus*, p. 279, for culture and propagation.

**CXLVIII. STYLOSANTHES** (from *στυλος*, *stylos*, a style, *anthos*, *anthos*, a flower; in allusion to the flower having a long style). Swartz, prod. 108. act. holm. 1789. p. 296. fl. ind. occ. 1280. t. 25. Lam. ill. t. 627. D. C. prod. 2. p. 317.

**LIN. SYST.** *Monadelphica*, *Decandria*. Tube of calyx very long and slender, with a 5-parted limb; the lobes unequal. Corolla inserted in the throat of the tube of the calyx. Keel minute, bifid at the apex. Stamens monadelphous, having the tube or sheath cleft in front. Ovary sessile. Style filiform,

very long and straight, crowned by a capitate, hispid stigma. Legume having 2 1-seeded joints, the upper joint acuminate and hooked at the apex from the permanent base of the style.—Small herbs or subshrubs, with branching stems, trifoliate leaves, having the middle leaflet almost sessile. Stipulas adnate to the petioles. Spikes of flowers terminal, dense, imbricated by the stipulas and bracteas. Flowers small, yellow.

1 *S. PROCUMBENS* (Swartz, in act. holm. l. c. t. 11. f. 1. fl. ind. occ. 3. p. 1282.) stem suffruticose, procumbent, clothed with adpressed pubescence at the apex; leaflets oblong, acute, glabrous, lined; spikes many-flowered.  $\frac{1}{2}$ . *S.* Native of Jamaica, St. Domingo, Porto Rico, and Guadaloupe, in waste grassy fields.—Sloan. hist. 1. t. 119. f. 2. *Hedysarum hamatum*  $\alpha$ , Lin. spec. 1056. *Ononis cerifolia*, Reichb. in Sieb. pl. exsic. seneg. no. 37.

*Procumbent Stylosanthes.* Fl. June, Aug. Clt. 1821. Sh. pr.

2 *S. ERECTA* (Beauv. fl. d'ow. 2. p. 28. t. 77.) stem erect, glabrous; leaflets ovate-oblong, glabrous, as well as the stipulas; spikes many-flowered, elongated.  $\odot$ . *S.* Native of tropical Africa, on the western coast.

*Erect Stylosanthes.* Fl. July, Aug. Clt. 1825. Shrub 1 ft.

3 *S. VISCOSA* (Swartz, in act. holm. l. c. t. 9. f. 2. fl. ind. occ. 3. p. 1285.) shrubby, erect; branches clothed with clammy hairs; leaflets elliptic, mucronate, ciliate, serrulated, hairy; spikes few-flowered.  $\frac{1}{2}$ . *S.* Native of the south of Jamaica and Mexico, in sandy mountainous places.—Sloan. hist. 1. t. 119. f. 1. *Hedysarum hamatum*  $\beta$ , Lin. spec. 1056.

*Clammy Stylosanthes.* Fl. July, Aug. Clt. 1818. Sh. 1 ft.

4 *S. MUCRONATA* (Willd. spec. 3. p. 1166.) stem suffruticose; branches pubescently hairy; leaflets oblong-ovate, pubescent beneath, ciliate, serrulated; spikes few-flowered; bracteas ciliated.  $\frac{1}{2}$ . *S.* Native of Ceylon and Tranquebar, in sandy places.—Burm. zeyl. t. 106. f. 2. *Hedysarum hamatum*, Burm. ind. 167. *Arachis fruticosa*, Retz. obs. 5. p. 26., but the stems are said to be erect, but in the specimens which have been examined they appear to be diffuse, but according to the description of Burmann, they are procumbent.

*Mucronate Stylosanthes.* Fl. July, Aug. Clt. 1817. Pl. diff.

5 *S. RIGIDA* (Spreng. syst. 3. p. 310.) stem shrubby; branches straight; leaflets almost sessile, oblong, mucronate, coriaceous, shining above, rather tomentose and reticulately wrinkled beneath; spikes short, few-flowered; bracteas ovate, minute.  $\frac{1}{2}$ . *S.* Native of Brazil.

*Stiff Stylosanthes.* Shrub 1 to 2 feet.

6 *S. HUMILIS* (H. B. et Kunth, nov. gen. amer. 6. p. 506. t. 594.) stems tufted and somewhat dichotomously branched, and marked with a hairy line; leaflets oblong, and are as well as the calyxes ciliated; stipulas hispid, falcate, subulate at the apex; flowers axillary, sessile; legumes ending in a hooked awn, reticulated, hispid.  $\frac{1}{2}$ . *S.* Native of South America, on the Orinoca, near Carichana, in very warm places.

*Humble Stylosanthes.* Shrub procumbent.

7 *S. GLUTINOSA* (H. B. et Kunth, l. c.) plant procumbent and clothed with clammy hairs; leaflets spatulate or obovate-oblong; flowers axillary, solitary, sessile; stipulas ovate-lanceolate, 4-nerved.  $\frac{1}{2}$ . *S.* Native of Mexico, near Acapulco, in sandy places. Flowers red.

*Glutinous Stylosanthes.* Pl. procumbent.

8 *S. TENUIFOLIA*; stem erect, branched; leaflets linear, acute, stiff; flowers numerous, disposed in terminal spikes.  $\odot$ . *S.* Native of Maranhão.

*Fine-leaved Stylosanthes.* Pl. 1 foot.

9 *S. ELATIOR* (Swartz, in act. holm. l. c. t. 11. f. 2.) stem herbaceous, erect, with one side pubescent only; leaflets lanceolate, glabrous; spikes few-flowered; bracteas lanceolate, ciliated.  $\frac{1}{2}$ . *F.* Native of North America, from Pennsylvania

to Carolina, and of Guadaloupe.—Pluk. alm. t. 447. f. 7. *Trifolium biflorum*, Lin. spec. 1088. *Arachis aprica*, Walt. carol. 182. *S. hispida*, Michx. but not of Rich.

*Taller Stylosanthes.* Fl. July, Aug. Clt. 1816. Pl. 1 to 2 ft.

10 *S. GRACILIS* (H. B. et Kunth, l. c. p. 596.) stem erect, marked with a pubescent line, rather hispid at the apex; leaflets linear, puberulous; young stipulas and bracteas hispid; flowers disposed in terminal glomerate heads, which are involucreted with bracteas; legumes glabrous, ending in a hooked mucrone, and having a few glandular tubercles at the apex.  $\odot$ . *H.* Native of Mount Turimiriqui, in the province of New Andalusia.

*Slender Stylosanthes.* Pl. 3 to 4 feet.

11 *S. HISPIDA* (Rich. in act. soc. h. n. par. 1792. p. 112.) stems herbaceous, glabrous, diffuse; leaflets lanceolate, mucronate, hispid; stipulas and bracteas ciliated, hispid; spikes many-flowered.  $\frac{1}{2}$ . *S.* Native of Cayenne.

*Hispid Stylosanthes.* Pl. diffuse.

12 *S. GUINEENSIS*; plant suffruticose, much branched, ascending; leaflets small, oblong-lanceolate, mucronate; stipulas sheath-formed, mucronate; pedicels short, 1-flowered, axillary.  $\frac{1}{2}$ . *S.* Native of Cape Coast.

*Guinea Stylosanthes.* Shrub 1 foot.

13 *S. GUIANEENSIS* (Swartz, in act. holm. l. c.) stem herbaceous, erect, hairy; leaflets lanceolate, pubescent, longer than the petioles; stipulas and bracteas hispid; spikes many-flowered.  $\odot$ . *S.* Native of French Guiana, in meadows, and near Mariquito, in New Granada. H. B. et Kunth, nov. gen. amer. 6. p. 508. *Trifolium Guianense*, Aubl. guian. 2. p. 776. t. 309.

*Guiana Stylosanthes.* Fl. July, Aug. Clt. 1820. Pl. 3 ft.

*Cult.* This genus contains plants of no beauty, and are therefore not worth cultivating, unless in botanical gardens. The annual species should be treated like the species of *Zornia*. The shrubby and perennial herbaceous kinds like other stove plants. They are all most easily increased by seeds.

CXLIX. ADESMIA (from  $\alpha$ , priv. and  $\delta\epsilon\sigma\mu\omicron\varsigma$ , *desmos*, a bond; in reference to the stamens being free). D. C. ann. se. nat. 4. p. 94. jan. 1825. legum. mem. vii. prod. 2. p. 318.

LIN. SYST. *Decandria, Monogynia*. Calyx 5-cleft, with the segments acute and nearly equal. Corolla papilionaceous. Vexillum complicated above the rest of the petals when young. Keel curved and truncate at the apex. Stamens distinct, approximate. Legume compressed, transversely many-jointed, having the upper suture straight and thickish, but the lower suture is sinuately lobed; joints 1-seeded, nearly orbicular, at length separating from each other. Seeds compressed, reniformly orbicular.—South American herbs, with lanceolate stipulas, abruptly pinnate leaves, ending in a bristle, axillary, 1-flowered pedicels, or the flowers are disposed in something like racemes at the tops of the branches, in consequence of the upper leaves being abortive. Dr. Hooker's arrangement of the species of this genus is here adopted.

SECT. I. A'SSUE. Annual herbs, having the lower flowers axillary, solitary, and pedicellate, but the upper ones form a panicle at the tops of the branches, in consequence of the upper leaves being abortive. Flowers yellow. The plants contained in this section have the habit of *Smithia*.

1 *A. MURICATA* (D. C. in ann. se. nat. 4. p. 94. jan. 1825.) stem decumbent, scabrous from glands; leaves with 5-7 pairs of obovate, emarginate leaflets, having scabrous margins; pedicels axillary, and also disposed in terminal racemes; legumes with 6-8 muricated joints.  $\odot$ . *H.* Native of Patagonia. *Hedysarum muricatum*, Jacq. icon. rar. t. 568. coll. 5. p. 145. *Æschinómene Patagónica*, Hortul. Patagónium *hedysaroides*, Schrank. in munch. denschr. 1808. p. 91. *Hedysarum pimpinellæfolium*, Poir. dict. 6. p. 447.

• O o

*Muricated-podded Adesmia.* Fl. June, July. Clt. 1793. Pl. decumbent.

2 *A. SMITHIÆ* (D. C. l. c.) stems decumbent, pubescent; leaves with 5 pairs of cuneate, emarginate, pubescent leaflets; pedicels axillary, 1-flowered, shorter than the leaves; joints of legume 4-8, pilose. ☉. S. Native of South America. Like *A. muricata*, but the down on the stems is soft, not glandular, and clammy, and the pedicels are all axillary. Habit of *Smithia*.

*Smith's Adesmia.* Pl. decumbent.

3 *A. HISPIDULA* (D. C. l. c. t. 48.) stems diffuse, puberulous, and with the petioles and peduncles scabrous from a few retrograde spines; leaves with 4-6 pairs of oblong, obtuse leaflets, which are a little toothed at the apex and pilose on the margins; pedicels axillary, 1-flowered; joints of legume 4-8, furnished in the centre with feathery bristles. ☉. S. Native of Peru. *Æschinómene hispidula*, Lag. nov. gen. et spec. p. 22. no. 297. *Hedýsarum pëndulum*, var.  $\beta$ , Poir. dict. 6. p. 449. ex Desv. *Hedýsarum uniflorum*, Donb. herb.

*Hispid Adesmia.* Pl. diffuse.

4 *A. TENÉLLA* (Hook. in Beech. voy. p. 19.) plant pubescently-hairy, glandless; stems procumbent, simple; leaves with 3-4 pairs of obovate, obtuse, or retuse leaflets, and sometimes furnished with a terminal one; pedicels axillary, 1-flowered, lower ones equal in length to the leaves; calycine segments ovate-lanceolate; legume with 2-3 muricated joints, equal in length to the calyx. ☉. H. Native of Chili, on hills near Valparaiso.

*Tender Adesmia.* Pl. procumbent.

5 *A. ANGUSTIFOLIA* (Hook. in Beech. voy. p. 19.) plant pubescently hairy, glandless; stems procumbent; leaves with 4-5 pairs of remote, linear, bluntish leaflets; pedicels 1-flowered, lower ones shorter than the leaves; calycine segments lanceolate; legume 5-6-jointed, beset with a few plumose stiff bristles, twice the length of the calyx. ☉. H. Native about Valparaiso.

*Narrow-leafletted Adesmia.* Pl. procumbent.

SECT. II. PERÉNNES. Perennial herbs, with very long, terminal leafless racemes, and panicles. Flowers yellow. Plants with the habit of *Onobrychis*.

6 *A. DENTÁTA* (D. C. in ann. sc. nat. 4. p. 91. jan. 1825. legum. mem. t. 49.) stem erect, beset with glandular pubescence; leaves with 4-5 pairs of obovate, truncate leaflets, which are deeply serrated at the apex, when young rather villous; joints of legume 4-8, muricated. ♀. S. Native of South America. *Æschinómene dentata*, Lag. nov. gen. et spec. p. 22. no. 296.

*Toothed-leafletted Adesmia.* Pl. 1 to 2 feet.

7 *A. BÍCOLOR* (D. C. l. c.) stems prostrate; leaves with 9-12 pairs of lanceolate, acute, entire, pubescent leaflets; stipulas conforming to the leaves; racemes very long, opposite the leaves; joints of legume 6-8, rounded in front, and clothed with very short pubescence. ♀. S. Native of Monte Video, on rocks by the sea-side and in the sand. *Hedýsarum bicolorum*, Poir. dict. 6. p. 448. Pedicels 6-8 lines long. Flowers rather large, red on the outside but yellow on the inside.

*Two-coloured-flowered Adesmia.* Pl. prostrate.

8 *A. PÉNDULA* (D. C. l. c.) stems diffuse, hardly pubescent; leaves with 7-9 pairs of oval-oblong, entire, pubescent leaflets; racemes elongated; lower flowers distant; legumes pendulous, with 7-8 rather hispid joints. ♀. S. Native of Monte Video and Buenos Ayres. *Hedýsarum pëndulum*, Poir. dict. 6. p. 449. var.  $\alpha$ . Flowers yellow, but reddish on the outside.

*Pendulous-podded Adesmia.* Fl. June, July. Clt. 1825. Pl. diffuse.

9 *A. PUNCTÁTA* (D. C. l. c.) stems procumbent, beset with glandular pili; leaves with 9-12 pairs of linear, obtuse, entire,

rather mucronate, pubescent, ciliated leaflets; racemes spicate, crowded with flowers; joints of legume 4-8, oblong, hairy, and dotted with black. ♀. S. Native of Monte Video and Buenos Ayres. *Hedýsarum punctatum*, Poir. dict. 6. p. 447. Calycine segments linear-subulate. Flowers apparently purplish on the outside.

*Dotted-podded Adesmia.* Pl. procumbent.

10 *A. PAPPÒSA* (D. C. l. c. with a figure) stem ascending, leafy and villous at the base; leaves with 8-10 pairs of obovate, retuse, mucronate, entire, rather pilose leaflets, when young pubescent beneath; racemes terminal, compound, very long, glabrous, pedunculate, many-flowered; calyx glandless; base of vexillum with a tuft of hairs; legume with 2 joints, beset with soft plumose bristles. ♀. G. Native of Chili. *Æschinómene papposa*, Lag. nov. gen. et spec. p. 23. no. 298. *Hedýsarum papposum*, Lher. ined. Flowers small, with a reflexed vexillum. Stamens probably only 5. Habit almost of *Oxytropis deflexa*.

*Downy-bristled Adesmia.* Fl. Ju. Jul. Clt. 1823. Pl. asc.

11 *A. LONGISE'TA* (D. C. l. c.) plant decumbent, villous; leaves with 6-7 pairs of obovate, mucronulate leaflets, which are villous on both surfaces; racemes almost terminal; flowers distant, on long pedicels; calyces glandular; legumes 2-jointed, beset with long, plumose stiff bristles. ♀. S. Native of South America. Herb almost with the habit of *Anthyllis montana*, the flowers of *Ononis*, the legumes of *Onobrychis*, and the stamens of *Sophora*.

*Long-bristled-podded Adesmia.* Pl. decumbent.

12 *A. CONFÉRTA* (Hook. in Beech. voy. p. 20.) plant ascending, pubescent; leaves with 6 pairs of obovate-oblong, retuse, mucronate leaflets; racemes terminal, compound, beset with black glands, many-flowered; fructiferous pedicels deflexed; calycine segments ovate; legume 3-4-jointed, muricated, and glandular. ♀. G. Native of Chili.

*Crowded-flowered Adesmia.* Pl. ascending.

13 *A. FRUTICULÒSA*; stem decumbent, pilose, as well as the petioles; leaves with numerous pairs of small, lanceolate, mucronate leaflets; peduncles few-flowered, shorter than the leaves; legumes 3-4-jointed, hairy, and muricated. ♀. S. Native of Mexico. *Æschinómene fruticulosa*, N. E. herb. Lamb.

*Fruticulose Adesmia.* Pl. decumbent.

14 *A. MIMOSOIDES*; plant procumbent; branches and petioles villously pubescent; leaves with numerous, linear, alternate, sessile, obtuse, mucronate leaflets, which are oblique at the base; pedicels short, 1-flowered. ♀. S. Native of Mexico. *Æschinómene mimosoides*, N. E. in herb. Lamb.

*Mimosa-like Adesmia.* Pl. procumbent.

SECT. III. SPINÒSÆ. Stems shrubby, spinose. There are numerous unpublished species belonging to this section in Dr. Gillies's herbarium.

15 *A. MICROPHY'LLA* (Hook. in Beech. voy. p. 19. t. 9. Lodd. bot. cab. 1691.) stem shrubby, much branched; branches striated, pubescent, divaricate, spinose; leaves with 6 pairs of small, orbicular leaflets, on short petioles, pubescent; racemes of flowers somewhat capitate, terminal, simple, spinescent; bractæas orbicular; legumes 3-jointed, covered with long plumose bristles, which are stiff and naked at the base. ♀. G. Native of Valparaiso. Plant dichotomous, resembling furze. Stamens and petals free.

*Small-leaved Adesmia.* Fl. summer. Clt. 1826. Sh. 1 to 2 ft.

16 *A. GLUTINÒSA* (Hook. in Beech. voy. p. 19.) stem shrubby, branched; branches spreading, beset with glandular, glutinous hairs, spinose; leaves with about 3 pairs of elliptic, hairy leaflets; racemes elongated, terminal, simple, spinescent, and are as well as the linear bractæas clothed with white hairs; legumes

3-jointed, very long, clothed with plumose bristles.  $\mathfrak{h}$ . G. Native of Chili, about Coquimbo.

*Glutinous Adesmia*. Shrub 1 to 2 feet.

SECT. IV. FRUTICOSÆ. Plants shrubby, unarmed.

17 *A. BALSAMIFERA* (Hook. in Beech. voy. p. 20.) plants densely beset with resinous glands; stem much branched; leaves with usually 10 pairs of cuneate-oblong leaflets, usually ending in an odd one; legume 6-jointed, silky when young.  $\mathfrak{h}$ . G. Native of Chili, where it is called *Jarilla*. *Mimosa balsàmica*, Feuill. chil. 1: p. 134. The plant, besides being of great beauty, yields a balsam of a highly agreeable odour, which is perceptible at a great distance, and is found to be of great efficacy in healing wounds.

*Balsam-bearing Adesmia*. Shrub.

18 *A. FLORIBUNDA*; plant erect, shrubby; branches pubescent; leaves with numerous pairs of lanceolate-oblong, mucronate, villous leaflets, which are obtuse at both ends and villous beneath as well as the petioles; peduncles axillary, few-flowered, aggregate, short, forming a paniced raceme at the tops of the branches, in consequence of the upper leaves being abortive.  $\mathfrak{h}$ . G. Native of Mexico. *Æschynomene*, spec. nov. N. E. in herb. Lamb. An elegant shrub.

*Bundle-flowered Adesmia*. Shrub 2 to 4 feet.

*Cult.* The annual species should be treated in the same manner as that recommended for *Myriadenus*, see p. 279. The shrubby and perennial kinds will grow well in a mixture of loam, peat, and sand, and they may be propagated either by young cuttings, planted in sand, with a hand-glass placed over them; those of the stove species in heat, or by seeds, the latter mode is to be preferred.

CL. ÆSCHYNOMENE (from *αἰσχυνω*, *aischuno*, to be ashamed; in reference to the leaves of some of the species falling on the slightest touch, like those of the sensitive plant). Lin. gen. 888. Lam. ill. 629. Beauv. fl. d'ow. 1. p. 88. R. Brown, in hort. kew. ed. 2. vol. 4. p. 336. Desv. journ. bot. 3. p. 124. t. 6. f. 26. D. C. prod. 2. p. 320, but not of Jaum.

LIN. SYST. *Diadelphia*, *Decandria*. Calyx 5-cleft, bilabiate, upper lip bifid, lower one trifid or tridentate. Corolla papilionaceous. Stamens 10, joined into 2 equal bundles or sets. Legume compressed, transversely articulated, straight, and exserted. Seeds compressed, solitary in the joints.—Tropical herbs and shrubs, with impari-pinnate leaves, having many pairs of leaflets, semisagittate stipulas, axillary racemes of yellow flowers, each furnished with 2 opposite bracteas just under the calyx.

1 *Æ. ASPERA* (Lin. spec. 1060.) stem herbaceous, erect, terete; leaves with 30-40 pairs of linear leaflets, which are smooth as well as the legumes; racemes compound; peduncles, bracteas, calyxes, and corollas hispid.  $\mathfrak{h}$ . S. Native of the East Indies and Cochin-china. *Æ. lagenària*, Lour. cochin. p. 446. *Æ. paludosa*, Roxb. *Æ. lagenarium*, Roxb. hort. beng. p. 57. Breyn. cent. 51. t. 52. Stipulas ending in a long acumen each. The centres of the joints of the legume are scabrous from tubercles.

The substance known by the name of rice-paper is the produce of *Æ. aspera*; when held between the eye and the light its beautiful cellular tissue is discoverable. Dr. Livingstone first brought from China to Europe a quantity of this substance, which he presented about 26 years ago to Miss Jane Jack, who was celebrated for the beauty and accuracy of her artificial flowers. Formed of rice-paper they obtained additional celebrity, fetched very high prices, and were eagerly sought for by persons of the greatest rank and most acknowledged taste. For a bouquet which Miss Jack presented to the late Princess

Charlotte of Wales, she received the regal present of 70*l*. When Dr. Livingstone first procured the rice-paper from the Chinese, the pieces did not exceed 4 inches square; they were dyed of various shades and colours, and cost about 6*d*. each square. Since that time the price has been much reduced, and the size of the pieces increased, so as to be upwards of a foot long and 5 inches across. The tinted pieces are employed by the Chinese for their artificial flowers, and the plain white for making drawings upon. Now this material is so much esteemed in Europe, that it is in request with people of all nations who visit Canton. The same substance is also known in our possessions in the East Indies, where it grows abundantly in the marshy plains of Bengal, and on the borders of the jeels, or extensive lakes in every province between Calcutta and Hurdwar. The plant is perennial and of low growth, and seldom exceeds a diameter of 2½ inches in the stem. It is brought to the Calcutta bazaars in great quantities in a green state, and the thickest stems are cut into laminæ, from which the natives form artificial flowers and various fancy ornaments to decorate their shrines at Hindoo festivals. The Indians make hats of rice-paper, by cementing together as many leaves as will produce the requisite thickness; in this way any kind of shape may be formed, and when covered with silk or cloth the hats are strong and inconceivably light. It is an article of great use to fishermen; it forms floats of the best description to their nets. The slender stems of the plant are bundled into fascines, about 3 feet long, and with one of these under his arm, does every fisherman go out to his daily occupation. With his net on his shoulders he proceeds to work without a boat, and stretches it into the deepest and most extensive lakes, supported by his buoyant faggot.

The cutting the material into laminæ is performed vertically round the stem. The most perfect stems are selected for this purpose, but few are found sufficiently free from knots to produce a cutting of more than 9 or 10 inches in length. The Bengalee name of the plant is *Shola*, commonly pronounced *Sola*, *Kath-shola*, and *Phool-shola*.

*Rough Æschynomene*. Fl. June, Jul. Clt. 1759. Sh. 6 to 8 ft.

2 *Æ. SENSITIVA* (Swartz, fl. ind. occ. 3. p. 1276.) stem shrubby, smooth, terete; leaves with 16-20 pairs of linear leaflets; legumes and racemes glabrous; peduncles branched, few-flowered; joints of legume 6-10, nearly quadrangular, smooth in the middle, but rather pilose at the upper suture.  $\mathfrak{h}$ . S. Native of Jamaica, Martinico, and Brazil, in sandy places, and on the banks of rivulets. Leaves falling on being touched. Flowers white.

*Sensitive Æschynomene*. Fl. June, July. Clt. 1733. Sh. 3 to 6 feet.

3 *Æ. MACROPODA* (D. C. prod. 2. p. 320.) stem herbaceous, terete, scabrous at the apex as well as the branches, peduncles, and petioles; leaves with 10-12 pairs of linear leaflets; peduncles few-flowered; joints of legume 5-7, smooth, the stipe 3 times the length of the lower joint.  $\odot$ . S. Native of Senegal. Stamens monadelphous at the base, but easily separated into 2 bundles, even in a dried state. Stipulas small.

*Var. β, Belisii* (D. C. prod. 2. p. 320.) leaves with 10 pairs of glabrous leaflets; peduncles branched, few-flowered, clothed with glandular pubescence; joints of legume 4-6, scabrous in the middle.  $\mathfrak{h}$ . S. Native of Prince's Island, on the western coast of Africa. *Æ. sensitiva*, Beauv. fl. d'ow. 1. p. 89. t. 53.

*Long-footed-podded Æschynomene*. Shrub 2 to 3 feet.

4 *Æ. SULCATA* (H. B. et Kunth, nov. gen. amer. 6. p. 530.) arborescent; branches striated from furrows, rather flexuous, glabrous, when young hispid as well as the peduncles; leaves with 17-21 pairs of linear, mucronate leaflets, which are glabrous as well as the calyxes; bracteas ciliated; joints of legume 7-9,

glabrous.  $\mathfrak{h}$ . S. Native of New Andalusia, near Bordones, in shady woods.

*Furrowed-stemmed Æschynomene.* Shrub 10 to 12 feet.

5 *Æ. HISPIDULA* (H. B. et Kunth, nov. gen. amer. 6. p. 530.) arborescent; branches striated and rather flexuous; rachis, peduncles, and legumes hispid from tubercles; peduncles few-flowered; leaves with 15-20 pairs of oblong-linear, somewhat mucronulate leaflets, which are glabrous as well as the calyxes; stipulas and bracteas ciliated.  $\mathfrak{h}$ . S. Native of South America, on the banks of the river Magdalena, near Badilla.

*Hispid-legged Æschynomene.* Shrub 6 to 10 feet.

6 *Æ. INDICA* (Lin. spec. 1061.) stem herbaceous, erect, terete, glabrous as well as the leaves; leaves with 15-20 pairs of linear leaflets; peduncles few-flowered; legumes glabrous, dotted; joints 10-12, straight on one side and rounded on the other.  $\odot$ . S. Native of the East Indies and Guinea. *Hedysarum*, Neli Tali. Roxb. hort. beng. 57.—Rheed. mal. 9. t. 18. Flowers yellow.

*Indian Æschynomene.* Fl. June, Jul. Clt. 1799. Pl. 2 to 3 ft.

7 *Æ. GLABERRIMA* (Poir. suppl. 4. p. 76.) stem erect, terete, glabrous as well as the leaves; leaves with 30-35 pairs of linear leaflets; peduncles few-flowered; legumes glabrous, dotted, having 10-12 joints, which are straight on one side and rounded on the other.  $\odot$ . II. Native of Carolina, where it is perhaps spontaneous.

*Quite-smooth Æschynomene.* Pl. 2 to 3 feet.

8 *Æ. AMERICANA* (Lin. spec. 1061.) stem erect, terete, hispid; leaves with 10-20 pairs of linear, mucronate, rather ciliated leaflets; racemes simple, few-flowered; legumes glabrous, dotless, having 4-8 joints, which are straight on one side and rounded on the other.  $\odot$ . S. Native of the West Indies. Lam. ill. t. 629. f. 2.—Sloan. jam. 1. t. 118. f. 3. There is a variety of this plant having a dwarfier, almost glabrous stem. Flowers brownish-yellow.

*American Æschynomene.* Fl. Jul. Aug. Clt. 1732. Pl. 3 ft.

9 *Æ. GUAYAQUILENSIS*; shrubby; plant hispid; leaves with numerous pairs of linear, obtuse, mucronate, smooth leaflets, which are serrated at the apex; peduncles few-flowered, shorter than the leaves; bracteas ovate, cordate, cuspidate, ciliate serrated; joints of legume 6-8, smooth, straight on one side and rounded on the other; stipulas semisagittate.  $\mathfrak{h}$ . S. Native of Guayaquil. *Æschynomene* species, Guayaquil, Ruiz et Pav. in herb. Lamb. along with the two following.

*Guayaquil Æschynomene.* Shrub 2 to 3 feet.

10 *Æ. FLURIARTICULATA*; plant herbaceous, smooth, erect; leaflets linear, obtuse, glabrous; peduncles few-flowered; joints of legume 14-18, smooth; bracteas large, serrated.  $\odot$ . S. Native of Guayaquil. Stipulas large, semisagittate.

*Many-jointed-legged Æschynomene.* Pl. 2 to 3 feet.

11 *Æ. SCABRA*; plant herbaceous, hispid; leaves with numerous pairs of linear leaflets, which are obtuse at both ends; peduncles few-flowered; bracteas serrated; joints of legume mucronate in the centre.  $\odot$ . S. Native of Guayaquil.

*Scabrous Æschynomene.* Pl. 2 to 3 feet.

12 *Æ. PATULA* (Poir. suppl. 4. p. 78.) stem suffruticose; branches spreading, hispid at the apex; leaves with 10-15 pairs of glabrous, linear, obtuse, hardly mucronulate leaflets; racemes simple, few-flowered; joints of legume 4-5, semi-orbicular, puberulous.  $\mathfrak{h}$ . S. Native of the Mauritius. Perhaps a variety of *Æ. Americana*.

*Spreading Æschynomene.* Fl. July, Aug. Clt. 1826. Shrub trailing.

13 *Æ. PUBULA* (Lin. spec. 1061.) stem herbaceous, smooth, rather diffuse; leaflets linear, obtuse, mucronulate, 10-15 pairs; racemes few-flowered; legumes glabrous, having a few joints which are straight on one side and rounded on the other, and

scabrous in the centre.  $\odot$ . S. Native of the East Indies.—Rheed. mal. 9. t. 21.

*Dwarf Æschynomene.* Fl. July, Aug. Clt. 1818. Pl.  $\frac{1}{2}$  ft.

14 *Æ. PLEURONEURIA* (D. C. prod. 2. p. 321.) stem terete, almost erect, clothed with adpressed pubescence, as well as the petioles and nerves; leaves with 20 pairs of semi-lanceolate leaflets, having almost a lateral nerve; stipulas lanceolate, striated, not produced at the base; racemes few-flowered, almost terminal; legumes pubescent, with a few distinct joints, which are straight on one side and rounded on the other.  $\odot$ . ? S. Native of St. Domingo. *Smithia Domingensis*, Balb. herb. In some specimens of this plant the stamens are monadelphous, but in others they are diadelphous.

*Side-nerved-leafletted Æschynomene.* Pl. 2 to 3 feet.

15 *Æ. DIFFUSA* (Willd. spec. 3. p. 1164.) stem herbaceous, smooth, diffuse; leaflets linear, obtuse; peduncles hispid, 1-flowered; joints of legume straight on one side and rounded on the other, and scabrous in the centre.  $\odot$ . S. Native of Tranquebar. Stem branched much at the base.

*Diffuse Æschynomene.* Pl. 1 to 2 feet.

16 *Æ. SUBVISCOSA* (D. C. prod. 2. p. 321.) stem herbaceous, erect, scabrous from small tubercles and pili, which are tipped with glands; leaflets linear, obtuse, glabrous; peduncles usually 2-flowered, and are as well as the legumes beset with glandular hairs.  $\odot$ . S. Native of the East Indies. *Æ. viscidula*, Roxb. hort. beng. in Willd. enum. 776. but not of Mich. *Æ. Roxbúrgii*, Spreng. syst. 3. p. 322. Flowers having the vexillum streaked and spotted with red, the wings of a dirty-yellow colour, and the keel violaceous at the apex.

*Rather-clammy Æschynomene.* Fl. July, Aug. Clt. 1816. Pl. 1 to 2 feet.

17 *Æ. GLANDULOSA* (Poir. suppl. 4. p. 76.) stem shrubby, beset with glandular hairs; leaflets linear, mucronate; peduncles few-flowered; joints of legume 4-5, semiarticulated, furnished with small prickles in the centre.  $\mathfrak{h}$ . S. Native of Porto Rico. Very like *Æ. Americana*.

*Glandular Æschynomene.* Shrub 1 to 2 feet.

18 *Æ. VILLOSA* (Poir. suppl. 4. p. 76.) stem suffruticose, terete, villous; leaflets linear, obtuse, nearly glabrous; racemes axillary, divaricate; legumes clothed with glandular pili.  $\mathfrak{h}$ . S. Native of Porto Rico. Corolla small, white. Perhaps not sufficiently distinct from *Æ. glandulosa*.

*Villous Æschynomene.* Shrub 1 to 2 feet.

19 *Æ. HISPIDA* (Willd. spec. 3. p. 1163.) stem herbaceous, erect, hispid; leaves with 20-25 pairs of linear obtuse leaflets; racemes simple, 3-5-flowered; legumes distinctly stipitate, 6-9-jointed, hispid.  $\odot$ . II. Native of North America, from Philadelphia to Carolina. *Hedysarum Virginicum*, Lin. ex Pursh. Flowers yellow, veined with red. Nutt. gen. amer. 2. p. 111. The hairs on the legume are scattered, and tubercularly glandular at the base.

*Hispid Æschynomene.* Fl. Aug. Clt. 1803. Pl. 2 to 3 ft.

20 *Æ. LATIFOLIA* (Spreng. syst. 2. p. 322.) leaflets oblong, mucronate, glabrous; racemes many-flowered, bracteate, and are as well as the legumes hispid.  $\odot$ . S. Native of Monte Video.

*Broad-leaved Æschynomene.* Pl. 1 to 2 feet.

21 *Æ. PUBERULA* (D. C. prod. 2. p. 321.) stem, leaves, and peduncles beset with scabrous down; leaves with 10 pairs of elliptic-linear, obtuse, mucronate leaflets; racemes short, branched, crowded, many-flowered; stipulas linear-subulate, striated; legumes with few joints.  $\mathfrak{h}$ . S. Native of South America. Branches terete, and probably suffruticose. Calyxes and bracteoles small.

*Puberulous Æschynomene.* Shrub 1 to 2 feet.

22 *Æ. HYSTRIX* (Poir. suppl. 4. p. 77.) stem terete, and is as well as the petioles and peduncles rough from long, yellow bris-

ties; leaves with 10 pairs of oval-linear, obtuse, mucronate leaflets; peduncles compound, many-flowered, shorter than the leaves; pedicels recurved; legumes glabrous, having few joints.  $\frac{1}{2}$ .? S. Native of Cayenne. *Æ. cassioides*, Desv.

*Porcupine Æschynomene*. Shrub 1 to 2 feet.

23 *Æ. PAUCIJUGA* (D. C. prod. 2. p. 321.) stem terete, beset with bristly, rather glandular hairs, as well as the petioles, peduncles, and bracteas; leaves with 4-5 pairs of obovate, obtuse, rather mucronate leaflets, which are hardly pubescent; racemes many-flowered, compound; stipulas and bracteas ovate, acute, striated; legumes smoothish.  $\frac{1}{2}$ .? S. Native of Cayenne.

*Var. β, subsæbra* (D. C. l. c.) legume scabrous from short stiff down. Native of South America.

*Few-paired-leafletted Æschynomene*. Shrub 2 to 3 feet.

24 *Æ. MICRANTHIA* (D. C. prod. 2. p. 321.) stems herbaceous, procumbent, pubescent; leaves with 2-4 pairs of small obovate-roundish, rather mucronate leaflets, which are scarcely pubescent; pedicels axillary, 1-2-flowered, length of leaves; joints of legume glabrous, compressed, nearly orbicular.  $\frac{1}{2}$ . S. Native of Madagascar. *Hedysarum micranthos*, Poir. dict. 6. p. 446. Leaves impari-pinnate.

*Small-flowered Æschynomene*. Pl. prostrate.

25 *Æ. VISCIDULA* (Michx. fl. bor. amer. 2. p. 75. but not of Willd.) plant clothed with clammy pubescence; stems herbaceous, slender, prostrate; leaves with 3-4 pairs of obovate leaflets; peduncles 1-2-flowered; legumes pubescent, with 2 oval-roundish joints.  $\odot$ . H. Native of Florida and Cumberland Island, in sandy places. Nutt. gen. amer. 2. p. 111. *Æ. prostrata*, Poir. suppl. 4. p. 76. This plant has very much the habit of a species of *Smithia*.

*Viscid Æschynomene*. Fl. July, Aug. Clt. 1816. Pl. pros.

26 *Æ. FALCATA* (D. C. prod. 2. p. 322.) stem much branched, villous; leaves with 2-3 pairs of obovate, cuneated, villous leaflets; peduncles usually 2-flowered, elongated; legumes falcate, with roundish pubescent joints.—Native of Brazil, at Rio Janeiro. *Hedysarum falcatum*, Poir. dict. 6. p. 448.

*Falcate-podded Æschynomene*. Pl. 1 foot.

27 *Æ. BRASILIANA* (D. C. prod. 2. p. 322.) stems diffuse, clothed with glandular pili; leaves with 5-6 pairs of ovate-elliptic, pubescent, rather ciliated leaflets; racemes divaricate, loose; joints of legume rather inflated, hispid, and clammy.—Native of Brazil, at Rio Janeiro. *Hedysarum Brasilianum*, Poir. dict. 6. p. 448.

*Brazilian Æschynomene*. Pl. diffuse.

28 *Æ. MICROPHYLLA* (Desv. in herb. mus. paris. D. C. prod. 2. p. 322.) stem terete, clothed with stiff villi; leaves with 20-30 pairs of pubescent, oblong, obtuse, much crowded, small leaflets; racemes much longer than the leaves; legumes glabrous, having 1-2 semi-ovate joints.—Native of Brazil. Bracteas 3, permanent at the origin of the pedicels, and 3 times shorter than them. Bracteoles 2, adpressed under the bilabiate calyx.

*Small-leaved Æschynomene*. Pl. 1 foot.

29 *Æ. ELEGANS* (Schlecht. et Cham. in Linnæa. 5. p. 583.) plant herbaceous; stems diffuse, weak, terete, beset with spreading pili at the apex; leaves with 5-8 pairs of elliptic, obtuse, mucronate leaflets, which are clothed with adpressed pili; stipulas lanceolate, ciliate-serrated; racemes 5-7-flowered, much longer than the leaves; legume on a long stipe, which is one-half the length of the legume, puberulous, and usually with 6 joints.  $\odot$ . S. Native of Mexico, on hills near Jalapa, and at Hacienda de la Laguna. *Æ. mimosoides*, Sesse et Moc. mss. Stems rather flexuous.

*Elegant Æschynomene*. Pl. 3 feet.

30 *Æ. FASCICULARIS* (Schlecht. et Cham. in Linnæa. 5. p. 584.) shrubby, erect, clothed with somewhat strigose, adpressed,

cinereous down; branches angular; leaves with 20 or more pairs of linear, acute, mucronate leaflets, which are almost glabrous above; racemes short, axillary; flowers in fascicles, on short pedicels; legume on a short stipe, 4-jointed.  $\frac{1}{2}$ . S. Native of Mexico, between La Laguna verde and Actopan. Leaves small. Legumes large. Stipe of legume hardly exerted from the calyx. Stipulas lanceolate, acuminate, nerved. Flowers yellow.

*Fascicular-flowered Æschynomene*. Shrub 2 to 3 feet.

† *Little known or doubtful species.*

31 *Æ. DIVISA* (Nees et Mart. in nov. act. bonn. 12. p. 31.) stem shrubby, smooth; petioles strigose; leaves with 12-15 pairs of linear acute leaflets; peduncles 2-3-flowered, shorter than the leaves; joints of legume semi-orbicular, hispid; vexillum of 2 petals.  $\frac{1}{2}$ . S. Native of Brazil. The vexillum is said to be obcordate, and constantly composed of 2 petals, which is a circumstance not to be found in any other papilionaceous flower, but perhaps the vexillum is only profoundly bipartite, or perhaps the flower is resupinate, and the 2-petalled keel has been taken for the vexillum.

*Divided Æschynomene*. Shrub 2 to 3 feet.

32 *Æ. HONESTA* (Nees et Mart. l. c. p. 32.) branches hispid at the apex; leaves with 10-11 pairs of linear, obtuse, glabrous leaflets; legumes disposed in something like a corymb, when young clothed with hispid pubescence, but glabrous in the adult state; vexillum broad, entire.  $\frac{1}{2}$ . S. Native of Brazil. Said to be nearly allied to *Æ. sensitiva*. Flowers yellow.

*Honest Æschynomene*. Shrub 2 to 4 feet.

33 *Æ. SCORPARIA* (H. B. et Kunth, nov. gen. amer. 6. p. 532) plant diffuse; branches elongated, twiggy, straight, angular, and are, as well as the calyxes, clothed with silky-silvery down; leaves with 10-14 pairs of oblong, mucronate, half-cordate leaflets, which are clothed with adpressed down on both surfaces; peduncles axillary, twin, few-flowered; legumes puberulous, usually 3-jointed.  $\frac{1}{2}$ . S. Native of Peru, near Guancabamba. Flowers yellow.

*Broom Æschynomene*. Shrub diffuse.

34 *Æ. MOLLICULA* (H. B. et Kunth, l. c.) suffruticose; branches elongated, clothed with yellowish-silky down; leaves with 18-20 pairs of oblong-linear, mucronate, semi-cordate leaflets, which are pubescent on both surfaces, as well as the rachis and calyx; peduncles axillary, short, few-flowered; legumes falcate, 1-6-jointed, pubescent.  $\frac{1}{2}$ . S. Native of South America, in the province of Jaen de Bracamoros. Flowers yellow.

*Soft Æschynomene*. Shrub 2 to 3 feet.

35 *Æ. PILOSA* (Poir. dict. 4. p. 450.) stem herbaceous, pilose, compressedly tetragonal at the apex; leaflets oval, retuse, mucronate, glabrous; racemes hairy, many-flowered; joints of legumes scabrous in the centre.  $\odot$ . S. Native of the East Indies. Nerves of leaves blackish.

*Pilose Æschynomene*. Pl. 1 to 2 feet.

36 *Æ. PUBESCENS* (Poir. dict. 4. p. 451.) stem herbaceous, glabrous; branches spreading; leaflets elliptic, retuse, mucronate, pubescent; racemes terminal, glabrous, many-flowered; calyx 5-cleft; joints of legume rather scabrous.  $\odot$ .? S. Native of the East Indies.

*Pubescent Æschynomene*. Pl. 1 to 2 feet.

37 *Æ. BREVIIFOLIA* (Poir. dict. 4. p. 451.) plant glabrous, and dwarf; stems filiform; leaves with 2 pairs of roundish, mucronate, glaucous leaflets; peduncles 1-2-flowered; calyx 5-toothed; legumes on long stipes; having 3-4 rather remote joints.—Native of Madagascar. Flowers small, yellow.

*Short-leaved Æschynomene*. Pl.  $\frac{1}{2}$  foot.

38 *Æ. HIRSUTA* (D. C. prod. 2. p. 322.) stem scabrous and

hairy; racemes 3-flowered; bracteas ciliate serrated; legumes hairy. ☉. S. Native of New Spain. Æ. *hirta*, Lag. nov. gen. et spec. 22. but not of Lam.

\* *Hirsute Æschynomene*. Pl. 1 foot.

39 Æ. *HIRTA* (Lam. ill. 629. f. 1. Poir. dict. 4. p. 450.) plant hispid in every part; stem herbaceous; branches terete; leaves with 7-9 pairs of oval-linear mucronulate leaflets; racemes terminal, many-flowered; calyx 5-parted, having the lobes nearly equal, and subulate at the apex; legumes hairy, with the joints tumid and tubercled in the centre. ☉. S. Native of the East Indies.

*Hairy Æschynomene*. Pl. 1 to 2 feet.

40 Æ. *ARBOREA* (Lin. spec. 1060.) stem arboreous, smooth; joints of legume semi-cordate, glabrous. ♀. S. Native of the East Indies. Flowers large, copper-coloured. Perhaps a species of *Desmodium*. Perhaps *D. Mauritium*.

*Arboreous Æschynomene*. Shrub 6 to 7 feet.

41 Æ. ? *HETEROPHYLLA* (Lour. coch. p. 446.) shrubby; branches tomentose; lower leaves ternate, with ovate leaflets, superior ones impari-pinnate, with roundish leaflets; peduncles many-flowered; calyx 4-toothed; stamens monadelphous; legumes pilose, with cordate joints. ♀. G. Native of the north of Cochin-china. Flowers small, white. This plant ought certainly to be removed from the present genus.

*Variable-leaved Æschynomene*. Shrub 7 to 8 feet.

42 Æ. ? *CREPITANS* (Jacq. fragm. 37. t. 42. f. 2.) stem arboreous; leaves glabrous, young ones decompound; legumes stipitate, glabrous, linear, the seeds intercepted by cellular substance; the sutures prominent, but retaining the joints. ♀. S. Native of Caraccas. Perhaps a species of *Mimosa*.

*Rattling Æschynomene*. Tree.

*Cult.* The species of this genus require more than an ordinary degree of heat to preserve them through the winter, so that they are seldom kept alive through the winter in this country, and consequently never grow to a flowering state. Rich loam suits them best, and cuttings may be rooted in sand under a hand-glass in heat; however, they are not worth growing except in botanical gardens.

CLI. SMITHIA (in honour of the late Sir James Edward Smith, M.D. F.R.S. and P.L.S. founder of the Linnæan society, and possessor of the Linnæan herbarium; author of English Botany, English Flora, Flora Britannica, and the botanical part of Rees' cyclopædia; died in 1829, in the 69th year of his age). Ait. hort. kew. ed. 1. vol. 3. p. 496. ed. 2. vol. 4. p. 336. Lam. ill. 627. Desv. journ. bot. 3. p. 121. t. 4. f. 12. D. C. prod. 2. p. 323.

LIN. SYST. *Diadelphia, Decándria*. Calyx bipartite. Corolla papilionaceous. Stamens divided into 2 equal bundles. Legume transversely articulated, plicate, inclosed in the calyx. This genus is nearly allied to *Æschynomene*, but is distinguished from it in the legume being inclosed with incumbent joints. The calyx, stamens, and habit are that of *Æschynomene*, but the pods are that of *Lourea*.

1 S. *SENSITIVA* (Ait. l. c. t. 13. Sal. par. lond. t. 92.) lips of calyx entire; racemes pedunculate, 3-5-flowered. ☉. S. Native of the East Indies. *Petagnana sensitiva*, Gmel. syst. p. 1119. *Coronilla Surattensis*, Garc. in herb. Burm. confused with *Galèga senticòsa*, Burm. fl. ind. 172. Leaves with many pairs of small leaflets. Plant trailing. Flowers yellow.

*Sensitive Smithia*. Fl. July, Sept. Clt. 1785. Pl. procumbent.

2 S. *CONFERTA* (Smith, in Rees' cycl. 33. no. 2.) lips of calyx toothed at the apex; racemes sessile, shorter than the leaves. ☉. ? S. Native of New Holland, within the tropic. *Smithia capitata*, Desv. l. c. Flowers yellow.

*Crowded-flowered Smithia*. Fl. July. Clt. 1820. Pl. proc.

3 S. *GEMINIFLORA* (Roth. nov. spec. 352.) lips of calyx entire; racemes pedunculate, 2-flowered. ☉. S. Native of the East Indies. Flowers probably purple. Calyxes or bracteas ending in a setose mucrone. On the pagina of the leaf the supine bristles or hairs are more copious than in *S. sensitiva*.

*Twin-flowered Smithia*. Fl. July. Clt. 1810. Pl. proc.

† *A doubtful species.*

4 S. *SPICATA* (Spreng. neue entd. 2. p. 160.) spikes of flowers on very short peduncles, secund, distich, very hairy; leaves impari-pinnate; stem shrubby; stamens monadelphous. ♀. S. Native of Senegambia. In every particular this plant differs from *Smithia*, but its legitimate genus is unknown.

*Spike-flowered Smithia*. Shrub.

*Cult.* See *Lourea* for culture and propagation.

CLII. LOUREA (the meaning of this name is unknown to us, but it is apparently the name of some person). Neck. elem. no. 1318. Desv. journ. bot. 3. p. 122. t. 5. f. 18. D. C. prod. 2. p. 323. but not of Jaum.

LIN. SYST. *Diadelphia, Decándria*. Calyx campanulate, permanent, 5-cleft (f. 43. a.), with equal spreading lobes, when in fruit inflated and conniving at the apex. Corolla papilionaceous, with an obcordate vexillum (f. 43. d.), and an obtuse keel (f. 43. b.). Stamens diadelphous (f. 43. c.). Legume with 4-6 flat 1-seeded joints (f. 43. i.), bent backward into plaits (f. 43. i.), which nestle within the calyx.—Erect Indian plants, with setaceous stipulas, simple or trifoliate leaves, and long terminal racemes of purple or white flowers.

1 L. *VESPERTILIONIS* (Desv. l. c.) lateral leaflets wanting or very small, terminal one large, transversely and falcately oblong, 10-times the breadth of the length. ☉. S. Native of Cochin-china. *Hedysarum vespertilionis*, Lin. fil. suppl. 331. Jacq. icon. rar. 3. t. 566. *Christia lunata*, Mœnch. suppl. 39. Corolla white, spreading. Leaves crescent-shaped, 4 lines long, and 2 inches broad, variegated with yellow, red, and green (f. 43.).

*But-wing-leaved Lourea*. Fl. July, Sept. Clt. 1780. Pl. 2 to 4 feet.

2 L. *OBCORDATA* (Desv. l. c.) leaves rather pubescent; lateral leaflets small, ovate-obcordate, rarely wanting, terminal one shorter than broad. ☉. S. Native of Java and Timor. *Hedysarum obcordatum*, Poir. dict. 6. p. 425.

*Obcordate-leafletted Lourea*. Pl. 2 to 4 feet.

3 L. *RENIFORMIS* (D. C. prod. 2. p. 324.) leaves simple, transversely-reniform, others trifoliate, with the lateral leaflets smaller and oval; racemes opposite the leaves, and longer than them. ☉. S. Native in the suburbs of Canton. *Hedysarum reniforme*, Lour. coch. p. 447. exclusive of the synonymes. *Hedys. Lourèirii*, Spreng. syst. append. p. 292. Flowers violaceous. Very like the first species.

*Reniform-leaved Lourea*. Fl. Jul. Aug. Clt. 1818. Pl. proc.

*Cult.* The species of *Lourea* have a rather singular appearance from their kidney-shaped painted leaves. Being annuals their seeds should be sown in pots, filled with a mixture of peat and sand, with a little loam, and placed in a hot-bed, and when the plants have grown 2 inches high, they should be planted into separate small pots, and afterwards shifted into larger ones as they grow.

FIG. 43.

CLIII. URARIA (a name not explained by its author). Desv. journ. bot. 3. p. 122. t. 5. f. 19.—Doodia, Roxb. hort. beng. p. 99. but not of R. Br.—Hedysarum species of Lin. and others.

LIN. SYST. *Diadelphia, Decandria*. Calyx profoundly 5-cleft, with setaceous segments. Corolla papilionaceous. Stamens diadelphous. Legume with a few ovate 1-seeded joints, bent back into plaits, nestling within the calyx.—Herbs, rarely shrubs, with impari-pinnate, ternate, or simple leaves, stipellate leaflets, lanceolate membranous acuminate stipulas, which are striated lengthwise, the upper ones answering the purpose of bracteas to the flowers, but soon falling off. Pedicels 1-flowered, rising in pairs from the axils of the bracteas, forming long, dense, simple, many-flowered racemes.

\* *Leaves impari-pinnate, with 2-4 pairs of leaflets.*

1 U. PICTA (Desv. l. c.) stem shrubby, erect, velvety; leaves with 2-4 pairs of long lanceolate leaflets, which are smoothish above, and blotched with white, but pubescent and reticulately-nerved beneath; racemes very long and spicate; bracteas ciliated; segments of the calyx setaceous, and very hairy.  $\frac{1}{2}$ . S. Native of Guinea, among grass all along the coast, and of the East Indies. Hedysarum pictum, Jacq. icon. rar. 3. t. 567. coll. 2. p. 262. Flowers purple.

*Painted-leaved Uraria*. Fl. July, Aug. Clt. 1788. Shrub 2 to 3 feet.

2 U. COMOSA (D. C. prod. 2. p. 324.) stem shrubby; branches and petioles villous; leaves with 3 pairs of linear-lanceolate glabrous leaflets; racemes elongated, cylindrical; bracteas villous; segments of the calyx setaceous, and very hairy.  $\frac{1}{2}$ . S. Native of the East Indies. Hedysarum comosum, Vahl. symb. 2. p. 84.

*Tufted Uraria*. Fl. July, Aug. Clt. 1818. Shrub 2 feet.

3 U. CRINITA (Desv. l. c.) stem shrubby, erect; leaves with 2-3 pairs of oblong leaflets; racemes elongated; pedicels hispid, recurved; the 3 largest segments of calyx pilose and reflexed; legumes smooth.  $\frac{1}{2}$ . S. Native of the East Indies. Hedysarum crinitum, Lin. mant. 102. Burm. ind. p. 169. t. 56.

*Hairy-calyxed Uraria*. Fl. July, Aug. Clt. 1780. Shrub 3 to 4 feet.

\* \* *Leaves trifoliate, the terminal leaflets stalked.*

4 U. LAGOPOIDES (D. C. prod. 2. p. 324.) stem shrubby, rather velvety; leaflets ovate, mucronate, almost naked; racemes oblong, about the length of the common petiole; segments of calyx setaceous, and very hairy.  $\frac{1}{2}$ . S. Native of the East Indies and China. Hedysarum lagopodioides, Lin. spec. 1057. Lespedeza lagopoides, Pers. ench. 2. p. 308.—Burm. ind. p. 163. t. 53. f. 2. Flowers purple.

*Hare's-foot-like Uraria*. Fl. June, July. Clt. 1790. Sh. 2 ft.

5 U. LAGOPUS (D. C. in ann. sc. nat. 4. p. 100.) stem shrubby, very hairy at the apex; leaflets ovate, obtuse, mucronate, clothed with soft velvety pubescence beneath; racemes cylindrical, twice the length of the petiole; segments of the calyx setaceous, and very hairy; bracteas hairy on the back.  $\frac{1}{2}$ . G. Native of Nipaul. Flowers purple.

*Hare's-foot Uraria*. Fl. June, July. Clt. 1824. Sh. 2 to 4 ft.

6 U. ARBOREUM; arboreous; leaflets oval, retuse, and are, as well as the branches, very hairy; stipulas cordate, stem-clasping, cuspidate; racemes elongated, bractless, densely clothed with stiff hairs; calycine segments lanceolate, feathery; legumes 3-seeded, plaited within the calyx.  $\frac{1}{2}$ . G. Native of Nipaul. Hedysarum arboreum, Hamilt. in D. Don, prod. fl. nep. 243. Erythrina arborescens, Roxb. hort. beng. p. 52.?

*Tree Uraria*. Tree 12 feet.

7 U. LAGOCÉPHALA (D. C. prod. 2. p. 324.) stem herbaceous; leaflets roundish, pilose beneath; panicle terminal, contracted,

bracteate; peduncles and calyxes very pilose; calycine segments long and linear; legumes deflexed, glabrous, 3-jointed.  $\frac{1}{2}$ . S. Native of Brazil. Hedysarum lagocéphalum, Link. enum. 2. p. 248. Flowers yellow.

*Hare's-headed Uraria*. Fl. July. Clt. 1824. Pl. 1 to 2 feet.

\* \* \* *Leaves simple.*

8 U. CERCIFOLIA (Desv. l. c. f. 19.) leaflet solitary at the top of the petiole, furnished with 2 stipels, roundish, and rather velvety beneath; racemes oblong, dense, terminal.  $\frac{1}{2}$ . S. Native of the East Indies. Hedysarum cercifolium, Steud. nom. 392.

*Judas-tree-leaved Uraria*. Shrub 2 to 3 feet.

9 U. CORDIFOLIA (Wall. pl. rar. asiat. p. 33. t. 37.) leaves simple, broadly ovate, cordate, villous on the under surface as well as the branches; racemes terminal, panicle, elongated, hairy; legume 2-3-jointed, villous, inclosed in the calyx; bracteas ovate, acuminate, clothed with silky pili.  $\frac{1}{2}$ . S. Native of the Burman Empire, near Prome and Meaong, on the banks of the Irawaddi. Flowers small, of a whitish-rose colour.

*Heart-leaved Uraria*. Shrub 2 to 3 feet.

*Cult.* A mixture of loam, peat, and sand will answer the species, and young cuttings will root in sand under a hand-glass in heat, but the species are more easily propagated by seeds.

CLIV. NICOLSONIA (in honour of M. Nicolson, author of Essai Sur L'Histoire Naturelle de Saint Domingue, 1 vol. 8vo. Paris, 1776). D. C. legum. mem. vii. prod. 2. p. 325.—Perrottetia, D. C. ann. sci. nat. jan. 1825. p. 95. but not of Kunth.

LIN. SYST. *Diadelphia, Decandria*. Calyx 5-parted, with lanceolate, subulate, bearded segments. Corolla papilionaceous, shorter than the calyx. Stamens diadelphous. Legume straight, exerted, constantly composed of numerous, compressed, semi-orbicular, 1-seeded joints, which open at the convex suture.—American herbs, with pinnately trifoliate leaves, the leaflets oval or oblong, and stipellate. Stipulas distinct from the petioles, rather scarious. Bracteas like the stipulas, but broader. Pedicels twin in the axils of the bracteas. Racemes terminal, crowded, almost constituting a panicle. Flowers small, bluish-purple. This genus differs from *Uraria* in the legume being straight and exerted, and from *Desmodium* in the calyx being 5-parted and bearded.

1 N. BARBATA (D. C. l. c.) leaflets elliptic-oblong; calyx closed after flowering; legumes glabrous.  $\frac{1}{2}$ ?  $\frac{1}{2}$ ? S. Native of Jamaica and St. Domingo, in arid sandy places. Hedysarum barbatum, Lin. spec. 1055. Swartz, obs. 287. Flowers bluish-purple.

*Bearded-calyxed Nicolsonia*. Fl. June, July. Clt. 1818. Pl. procumbent.

2 N. CAYENNE'NSIS (D. C. leg. t. 51.) leaflets elliptic-obovate; calyx spreading after flowering; legumes smoothish.  $\frac{1}{2}$ . S. Native of Cayenne. Flowers bluish-purple. Racemes looser, and the pedicels are longer than the first species, but very similar.

*Var.  $\beta$ , laxiuscula* (D. C. prod. 2. p. 325.) leaflets elliptic-obovate, and a little more villous beneath than the species; legumes rather scarious; stamens monadelphous.  $\frac{1}{2}$ . S. Native of Cayenne. Perhaps a proper species.

*Cayenne Nicolsonia*. Pl. procumbent.

3 N. VENUSTULA (D. C. prod. 2. p. 325.) stems suffruticose, erect, and are, as well as the petioles, clothed with adpressed pubescence; leaflets oblong-elliptic, clothed with silky, glaucous pubescence beneath; racemes terminal, short, sessile; calyx pilosely bearded; legumes with 1-3 semi-orbicular hairy joints.  $\frac{1}{2}$ . S. Native of Cumaua, on the declivity of mount Turimiquire. Hedysarum venustum, H. B. et Kunth, l. c.

*Pretty Nicolsonia*. Shrub 2 feet.

4 *N. VILLOSA* (Schlecht. et Cham. in Linnæa. 5. p. 584.) plant herbaceous; stems erect, clothed with rusty spreading hairs; leaflets elliptic, silky and glaucous beneath, but almost glabrous above; legumes puberulous, 3-jointed. 2. G. Native of Mexico. Axillary branches bearing the flowers at the apex, hardly longer than the leaves. Flowers disposed in dense racemes.

*Villous Nicolsonia.* Pl. 3 feet.

*Cult.* For culture and propagation see *Uraria*, p. 287.

**CLV. DESMODIUM** (from *δεσμος*, *desmos*, a band; in reference to the stamens being connected). D. C. legum. mem. vi. prod. 2. p. 325.—Desmodium and Hedysarum, Desv. journ. bot. 3. p. 122. t. 5. f. 15 and 22. H. B. et Kunth, nov. gen. amer. 6. p. 516 and 527.—Hedysarum species of Lin. and others.

**LIN. SYST.** *Diadelphina*, *Decandria*. Calyx bibracteolate at the base, obscurely bilabiate to the middle, upper lip bifid, lower one 3-parted (f. 44. a.). Corolla papilionaceous, with a roundish vexillum (f. 44. b.) and an obtuse keel (f. 44. c.), which is shorter than the wings. Stamens diadelphous (f. 44. d.), with the filaments almost permanent (f. 44. f.). Legume of many 1-seeded, compressed, membranous or coriaceous, hardly deliscent joints (f. 44. g.), which separate at maturity.—Herbs or small shrubs, for the most part natives within the tropics, with pinnately-trifoliate leaves, sometimes the lateral leaflets absent altogether, or very small, then the leaves in such cases are called simple. Stipels 2 at the base of the terminal leaflet, and one at the base of each lateral leaflet. Racemes of flowers terminal, usually loose. Pedicels filiform, 1-flowered, rising singly, but usually by threes from the axils of the bracteas. Flowers purple, blue, or white, smaller than those of *Hedysarum*. The plants belonging to this genus are not well defined.

**SECT. I. EUDESMODIUM** (from *eu*, good or well, and *Desmodium*; this section contains the genuine species of the genus). D. C. legum. vi. prod. 2. p. 325. Joints of legume coriaceous, indeliscent, rather elliptic and somewhat truncate at both extremities. Leaves pinnately-trifoliate. Peduncles axillary, shorter than the petioles. Flowers disposed in corymbose umbels.

1 *D. UMBELLATUM* (D. C. prod. 2. p. 325.) stem shrubby, branched, terete, smooth; branches pubescent; leaflets ovate, obtuse, glabrous above, but canescent beneath from short down; peduncles axillary, shorter than the petioles, bearing umbels of flowers at their apexes; legumes clothed with adpressed villi. 2. S. Native of Malacca, Ceylon, Java, and Madagascar. Hedysarum umbellatum, Lin. spec. 1053. Burm. ind. 166. Jacq. hort. schœnbr. 297.—Rumph. amb. 4. t. 52. Flowers white.

*Var. β. hirsutum* (D. C. prod. 2. p. 326.) branches and petioles hairy; leaflets ovate, rather glabrous above, but hairy beneath; racemes shorter than the petioles, umbelliferous; legumes hairy. 2. S. Native of the East Indies.

*Umbellate-flowered Desmodium.* Clt. 1801. Sh. 3 to 6 feet.

2 *D. AUSTRALIS* (D. C. prod. 2. p. 326.) stem shrubby, branched, terete, glabrous; branchlets pubescent; leaflets elliptic, acute, glabrous above, but canescent beneath from short down; peduncles axillary, shorter than the leaves, somewhat umbelliferous; legumes smooth. 2. S. Native of New Caledonia, and the island of Tanna. Hedysarum umbellatum, Forst. prod. no. 274. but not of Lin. Hedysarum australe, Willd. spec. 3. p. 1183. Very like the preceding species.

*Southern Desmodium.* Shrub 2 to 4 feet.

3 *D. LUTESCENS* (Desv. l. c.) stem terete, pubescent; leaflets obovate-roundish, pubescent; racemes terminal, and are as well as the legumes clothed with velvety villi. 2. G. Native of China. Hed. lutescens, Poir. dict. 6. p. 417. Zornia lutescens, Steud. nom. 900. Flowers yellowish.

*Yellowish Desmodium.* Shrub 2 to 3 feet.

**SECT. II. PLEUROLØBIUM** (from *πλευρον*, *pleuron*, a side, and *λοβος*, *lobos*, a lobe; in reference to the joints of the legumes being rather convex on one side). D. C. legum. vi. prod. 2. p. 326. Joints of legume membranous, nearly square, the lower side rather convex, and at length deliscent. Leaves furnished with one leaflet, or pinnately-trifoliate, the lateral leaflets very small. Perhaps a proper genus.

\* *Pteropoda* (from *πτερον*, *pteron*, a wing, and *πους ποδος*, *pous podos*, a foot; in reference to the footstalks of the leaves being winged). D. C. prod. 2. p. 326. Leaves having only one leaflet. Petioles winged; wing drawn out into a tooth on both sides at the apex.

4 *D. AURICULATUM* (D. C. legum. mem. vi.) stems erect, glabrous, triquetrous; leaves ovate, acute, glabrous, 4 times longer than the winged petioles; legumes quite glabrous, and rather coriaceous. 2. G. Native of the island of Timor. Pteroloma auriculatum, Desv. in herb. mus. par. Joints of legume 4 or 5, easily separating at maturity.

*Auricled-leaved Desmodium.* Fl. July, Aug. Clt. 1819. Shrub 3 to 6 feet.

5 *D. TRIQUETRUM* (D. C. prod. 2. p. 326.) stems erect, smoothish, triquetrous; leaves ovate-lanceolate, rather cordate, acuminate, 3 times longer than the winged petiole; legumes nearly sessile, hairy. 2. S. Native of the East Indies. Hedysarum triquetrum, Lin. spec. 1052. Burm. ind. t. 52. f. 2. zeyl. t. 81. Flowers purple.

*Triquetrous-stemmed Desmodium.* Fl. July, Aug. Clt. 1802. Shrub 3 to 6 feet.

6 *D. PSEUDOTRIQUETRUM* (D. C. in ann. sc. nat. 1. p. 100. legum. mem. vi.) stems ascending, rather hairy, triquetrous; leaflets ovate-lanceolate, rather cordate, acuminate, twice the length of the winged petioles; legumes glabrous, but ciliated on both sutures with adpressed villi. 2. G. Native of Nipaul. Flowers purple.

*Palse-triquetrous-stemmed Desmodium.* Fl. July, Aug. Clt. 1820. Shrub 3 to 6 feet.

7 *D. ALATUM* (D. C. legum. mem. vi.) stems erect, somewhat tetragonal, glabrous; leaflets lanceolate, acuminate, 8 times longer than the petioles; legumes glabrous, membranous. 2. S. Native of the East Indies, at Cawnpore. Hedysarum alatum, Roxb. hort. beng. 56. Joints of legume 5-6, sometimes irregularly triangular. Flowers purple.

*Winged-petioled Desmodium.* Fl. July, Aug. Clt. 1817. Shrub 3 to 6 feet.

\*\* *Gyrantia* (from *gyro*, to whirl). D. C. prod. 2. p. 326. Leaves pinnately-trifoliate; petiole wingless.

8 *D. GYRANS* (D. C. prod. 2. p. 326.) plant glaucous; leaflets 3, elliptic-oblong, terminal one very large, but the lateral ones are very small; racemes numerous, disposed in a panicle; legumes pubescent. 2. S. Native of Bengal. Hedysarum gyrans, Lin. fil. suppl. 332. Jacq. icon. rar. 3. t. 562. Flowers violaceous. The singular motion with which the lateral leaflets of this plant are endued is thus described in Linnæus's supplement. "This is a wonderful plant on account of its singular motion, which is not occasioned by any touch, or irritation, or movement in the air, as in *Mimosa Opuntia*

FIG. 44.

and *Dionæa*; nor is it so evanescent as in *Amórpha*. No sooner had the plants raised from seed acquired their ternate leaves than they began to be in motion in every direction; this movement did not cease during the whole course of their vegetation, nor were they observant of any time, order, or direction; one leaflet frequently revolved, whilst the other on the same petiole was quiescent; sometimes a few leaflets only were in motion, then almost all of them would be in movement at once; the whole plant was very seldom agitated, and that only during the first year. It continued to move in the stove during the second year of its growth, and was not at rest even in winter." In our climate the lateral leaflets move up and down, either steadily or by jerks, particularly if the house in which it is growing be shut up very warm. This motion is most evident when the sun's rays are on the plant, it therefore appears to us that it is the action of the sun's rays upon it which occasions the motion of the leaflets. For further particulars see Brouss. mem. acad. scienc. paris, 1784. p. 616. Silvestr. bull. philom. 1. p. 67. t. 5. (f. 44.)

*Var. β*; lateral leaflets almost wanting. ♂. S. Native of Nipaul. Wallich. Hedys. gyraus, Roxb. hort. beng. p. 57.

*Moving Plant or Whirling Desmodium.* Fl. July, Aug. Clt. 1775. Pl. 1 to 3 feet.

9 *D. GYROIDES* (D. C. legum. vi. prod. 2. p. 326.) leaflets 3, elliptic, the terminal one large, and the lateral ones small; racemes numerous, disposed in a panicle; legumes hairy. ♀. S. Native of the East Indies, in Silhet. Hedysarum gyroides, Roxb. hort. beng. 57. The legume is very like that of *D. triquetrum*, but hairy. The plant is hoary in every part.

*Gyran-like Desmodium.* Clt. 1817. Pl. 3 to 5 feet.

10 *D. TIMORIENSE* (D. C. leg. mem. vi. prod. 2. p. 327.) leaflets 3, rhomboid, canescent from villi beneath, and with a few scattered hairs above; lateral ones one-half smaller than the terminal one; racemes numerous, disposed in a panicle; legumes short, pubescent. ♂. S. Native of the island of Timor.

*Timor Desmodium.* Pl. 2 to 4 feet.

SECT. III. CHALA'RIUM (probably from χαλαω, *chalaō*, to loose; from containing a loose heterogeneous mass of plants). D. C. prod. 2. p. 327. Joints of legume membranous, indehiscent, oval or orbicular, rarely oblong, convex on both sides, or with the superior side straightish, tapering to both ends.—Leaves simple or pinnately-trifoliate. Racemes loose, elongated, with 3 pedicels rising from each bractea.

§ 1. *Leaves simple, that is, only having one leaflet.*

11 *D. GANGETICUM* (D. C. prod. 2. p. 327.) stem erect; leaflets ovate, acute, clothed with adpressed silky pubescence beneath; stipulas 4 times shorter than the petiole; legumes puberulous, having 5-6 semi-orbicular joints. ♀. S. Native of the East Indies. Burm. zeyl. t. 49. Hedys. Gangéticum, Lin. spec. 1052. *Æschynomene Gangética*, Poir. Hedys. ochroleucum, Mæench. Flowers dirty purple?

*Var. β, Neaia* (D. C. prod. 2. p. 327.) leaflets ovate-lanceolate, acuminate, silky beneath; stipulas exceeding half the length of the petioles. ♀. S. Native of the Philippine islands. Perhaps a distinct species.

*Ganges Desmodium.* Fl. July, Aug. Clt. 1762. Pl. 2 to 3 ft.

12 *D. MACULATUM* (D. C. prod. 2. p. 327.) stem erect, herbaceous; leaves ovate, obtuse or rather acute, spotted with white above, and clothed with adpressed pubescence beneath; legumes rather puberulous, having 5-6 semi-orbicular joints. ♂. S. Native of the East Indies. Hedys. maculatum, Lin. spec. 1051. *Æschynomene maculata*, Poir.—Dill. hort. elth. 1. t. 141. f. 168. Flowers pale violet, or red and yellow. (Mill.)

*Spotted-leaved Desmodium.* Fl. July, Aug. Clt. 1732. Pl. 1 foot.

13 *D. RENIFORME* (D. C. prod. 2. p. 327.) stem erect; leaves

roundish-reniform, very blunt; joints of legume semi-orbicular. ♂. S. Native of the East Indies. Hedys. reniforme, Lin. spec. 1051. Burm. ind. t. 52. f. 1. Lower flowers solitary in the axils of the leaves. Flowers purple. Habit of *Elciotis monophylla*, but the legume is very distinct.

*Reniform-leaved Desmodium.* Fl. Jul. Aug. Clt. 1820. Pl. 1 ft.

14 *D. RUBRUM* (D. C. prod. 2. p. 327.) stem suffrutescent; branches nearly erect; leaves ovate, ciliated; racemes terminal, spicate; legumes arched, scabrous. ♀. G. Native of Cochinchina. Ornithopus ruber, Lour. coch. p. 452. Branches red. Flowers pale.

*Red-branched Desmodium.* Shrub 2 feet.

15 *D. TERMINALE* (D. C. prod. 2. p. 327.) stem tall, shrubby at the base; leaves large, rather tomentose; panicle loose; outer joint of legume sterile and dilated. ♀. S. Native of Guiana. Hedys. terminale, Rich. act. soc. hist. nat. par. p. 105. Flowers purple.

*Terminal Desmodium.* Shrub 2 feet.

16 *D. PERROTETII* (D. C. legum. mem. vi. prod. 2. p. 327.) stem terete, erect, scabrous from short curved hairs; leaves ovate, rather acute, puberulous beneath, but villous when young, nearly glabrous above; panicle terminal; joints of legume ovate, equal, velvety. ♀. S. Native of Guiana. The leaves appear to be spotted with white in the dried specimens.

*Perrotet's Desmodium.* Shrub 1 to 2 feet.

17 *D. ORMOCARPOIDES* (D. C. prod. 2. p. 327.) stem suffrutescent, erect, glabrous; leaves ovate, acuminate, glabrous; racemes nodding; legumes hairy from short down, with elliptic, elongated, compressed joints. ♀. S. Native of Java. Hedys. ormocarpoides, Desv. in herb. Desf. Hedys. adhaerens, Poir. suppl. 5. p. 15. but not of Vahl. Perhaps this plant is referrible to the first section.

*Ormocarpum-like Desmodium.* Shrub 2 to 3 feet.

18 *D. SAGITTATUM* (D. C. prod. 2. p. 327.) leaves oblong or linear-lanceolate, cordately-sagittate, on very short petioles; flowers solitary, axillary, on long pedicels.—Native of the East Indies. Hedys. sagittatum, Poir. dict. 6. p. 403. The legume is unknown. Flowers red. Stem triquetrous, glabrous.

*Sagittate-leaved Desmodium.* Fl. July, Aug. Clt. 1807. Pl. 1 to 2 feet.

19 *D. LINEARIFOLIUM* (D. C. legum. mem. vi. prod. 2. p. 327.) stem herbaceous, terete, glabrous at the base; leaves linear, mucronate, glabrous, on short petioles; racemes terminal, puberulous; legumes puberulous, with 4-6 compressed, roundish-elliptic joints.—Native country unknown.

*Linear-leaved Desmodium.* Pl. 1 to 2 feet.

20 *D. DENUDATUM* (D. C. legum. mem. vi. prod. 2. p. 328.) stems terete, suffruticose, glabrous; branches twiggy, puberulous, bearing leaves only at the base; leaves oblong-lanceolate, acutish; stipulas and stipels setaceous; racemes elongated, naked; pedicels usually twin. ♀. S. Native of St. Domingo, in dry pastures. Flowers purple.

*Naked-branched Desmodium.* Shrub 1 to 2 feet.

21 *D. ANGUSTIFOLIUM* (D. C. prod. 2. p. 328.) shrubby; branches twiggy; leaves linear-lanceolate, mucronate, puberulous beneath, and with the margins scabrous; racemes solitary; bractea ciliated, with stiff hairs; joints of legume 1-6, roundish, hairy, with rather hispid margins. ♀. S. Native of Mexico. Hedysarum angustifolium, H. B. et Kunth, nov. gen. amer. 6. p. 517. Flowers minute, purple.

*Narrow-leafletted Desmodium.* Fl. June, Aug. Clt. 1824. Shrub 2 feet.

22 *D. VELUTINUM* (D. C. prod. 2. p. 328.) stem shrubby, terete, pubescent; leaves ovate, clothed with velvety tomentum on both surfaces, mucronate; racemes terminal and axillary; calyx 5-parted, villous; legumes clothed with villous tomentum, having oblong compressed joints. ♀. S. Native of South Ame-

rica. Hedys. velutinum, Willd. spec. 3. p. 1174. Flowers small, violet. Perhaps a species of *Uraria*.

*Velvety* *Desmodium*. Shrub 2 to 3 feet.

23 *D. LATIFOLIUM* (D. C. prod. 2. p. 328.) stems shrubby, terete, when young clothed with rufous velvety down, but at length becoming smooth; leaves broad, ovate, rather cordate, mucronulate, and repand, clothed with velvety villi on both surfaces; stipulas cordate at the base, cuspidate; racemes terminal and axillary; legume hairy, with 3-5 semi-orbicular joints.  $\frac{1}{2}$ . S. Native of the East Indies and China. Hedys. latifolium, Roxb. hort. beng. p. 57. Ker. bot. reg. 356. Horn. hort. hafn. suppl. 152. Roth. nov. spec. 355. Pluk. alm. 432. f. 3. ? Flowers purple.

*Broad-leaftletted* *Desmodium*. Fl. Aug. Clt. 1818. Sh. 3 ft.

24 *D. LASIOCARPUM* (D. C. prod. 2. p. 328.) villous in every part; stem shrubby, terete, when young clothed with rufous velvety down, but glabrous in the adult state; leaves broad, ovate-lanceolate, mucronulate, rather repand, clothed with velvety villi on both surfaces; stipulas subulate, hairy; racemes long, spike-formed, terminal, and axillary, forming a panicle; legumes hispid, with 3-4 semi-orbicular joints.  $\frac{1}{2}$ . S. Native of Africa, in the kingdoms of Warea and Benin, and plentiful in the island of St. Thomas in the gulf of Guinea. Hedys. lasiocarpum, Beauv. fl. d'ow. 1. p. 32. t. 18. Poir. suppl. 5. p. 15. Hedys. deltoideum, Poir. suppl. 5. p. 15. Flowers small, red.

*Woolly-fruited* *Desmodium*. Fl. June, Aug. Clt. 1823. Shrub 3 to 6 feet.

25 *D. ELATUM* (H. B. et Kunth, nov. gen. amer. 6. p. 527.) stem erect, shrubby, and is, as well as the petioles, clothed with stiff hairs; leaves ovate, obtuse, pilose on both surfaces, very soft beneath, and glaucescent; racemes paniced; legumes hairy.  $\frac{1}{2}$ . S. Native of New Andalusia, near Caripe. Flowers purple. Allied to *D. aspera*.

*Tall* *Desmodium*. Shrub 3 to 6 feet.

§ 2. *Trifoliata* (the plants contained in this division have trifoliate leaves). Leaves pinnately trifoliate, the terminal leaflet the largest.—This section contains a great number of species which are very nearly allied to each other, but which are very difficult to extricate, or to place into any kind of order, and therefore they are here arranged geographically.

\* *Boreali-Americana* (the species contained in this division are all natives of North America). Hedysari species foliis ternatis, Michx. fl. bor. amer. 2. p. 72. Pursh. fl. amer. sept. 2. p. 482. Nutt. gen. amer. 2. p. 108.

26 *D. CANADENSE* (D. C. prod. 2. p. 328.) stem erect, rather pilose and striated; leaflets oblong-lanceolate, smoothish; stipulas filiform; racemes terminal; joints of legume 4-5, oval, bluntly triangular, hispid from short hairs.  $\frac{1}{2}$ . H. Native of North America, in sandy fields and woods; plentiful throughout Canada. Hedys. Canadense, Lin. spec. 1054. Hedys. scabrum, Moench.—Corn. can. 45. with a figure.—Moris. oxon. sect. 2. t. 11. f. 9. Flowers reddish purple, in simple or paniced, lateral or terminal racemes. Bracteas lanceolate.

*Canadian* *Desmodium*. Fl. Jul. Aug. Clt. 1640. Pl. 4 to 6 ft.

27 *D. CANESCENS* (D. C. prod. 2. p. 328.) stem erect, angular, ciliated, hispid; leaflets ovate-roundish, canescent from adpressed hairs beneath; stipulas ovate; racemes paniced; bracteas cordate; joints of legume ovate-triangular, hispid.  $\frac{1}{2}$ . H. Native of Virginia and Carolina. Hedys. canescens, Lin. spec. 1054. but not of Mill. Hedys. scaberrimum, Ell. sketch. 2. p. 217. ?—Pluk. alm. t. 308. f. 5. Flowers pale purple, middle-sized.

*Var.  $\beta$ , paleaceum* (D. C. l. c.) racemes almost simple.  $\frac{1}{2}$ . H. Native of Virginia. Hedys. paleaceum, Poir. dict. 6. p. 418.

*Canescent* *Desmodium*. Fl. July, Aug. Clt. 1733. Pl. 3 to 4 ft.

28 *D. MARYLANDICUM* (D. C. prod. 2. p. 328.) stem erect, pilose, branched; leaflets oblong, villous beneath; stipulas subulate; racemes paniced; joints of legume 3, rhomboid, reticulated, and rather pilose.  $\frac{1}{2}$ . H. Native of North America, from New York to Carolina. We have seen this plant growing in great plenty in dry sandy woods near New York and in Long Island. Hedys. Marylandicum, Lin. spec. 1055.—Dill. hort. elth. t. 174. f. 171. Flowers pale purple, fading to blue, the vexillum having a green spot at the base.

*Maryland* *Desmodium*. Fl. July, Oct. Clt. 1725. Pl. 2 feet.

29 *D. OBTUSUM* (D. C. prod. 2. p. 329.) stem erect, pubescent; leaflets ovate, obtuse, somewhat cordate at the base; stipulas lanceolate-subulate; panicle terminal; joints of legume semi-orbicular, reticulated, and hispid.  $\frac{1}{2}$ . H. Native from Pennsylvania to Virginia, in woods and fields, and in dried up marshes. Hedys. obtusum, Muhl. in Willd. Hedys. coriaceum, Poir. dict. 6. p. 418. ? Flowers violaceous.

*Obtuse-leaftletted* *Desmodium*. Fl. July, Aug. Clt. 1805. Pl. 2 feet.

30 *D. CILIARE* (D. C. prod. 2. p. 329.) stem erect, rather pilose, slender; leaves approximate, on very short petioles; leaflets small, oval, obtuse; stipulas subulate; racemes axillary, and terminal, paniced; joints of legume oval, hispid.  $\frac{1}{2}$ . H. Native about New York and Philadelphia. Hedys. ciliare, Nutt. gen. amer. 2. p. 109. Flowers small, violaceous.

*Ciliated* *Desmodium*. Fl. July, Aug. Clt. 1823. Pl. 1 to 2 ft.

31 *D. VIRIDIFLORUM* (D. C. prod. 2. p. 329.) stem erect, branched, pubescent; leaflets ovate-oblong, scabrous beneath; stipulas lanceolate, cuspidate; racemes paniced, bracteate; joints of legume oval, rough.  $\frac{1}{2}$ . H. Native from New Jersey to Carolina, and of Upper Louisiana, in woods and in waste fields. Hedys. viridiflorum, Lin. spec. 1055. but not of Burm.—Pluk. alm. t. 308. f. 5. Flowers reddish purple, but at length becoming greenish.

*Greenish-flowered* *Desmodium*. Fl. July, Sept. Clt. 1787. Pl. 3 feet.

32 *D. LÆVIGATUM* (D. C. prod. 2. p. 329.) stem simple, erect, glabrous, and rather glaucous; leaves quite glabrous, on long petioles; leaflets ovate, acute; stipulas subulate; panicle terminal; flowers twin, on long pedicels; bracteas ovate, acute, shorter than the flower-buds; lower segment of calyx elongated.  $\frac{1}{2}$ . H. Native of the State of New York, in woods. Hedys. lævigatum, Nutt. gen. amer. 2. p. 109. Flowers purple. Legume unknown. Allied to the following species.

*Smooth* *Desmodium*. Pl. 2 to 3 feet.

33 *D. BRACTEOSUM* (D. C. prod. 2. p. 329.) stem erect, glabrous; leaflets oblong-oval, acuminate, glabrous; stipulas subulate; racemes terminal, few-flowered; bracteas ovate, acuminate, striated, glabrous; joints of legume nearly oval.  $\frac{1}{2}$ . H. Native of Pennsylvania and the western parts of Virginia. Hedys. bracteosum, Michx. fl. bor. amer. 2. p. 73. Pursh, fl. amer. sept. 2. p. 482. Flowers largish, purple.

*Var.  $\beta$ , cuspidatum* (D. C. l. c.) leaves with scabrous margins; stipulas ovate-lanceolate; joints of legume ovate, reticulated, glabrous, but with pubescent margins.  $\frac{1}{2}$ . H. Native of shady woods. Hedys. cuspidatum, Willd. spec. 3. p. 1198. Pursh, l. c. Said by Nuttall to be hardly a variety of *D. bracteosum*.

*Large-bracted* *Desmodium*. Fl. July, Aug. Clt. 1806. Pl. 1 to 2 feet.

34 *D. GLABELLUM* (D. C. prod. 2. p. 329.) stem erect, glabrous; leaflets ovate, obtuse, rather glaucous beneath; stipulas small, subulate; panicle terminal; joints of legume triangularly-rhomboid.  $\frac{1}{2}$ . H. Native from Virginia to Carolina, in woods and fields. Hedys. glabellum, Michx. fl. bor. amer. 2. p. 73. Flowers small, purple. Perhaps the same as *D. paniculatum*.

according to Ell. sketch. 2. p. 211. but the leaflets are said to be not half the size, and blunter.

*Glabrous* *Desmodium*. Fl. July, Sept. Pl. 1 to 2 feet.

35 *D. PANICULATUM* (D. C. prod. 2. p. 329.) stem erect, glabrous; leaflets oblong-lanceolate or elliptic, glabrous; stipulas subulate; panicle terminal; joints of legume 4, rhomboid, pubescent.  $\mathcal{U}$ . H. Native from New York to Carolina, in dry woods. Hedys. paniculatum, Lin. spec. 1056.—Pluk. alm. t. 432. f. 6. Flowers small, pale purple.

*Panicle-flowered* *Desmodium*. Fl. July. Clt. 1781. Pl. 2 ft.

36 *D. STRICTUM* (D. C. prod. 2. p. 329.) stem straight, erect, glabrous, simple; leaflets linear-elliptic, glabrous, reticulately veined, glaucous beneath; stipulas subulate; panicle terminal, pedunculate, few-flowered; joints of incurved legume somewhat lunately triangular, hispid.  $\mathcal{U}$ . H. Native of woods, in New Jersey. Hedys. hirtum, Pursh, fl. amer. sept. 2. p. 483. Nutt. gen. amer. 2. p. 109. Flowers purple.

*Straight* *Desmodium*. Pl. 1 to 2 feet.

37 *D. ACUMINATUM* (D. C. prod. 2. p. 329.) stem erect, simple, pubescent, leafy at the apex; leaves on long footstalks; leaflets ample, ovate, long-acuminate, rather pilose on both surfaces, the terminal one roundish-ovate; panicle terminal, on a long peduncle; pedicels rather pilose; joints of stipitate legume 3, bluntly triangular, pubescent.  $\mathcal{U}$ . H. Native from New England to Carolina, and Upper Canada at Lake Huron. Hedys. acuminatum, Michx. fl. bor. amer. 2. p. 72. Pursh, l. c. Hedys. glutinosum, Willd. spec. 3. p. 198. Pursh, l. c. ex Nutt. l. c. Flowers purple.

*Acuminate-leafletted* *Desmodium*. Fl. July, Aug. Clt. 1805. Pl. 1 to 2 feet.

38 *D. NUDIFLORUM* (D. C. prod. 2. p. 330.) stem erect, simple, smoothish; leaflets broad-oval, acuminate; scape panicle, glabrous, radical, higher than the leaf-bearing stems; joints of legume roundish-triangular, smoothish.  $\mathcal{U}$ . H. Native from New England to Carolina, and in Canada about Quebec, in woods and in waste fields. Hedys. nudiflorum, Lin. spec. 1056. Ell. sketch. 2. p. 209. Flowers purple.

*Naked-flowered* *Desmodium*. Fl. Jul. Aug. Clt. 1823. Pl. 1 ft.

39 *D. PAUCIFLORUM* (D. C. prod. 2. p. 330.) stem decumbent, very humble and filiform; leaves on very long petioles; leaflets broad-ovate, acuminate, ciliated with pubescence; stipulas obsolete; racemes terminal, pedunculate, few-flowered, hardly exceeding the leaves.  $\mathcal{U}$ . H. Native of the woods of Ohio, Kentucky, and Tennessee. Hedys. pauciflorum, Nutt. gen. amer. 2. p. 109. Flowers small, white.

*Few-flowered* *Desmodium*. Fl. July, Aug. Clt. 1818. Pl. decumbent.

40 *D. RIGIDUM* (D. C. prod. 2. p. 330.) stem erect, much branched, tomentose; leaflets oblong-ovate, obtuse, reticulated, pubescent; panicle branched; bracteas ovate-lanceolate, acuminate.  $\mathcal{U}$ .? H. Native of Carolina. Hedys. rigidum, Ell. sketch. 2. p. 215. Flowers purple.

*Stiff* *Desmodium*. Pl. 1 to 2 feet.

41 *D. RHOMBIFOLIUM* (D. C. prod. 2. p. 330.) plant pubescent; leaflets rhomboid, obtuse, thickish, reticulately wrinkled; panicle compound; bracteas small; joints of legume 1-3, almost orbicular, veiny and pubescent.  $\mathcal{U}$ .? F. Native of Carolina, near Beaufort. Hedys. rhombifolium, Ell. sketch. 2. p. 215. Flowers purple.

*Rhomb-leafletted* *Desmodium*. Pl.

42 *D. LINEATUM* (D. C. prod. 2. p. 330.) stem creeping, green, and lined; leaves almost sessile; leaflets nearly orbicular, smoothish; racemes elongated, few-flowered; joints of legume lenticular.  $\mathcal{U}$ . H. Native of Carolina. Hedys. lineatum, Michx. fl. bor. amer. 2. p. 72. but not of Lin. Flowers purple.

*Lineated-stemmed* *Desmodium*. Pl. creeping.

43 *D. ROTUNDIFOLIUM* (D. C. prod. 2. p. 330.) stem prostrate, hairy; leaflets orbicular, pilose on both surfaces; stipulas roundish-cordate, reflexed; racemes axillary, and forming a terminal few-flowered panicle; bracteas cordate; joints of legume rather rhomboid, reticulated, and scabrous.  $\mathcal{U}$ . H. Native from Pennsylvania to Carolina, in dry rocky places. Hedys. rotundifolium, Michx. l. c. Pursh, l. c. but not of Vahl. Hedys. canescens, Willd. ex Ell. Flowers purple.

*Round-leafletted* *Desmodium*. Fl. July, Aug. Clt. 1733. Pl. prostrate.

† *North American species not sufficiently known.*

44 *D. PEDUNCULATUM* (D. C. prod. 2. p. 338.) stem herbaceous, erect; leaflets ovate at the base, and acuminate at the apex, smooth, middle one longer than the petiole; racemes axillary, erect, very long.  $\mathcal{U}$ . F. Native of South Carolina. Hedys. pedunculatum, Mill. dict. no. 17. Flowers pale yellow.

*Peduncled* *Desmodium*. Pl. 1 foot.

45 *D. GRANDIFLORUM* (D. C. prod. 2. p. 338.) leaflets oval, veiny, smooth on both surfaces; racemes axillary, erect; flowers large; legumes pendulous, many-jointed.—Native of Carolina. Hedys. grandiflorum, Walt. car. 185. but not of Pall.

*Great-flowered* *Desmodium*. Pl. 2 feet.

46 *D. REPENS* (D. C. prod. 2. p. 338.) stems procumbent; leaflets obcordate; racemes lateral.  $\mathcal{U}$ . H. Native of Virginia. Hedys. repens, Lin. spec. 1056.—Dill. hort. elth. 172. t. 142. f. 9. ex Lin. but Dillenius's plant is a native of the East Indies.

*Creeping* *Desmodium*. Pl. creeping.

\* \* *Mexican species.*

47 *D. ALAMANI* (D. C. prod. 2. p. 330.) stem erect, angular, smoothish, branched; leaflets ovate, acute, hardly pubescent; stipulas lanceolate, acuminate, spreadingly reflexed; racemes terminal; pedicels twin; bracteas lanceolate, acuminate, deciduous; lower segment of the calyx elongated.  $\mathcal{U}$ . G. Native of Mexico. Hedys. geminiflorum, and perhaps Hedys. mucronatum, Moc. et Sesse, fl. mex. icon. ined. Hedys. Alamani, Spreng. syst. append. p. 291. Flowers purple. Young legume 4-5-jointed, rather hoary.

*Alaman's* *Desmodium*. Pl. 1 to 3 feet.

48 *D. STIPULACEUM* (D. C. prod. 2. p. 330.) stem erect, branched, pilose; leaflets ovate, rather obtuse; stipulas horizontal, obliquely ovate-lanceolate, acuminate, ciliated; stipels large; racemes terminal, somewhat panicle.  $\mathcal{U}$ . G. Native of Mexico, on the mountains. Hedys. stipulaceum, Moc. et Sesse, fl. mex. icon. ined. Flowers purple.

*Large-stipuled* *Desmodium*. Fl. July, Aug. Clt. 1824. Pl. 1 to 2 feet.

49 *D. INFRACTUM* (D. C. prod. 2. p. 330.) stem nearly erect, rather angular, bent at the leaves; leaflets ovate, acute, puberulous as well as the petioles and peduncles; stipulas ovate, acute; racemes axillary, simple; joints of legume 2, semi-orbicular, glabrous.  $\mathcal{U}$ . G. Native of Mexico, on the mountains. Hedys. biarticulatum, Moc. et Sesse, fl. mex. icon. ined. but not of Lin. Hedys. infractum, Spreng. syst. append. 290. Flowers violaceous.

*Bent-stemmed* *Desmodium*. Pl. 1 to 2 feet.

50 *D. APARINES* (D. C. prod. 2. p. 330.) stem erect, rough from crowded hairs, which are hooked at the apex; leaflets oblong, rather pilose, painted with white above and pale beneath; racemes terminal.  $\mathcal{U}$ . G. Native of Mexico. Hedys. Aparines, Link. enum. 2. p. 247. Hedys. ramosum, H. W. no. 13789. ex Schlecht. et Cham. in Linnæa. 5. p. 586. Leaflets sometimes roundish. Flowers purple.

*Clearer* *Desmodium*. Fl. June, Jul. Clt. 1823. Pl. 1 to 2 ft.

51 *D. CINE'REUM* (D. C. prod. 2. p. 330.) branches clothed

with white tomentum; leaflets elliptic, rather mucronate, having parallel veins, clothed with hoary silky tomentum on both surfaces; racemes elongated; joints of legume 1-5, deltoid, semi-orbicular, clothed with soft canescent pubescence. *h. S.* Native between Acapulco and the city of Mexico, near Mascala and Chilpacingo, Hedys. cinereum, H. B. et Kunth, nov. gen. amer. 6. p. 526. Flowers purple.

*Cinereous* *Desmodium*. Fl. Jul. Aug. Clt. 1820. Sh. 1 to 2 ft.

52 *D. serotinum* (D. C. prod. 2. p. 338.) stem herbaceous; leaflets elliptic, obtuse, pubescent beneath as well as the petioles; racemes terminal, simple. *U. G.* Native of Mexico, near Jalapa. Hedys. serotinum, Willd. enum. p. 777.

*Late-flowering* *Desmodium*. Pl. 1 foot.

53 *D. plicatum* (Schlecht. et Cham. in Linnæa. 5. p. 585.) stem erect, terete, clothed with retrograde canescent tomentum upwards, but below with dense canescent pubescence; leaves on short petioles; leaflets oblong-elliptic, rather retuse and mucronate at the apex, pubescent above and tomentose beneath; stipulas and stipels ending in a long acumen each; spikes paniced; flowers in fascicles; bracteas very narrow and very acute, exceeding the calyx; legumes tomentose, with a few, usually 3-4, complicated joints. *h. G.* Native of Mexico, in fields, between Misantla and Colipa. The whole plant is of a yellowish-cinereous colour. Corolla violaceous. Habit of *Hedys. cajanifolium*, H. B. et Kunth. Hedys. multiflorum, H. W. no. 13797. et Schlecht. et Cham. l. c.

*Plicate-podded* *Desmodium*. Shrub 2 feet.

\*\*\* *South American and West Indian species. Hedysarum*, Swartz, fl. ind. occid. 3. p. 1263. H. B. et Kunth, nov. gen. amer. 6. p. 517.

54 *D. uncinatum* (D. C. prod. 2. p. 331.) stem shrubby, climbing, rough from hairs, which are hooked at the apex; leaflets ovate, villous, painted with white above; racemes terminal. *h. S.* Native of the Caraccas. Hedys. uncinatum, Jacq. hort. schœnb. 3. t. 298. Flowers violaceous.

*Hooked-haired* *Desmodium*. Shrub cl.

55 *D. cœruleo-violaceum* (D. C. prod. 2. p. 331.) stems shrubby, terete, diffuse, and are as well as the leaves clothed with villous pubescence; leaflets elliptic; stipulas lanceolate-subulate, ciliated; racemes terminal, capitate; legumes scabrous, pilose. *h. S.* Native of Guiana. Hedys. cœruleo-violaceum, Meyer. esseq. 246. Calyx 5-parted, with lanceolate-subulate lobes. Corolla bluish violet.

*Bluish-violet-flowered* *Desmodium*. Shrub 1 to 2 feet.

56 *D. molliculum* (D. C. prod. 2. p. 331.) stems diffuse, clothed with soft pili as well as the petioles and peduncles; leaflets pilose on both surfaces, terminal one rhomboid-orbicular, lateral ones roundish-elliptic, mucronate; racemes loose-flowered, young legumes with 2 hispid joints. *h. S.* Native of South America. Hedys. molliculum, H. B. et Kunth, nov. gen. amer. 6. p. 512. *Heteroloma lanatum*, Desv. ined. Flowers purple. Allied to *D. lanatum* and *D. rotundifolium*.

*Softish* *Desmodium*. Shrub diffuse.

57 *D. arenarium* (H. B. et Kunth, nov. gen. amer. 6. p. 527.) stems herbaceous, procumbent; stipulas ovate, acuminate-subulate; leaflets oblong-elliptic, clothed with adpressed pubescence on both surfaces, glaucescent beneath; racemes almost terminal or opposite the leaves, solitary; joints of legume few, hairy. *U. S.* Native on the banks of the Orinoco, near Atures, in sandy places. Flowers violaceous.

*Sand* *Desmodium*. Pl. procumbent.

58 *D. ? multicaule* (D. C. prod. 2. p. 331.) stems diffuse, slender, suffrutescent at the base, clothed with hoary-velvety down as well as the leaves; leaflets elliptic; stipulas broad, cordate, acuminate; racemes opposite the leaves and about the

same length; pedicels twin; bracteas tern, acuminate. *h. S.* Native of Peru. Root thick, woody. Flowers small. Young legume slender and many-jointed, villous. Perhaps this plant does not belong to the present genus.

*Many-stemmed* *Desmodium*. Shrub diffuse.

59 *D. erythrinæfolium* (D. C. prod. 2. p. 331.) stems twiggy, glabrous, angular; leaflets broad-ovate, acuminate, glabrous, pale beneath; stipulas subulate; racemes terminal, somewhat paniced; joints of legume very smooth and dolabriliform, acute at both ends. *h. S.* Native of South America. Hedys. erythrinæfolium, Juss. in Poir. dict. 6. p. 408.

*Erythrina-leaved* *Desmodium*. Shrub.

60 *D. caripense*; plant erect; branches, petioles, and peduncles rather hairy; leaflets ovate-oblong, mucronate, ciliated, hairy above but glabrous beneath; racemes elongated; joints of legume 3-5, rhomboid, hairy. *h. S.* Native of Cumana, near Caripe. Hedys. Caripense, H. B. et Kunth, nov. gen. amer. 6. p. 523. *D. Cumanense*, D. C. prod. 2. p. 331. Flowers purple.

*Caripe* *Desmodium*. Shrub 2 to 3 feet.

61 *D. cajanifolium* (D. C. prod. 2. p. 331.) branches densely hairy; leaflets oblong, obtuse, full of parallel veins, glabrous and shining above, but covered with soft silky pubescence and glaucescent beneath; racemes paniced; joints of legume 2-6, semi-orbicular, and puberulous. *h. S.* Native on the banks of the river Magdalena, near Honda, and of the island of Trinidad. Hedys. cajanifolium, H. B. et Kunth, nov. gen. amer. 6. p. 525. t. 598. Flowers bluish.

*Pigeon-pea-leaved* *Desmodium*. Fl. July, Aug. Clt. 1820. Shrub 2 to 3 feet.

62 *D. wadei* (D. C. prod. 2. p. 331.) stem shrubby; lower leaves simple, the rest trifoliate; leaflets ovate-lanceolate, ciliated; racemes very long, opposite the leaves; pedicels tern; legumes membranous, scabrous, 3-jointed. *h. S.* Native of Brazil, particularly in Para. Hedys. Wade, Vand. in Roem. script. 63. Flowers small, white. *Wade* is the vernacular name of the plant.

*Wade* *Desmodium*. Shrub 1 to 2 feet.

63 *D. racemiferum* (D. C. prod. 2. p. 331.) stem terete, slender, hispid; leaflets oval, obtuse, glabrous above, villous beneath, and somewhat marcescent; stipulas and bracteas oblong, acuminate, villous; racemes terminal; pedicels twin at each bractea, which is caducous. *h. S.* Native of Cayenne. Hedys. racemodum, Aubl. guian. 2. p. 774. ? but not of Thunb. Flowers purple.

*Raceme-bearing* *Desmodium*. Shrub 1 to 2 feet.

64 *D. ancistrocarpum* (D. C. prod. 2. p. 331.) stem frutescent, pilosely-pubescent; leaves glaucous beneath; leaflets of the lower leaves orbicular, of the upper ones elliptic; racemes opposite the leaves, elongated; joints of legume numerous, semi-orbicular, hispid from stiff hairs, which are hooked at their apices. *h. S.* Native of Brazil. Hedys. ancistrocarpum, Ledeb. ind. hort. dorp. suppl. 1823. Flowers small, purple.

*Ancistrum-fruited* *Desmodium*. Shrub 1 to 2 feet.

65 *D. incanum* (D. C. prod. 2. p. 332.) stem suffrutescent, erect, terete, pubescent; leaflets ovate-oblong, hoary beneath; stipulas oblong, acuminate, glabrous; racemes terminal; pedicels solitary; legumes deflexed, puberulous, having semi-orbicular joints. *h. S.* Native of Jamaica and St. Domingo, among bushes and grass. Hedys. incanum, Swartz, fl. ind. occid. 1265. but not of Thunb. Hedys. canescens, Mill. but not of Lin. Hedys. incanum, Lun. hort. jam. *Æschynomene incana*, Meyer.—Plum. ed Burm. t. 149. f. 1. Flowers pale red.

*Hoary* *Desmodium*. Fl. Jul. Aug. Clt. 1818. Sh. 2 to 3 ft.

66 *D. supinum* (D. C. prod. 2. p. 332.) stems frutescent, decinate, pubescent above; leaflets ovate, clothed with hoary villi beneath; stipulas lanceolate, acuminate, puberulous; racemes

terminal; pedicels solitary; legumes nearly erect, pubescent, with semi-ovate joints.  $\frac{1}{2}$ . S. Native of Jamaica, Guadaloupe, Santa Cruz, among grass, and of the Spanish Main, about Bordonos and Cumana. Hedys. supinum, Swartz, fl. ind. occid. 1264. H. B. et Kunth, nov. gen. amer. 6. p. 524. but not of Vill. nor Pall. *Æschynomene spicata*, Poir. 4. p. 452. ex herb. mus. par. D. Cumanense, Willd. herb.—Sloane, hist. jam. 1. t. 118. f. 2. Flowers small, bluish purple. Perhaps the plant of Kunth is distinct from that of Swartz.

*Supine* Desmodium. Fl. July, Aug. Clt. 1816. Sh. trail.

67 D. TORTUOSUM (D. C. prod. 2. p. 332.) stem erect, herbaceous, terete, pubescent, suffrutescent at the base; leaflets elliptic, smoothish; stipulas much acuminate; racemes axillary, elongated, loose; legumes erectish, pubescent, with roundish twisted joints.  $\frac{1}{2}$ . S. Native among bushes on the mountains of Jamaica, Porto Rico, and on the banks of the river Magdalena, near Honda. Hedys. tortuosum, Swartz, fl. ind. occid. 1271. H. B. et Kunth, nov. gen. amer. 6. p. 521.—Sloan. jam. 1. t. 116. f. 9. Flowers pale blue.

*Var.  $\beta$ , hirtellum* (D. C. prod. 2. p. 332.) stem beset with short hooked hairs; leaves rather villous on both surfaces.  $\frac{1}{2}$ . S. Native of Guadaloupe. Perhaps a proper species.

*Twisted* Desmodium. Fl. Jul. Aug. Clt. 1781. Sh. 2 to 3 ft.

68 D. MÔLLE (D. C. prod. 2. p. 333.) stem erect, terete, glabrous; leaflets ovate, attenuated, clothed with soft villi beneath; racemes terminal; pedicels tern; young legumes twisted, puberulous, with rhomboid joints, the ultimate one largest and somewhat orbicular, at length all glabrous.  $\frac{1}{2}$ . S. Native of the islands of Santa Cruz, St. Thomas, and St. Domingo. Hedys. môle, Vahl. symb. 2. p. 83. Flowers purple.

*Soft* Desmodium. Shrub 1 to 2 feet.

69 D. ADSCENDENS (D. C. prod. 2. p. 332.) stem suffrutescent, ascending, terete, pilose; leaflets roundish, pubescent beneath; stipulas lanceolate, falcate; racemes erect, axillary, simple; pedicels solitary; legumes declinate, pubescent.  $\frac{1}{2}$ . S. Native of the West Indies. Hedys. adscendens, Swartz, fl. ind. occid. 1263. but not of Sieb. Flowers small, red. Perhaps many species are confused under this name.

*Var.  $\beta$ , Orinocense* (H. B. et Kunth, nov. gen. amer. 6. p. 520. t. 597.) legumes with 1-3 joints.

*Ascending* Desmodium. Fl. Ju. Aug. Clt. 1818. Sh. 1 to 2 ft.

70 D. CÆRULEUM; stem terete; branches declinate, ascending, pilose; leaflets roundish, pubescent beneath, mucronate, somewhat emarginate; stipulas rather falcate; racemes simple, erect, axillary, many-flowered.  $\frac{1}{2}$ . S. Native of Brazil. D. adscendens var.  $\beta$ , cœruleum, Lindl. bot. reg. 815. D. C. prod. 2. p. 332. Flowers large, blue. Stamens monadelphous according to the figure.

*Blue-flowered* Desmodium. Fl. June, Aug. Clt. 1818. Sh. 1 to 2 feet.

71 D. LIMENSE (Hook, bot. misc. 2. p. 215.) stem erect, furrowed, hairy; leaves on long stalks; leaflets smoothish above, and covered with adpressed hairs beneath; racemes long, terminal, and axillary; bractæas ovate, acuminate, silky; legumes flexuous, with 5-8 oval, hairy, scabrous joints.  $\frac{1}{2}$ . S. Native of Peru, near Lima.

*Lima* Desmodium. Shrub 1 to 2 feet.

72 D. TRIGONUM (D. C. prod. 2. p. 332.) stem herbaceous, scandent, triquetrous, hairy; leaflets ovate, acute, hairy; racemes terminal, very long; legumes twisted, hispid, and inflexed.  $\frac{1}{2}$ . S. Native of Jamaica, in shady bushy places. Hedys. trigonum, Swartz, fl. ind. occ. 1267. Hedys. triphyllum, P. Browne, jam. 301. f. 7. Hedys. intortum, Mill. dict. Hedys. adhærens, Vahl. symb. 2. p. 82. Flowers large, pale red or bluish.

*Trigonal-stemmed* Desmodium. Fl. July, Aug. Clt. 1733. Pl. climbing.

73 D. OBLONGIFOLIUM (D. C. prod. 2. p. 332.) stems herbaceous, diffuse, terete, and are as well as the petioles clothed with rough villi; stipulas scarious, ovate, acuminate; leaflets ovate-oblong, acuminate, villously pubescent; peduncles almost radical, elongated, loosely racemose at the apex; lower pedicels twin.  $\frac{1}{2}$ . S. Native of Jamaica, on the higher mountains. Hedys. oblongifolium, Bert. ined. Flowers purplish-violet. Ovary puberulous, 2-3-jointed.

*Oblong-leaved* Desmodium. Pl. diffuse.

74 D. SPIRALE (D. C. prod. 2. p. 332.) stem herbaceous, climbing, rooting at the base, angular, glabrous; leaflets ovate, glabrous; stipulas subulate; racemes terminal, elongated; pedicels twin or tern; legumes pubescent, spirally twisted.  $\frac{1}{2}$ . S. Native of the south of Jamaica, in shady, arid, bushy places. Hedys. spirale, Swartz, fl. ind. occid. p. 1273. H. procumbens, Mill. dict. Flowers small, greenish yellow. Leaflets marked with a shining spot above, sometimes obtuse and sometimes acuminate, according to Swartz.

*Var.  $\beta$ , stoloniferum* (D. C. prod. 2. p. 333.) leaflets acuminate; stipulas ovate, acute, striated.  $\frac{1}{2}$ .?  $\frac{1}{2}$ .? S. Native of Porto Rico. Hedys. stoloniferum, Poir. dict. 6. p. 421. Perhaps a proper species. Plant creeping and rooting.

*Spiral-podded* Desmodium. Fl. July, Aug. Clt. 1700. Pl. cl.

75 D. TENUELLUM (D. C. prod. 2. p. 333.) stems herbaceous, diffuse, slender, smoothish; leaflets ovate, acute, glabrous, the terminal one twice the size of the rest; stipulas spreading, subulate; racemes terminal; pedicels twin, spreading.  $\frac{1}{2}$ . S. Native of St. Domingo. Hedys. tenellum, Spreng. in herb. Balb. Flowers small, purple.

*Very small* Desmodium. Pl. diffuse.

76 D. TENELLUM (D. C. prod. 2. p. 333.) branches ascending, glabrous; floral leaves simple, the rest trifoliate; leaflets clothed with adpressed pubescence on both surfaces, glaucescent beneath, terminal one ovate-oblong, lateral ones elliptic, acute; racemes loose, rather flexuous; legumes with 2-5 joints, spirally twisted, glabrous, the joints rhomboid.  $\odot$ . S. Native of shady humid places near Caracas. Hedys. tenellum, H. B. et Kunth, nov. gen. amer. 6. p. 522. Nearly allied to *D. tortuosum* and *D. spirale*. Flowers purple.

*Slender* Desmodium. Fl. July, Aug. Clt. 1818. Pl. 1 ft.

77 D. AXILLARE (D. C. prod. 2. p. 333.) stem herbaceous, creeping, and rooting at the joints, rather pubescent; leaflets rhomboid-roundish, pubescent beneath, and reticulately veined; racemes axillary, much longer than the leaves; pedicels 1-3-together; legumes declinate, pubescent, with 2-4 semi-ovate joints.  $\frac{1}{2}$ . S. Native of Jamaica, St. Domingo, and Guadaloupe. Hedys. axillare, Swartz, fl. ind. occ. 1274. Flowers small, of a purplish blood-colour.

*Axillary-flowered* Desmodium. Pl. creeping.

78 D. RÉPTANS (D. C. prod. 2. p. 333.) stems creeping; leaflets obovate-roundish, lateral ones unequal-sided, rounded at both ends, glabrous above, but clothed with canescent pubescence beneath; racemes ascending, on very long peduncles; joints of legume 2, semi-orbicular, hispid.  $\frac{1}{2}$ . S. Native of St. Domingo and of New Granada, in very hot places, on the banks of the river Magdalena, near Nares. Hedys. réptans, Poir. dict. 6. p. 422. H. B. et Kunth, nov. gen. amer. 6. p. 518. Flowers flesh-coloured.

*Creeping* Desmodium. Shrub creeping.

79 D. SCORPIURUS (Desv. l. c.) stems herbaceous, procumbent, rather pilose; stipulas ovate-falcate, apiculated; leaflets obovate-oblong, obtuse, pubescent beneath; racemes opposite the leaves, elongated; joints of legume 4-5, ovate.  $\frac{1}{2}$ . S. Native of Jamaica and St. Domingo. Hedys. scorpiurus, Swartz, fl. ind. occid. p. 1268. Flowers purple.

*Scorpion-tail-like-racemed* Desmodium. Pl. procumbent.

80 D. ASPERUM (Desv. l. c.) stems tetragonal, hispid, fistular;

stalked, 5-9, oblong-lanceolate, bluntly acuminate, repandly-crenulated at the top; racemes axillary, simple.  $\frac{1}{2}$  S. Native of Java, where it is called *Katos*.

*Toothed-leaved Amyris*. Fl. Aug. Tree.

16 *A. ? ROBINSONII* (D. C. prod. 2. p. 82.) leaves trifoliate; petioles margined; racemes lateral.  $\frac{1}{2}$  S. Native of Jamaica. Lunan. hort. jam. 1. p. 169.

*Robinson's Amyris*. Shrub 8 feet.

17 *A. BIPINNATA* (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 82.) leaves bipinnate at the base; leaflets numerous, small, ovate, quite entire; peduncles terminal, rather hairy, longer than the leaves.  $\frac{1}{2}$  S. Native of Mexico.

*Bipinnate-leaved Amyris*. Shrub.

18 *A. PAPHYRIFERA* (Gailland, voy. a Meroc. cent. ex Bull. scienc. Aug. 1827. p. 285.) trunk arborescent, coated, with vertical, somewhat diaphanous lamina; flowers racemously-panniced, decandrous.  $\frac{1}{2}$  G. Native of Africa, at the White River. The Nubian Mahomedans use the bark of this tree for writing their legends upon.

*Paper-bearing Amyris*. Tree.

*Cult.* The species of *Amyris* grow freely in a mixture of loam and peat, and cuttings root freely in sand, under a hand-glass, those of the stove species in heat.

II. *PACHYLOBUS* (from *παχυς*, *pachys*, thick, and *λοφος*, *lobos*, a lobe; the lobes of the cotyledons are thick).

LIN. SYST. unknown. Fruit oval, black, superior, about the size of a hen's egg, 1-celled, containing a large embryo, having 2 3-parted cotyledons, the lobes large, thick, angular, and twisted.—A large tree with impari-pinnate, smooth leaves, with the leaflets nearly opposite, ovate, acuminate, entire, the young branches rather tomentose.

1 *P. EDULIS*.  $\frac{1}{2}$  S. Native of the island of St. Thomas, in the Gulf of Guinea, where the fruit is much esteemed by the inhabitants, and sold in great quantities in the market of St. Ann de Chaves, under the name of *Safu*: in taste it is bitter and astringent. It is usually roasted. There is another species, which goes under the name of *Pasco*, which appears only to differ in having hairy leaves, and in the shape of the fruit. The whole description of this tree is given from memory, as we have had no specimen to examine.

*Edible Safu*. Fl. Nov. Tree 40 feet.

*Cult.* For culture and propagation see stove species of *Amyris*.

ORDER LXXVII. CONNARACEÆ (plants agreeing with *Connarus* in important characters). Kunth, in ann. scienc. nat. 2. p. 359. Lindl. introd. nat. ord. 125. Terebinthaceæ, part. Juss. gen. 369. Terebinthaceæ, Tribe VII. Connaraceæ, D. C. prod. 2. p. 84.

Flowers hermaphrodite, rarely unisexual. Calyx 5-parted, regular, permanent, either imbricate or valvular in æstivation. Petals 5 (f. 20. b.), inserted in the calyx, imbricate, rarely valvate in æstivation. Stamens twice the number of the petals (f. 20. c.), hypogynous, those opposite the petals shorter than the others, usually monadelphous at the base (f. 20. d.). Ovary solitary or simple, or several together, each with a separate style, with an usually dilated stigma. Ovula 2, collateral, ascending. Capsules usually several, rarely single (f. 20. k.), dehiscent, splitting lengthwise internally. Seeds erect, in pairs, or solitary, with or without albumen, but usually furnished with aril. Radicle superior at the extremity most remote from the hilum. Cotyledons thick in the species without albumen, and leafy in those with al-

bumen.—Trees or shrubs, with compound, dotted, alternate, exstipulate leaves, and terminal racemes or panicles of bracteate flowers. *Connarus* can only be distinguished from *Leguminosæ* by the relation the parts of the embryo have to the umbilicus of the seed (R. Brown, cong. 432.) that is to say by the radicle being at the extremity most remote from the hilum. The want of stipulas is, however, usually sufficient to distinguish them. It differs from *Terebinthaceæ* in the want of resinous juice.

### Synopsis of the Genera.

1 *CONNARUS*. Calyx 5-parted. Petals imbricate in æstivation. Stamens somewhat monadelphous at the base. Carpels 5, each bearing a style, bi-ovulate, some of them are usually abortive. Capsules sessile, 2-valved, 1-seeded; seeds exalbuminous. Leaves trifoliate or impari-pinnate.

2 *OMPHALOBium*. Calyx 5-parted. Petals 5 (f. 20. b.), imbricate in æstivation. Stamens monadelphous (f. 20. d.), or somewhat polyadelphous at the base. Carpels 5, each bearing a style. Capsules 1-5, legume-formed (f. 20. k.), 2-valved, dehiscent. Seeds twin or solitary, exalbuminous. Leaves trifoliate or impari-pinnate.

3 *EURYCOMA*. Flowers polygamous. Calyx 5-parted. Petals 5, covered with glandular hairs. Stamens 5. Glands 10, twin, between the stamens. Carpels 5, joined at the base, 1-seeded. Seeds exalbuminous. Leaves pinnate.

4 *CNESTIS*. Calyx 5-cleft, tomentose, valvate in æstivation. Stamens free, inserted in the calyx. Carpels 5, distinct, each bearing a style, coriaceous, 2-valved, legume-formed, opening on the back, usually prurient, 2-ovulate. Seed solitary in the capsule. Albumen fleshy. Leaves impari-pinnate.

† A genus allied to *Connaraceæ*, but is not sufficiently known.

5 *TAPIRIA*. Calyx 5-parted. Petals 5. Stamens 10, both rising from the hypogynous disk. Stigmas 5, sessile. Capsule 5-furrowed, 5-valved, 5-seeded. Seeds arillate. Leaves impari-pinnate.

I. *CONNARUS* (*κοίραρος*, *connaros*, is the name of a tree described at length by Athenæus). Lin. gen. no. 944. D. C. prod. 2. p. 84.—Roûrea, Aubl. guian. 1. p. 467. t. 187. Roûbergia, Schreb. gen. no. 787. Malbrancia, Neck. elem. no. 1171.

LIN. SYST. *Decandria, Pentagynia*. Calyx 5-parted, permanent, girding the fruit closely at the base; lobes ovate, imbricate in æstivation. Petals 5, also imbricate in æstivation. Stamens 10, somewhat monadelphous at the base, inserted in the base of the calyx. Ovaries 5, each bearing a style and containing 2 ova, 4 of which are almost always abortive, or reduced to the styles. Capsule baccate, sessile, 2-valved, bursting at the side, ovate, 1-seeded. Seed erect, inserted in the bottom of the cell, arillate at the base, destitute of albumen. Cotyledons thick.—Shrubs, with impari-pinnate leaves with 1 or many pairs of leaflets. Flowers disposed in racemose panicles, white.

1 *C. MONOCARPUS* (Lin. spec. 1. p. 678.) leaves trifoliate; leaflets ovate, acuminate, quite smooth; panicles terminal.  $\frac{1}{2}$  S. Native of Ceylon. Lin. fl. zeyl. no. 248. exclusive of the synonym of Burm. Flowers yellowish.

*One-fruited Connarus*. Clt. 1768. Shrub 10 feet.

2 *C. PUBESCENS* (D. C. prod. 2. p. 85.) climbing; leaflets 5, oval, acute, smooth above, covered beneath with rather white pubescence.  $\frac{1}{2}$  S. Native of French Guiana. Roûrea

frutescens, Aubl. guian. 1. p. 467. t. 187. *Robérgeia frutescens*, Willd. spec. 2. p. 752. Flowers white, sweet-scented, disposed in axillary and terminal panicles. Fruit very like that of *C. monacarpus*.

*Pubescent Connarus*. Clt. 1822. Shrub 5 feet.

3 *C. JAVA'NICUS* (Blum. bijdr. 1166.) leaves ternate and pin-nate, ovate, or elliptical-oblong, obtusely acuminate, veiny, smooth; racemes crowded, axillary; flowers pentagynous; stem sarmentose. *h. S.* Native of Java.

*Java Connarus*. Fl. May. Shrub 8 feet.

† *Species not sufficiently known*.

4 *C. ? GLABER* (D. C. prod. 2. p. 85.) leaflets 3-5, oblong, somewhat cordate, acuminate, quite smooth; panicles axillary, twin, simple, much shorter than the leaves. *h. S.* Native of South America, on the banks of the river Orinoco, near Caycara. *Rourea glabra*, H. B. et Kunth, nov. gen. amer. 7. p. 41. Flowers white. Fruit unknown.

*Smooth Connarus*. Shrub 6 feet.

5 *C. ? SANTALOIDES* (Vahl. symb. 3. p. 87.) leaves with 2-4 pairs of ovate, acuminate, smooth leaflets, with an odd one; peduncles axillary, aggregate; flowers disposed in racemes, monogynous. *h. S.* Native of the East Indies. *Santaloides*, Lin. fl. zeyl. no. 408. Segments of calyx rounded (ex Lin.) acute (ex Vahl.). Flowers white. Fruit not sufficiently known. It is probably a species of *Omphalobium*.

*Santalum-like Connarus*. Shrub 6 feet.

6 *C. MIMOSOIDES* (Vahl. symb. 3. p. 87.) leaflets about 10 pairs, with an odd one, oval-oblong, emarginate; petioles and branchlets pubescent; racemes axillary; flowers monogynous. *h. S.* Native of the islands of Nicobar. This is also probably a species of *Omphalobium*.

*Mimosa-like Connarus*. Shrub 6 feet.

*Cult.* A mixture of loam and peat will answer the species of this genus, and ripened cuttings will root in sand, under a hand-glass, in heat.

II. OMPHALOBIMUM (from *ομφαλος*, *omphalos*, a navel, and *λοφος*, *lobos*, a pod). Gært. fruct. 1. p. 217. t. 16. D. C. diss. prod. 2. p. 85.—*Connarus*, species of authors.

LIN. SYST. *Monadelphica*, *Decandria*. Calyx 5-parted, permanent, girding the fruit loosely at the base; lobes oblong, acute, imbricate in æstivation. Petals 5 (f. 20. b.). Stamens 10 (f. 20. c.), monadelphous at the base (f. 20. d.), or somewhat polyadelphous. Carpels 5, each bearing a style, and containing 2 ova, some of them usually abortive. Capsules 1 (f. 20. k.) -5, legume-formed, 2-valved, dehiscent (f. 20. k.), narrowed or stipitate at the base. Seeds twin, but usually solitary, not inserted at the base, but in the lower part along the suture, arillate, without albumen. Cotyledons thick.—Trees and shrubs with imparipinnate leaves, having 1 or many pairs of leaflets. Racemes axillary, usually disposed in a terminal panicle.

§ 1. *Connaroides* (from their similarity to *Connarus*, in having a solitary carpel). D. C. prod. 2. p. 85. *Carpels solitary* (f. 20. k.).

1 *O. INDICUM* (Gært. fruct. 1. p. 217. t. 46.) leaflets 3, ovate, somewhat acute, quite smooth on both surfaces, coriaceous; flowers paniced; carpels solitary, stipitate. *h. S.* Native of Ceylon. Rhûs, &c. Burm. zeyl. 199. t. 89. ? and therefore *Connarus Asiaticus*, Willd. spec. 3. p. 691. Rhûs *Rædælijævel*, Mill. dict. no. 13. ? Flowers paniced, and the stamens are, according to Gærtner, somewhat polyadelphous. Capsules nearly an inch and a half long, and evidently stalked. Radicle at the vertex of the seed.

*Indian Omphalobium*. Clt. ? Shrub 6 feet.

2 *O. AFRICA'NUM* (D. C. prod. 2. p. 85.) leaflets 3, oval, acuminate, smooth on both surfaces, somewhat membranous and feather-nerved; flowers paniced; carpels solitary, stipitate. *h. S.* Native of Sierra Leone. *Connarus Africanus*, Lam. dict. 2. p. 95. Cav. diss. 7. p. 375. t. 221. *Connarus venosus*, Smeathm. mss. Flowers white. Capsule about an inch and a half long, and evidently stipitate. Radicle under the top of the seed, usually germinating in a simple or branched root in the fruit (f. 20. i.).

*African Omphalobium*. Fl. Mar. Clt. 1822. Shrub 8 feet.

3 *O. NERVOSUM*; leaflets 3, obovate, acuminate, 3-nerved at the base, pubescent beneath, smooth above, on long pubescent petioles; flowers terminal, paniced. *h. S.* Native of Sierra Leone.

*Nerved-leaved Omphalobium*. Shrub 10 feet.

4 *O. GANDICHAN'DI* (D. C. prod. 2. p. 85.) leaflets 3, ovate, acuminate, quite smooth on both surfaces; fruit racemose; carpels solitary, stipitate, somewhat obovate, obtuse, smooth. *h. S.* Native of the Moluccas, in marshes by the sea-side at Rawak. Capsule 12-14 lines long, 7-8 broad. Radicle at the top of the seed.

*Gandichand's Omphalobium*. Shrub 6 feet.

5 *O. LAMBERTII* (D. C. prod. 2. p. 85.) leaflets 3, elliptical-oblong, acuminate, smooth on both surfaces, somewhat membranous; flowers paniced; carpels solitary, stipitate, incurved, a little striated, smooth. *h. S.* Native of Guiana, in the interior or sandy savannahs. *Connarus Guianensis*, Lamb. herb. Flowers white? Capsule 8-10 lines long, 5-8 broad. Radicle at the vertex of the seed.

*Lambert's Omphalobium*. Shrub 6 feet.

6 *O. FASCICULATUM* (D. C. prod. 2. p. 86.) leaves? fruit rising in fascicles from the branches; carpels solitary, stipitate, compressed. *h. S.* Native of French Guiana. Capsule an inch long, 5 lines broad. In the disposition of the flowers this species is very distinct.

*Fascicled-flowered Omphalobium*. Shrub 6 feet.

7 *O. PATRISII* (D. C. diss. with a figure.) leaflets 5-9, oval-oblong, acuminate, quite smooth on both surfaces, coriaceous; flowers paniced; carpels solitary, stipitate, obovate, blunt, smooth. *h. S.* Native of Cayenne. Leaves smooth, with 3-4 pairs of leaflets and an odd one. Carpels dehiscent. Seeds arillate.

*Patris's Omphalobium*. Shrub 6 feet.

8 *O. THONNINGII* (D. C. prod. 2. p. 86.) leaflets 3-5, elliptical, acute, smooth on both surfaces, somewhat membranous, feather-nerved, and almost veinless between the lateral nerves; panicle terminal; ovary hairy, solitary. *h. S.* Native of Guinea. *Connarus florulentus*, Thonn. in herb. Puer. Leaves somewhat membranous. Flowers very numerous. Petals oblong-linear. Fruit unknown.

*Thonning's Omphalobium*. Shrub 6 feet.

9 *O. PINNATUM* (D. C. prod. 2. p. 86.) leaflets 3-5, oval-oblong, acute, quite smooth on both surfaces, feather-nerved, with the lateral veins confluent at the apex; panicle terminal, elongated; ovary solitary, downy; petals with two bristles at the base of each. *h. S.* Native of the East Indies. *Connarus pinnatus*, Lam. dict. 2. p. 95. ill. t. 572. Cav. diss. 7. p. 376. t. 222. Flowers white.

*Pinnate-leaved Omphalobium.* Shrub 6 feet.

10 *O. SMEATHMANI* (D. C. prod. 2. p. 86.) leaflets 3-5, elliptical-oblong, acuminate, smooth above, somewhat ferrugineous and somewhat pubescent, feather-nerved, and finely reticulated; panicles terminal; ovary solitary, somewhat pubescent. *h. S.* Native of Sierra Leone. Leaflets 3 inches long, and about  $1\frac{1}{2}$  broad.

*Smeathman's Omphalobium.* Shrub 12 feet.

11 *O. PEROTTETII* (D. C. prod. 2. p. 86.) leaflets elliptical-oblong, acuminate, smooth above and shining, but covered with short woolly ferrugineous down beneath; panicle terminal; carpels solitary, obovate, obtuse, somewhat stipitate, young ones clothed with deciduous rusty down, but they are smooth at length. *h. S.* Native of French Guiana. Leaflets 3-6 inches long and 1-2 inches broad.

*Perottet's Omphalobium.* Shrub 6 feet.

§ 2. *Cnestoides* (plants agreeing with *Cnestis* in having numerous carpels). *D. C. prod. 2. p. 86. Carpels numerous.*

12 *O. VILLOSUM* (D. C. prod. 2. p. 86.) leaflets 3, oval, acute, tapering to the base, somewhat membranous, feather-nerved, smooth above, but clothed beneath with rusty velvety villi, as well as the panicles and carpels. *h. S.* Native of Sierra Leone. *Cnestis trifolia*, Lam. dict. 3. p. 34. *Spondioides villosa*, Smeathm. herb. Lobes of calyx imbricate in æstivation. Carpels 1-5, tapering very much to the base. Cotyledons thick. Radicle superior. Albumen wanting.

*Villous Omphalobium.* Shrub 6 feet.

13 *O. PENTAGYNUM* (D. C. prod. 2. p. 86.) leaflets 3, coriaceous, orbicular, acuminate, quite smooth on both surfaces, 3-nerved; panicles axillary and terminal; calyxes and ovaries villous. *h. S.* Native of Madagascar. *Connarus pentagynus*, Lam. dict. 2. p. 95. Cav. diss. 7. p. 376. t. 223.

*Five-styled Omphalobium.* Shrub 6 feet.

*Cult.* See *Connarus* for culture and propagation, p. 90.

III. *EURYCOMA* (from *εὐρύς*, *eurys*, wide, and *κομή*, *kome*, hair; in allusion to the tufts of leaves at the tops of the branches). Jack. in Roxb. fl. ind. 2. p. 307. D. C. prod. 2. p. 86.

LIN. SYST. *Polygâmia, Diœcia*. Flowers polygamous. Calyx 5-parted. Petals 5, covered with glandular hairs. Stamens 5, with a pair of glands between each. Ovary 5-lobed, crowned by 5 joined styles, and 5 separate stigmas. Carpels 3-5, 1-seeded. Seeds destitute of aril and albumen.—A small tree, with pinnate, fastigiate leaves. Panicle axillary. Corolla purple.

1 *E. LONGIFOLIA* (Jacq. et Wall. l. c.) *h. S.* Native of Sumatra and Singapore. Leaves 2 feet long. Flowers purple.

*Long-leaved Eurycoma.* Tree 20 feet.

*Cult.* See *Connarus* for culture and propagation, p. 90.

IV. *CNESTIS* (from *κνέω*, *kneo*, to scratch; in allusion to the capsules being covered with stinging hairs on the outside). Juss. gen. p. 374. Kunth, gen. tereb. D. C. prod. 2. p. 86.

LIN. SYST. *Decândria, Pentagynia*. Calyx 5-cleft, downy on the outside, ovate in the bud. Petals 5, inserted in the bottom of the calyx as well as the 10 stamens, free. Carpels 5, (1-4) distinct, 1-styled, somewhat stipitate at the base, coriaceous, 2-valved, pod-formed, opening on the back, usually clothed with stinging hairs both inside and outside, with 2 ova in each carpel. Seeds solitary, rising from the base of the carpel, erect, destitute of aril. Albumen fleshy. Embryo straight. Cotyledons leafy. Radicle superior. Usually scandent shrubs, with impari-pinnate leaves, and racemose panicles of flowers.

1 *C. GLABRA* (Lam. dict. 2. p. 23. ill. t. 387. f. 1.) leaflets

5-7 pairs, ovate-oblong, smooth; small racemes in fascicles; carpels obovate, obtuse, prurient. *h. S.* Native of the islands of the Mauritius and Bourbon.

*Smooth Cnestis.* Shrub 6 feet.

2 *C. POLYPHYLLA* (Lam. dict. 2. p. 23. ill. t. 387. f. 2.) leaves with 8-9 pairs of ovate-oblong leaves, which are villous beneath; racemes tomentose; carpels very blunt, velvety. *h. S.* Native of Madagascar.

*Many-leaved Cnestis.* Clt. 1823. Shrub 8 feet.

3 *C. FERRUGINEA* (D. C. prod. 2. p. 87.) leaves with 8-10 pairs of oval-oblong leaflets, which are somewhat cordate at the base and acuminate at the apex, smooth above, but downy beneath from ferrugineous hairs as well as the petioles and branchlets. *h. S.* Native of Sierra Leone. *Spondioides ferruginea*, Smeathm. herb.

*Rusty Cnestis.* Shrub 8 feet.

4 *C. CORNICULATA* (Lam. dict. 3. p. 23.) leaves with 4-5 pairs of oval-oblong, acuminate, smooth leaflets, but with the midrib beset with rusty hairs; carpels oblong, covered with stinging hairs, and drawn out at the apex into a long acumen. *h. S.* Native of Sierra Leone. *Spondioides pruriens*, Smeathm. Petals pale-red.

*Horned-capsuled Cnestis.* Shrub 5 feet.

5 *C. RACEMOSA*; leaves pinnate; leaflets ovate-elliptic, entire, acuminate, smooth on both surfaces; racemes simple, lateral; capsules obovate, arched, very villous. *h. S.* Native of Sierra Leone.

*Racemose-flowered Cnestis.* Shrub 10 feet.

6 *C. MONADELPHA* (Roxb. hort. beng. p. 34.) leaves with 2-3 pairs of quite smooth, shining, ovate-lanceolate, acuminate leaflets. *h. S.* Native of the East Indies, in the province of Sillhet.

*Monadelphous Cnestis.* Shrub 10 feet.

7 *C. ? PINNATA* (Beauv. fl. d'ow. 1. p. 98. t. 60.) leaves impari-pinnate; leaflets ovate, acute; flowers corymbose, axillary, bracteolate. *h. S.* Native of Guinea, in the kingdom of Warea. This is probably a species of *Omphalobium*.

*Pinnate-leaved Cnestis.* Shrub 8 feet.

8 *C. OBLIQUA* (Beauv. fl. d'ow. p. 98. t. 59.) leaflets 3, ovate, acuminate, lateral ones oblique at the base, the odd one a great distance from the lateral ones; flowers in panicles. *h. S.* Native of Guinea, in the kingdom of Warea.

*Oblique-leafletted Cnestis.* Shrub 6 feet.

*Cult.* See *Connarus* for culture and propagation, p. 90.

V. *TAPIRIA* (*Tapiriri* is the Caribbean name of the tree). Juss. gen. 372. D. C. prod. 2. p. 90.—*Tapirira*, Aubl. guian. 1. p. 470. t. 188.—*Salabérria*, Neck. elem. no. 985.—*Jouqueëtia*, Schreb. gen. no. 785.

LIN. SYST. *Decândria, Pentagynia*. Calyx 5-parted, deciduous, equal; sepals roundish. Petals 5, exserted from the hypogynous prominent disk, as well as the 10 stamens. Styles none. Stigmas 5. Capsule 5-furrowed, 5-valved, 5-seeded. Seeds arillate (perhaps the capsule is composed of 5 1-seeded carpels?).—A tree, with impari-pinnate leaves, having 2-3 pairs of almost opposite leaflets, and axillary and terminal panicles of flowers. This genus is excluded from *Connaraceæ* by S. Kunth, but a more apt place for its insertion in the natural system is not known to De Candolle.

1 *T. GUIANENSIS* (Aubl. l. c.) *h. S.* Native of Guiana, in the woods of Sinemari. *Jouqueëtia paniculata*, Willd. spec. 2. p. 750. Flowers white.

*Guiana Tapiria.* Tree 50 feet.

*Cult.* See *Connarus* for culture and propagation, p. 90.

ORDER LXXVIII. LEGUMINOSÆ (this order is composed

of plants bearing legumes or pods like the pea). Juss. gen. 345. Gært. fruct. 2. p. 301. D. C. fl. franc. ed. 3. vol. 4. profr. med. ed. 2. p. 131. D. C. prod. 2. p. 93.—Papilionaceæ and Lomentaceæ, Lin. ord. ed. gies. p. 415.

Calyx constantly of 5 sepals (f. 31. a.), which are more or less connected at the base, forming a 5-cleft (f. 31. a.) or 5-toothed (f. 27. a.) calyx, never 5-sepalled, in the strict sense of the word, it is, however, sometimes composed of 1 (f. 52. g.) or 2 sepals from coalition or abortion (f. 43. a.), the teeth or segments of the calyx usually unequal, sometimes connected into 2 lips (f. 48. a.); the upper lip bidentate (f. 48. a.); the lower one trifid (f. 48. a.). Petals usually 5 (f. 27. c. f. 47. c.), generally unequal, inserted in the bottom of the calyx, rarely in the torus, usually variously imbricated in æstivation, rarely valvate, generally free, rarely joined into a gamopetalous corolla (sometimes, however, the petals are wanting, and sometimes the corolla is formed of 1, 2, 3, or 4 petals only). Stamens inserted with the petals, usually double the number of the petals, rarely triple or quadruple that number or fewer, sometimes all free (f. 54. b. f. 56. c. f. 24. c.), sometimes variously connected or monadelphous, with the stamiferous tube entire (f. 29. c.), or cleft in front (f. 27. d.), or diadelphous, usually with 9 joined and 1 free (f. 44. d.), rarely joined in 2 equal bundles, containing 5 stamens each, and more rarely connected into 3 bodies. Anthers 2-celled (f. 23. f.), sometimes some of them are changed into abortive threads. Ovary oblong (f. 23. d.) or ovate, sessile (f. 25. d.) or stipitate (f. 58. d.), usually free, rarely with the stipe adnate to the calyx. Style filiform (f. 25. c. f. 31. d.), rising from the top of the upper suture of the ovary, crowned by a terminal (f. 44. c.) or lateral stigma. Legume usually 2-valved (f. 29. d.), membranous, coriaceous, rarely fleshy or drupaceous, dehiscent (f. 29. d.) or indehiscent (f. 44. g.), 1-celled (f. 52. h.), sometimes longitudinally 2-celled from the upper suture being bent in so much, or often transversely many-celled in consequence of the seeds being separated by spongy or membranous substance (f. 49. e.), often separating into 1-celled joints (f. 41. c.). Seeds usually numerous (f. 29. d.), rarely solitary (f. 36. e.) or twin (f. 56. e.) from abortion, fixed to the upper suture of the legume (f. 56. c. f. 52. h. f. 29. d.), alternately inserted in both valves, usually oval (f. 29. d.) or kidney-shaped (f. 51. e.), hanging by various shaped funicles, rarely expanded into aril. Testa or spermaderm smooth, usually very smooth and hard. Endopleura usually tumid, appearing like albumen. Embryo sometimes straight (f. 21. i. l. m.), sometimes with the radicle curved back upon the edge of the cotyledons, and lying in the commissure formed by them (f. 21. e. f. b.), but in either case the radicle is directed towards the hilum (f. 21. i. m.). Cotyledons leafy, flat (f. 21. a. f.), changing through germination, or fleshy (f. 21. c. g.), (the flesh farin-

naceous or oily), in a few they are exserted from the spermaderm (f. 21. c.), others are inclosed in it, as the common pea, never changing through germination (f. 20.).

This order is composed of trees, shrubs, or herbs, with very variable habits. The leaves usually alternate and bistipulate, simple, but usually variously compound, generally pinnate or bipinnate, petiolate. Petioles usually bicallous at the base, sometimes the petiole is dilated into a leafy limb, when this is the case it is called a phyllodium. Flowers of various hues, axillary or terminal, disposed in racemes or panicles, rarely solitary.

*Leguminosæ* is a vast and very natural order, diffused throughout the world, and is supposed by Humboldt to be a twelfth of all the phænogamous plants or vasculares, and we think he has not underrated it. This is the family to which the various kinds of pulse belong, and is one of the most familiar to the world. Their papilionaceous or pea flowers characterize the greater number, and their legumes or pea pods the remainder, with very few exceptions. As objects of ornament many are possessed of unrivalled beauty; for example, *Robinia*, *Laburnum*, *Wistaria*, *Lupinus*, *Astragalus*, *Erythrina* or *Coral-flower*, &c. Great, however, as is the beauty of the *Leguminosæ* which can brave the inclemencies of the seasons of northern Europe, it must give way before the splendour and elegance of those of the tropics. The flowers of *Amherstia* and *Erythrina* are of the deepest crimson, and borne in profusion upon some of the loftiest trees of the forest. But these are surpassed by the elegant fine-leaved *Acacias*, with their golden flowers, which cast a charm even over the most sterile deserts of Africa. While the forests of hot countries are thus indebted to species of this order for their timber, the meadows and pastures of the same latitudes are enamelled with the flowers of myriads of *Indigiferas*, *Hedysarums*, and *Desmodiums*, and animated by the wonderful motion of the sensitive plants. In our own country, the gayest part of our scenery is in many places indebted to the furze and broom, so in other countries the same effect is produced by other genera of *Leguminosæ*; by *Liparia* and *Aspalathus* at the Cape of Good Hope, and by the *Pultenæus* and *Daviesias*, and similar genera in New Holland. The wood of the order is very hard and durable, with a yellow tinge, sometimes changing into green, as in the *Laburnum* of Europe, and in the better known Brazil-wood of commerce, produced by *Cesalpinia Brasiliensis*.

The following remarks upon the properties of the order are made by M. de Candolle: The family of Leguminous plants, though established upon characters of primary importance, offers nevertheless so large a number of species, and such singular botanical anomalies, that it is easy to foresee that its properties will exhibit little uniformity. Still more exceptions may be anticipated, if one reflects that the chemical principle which is found most abundantly in every part of leguminous plants, and to which we must attribute their principal properties, is the extractive. It is probable that this principle, either from its own nature or from its peculiar power of uniting with different matters, or perhaps instead of being a simple principle, it is rather a compound of different matters; it is probable, I say, that this extractive prin-

FIG. 21.

ciple exhibits much less uniformity in its results than any other. It is without doubt to the presence of the extractive principle in considerable quantities that many leguminous plants owe their purgative properties, which are common to several extracts, and which many chemists attribute to the acetate of potass, which they are almost universally found to contain. Thus the leaves and pods of *Cassia senna*, and several other species, the *Colutea arborescens* of *Genista pürgans*, and of *Coronilla L'merus* act as brisk purgatives, and often cause pain in the bowels. The juice of *Coronilla varia* excites vomiting. It is perhaps from a different cause that the pulp, which is contained in the husks of leguminous plants, operates upon the human body, being gently laxative without causing the least pain; such is the character of *Cathartocarpus fistula*, *Tamarindus Indica*, *Ceratonia siliqua*, and probably some species of *L'uga* and *Parkia*. There is a juice which surrounds the seeds in the tumid pods of *Gleditschia* and *Sophora*, which differs altogether in its very astringent nauseous flavour. It is undoubtedly to a secretion from the external part of the seed, or of the pericarp, or some one of these modifications, that the singular property of the *Piscidia* and many *Galëgas* is derived, which are employed in America to stupefy fish, which are taken by this means as readily as by *Nux vomica*. The decoction of the root of *Galëga Virginiana* is considered in America as a powerful vermifuge. It is perhaps to the extractive principle that the rubefacient powers of the fresh leaves of some leguminous plants are to be attributed, which act readily upon the skin if applied in plasters; as for example, the leaves of *Ornithopus scorpioides* and *Moringa pterogospërma*. It appears that it is to the greater or less considerable mixture of the extractive principle with the fecula contained in the seed, that the different properties of the pulse of leguminous plants may be attributed. If found in small quantities, the seed may serve as food for man and animals, as we see in French beans, scarlet runners, beans and peas, &c. If found in a more considerable quantity, it will render them purgative or emetic, as in *Cytisus Laburnum* and *Anagyris foetida*, &c., and most of those belonging to the subdivision *Phyllolobæ*. The seeds of leguminous plants also present many other anomalies more difficult to reduce to any fixed laws; thus some are found which contain a rather large portion of fixed oil, such as the seed of the *A'rachis hypogæa* and *Moringa pterogospërma*, which produces oil of ben; there are some of which the smell and flavour are rather powerful, as the seed of *Dipterex odora* or Tonquin bean; there are others, which, like the chick pea, have rather a bitter taste and exciting properties, and are on that account administered for the jaundice. There are others again, like those of the *Andira*, which are so bitter as to be used in Java and Brazil as tonic, alexiteric, and vermifuge. In short, are not the aperient and diuretic qualities which are observable in the roots and herbage of many leguminous plants, such as broom, beans, *Ononis*, &c. to be attributed to a modification of this extractive principle? There are, in another view, roots which are tuberous, and furnish mankind with wholesome food, as *Láthyris tuberösus*, *Dólichos tuberösus*, and *D. bulbösus*, which last the Indians use for food. The roots of liquorice have a sweet and mucilaginous taste, which, united to

an acrid and rather exciting principle, causes it to be employed as a pectoral. It may be here added, that the sweet flavour of liquorice and its properties are not confined to the genus, but is found equally in the roots of many other plants of the order, as *A'brus precatorius*, various species of *Trifolium*, &c. The bark of some trees of leguminous plants is remarkable for its bitterness, and is used as febrifuges; the different kinds of *Geoffroya* and *Andira* possess this bitter and febrifugal quality in a remarkable degree. In India the barks of the *Agati grandiflora* and of the *Guilandina Bonducëlla* are employed for the same purpose. The barks of many leguminous plants are also remarkable for their astringent qualities, caused by the quantity of tannin which they are found to contain; this is observable in the *Acacia Catechu* and *A. Arabica*, which are used for tanning leather. It is well known that almost all colouring matter proceeds from the extractive principle, and this principle abounds in *Leguminosæ*. To this family belong the principal blue colours known by the name of Indigo, extracted from every kind of *Indigofera*, and from some *Tephrosias*; and the red colours are yielded by all the species of *Cæsalpinia*, and of *Hæmatoxylon* or Logwood. We may add the red juice which is drawn from the *Pterocarpus Dræco* and *Santalinus*, under the name of Sandal and Dragon's blood; from *Butea*, under the name of Gum lac, and also from *Dalbergia Monetaria*. The red juice of *Erythrophlëum* or Greec-tree, is used as an ordeal in Africa. These juices appear to differ in many particulars, but their history and analysis being unknown, it is impossible to form an estimate of the nature of their differences.

Among the exotic drugs employed in the arts, are the balsam of Copiva, produced by the *Copaifera*; the balsam of Peru, which Mutis says is produced by *Myrospërium peruviferum*, and the balsam of Tolu from *Myrospërium toluiferum*, the cachou, which has been found to be almost pure tannin, and which is supposed to be produced by *Acacia Catechu*. Of the same character is that remarkable resin that is yielded by *Hymenæa Courbaril*; gum Arabic, produced by the bark and roots of *Acacia vera*, *Sénegal*, *Arabica*, and others; gum tragacanth, obtained from *Astragalus Créticus*, *gummifer*, and *cerus*; and, finally, manna is secreted by *Alhagi Maurorum*.

It is remarkable that the botanical characters of *Leguminosæ* should so strictly agree with the properties of their seeds; the latter may be divided into two sections, namely, the first *Sarcolobæ*, or those of which the cotyledons are thick (f. 21. c. g.), and filled with fecula, and destitute of cortical pores, and which, moreover, in germination do not undergo any change, but nourish the young plant by means of that supply of food which they already contain; second, the *Phyllolobæ*, or those of which the cotyledons are thin (f. 21. c. f.), with a very little fecula, and furnished with cortical pores, and which change at once into leaves at the time of germination, for the purpose of elaborating food for the young plant. All the seeds of *Sarcolobæ* are used as food, in different countries, and none of those of *Phyllolobæ* are ever so employed.

M. de Candolle's arrangement of *Leguminosæ* being here adopted, it will be useful to explain the principles on which it is founded. He divides *Leguminosæ* into two grand divisions.

the first of which consists of plants, the radicle of whose embryo is curved back upon the edge of the cotyledons (f. 21. *b. c. f.*); the second, of those whose radicle and cotyledons are straight (f. 21. *i. k. l. m.*); the former is called *Curvémbriæ*, the latter *Rectémbriæ*. In the *Curvémbriæ* certain diversities in the structure of the calyx and corolla again divide into two principal forms, one of which, comprehending all the genera with papilionaceous flowers (f. 27.), is called *Papilionacææ*, and the other consisting of a very small number of species with 1 or 2 petals or more, and an obscurely lobed calyx, is called *Swartzicææ* (f. 52.). The last is not subdivided, but the *Papilionacææ* resolve themselves into two great tribes, namely, those with fleshy cotyledons (f. 21. *c.*) and eatable pulse called *Sarcólobææ*, and those with foliaceous cotyledons (f. 21. *a. f.*), and seeds which are not eatable, called *Phyllólobææ*, each of these is divisible by three upon slight differences in the fructification. In the *Rectémbriæ* two suborders, *Mimóscææ* (f. 53. f. 54.) and *Cæsalpiniææ* (f. 56. f. 57.), are formed upon variations in the æstivation of the calyx and corolla; in the former it is valvate, in the latter imbricated; the first constitutes a single tribe, the latter divides into three. Having thus explained the principles upon which *Leguminosææ* is arranged, the following synopsis of the genera will be intelligible.

#### *Synopsis of the Genera.*

##### DIVISION I.

**CURVÉMBRIÆ.** Radicle bent back upon the edge of the lobes of the cotyledons in embryo (f. 21. *b. c. f.*).

##### SUBORDER I.

**PAPILIONACÆÆ.** Embryo with the radicle lying in the fissure of the cotyledons (f. 21. *b. c. f.*). Sepals imbricate in æstivation or somewhat valvate. Petals disposed in a papilionaceous manner (f. 21. *b. f. 25. b. &c.*), always irregular, the upper one is called a vexillum (f. 21. *n.*), the two side ones wings (f. 21. *o.*), and the lower one, which is usually composed of 2 petals, the keel (f. 21. *p.*). Stamens inserted in the bottom of the calyx, or perigynous.

§ 1. *Phyllólobææ.* Cotyledons thin, leafy (f. 21. *a. f.*).

##### TRIBE I.

**SOPHOREÆ.** Flowers papilionaceous (f. 24. *b. f. 22. c. &c.*). Stamens 10, unconnected (f. 23. *f. f. 24. c.*). Legume continuous, not articulated (f. 22. *d.*). Cotyledons flat, leafy (f. 21. *a. f.*).

1 **MYROSPERMUM.** Calyx campanulate, 5-toothed, superior petal larger than the rest. Legume stipitate, naked at the base, and winged at the apex, indehiscent, 1-celled, 1-2-seeded. Seeds enveloped in balsamic juice. Trees, with pinnate leaves.

2 **SOPHORA.** Calyx 5-toothed (f. 22. *a.*), campanulate. Petals of keel usually concrete at the apex. Legume wingless, moniliform, many-seeded (f. 24. *d.*). Trees, with impari-pinnate leaves, and variable flowers.

3 **EDWARDSDIA.** Calyx oblique, 5-toothed. Petals connivent. Keel long. Legume moniliform, 2-valved, 4-winged, many-seeded. Shrubs, with impari-pinnate leaves, and yellow flowers.

4 **ORMOSIA.** Calyx 5-parted, bilabiate. Vexillum roundish, hardly longer than the keel and wings. Legume woody, com-

pressed, 2-valved, 1-3-seeded. Trees, with impari-pinnate leaves, and blue or purple flowers.

5 **VIRGILIA.** Calyx 5-cleft. Petals about equal in length. Vexillum flat. Legume compressed, oblong, 2-valved, many-seeded. Trees, with impari-pinnate leaves, and purplish and yellow flowers.

6 **MACRÓTROPIS.** Calyx cup-shaped, inflated, 5-toothed. Keel longer than the vexillum. Legume straight, compressed or subterete, many-seeded. Shrubs, with impari-pinnate leaves and white flowers.

7 **ANAGYRIS.** Calyx 5-toothed, somewhat bilabiate. Wings longer than the vexillum and keel. Legume on a short stipe, compressed, many-seeded, 2-valved. Shrubs, with trifoliate leaves and yellow flowers.

8 **PITTAETHUS.** Calyx 5-toothed, somewhat bilabiate at the apex. Vexillum with subincurved edges. Wings involute at the apex. Keel obtuse, bifid. Legume linear, stipitate, many-seeded. A shrub, with trifoliate leaves and yellow flowers.

9 **THERMÓPSIS.** Calyx campanulate, 4-5-cleft, somewhat bilabiate, convex behind. Petals nearly equal. Vexillum with reflexed sides. Legume compressed, falcate or linear, many-seeded. Perennial herbs, with trifoliate leaves and yellow flowers.

10 **BARTSIA.** Calyx half 4-5-cleft, bilabiate. Petals nearly equal. Vexillum with reflexed edges. Legume ventricose, pedicellate, many-seeded. Perennial herbs, with trifoliate, rarely simple leaves, and yellow and blue flowers.

11 **CYCLOPIA.** Calyx 5-cleft, thrust in at the base. Stigma bearded. Vexillum large. Wings with a transverse plait. Keel mucronate. Legume compressed, pedicellate, 1-celled, many-seeded, coriaceous. Shrubs, with sessile trifoliate leaves and yellow flowers.

12 **PODALYRIA.** Calyx 5-cleft, thrust in at the base. Vexillum large. Keel covered by the wings. Stamens rather connate at the base. Legume sessile, ventricose, many-seeded. Shrubs, with simple leaves and red or white flowers.

13 **CHORIZEMA.** Calyx half 5-cleft, bilabiate. Keel ventricose, shorter than the wings. Legume ventricose, 1-celled, many-seeded, sessile or subsessile. Shrubs, with simple, toothed or entire leaves, and yellow and red flowers.

14 **PODOLÓBIUM.** Calyx 5-cleft, bilabiate. Vexillum spreading. Legume stalked, linear-oblong, smooth inside, 4-seeded. Shrubs, with simple, lobed or entire leaves, and yellow and red flowers.

15 **OXYLÓBIUM.** Calyx deeply 5-cleft (f. 23. *a.*), somewhat bilabiate. Vexillum spreading (f. 23. *b.*). Legume sessile (f. 23. *d.*) or subsessile, many-seeded, ventricose, ovate, acute. Little shrubs, with whorled leaves and yellow flowers.

16 **CALLISTACHYS.** Calyx 5-cleft, bilabiate. Vexillum erect. Legume stipitate, woody, opening at the top, many-seeded. Shrubs, with entire, scattered, or whorled leaves, and yellow flowers.

17 **BRACHYSEMA.** Calyx 5-cleft, ventricose. Vexillum shorter than the wings or keel. Legume ventricose, many-seeded. Procumbent or climbing shrubs, with simple entire leaves, and scarlet or greenish-yellow flowers.

18 **GOMPHOLÓBIUM.** Calyx 5-parted. Vexillum spreading.

Legume many-seeded, rather spherical, and very obtuse. Shrubs, with impari-pinnate or palmately 3-5-foliate leaves, and yellow flowers.

19 BURTŌNIA. Calyx deeply 5-cleft. Petals about equal in length. Legume roundish, rather ventricose. Shrubs, with awl-shaped, trifoliate, sessile leaves, and yellow flowers.

20 JACKSŌNIA. Calyx 5-parted. Petals and stamens deciduous. Legume rather ventricose, ovate or oblong, with the valves pubescent inside. Shrubs, almost leafless in the adult state, with filiform branches, and yellow flowers.

21 VIMINARIA. Calyx 5-toothed, angular. Petals equal in length. Legume valvless, ovate. Shrubs, in the adult state leafless. Flowers yellow.

22 SPHEROLŌBIUM. Calyx 5-cleft, bilabiate. Legume spherical, 1-2-seeded, pedicellate. Shrubs, in the adult state nearly leafless, when present simple, with red or yellow flowers.

23 ADRUS. Calyx 5-cleft, bilabiate. Petals and stamens deciduous. Legume 2-valved, 1-2-seeded. Shrubs, with simple narrow leaves and yellow flowers.

24 DILLWYNIA. Calyx 5-cleft, bilabiate, tapering to the base. Vexillum large, 2-lobed. Legume ventricose, 1-2-seeded. Seeds strophiolate. Shrubs, with simple leaves and yellow flowers.

25 EUTA'XIA. Calyx 5-cleft, bilabiate. Vexillum broad. Legume rather ventricose, 1-2-seeded. Seed strophiolate. Shrubs, with simple leaves and yellow flowers.

26 SCLEROTHAMNUS. Calyx 5-cleft, bilabiate, bibracteate at the base. Keel length of wings. Legume ventricose, pedicellate, 2-seeded. A shrub, with simple leaves and yellow flowers.

27 GASTROLŌBIUM. Calyx 5-cleft, bilabiate. Keel length of wings. Legume ventricose, 2-seeded. Seeds strophiolate. Shrubs, with simple leaves, disposed 4 in a whorl, and yellow flowers.

28 EUCH'LUS. Calyx deeply 5-cleft, bibracteolate at the base, bilabiate, lower lobes setaceous. Keel length of wings. Legume compressed, pedicellate, 2-seeded. Seed strophiolate. Shrubs, with opposite simple leaves and yellow flowers.

29 PULTENÆA. Calyx 5-cleft, somewhat bilabiate (f. 24. a.), bibracteolate at the base. Legume sessile (f. 24. d.), 2-seeded. Shrubs, with simple alternate leaves.

30 DAVIESIA. Calyx angular, 5-toothed. Keel shorter than the wings. Legume compressed, angular, opening elastically at the lower suture, 2-seeded, pedicellate. Seeds strophiolate. Spiny or unarmed shrubs, with simple leaves, sometimes leafless, and yellow flowers.

31 MIRBELIA. Calyx 5-cleft, bilabiate. Legume 2-seeded, longitudinally 2-celled, from the suture being bent inwards above. Shrubs, with ternately verticillate leaves and purple flowers.

#### TRIBE II.

LOTEÆ. Corolla papilionaceous (f. 25. b.). Stamens 10, monadelphous (f. 25. c. f. 29. c.) or diadelphous, that is to say, 9 joined, and 1 free. Legume continuous, 1-celled (f. 29. d.), rarely 2-celled, from the upper suture being bent inwards. Cotyledons flat, foliaceous (f. 21. a. f.).

SUBTRIBE I. GENISTEÆ. Legume 1-celled (f. 26. d. f. 29. d.). Stamens usually monadelphous (f. 25. c. f. 27. d. f. 29. c.). Leaves simple or palmately trifoliate, rarely pinnate. Stems usually shrubby.

32 HŌVEA. Calyx 5-cleft, bilabiate (f. 25. a.). Keel obtuse (f. 25. f.). Stamens monadelphous (f. 25. c.), upper one more or less free. Legume sessile (f. 25. d.), roundish, ventricose, 2-seeded. Seeds strophiolate. Shrubs, with alternate simple leaves and purplish flowers.

33 PLACIOLŌBIUM. Calyx bilabiate (f. 26. a.), upper lip broad, retuse, lower one 3-parted. Keel obtuse (f. 26. c.). Stamens diadelphous, 9 joined, and 1 free. Legume oblique (f. 26. d.), coriaceous, ventricose, 2-seeded. Seeds strophiolate. Shrubs, with simple spiny-toothed leaves, and blue flowers.

34 PLATYLŌBIUM. Calyx 5-cleft, bracteate, bilabiate. Stamens all connected. Legume pedicellate, compressed, flat, many-seeded, winged on the back. Shrubs, with opposite simple leaves and yellow flowers, with the base of the vexillum red.

35 BOSSIAEA. Calyx 5-cleft (f. 27. a.), bilabiate. Stamens monadelphous (f. 27. d. f. 28. b.). Legume compressed (f. 28. c.), pedicellate (f. 27. c.), many-seeded, with the margins thickened on both sides. Seeds strophiolate. Shrubs, with flat or terete branches, and alternate simple leaves, when present, and yellow flowers, with the keel usually red or brown.

36 GOODIA. Calyx 5-cleft, bilabiate. Vexillum large, flat. Stamens all connected. Legumen pedicellate, compressed. Seeds strophiolate. Shrubs, with alternate, stalked, trifoliate leaves, and yellow flowers.

37 SCOTTEA. Calyx bracteate, 5-toothed. Stamens all connected. Vexillum very short. Legume stalked, compressed, thickened at the sutures. Seeds 3-4, strophiolate. Shrubs, with toothed simple leaves and reddish flowers.

38 TEMPLETONIA. Calyx 5-toothed. Stamens all connected, the tenth sometimes free. Keel oblong, rather longer than the wings. Legume pedicellate, compressed, many-seeded. Seeds strophiolate. Shrubs, with alternate, simple, wedge-shaped leaves and scarlet flowers.

39 RA'FNIA. Calyx cleft in 5 lobes to the middle, lowest lobe setaceous. Keel obtuse. Vexillum roundish. Stamens monadelphous. Legume lanceolate, compressed, many-seeded. Shrubs, with alternate simple leaves and yellow flowers.

40 VASCŌA. Calyx half 5-cleft. Lobes acute, not spinose. Vexillum roundish. Stamens monadelphous. Legume compressed, sessile, many-seeded. Shrubs, with simple, stem-clasping leaves, upper ones opposite, lower ones alternate, and yellow flowers.

41 BORBŌNIA. Calyx 5-cleft; lobes spiny at apex. Corolla villous. Vexillum emarginate. Keel obtuse. Stamens monadelphous. Legume linear, flat, many-seeded. Shrubs, with simple, alternate, stem-clasping leaves and yellow flowers.

42 ACHYRŌNIA. Calyx 5-toothed, lower tooth elongated and bifid. Stamens diadelphous. Legume compressed, many-seeded. Shrubs, with habit of last genus, with yellow flowers.

43 LIPARIA. Calyx thrust in at the base, 5-lobed, lower lobe very long, elliptic, petaloid. Corolla smooth. Keel acute.

Stamens diadelphous. Legume ovate, few-seeded. Shrubs, with lanceolate leaves, which are pungent at the apex, and fulvous flowers.

44 PRIESTLEYA. Calyx 5-lobed, subbilabiate. Corolla smooth. Wings falcate. Stamens diadelphous. Legume sessile, compressed, 4-6-seeded. Shrubs, with simple leaves and yellow flowers.

45 HA'LLIA. Calyx 5-cleft. Keel obtuse. Stamens monadelphous, entire. Legume membranous, 2-valved, 1-seeded. Suffruticose herbs, with simple leaves and purple flowers.

46 HEYLANDIA. Calyx 5-cleft. Keel obliquely truncate, acuminate. Stamens monadelphous, cleft in front. Legume compressed, 1-seeded. Suffruticose herbs, with cordate, roundish leaves and yellow flowers.

47 CROTALARIA. Calyx 5-lobed, subbilabiate. Vexillum cordate, large. Keel falcate, acuminate. Stamens monadelphous. Style bearded laterally. Legume turgid, with ventricose valves, usually many-seeded. Herbs or shrubs, with simple or palmately compound leaves and usually yellow flowers, rarely purplish.

48 CLAVULUM. Calyx 5-cleft, somewhat bilabiate. Vexillum somewhat plicate. Keel large, short. Wings short. Stamens monadelphous, with the tube cleft. Style acute. Legume inflated, many-seeded.

49 HYPOCALYPTUS. Calyx 5-lobed, thrust in at the base. Stamens monadelphous. Legume compressed, lanceolate. A smooth shrub, with trifoliate leaves and purple flowers.

50 VIBORGIA. Calyx tubular, 5-toothed. Vexillum obovate. Keel obtuse. Stamens monadelphous, cleft in front. Legume compressed, 1-seeded, winged on the upper side, and with ventricose valves. Shrubs, with trifoliate leaves and yellow flowers.

51 LODDIGESIA. Calyx rather inflated, acutely 5-toothed. Vexillum shorter than the wings or keel. Stamens monadelphous. Ovary oblong, 2-4-ovulate, compressed. Shrubs, with trifoliate leaves and reddish-white flowers.

52 DICHILIS. Calyx tapering at the base, 5-toothed, deeply bilabiate; teeth all acute. Vexillum shorter than the obtuse keel. Stamens monadelphous, with the sheath cleft in front. Ovary linear, 8-ovulate. A shrub, with trifoliate leaves and white or yellow flowers.

53 LEBECKIA. Calyx 5-cleft; lobes acute. Stamens monadelphous, with the sheath cleft in front. Legume cylindrical, many-seeded. Shrubs with the habit of *Genista*, with simple or trifoliate leaves and yellow flowers.

54 SARCOPHYLLUM. Calyx 5-parted, regular, 2 superior teeth divaricate. Keel obtuse. Stamens monadelphous. Legume compressed, elongated, falcate, many-seeded. A shrub, with fascicles of filiform fleshy leaves and yellow flowers.

55 ASPALATHUS. Calyx 5-toothed. Vexillum stipitate. Stamens monadelphous, with the sheath cleft in front. Legume oblong, few-seeded. Shrubs, with fascicled leaves, usually trifoliate and sessile, and usually yellow flowers.

56 ULEX. Calyx 5-toothed, hibracteate, 2-parted. Stamens monadelphous. Legume short, turgid, few-seeded. Shrubs, with spiny branches and leaves, and yellow flowers.

57 STAURACANTHUS. Calyx 5-toothed, bilabiate. Stamens monadelphous. Legume long, exserted, flat, many-seeded. Shrub with the habit of *Ulex*, with yellow flowers.

58 SPARTIUM. Calyx spathaceous, cleft above, 5-toothed, subbilabiate. Vexillum roundish. Keel acuminate. Stamens monadelphous. Legume compressed, many-seeded. Shrub, with lanceolate, scattered leaves and yellow flowers.

59 GENISTA. Calyx 5-toothed, bilabiate (f. 29. d.). Vexillum obtuse (f. 29. a.). Keel oblong (f. 29. b.). Stamens monadelphous (f. 29. c.). Legume compressed, rarely somewhat turgid (f. 29. d.), few or many-seeded. Unarmed or spiny shrubs, with simple or trifoliate leaves and yellow flowers.

60 CYTISUS. Calyx bilabiate, upper lip usually entire, lower one 3-toothed. Vexillum large. Keel obtuse. Stamens monadelphous. Legume compressed, many-seeded. Shrubs or trees, with trifoliate leaves, and yellow, purple, or white flowers.

61 ADENOCARPUS. Calyx 5-cleft, obconical, usually glandular, bilabiate. Keel obtuse. Stamens monadelphous. Legume oblong, flat, covered with pedicellate glands. Shrubs, with trifoliate leaves and yellow flowers.

62 ONONIS. Calyx campanulate, 5-cleft, with the segments linear. Vexillum large. Stamens monadelphous, one of which is sometimes nearly free. Legume usually turgid, few-seeded. Herbs or shrubs, with simple, trifoliate, rarely impari-pinnate leaves and variable flowers.

63 REQUIENIA. Calyx 5-toothed, acute. Keel obtuse. Stamens monadelphous, with the sheath cleft in front. Legume oval, compressed, 1-seeded. Shrubs, with bistipulate, obcordate, simple leaves.

64 ANTHYLLIS. Calyx tubular, 5-toothed, more or less inflated after flowering. Petals about equal in length. Stamens monadelphous. Legume ovate, 1-2-seeded, rarely oblong-linear and many-seeded, covered by the calyx. Shrubs or herbs, with trifoliate or impari-pinnate leaves, and yellow, white, or red flowers.

SUBTRIBE II. TRITOLIEÆ. Legume 1-celled (f. 30. c. f. 31. c.). Stamens diadelphous (f. 31. b.). Stems herbaceous, rarely frutescent. Leaves usually palmately 3-5-foliate, rarely impari-pinnate, primordial ones alternate.

65 MEDICAGO. Calyx subcylindrical, 5-cleft. Keel remote from the vexillum (f. 30. b.). Legume many-seeded, of various forms, usually spirally twisted (f. 30. c.). Herbs or shrubs, with yellow or red flowers.

66 HYMENOCARPUS. Calyx subcylindrical, 5-cleft. Keel remote from the vexillum. Legume membranous, compressed, arched. Herbs, with yellow flowers.

67 TRIGONELLA. Calyx campanulate, 5-cleft. Keel small, but with the wings and vexillum spreading, appearing like a 3-petalled corolla. Legume oblong, compressed, or cylindrical, many-seeded. Herbs, with yellow and white flowers.

68 РОСОЧКА. Calyx campanulate, 5-toothed. Keel shorter than the wings and vexillum. Legume longer than the calyx, membranous, compressed, winged. An upright herb, with yellow flowers.

69 *MELILÏTUS*. Calyx tubular, 5-toothed. Keel shorter than the wings or vexillum. Legume longer than the calyx, coriaceous, 1 or many-seeded, of various forms. Herbs, with yellow or white flowers.

70 *TRIFOLIUM*. Calyx tubular, 5-cleft (f. 31. a.). Keel shorter than the wings and vexillum. Legume small (f. 31. c.), hardly dehiscent, shorter than the calyx, usually ovate, 1-2-seeded, rarely oblong, 3-4-seeded, and a little longer than the calyx. Herbs, with variable flowers.

71 *ACROPODIUM*. Calyx 5-cleft. Vexillum short, hispid. Wings bidentate. Stamens diadelphous. Legume ovate-oblong, usually 2-seeded, stalked. A subshrub, with fascicled leaves, and 3-flowered axillary racemes.

72 *DORYCNium*. Calyx subcampanulate, bilabiate, rather gibbous at the base. Wings shorter than the vexillum. Keel almost mutic. Stigma capitate. Herbs or subshrubs, with white or red flowers.

73 *LÏTUS*. Calyx tubular, 5-cleft. Wings and vexillum nearly equal. Keel beaked. Legume cylindrical or compressed, wingless. Stigma subulate. Herbs, usually with yellow flowers.

74 *TETRAGONOLobus*. Calyx tubular, 5-cleft. Wings shorter than the vexillum. Keel beaked. Stigma funnel-shaped, at length obliquely beaked. Legume furnished with 4 marginal wings. Herbs, with red or yellow flowers.

75 *HOSA'CKIA*. Calyx campanulate, 5-cleft (f. 32. a.). Wings equal in length to the vexillum (f. 32. b.). Keel beaked. Stigma capitate. Legume cylindrical, or rather compressed, straight. Herbs, with impari-pinnate leaves, and variegated flowers.

76 *CARMICHELIA*. Calyx cup-shaped, 5-toothed. Vexillum broad. Ovary many-seeded. Legume few-seeded, with the valves separating at both margins, leaving the dissepiments upon the plant after the seeds have fallen. A shrub, with flat branches and blue flowers, and the leaves pinnate when present.

77 *CYAMOPsis*. Calyx turbinate-tubular, 5-cleft; lobes lanceolate-awl-shaped, 2 upper ones remote. Flowers with a roundish vexillum, oblong wings, and a 2-petalled, straight, acute keel, all nearly equal in length. Stamens monadelphous. Stigma capitate. Legume compressed, many-seeded. An herb, with purple flowers.

**SUBTRIBE III. CLITÏRIÆ.** Legume 1-celled (f. 34. c.). Stamens usually diadelphous (f. 34. d.). Stems herbaceous or suffrutescent, usually climbing. Leaves various, primordial ones opposite. Flowers usually blue, red, or purple, rarely yellow.

78 *PSORA'LEA*. Calyx tubular, 5-cleft, usually glandular; lobes acuminate, lowest one longest. Legume valveless, 1-seeded, length of calyx. Shrubs or herbs. Flowers blue.

79 *INDIGÏFERA*. Calyx 5-cleft; lobes acute. Vexillum roundish, emarginate (f. 33. a.). Keel having an awl-shaped spur on both sides. Legume terete (f. 33. c.), flat, or tetragonal, 2-valved, rarely few-seeded, usually many-seeded. Herbs or shrubs, with simple, impari-pinnate or trifoliate leaves, and red, blue, or white flowers.

80 *OU'STROPIs*. Calyx tubular, 5-cleft. Wings equal in length to the vexillum. Keel blunt, with an auricle on each

side. Legume compressed, 2-valved, 3-4-celled; cells 1-seeded. A prostrate herb, with trifoliate leaves, and heads of red flowers.

81 *CLITÏRIA*. Calyx bibracteate at the base, 5-cleft (f. 34. a.). Vexillum large (f. 34. b.). Stamens and petals inserted above the base of the calyx. Style rather dilated at the apex. Legume linear (f. 34. c.), compressed, 2-valved, 1-celled, many-seeded. Climbing herbs, with trifoliate or impari-pinnate leaves. Flowers large, white, blue, or purple.

82 *NEUROCARPUM*. Calyx tubular, with 5 acuminate, nearly equal teeth, and furnished with 2 bracteas at the base. Vexillum large, roundish. Keel obtuse. Legume stipitate, compressed, sub-tetragonal, from the middle nerve of the valves being rather prominent, 4-8-seeded. Usually climbing subshrubs, with trifoliate leaves, and large white or purplish flowers.

83 *MARTIUSIA*. Calyx tubular, somewhat bilabiate, with 5 acute teeth, lowest one longest. Corolla none. Stamens 4, 2 fertile and 2 sterile, distinct. Legume stipitate, compressed, somewhat tetragonal in consequence of the valves being furnished with a prominent middle nerve. A climbing shrub, with trifoliate leaves.

84 *COLOGA'NIA*. Calyx tubular, 5-cleft, bibracteate at the base, somewhat bilabiate. Vexillum roundish. Ovary stipitate, linear, very hispid, girded by the disk. Style smooth, obtuse. Procumbent or twining herbs, with simple or trifoliate leaves, and violaceous flowers.

85 *GALA'CTIA*. Calyx bibracteate at the base, 4-cleft. Petals 5, oblong, distinct, with the vexillum broader than the rest. Stigma obtuse. Legume terete or compressed, many-seeded, elongated. Climbing herbs or subshrubs, with trifoliate or impari-pinnate leaves, and usually red flowers.

86 *ODÏNIA*. Calyx 4-parted. Vexillum erectly spreading. Wings having a tooth each at the apex. Keel 2-parted, reflexed, remote from the vexillum. Legume compressed, usually 8-seeded. A twining herb, with trifoliate leaves.

87 *STEGANÏTROPIs*. Calyx 5-toothed, bibracteate, permanent. Vexillum cucullate, bicallous at the base, and spurred behind, inclosing the wings and keel, which are membranous. Style membranous, dilated and bearded at the apex. Legume linear, many-seeded. A twining herb, with ternate leaves, and 2-flowered peduncles.

88 *VILMORINIA*. Calyx cylindrical, 4-toothed, somewhat bilabiate. Wings shorter than the keel. Style acute. Legume stalked, lanceolate, compressed, tapering. A shrub, with impari-pinnate leaves, and purple flowers.

89 *DIPLONYX*. Calyx urceolate, bilabiate. Vexillum reflexed, standing on a glandular claw. Wings biauriculate. Keel biauriculate. Stamens diadelphous. Legume terete, many-seeded. A twining shrub, with impari-pinnate leaves, and axillary racemes of violaceous flowers.

90 *BARBÏERIA*. Calyx tubular, 5-cleft, bibracteate at the base. Wings shorter than the keel and keel shorter than the vexillum. Style bearded at the apex. Stigma obtuse. Legume linear, villous, many-seeded. A shrub, with impari-pinnate leaves, and scarlet-purplish flowers.

91 *KIESE'RIA*. Calyx campanulate, gibbous at the base, 5-toothed, lower tooth longer and keeled. Vexillum orbicular.

Stamens diadelphous. Style villous in front. Legume linear, compressed, hooked at the end, many-seeded. A tomentose herb, with pinnate leaves, and racemes of white flowers.

92 GRONA. Calyx 4-cleft; upper lobe emarginate. Wings obtuse. Vexillum obcordate. Keel concave, adnate to the middle of the wings. Stigma simple. Legume linear, compressed, many-seeded. A prostrate shrub, with simple leaves, and purple flowers.

93 COLLEA. Calyx 5-cleft; upper lobe a little broader than the rest. Petals unguiculate. Vexillum biauriculate at the base. Stigma capitate. Legume compressed, tomentose, 4-6-seeded. Shrubs, with trifoliate leaves, and purple flowers.

94 OTOPTERA. Calyx 5-cleft, 2 superior lobes approximate. Vexillum large, roundish. Wings oblong, furnished with an auricle on the stipe. Keel 2-edged. Stigma bilabiate, obtuse. Ovary linear, straight, compressed, many-ovulate. A twining shrub, with trifoliate leaves, and purplish flowers.

95 PUERA'RIA. Calyx bilabiate, upper lip entire or hardly bidentate, lower one trifid. Keel obtuse. Vexillum obovate. Stamens monadelphous. Legume compressed, stipitate, many-seeded. Climbing shrubs, with trifoliate leaves, and yellowish flowers.

96 DUMA'SIA. Calyx obliquely truncate, toothless, bibracteate at the base. Claws of petals length of calyx. Keel obtuse. Legume tapering to the base, compressed, few-seeded. Climbing herbs, with trifoliate leaves, and purplish or yellow flowers.

97 GLYCINE. Calyx 5-cleft, somewhat bilabiate. Style acute. Legume linear, compressed, straight, many-seeded, hooked at the end. Climbing herbs, with trifoliate leaves, and usually yellowish flowers.

98 CHETO'CALYX. Calyx bilabiate, with awl-shaped segments, those of the upper lip recurved and those of the lower lip adpressed, beset with glandular bristles. Vexillum roundish, emarginate. Keel conforming to the wings. Ovary linear, many-seeded. Style filiform, villous. A climbing shrub, with imparipinnate leaves, and yellow flowers.

SUBTRIBE IV. GALE'GÆ. Legume 1-celled (f. 36. c. f. 37. c.). Stamens diadelphous, rarely monadelphous. Stems herbaceous, shrubby, or arborescens. Leaves alternate or opposite, usually imparipinnate.

99 PETALOSTEMUM. Calyx 5-cleft or 5-toothed. Petals unguiculate, like each other in shape. Stamens 5, monadelphous. Vexillum conduplicate, free. Legume covered by the calyx, 1-seeded, indehiscent. Herbs, with white or purple flowers.

100 DA'LEA. Calyx 5-cleft (f. 36. a.), or 5-toothed. Wings and keel adnate to the base of the stamens (f. 36. b.). Vexillum short, free. Stamens 10, monadelphous. Legume ovate, 1-seeded (f. 36. c.), shorter than the calyx. Herbs, with white or blue flowers.

101 GLYCYRH'IZA. Calyx tubular, 5-cleft, bilabiate, especially the 2 upper lobes are joined together, higher up than the others. Vexillum ovate-lanceolate. Keel 2-edged or 2-petalled, acute. Legume ovate or oblong, compressed, 1-4-seeded. Herbs, with sweet roots, and bluish or white flowers.

102 GALE'GA. Calyx of 5 awl-shaped, equal teeth. Vexillum obovate-oblong. Keel obtuse. Stamens monadelphous. Stigma dot-formed. Legume terete, tomentose. Herbs, with blue, red, or white flowers.

103 CALLÓTROPIS. Calyx of 5 equal filiform teeth. Vexillum erect, ovate. Wings shorter than the keel, which is incurved. Style incurved, tipped by a hairy stigma. Stamens diadelphous, the 9 joined ones incurved. Legume stipitate, compressed, tapering to both ends, many-seeded. Herbs, with blue flowers.

104 TEPHRÓSIA. Calyx 5-toothed (f. 37. a.). Vexillum large (f. 37. b.), roundish, silky or pubescent outside, reflexed. Wings adhering to the obtuse keel. Stamens either monadelphous or diadelphous. Legume compressed, linear, many-seeded (f. 37. c.). Shrubs or herbs, with purple or white flowers.

105 AMÓRPHIA. Calyx 5-toothed. Vexillum ovate, concave. Wings and keel wanting. Stamens exserted, monadelphous at the base. Legume compressed, ovate, or lunulate, 1-2-seeded. Shrubs, with bluish-purple flowers.

106 EYSENIA'RDIA. Calyx campanulate, 5-toothed, upper teeth more remote, lowest one longest. Vexillum oblong, distinct from the keel. Ovary biovulate. Style hooked at the apex. A tree, with white flowers.

107 NISSÓLIA. Calyx campanulate, 5-toothed. Stamens monadelphous, with a dorsal fissure, or diadelphous. Legume stipitate, ending in a leafy wing, 1 or many-seeded. Climbing shrubs.

108 MULLE'RA. Calyx campanulate, 5-toothed, circumscribed at the base after flowering. Petals deciduous. Stamens 8-10, monadelphous, falling off with the calyx. Legume moniliform; links 1-5, distinct, indehiscent, 1-seeded. A tree.

109 LONCHOCARPUS. Calyx urceolate, 5-toothed. Vexillum orbicular, about equal in length with the wings and keel. Stamens monadelphous and diadelphous. Legume on a short stipe, flat, membranous, 4-8-seeded. Trees, with purplish flowers.

110 ROBÍNIA. Calyx 5-toothed; teeth lanceolate, 2 superior ones shorter and approximate. Vexillum large. Keel obtuse. Stamens deciduous. Style bearded in front. Legume nearly sessile, many-seeded, margined at the seminiferous suture. Spiny trees, with white or rose-coloured flowers.

111 POITAEA. Calyx obliquely truncate, 5-toothed, 2 upper teeth very short. Petals connivent. Vexillum retuse, shorter than the wings, but with the keel longer than the wings. Stamens a little exserted. Legume stipitate, mucronate, compressed, many-seeded. Shrubs, with white or red flowers.

112 SABINEA. Calyx cup-shaped, with a truncate somewhat entire margin. Keel very blunt, rather shorter than the vexillum. Legume compressed, elongated, mucronate, many-seeded. Shrubs, with abruptly-pinnate leaves, and purplish flowers.

113 COURSE'TIA. Calyx 5-cleft, 2 superior lobes shorter than the rest, and joined together a little higher. Vexillum obcordate. Keel obtuse, shorter than the wings. Style bearded at the apex. Stigma capitate. Legume compressed, 5-8-seeded, mucronate. Woolly trees, with abruptly pinnate leaves, and yellow flowers.

114 SESBA'NIA. Calyx 5-cleft, or 5-toothed (f. 38. a.). Vexillum roundish, complicated (f. 38. b.), larger than the keel,

which is obtuse, and 2-edged at the base. Sheath of stamens bilauriculate at the base. Legume elongated, slender (f. 38. c.). Shrubs or herbs, with abruptly pinnate leaves, and usually with yellow flowers.

115 ΑΓΑΤΙ. Calyx campanulate, bluntly 5-toothed. Vexillum oval-oblong, shorter than the oblong wings. Keel large, straight. Sheath of stamens furnished with large auricles. Legume stipitate, compressed, transversely many-celled. Trees, with abruptly pinnate leaves, and red flowers.

116 ΓΛΟΤΤΙΔΙΟΝ. Calyx 5-toothed, somewhat bilabiate, lower teeth longer than the rest. Vexillum kidney-shaped. Legume stipitate, compressed, 1-celled, 2-seeded. Herbs, with simple and abruptly-pinnate leaves, and yellow flowers.

117 ΠΙΣΚΙΔΙΑ. Calyx campanulate, 5-cleft. Keel obtuse. Legume stalked, linear, having 4 membranous wings, with the seeds interrupted by spongy substance. Trees, with white flowers variegated with red.

118 ΔΑΥΒΕΝΤΟΝΙΑ. Calyx campanulate, 5-toothed. Keel very blunt. Vexillum roundish, stipitate. Legume stalked, oblong, compressed, furnished with 4 wings, and with the seeds interrupted by spongy substance. Shrubs, with abruptly pinnate leaves, and yellow or scarlet flowers.

119 ΚΟΡΥΝΕΛΛΑ. Calyx somewhat bilabiate, 5-toothed. Petals with short claws. Keel obtuse. Style clavate. Legume lanceolate, compressed, marginate, many-seeded. Shrubs, with abruptly pinnate leaves and purplish flowers.

120 ΚΑΡΑΓΑΝΑ. Calyx tubular, 5-toothed. Wings and vexillum about equal in length. Stigma truncate. Legume sessile and subterete, many-seeded. Shrubs, with abruptly pinnate leaves, and yellow and white flowers.

121 ΗΑΛΙΜΟΔΕΝΔΡΟΝ. Calyx campanulate, 5-toothed. Keel obtuse. Wings acute, auricled. Legume stipitate, inflated, ovate, few-seeded, depressed at the seminiferous suture. A shrub, with abruptly pinnate leaves, and purplish flowers.

122 ΔΙΡΗΥΣΑ. Calyx 5-cleft, 2 upper lobes roundish. Vexillum obovate, reflexed. Wings flat. Keel falciform. Legume linear, compressed, 5-6-seeded, furnished with a large membranous vesicle at each side on the sutures, opposite each other. Shrubs, with yellow flowers.

123 ΚΑΛΟΨΗΑΚΑ. Calyx 5-cleft; lobes acuminate. Keel obtuse. Style hairy, incurved at the apex. Legume sessile, oblong, nearly terete, mucronate, hairy. A shrub, with yellow flowers.

124 ΚΟΛΥΤΕΑ. Calyx 5-toothed. Vexillum bicallous, larger than the obtuse keel. Stigma lateral, hooked. Style bearded behind. Legume stipitate, boat-shaped, inflated. Shrubs, with yellow flowers.

125 ΣΦΑΙΡΟΦΥΣΑ. Calyx 5-toothed. Vexillum broad. Keel obtuse. Style bearded lengthwise. Legume stipitate, inflated, spherical. Herbs, with red flowers.

126 ΣΒΑΙΝΣΟΝΙΑ. Calyx bicallous, 5-toothed. Vexillum large. Keel obtuse, rather longer than the wings. Style bearded lengthwise behind. Shrubs, with purple, scarlet, and white flowers.

127 ΛΕΣΣΕΡΤΙΑ. Calyx half 5-cleft. Vexillum broad. Keel

obtuse. Stigma capitate. Style with a transverse beard in front. Legume indehiscent, compressed, or inflated. Herbs or subshrubs, with nodding purple flowers.

128 ΣΥΤΗΡΛΑΝΔΙΑ. Calyx 5-toothed. Vexillum with replicate sides. Keel oblong. Wings very short. Style bearded lengthwise behind. Legume inflated. Shrubs, with scarlet flowers.

SUBTRIBE V. ΑΣΤΡΑΓΑΛΕÆ. Legume (f. 39. c. f. 40. c.) bilocular or half bilocular from one of the sutures being bent inwards lengthwise. Stamens diadelphous, 9 joined and 1 free. Stems herbaceous or suffrutescent. Leaves impari-pinnate, primordial ones alternate.

129 ΠΗΛΕΑ. Calyx 5-toothed (f. 39. a.), 2 upper teeth remote. Keel obtuse (f. 39. b.). Stigma capitate. Legume somewhat turgid (f. 39. c.), 1-celled, upper suture tumid, seminiferous. Herbs, with yellow or white flowers.

130 ΟΞΥΤΡΟΠΙΣ. Calyx 5-toothed (f. 40. a.). Keel ending on the back in a mucrone. Legume turgid (f. 40. c.). Herbs, with radicle spikes of white or blue flowers.

131 ΑΣΤΡΑΓΑΛΟΣ. Calyx 5-toothed. Keel obtuse. Herbs or subshrubs, with blue, purple, red, white, or yellow flowers.

132 ΓΟΥΔΕΝΣΤΕΔΤΙΑ. Calyx campanulate, bibracteate at the base, 5-cleft, 2 superior segments broadest. Vexillum entire, about the length of the wings. Keel minute. Legume subcylindrical, 1-celled, many-seeded. Stemless herbs, with simple or impari-pinnate leaves, and red or violaceous flowers.

133 ΒΙΣΕΡΡΕΛΙΑ. Calyx 5-cleft. Keel obtuse. Legume depressed, flat, sinuately toothed on the back. An herb, with blue flowers.

### TRIBE III.

ΗΕΔΥΣΑΡΕÆ. Embryo with the radicle bent back upon the edge of the cotyledons (f. 21. c. f.). Corolla papilionaceous (f. 42. b.). Stamens rarely free, usually monadelphous (f. 43. c.) or diadelphous, 9 joined and 1 free (f. 44. d.), or 5 in each bundle. Legume dividing transversely into 1-seeded cells or joints (f. 41. e.). Cotyledons flat (f. 21. f.). This tribe is easily distinguished from the rest in the legumes dividing transversely into joints or cells.

SUBTRIBE I. ΚΟΡΟΝΙΛΛΕÆ. Flowers umbellate (f. 41. b. f. 42. b.). Legume terete (f. 41. c.) or compressed. Stamens diadelphous, 9 joined and 1 free.

134 ΣΚΟΡΠΙΟΥΡΟΣ. Calyx with 5 acute lobes. Keel 2-edged. Style acute. Legume revolute, rather spiral, 3-6-jointed, mucronated. Herbs, with simple leaves, and yellow flowers.

135 ΚΟΡΟΝΙΛΛΑ. Calyx 5-toothed (f. 41. a.), 2 upper teeth approximate. Petals unguiculate. Keel acute. Legume rather terete, many-jointed (f. 41. e.). Shrubs or herbs, with impari-pinnate leaves, and yellow, white, or purple flowers.

136 ΑΣΤΡΟΛΟΒΙΟΝ. Calyx 5-toothed. Keel small, compressed. Legume rather terete, many-jointed. Herbs with impari-pinnate leaves, and yellow flowers.

137 ΟΡΝΙΘΙΟΠΟΣ. Calyx bracteate, 5-toothed. Keel small,

compressed. Legume compressed, many-jointed. Herbs, with impari-pinnate leaves, and white or rose-coloured flowers.

138 *HIPPOCREPIS*. Calyx 5-cleft (f. 42. a.), lobes acute. Keel 2-edged (f. 42. d.). Style acute. Legume curved, many-jointed (f. 42. e.). Herbs, with impari-pinnate leaves, and yellow flowers.

139 *SECURIGERA*. Calyx bilabiate, lower lip 3-parted, upper one bidentate. Petals unguiculate. Keel acute. Legume compressed, ending in a long beak. An herb, with impari-pinnate leaves, and yellow flowers.

**SUBTRIBE II. EUHEDYSA'REÆ.** *Flowers disposed in racemes* (f. 43. g. f. 44. c.). *Legumes compressed* (f. 43. i. f. 44. g.).

140 *DIPHACA*. Calyx 5-cleft, bibracteate at the base. Stamens disposed in two 5-anthered bodies. Legume compressed, jointed. A shrub, with impari-pinnate leaves.

141 *PICTETIA*. Calyx 5-cleft, 2 upper lobes obtuse, 3 lower ones spiny. Vexillum roundish, complicated. Keel obtuse, a little shorter than the wings. Stamens diadelphous (9-1). Legume stipitate, compressed, few-seeded. Shrubs, with impari-pinnate leaves and yellow flowers.

142 *ORMOCARPUM*. Calyx bracteate, 5-cleft; lobes acute. Vexillum broad, entire. Keel obtuse, 2-edged. Stamens diadelphous (9-1). Legume stipitate, many-jointed. Shrubs, with simple or impari-pinnate leaves, and yellow flowers.

143 *AMICIA*. Calyx 5-cleft, very unequal. Vexillum orbicular. Wings applied to the keel. Stamens monadelphous, with the sheath cleft in front. Legume linear, compressed, many-jointed. Climbing shrubs, with abruptly-pinnate leaves, and yellow flowers.

144 *POIRETIA*. Calyx bilabiate; upper lip bidentate, lower one 3-toothed. Vexillum semiorbicular, emarginate, with reflexed sides. Wings spreading. Stamens 8-10, monadelphous, with the tube cleft above. Stigma capitate. Legume compressed, 3-4-jointed. Climbing shrubs, with abruptly-pinnate leaves.

145 *PLANARIUM*. Calyx subcampanulate. Stamens diadelphous. Legume stipitate, compressed, 8-jointed, marked with a prominent nerve on the sides. A climbing shrub, with impari-pinnate leaves.

146 *MYRIADENUS*. Calyx inclosed in 2 opposite, leafy bractes, 5-toothed. Legume many-seeded. An herb, with abruptly-pinnate leaves, and yellow flowers.

147 *ZORNIA*. Calyx bilabiate; upper lip emarginate; lower one trifid. Vexillum with revolute edges. Keel bifidly lunulate. Stamens monadelphous. Legume compressed, 3-5-jointed. Leaves with 2-4 leaflets, and yellow flowers.

148 *STYLOSANTHES*. Calyx long, tubular, 5-parted, unequal. Petals inserted in the tube of the calyx. Keel minute, bifid at the apex. Style very long. Stamens monadelphous, with the tube cleft. Stigma capitate, hispid. Legume 2-jointed. Herbs or subshrubs, with trifoliate leaves, and yellow flowers.

149 *ADESMIA*. Calyx 5-cleft; lobes acute. Vexillum complicated above the wings when young. Keel curved and truncate at the apex. Stamens distinct, but approximate. Legume

compressed, many-jointed. Herbs, with abruptly-pinnate leaves, and usually yellow flowers.

150 *ÆCHYNOMENE*. Calyx 5-cleft, bilabiate; upper lip bifid or bidentate, lower one 3-toothed. Stamens 10, diadelphous in 2 equal bundles. Legume compressed, jointed, straight. Herbs or shrubs, with impari-pinnate leaves, and usually yellow flowers.

151 *SMITHIA*. Calyx bipartite. Stamens diadelphous, divided in 2 equal bundles. Legume plicate, jointed, inclosed in the calyx. Herbs, with impari-pinnate leaves, and yellow flowers.

152 *LOUREA*. Calyx campanulate, 5-cleft (f. 43. a.), when in fruit inflated. Vexillum obcordate (f. 43. d.). Keel obtuse (f. 43. b.). Legume 4-6-jointed (f. 43. i.), plaited, or rather spiral (f. 43. i.). Herbs, with simple or trifoliate leaves, and white or purple flowers.

153 *URARIA*. Calyx 5-cleft; segments setaceous. Legume with few joints, plaited, or rather spiral. Herbs or subshrubs, with impari-pinnate, ternate, or simple leaves, and purplish or yellow flowers.

154 *NICOLSØNIA*. Calyx 5-parted; segments subulate, bearded. Corolla shorter than the calyx. Legume straight, exserted, compressed, many-jointed. Herbs, with trifoliate leaves, and bluish-purple flowers.

155 *DESMODIUM*. Calyx bibracteolate at the base, obscurely bilabiate; upper lip bifid, lower one 3-parted (f. 44. a.). Vexillum roundish (f. 44. c.). Keel obtuse (f. 44. b.), shorter than the wings. Legume compressed, many-jointed (f. 44. g.); joints separating at maturity. Herbs or shrubs, with trifoliate, rarely simple leaves, and purple, blue, or white flowers.

156 *DICERMA*. Calyx bibracteolate, bilabiate; upper lip entire, lower one trifid. Vexillum obovate, about equal in length to the keel and wings. Keel obtuse. Legume 2-3-jointed. Shrubs, with trifoliate leaves, and yellow flowers.

157 *TAVERNIERA*. Calyx bibracteolate, half 5-cleft; segments lanceolate-linear. Vexillum somewhat obovate. Wings shorter than the calyx. Keel obtuse. Style long, flexuous. Legume of 2 orbicular, flat joints. Shrubs, with simple or trifoliate leaves, and rose-coloured or yellow flowers.

158 *HEDYSARUM*. Calyx 5-cleft; segments linear-awl-shaped. Vexillum large. Keel obliquely truncate, longer than the wings. Legume many-jointed, compressed. Herbs or subshrubs, with impari-pinnate leaves, and rather large, purple, white, or cream-coloured flowers.

159 *ONOBRYCHIS*. Calyx 5-cleft; segments subulate. Keel obliquely truncate. Wings short. Legume sessile, compressed, 1-seeded, echinated, crested or winged. Herbs, with impari-pinnate leaves, and red or white flowers.

160 *ELIOTIS*. Calyx campanulate, truncate, hardly 5-toothed. Vexillum obovate. Keel obtuse. Legume compressed, 1-celled, 1-seeded, rather membranous. Herbs, with trifoliate leaves, and yellow flowers.

161 *LESPEDeza*. Calyx 5-parted, bracteate at the base. Keel transversely obtuse. Legume 1-seeded, compressed, unarmed. Herbs and subshrubs, with trifoliate leaves, and purplish or cream-coloured flowers.

162 *E'GENUS*. Calyx 5-cleft, with the tube at length rather

ventricose; segments linear-awl-shaped, equal in length to the corolla. Wings small, shorter than the tube of the calyx. Stamens monadelphous. Legume roundish, 1-2-seeded. Leaves usually impari-pinnate, and flowers red.

163 FLEMINGIA. Calyx acutely 5-cleft; lower segment longest. Vexillum striated. Legume sessile, oval, turgid, 2-valved, 1-celled, 2-seeded. Herbs or subshrubs, with simple or trifoliate leaves, and red or purple flowers.

SUBTRIBE III. ALHAGEÆ. *Flowers disposed in racemes (f. 45. h.) or spikes. Legumes rather terete (f. 45. d.).*

164 ALHAGE. Calyx 5-toothed. Petals equal in length. Vexillum obovate, complicate. Keel straight, obtuse. Style filiform, acute. Legume stipitate, terete, few-seeded, not articulated. Subshrubs or herbs, with simple leaves, and red flowers.

165 ALYSICARPUS. Calyx campanulate, 5-cleft (f. 45. a.). Legume many-jointed, terete (f. 45. d.) or somewhat compressed. Herbs, with simple leaves, and yellow or purple petals, which are hardly longer than the calyx.

166 BREMONTIERA. Calyx campanulate, subtruncate, hardly 5-toothed. Corolla 3 times longer than the calyx. Legume many-jointed, somewhat compressed. Shrubs, with simple leaves, and small purple flowers.

§ 2. SARCLOBÆ. *Embryo with thick fleshy cotyledons (f. 21. b.).*

#### TRIBE IV.

VICIEÆ. *Corolla papilionaceous (f. 46. d.). Stamens diadelphous (f. 46. g.), that is, 9 joined together, and 1 free. Cotyledons thick, mealy, not changing even in germination, when above the earth, but remaining inclosed in the spermaderm. Radicle curved inwards (f. 21. f.). The leaves of all are abruptly pinnate (except in Cicer), and the common petiole either terminates in a bristle or tendril, and it is not articulated above the stem.*

167 CICER. Calyx 5-lobed, with the tube rather gibbous at the base, 2 or 4 of the upper lobes lying over the vexillum. Legume turgid, few-seeded. Tendrilled herbs, with white flowers, and impari-pinnate or abruptly-pinnate leaves.

168 FAABA. Character the same as that of *Vicia*, but the legume is large and coriaceous, containing large flat seeds, and the leaves are almost without tendrils, and the stem is erect. Flowers white or red.

169 VICIA. Calyx tubular, 5-cleft (f. 46. a.) or 5-toothed, 2 superior teeth shortest. Style villous at the apex (f. 46. f.). Legume many-seeded (f. 46. h.). Usually climbing herbs, with the leaves generally ending in a branched tendril (f. 46. i.). Flowers white, purple, or yellow.

170 ERVUM. Calyx 5-cleft, with linear acute segments, about equal in length to the corolla. Stigma smooth. Legume oblong, 2-4-seeded. Tendrilled herbs, with small white flowers.

171 PISUM. Calyx 5-cleft; segments leafy, 2 superior ones shortest. Style compressed, keeled, villous above. Legume rather compressed. Seeds globose. Climbing tendrilled herbs, with white or purple flowers.

172 LA'THYRUS. Calyx campanulate, 5-cleft, 2 superior lobes shortest. Style flattened, dilated at the apex, villous or pubescent in front. Legume many-seeded. Usually climbing tendrilled herbs, with purple, white, or yellow flowers.

173 OCHRUS. Calyx campanulate, 5-cleft, 2 upper segments conniving. Vexillum furnished with a tooth on each side. Style flattened, villous above. Legume few-seeded, winged on the seminiferous suture. An herb, with bifoliate tendrilled leaves, and solitary white flowers.

174 OROBUS. Calyx campanulate, 5-cleft, 2 superior lobes shortest. Style slender, linear, villous at the apex. Legume cylindrical, many-seeded. Erect herbs, with the leaves having one or many pairs of leaflets, and with the common petiole ending in a bristle. Flowers of various hues.

175 PLATYSTYLIS. Calyx campanulate, 5-cleft, 2 superior lobes shortest. Style broad-spatulate, villous at the apex. Legume oblong, many-seeded. Erect herbs, with abruptly-pinnate few-paired leaves, ending in a simple tendril at the apex. Flowers bluish-purple.

#### TRIBE V.

PHASEOLEÆ. *Corolla papilionaceous (f. 47. c. f. 48. b.). Stamens monadelphous (f. 47. g.), but usually diadelphous (f. 48. c. f.), that is, 9 joined together, and 1 free. Legume many-seeded (f. 49. c.), dehiscent, with a cellular transverse membrane between each seed, usually subdivided, but not articulated. Radicle bent in above the fissure of the lobes of the cotyledons (f. 21. e. f.). Cotyledons not changing by germination (f. 21. c.), but grow into thick leaves, and when above the earth they are usually exerted beyond the spermaderm. Primordial leaves opposite, the rest with the leaflets usually pinnately, rarely palmately disposed.*

176 ABRUS. Calyx obsolete 5-lobed, upper lobe broadest. Vexillum acute. Stamens 9 joined, the 10th wanting. Stigma obtuse. Legume compressed, 4-6-seeded. Seeds intercepted by cellular substance. Twining shrubs, with abruptly-pinnate leaves.

177 SWEETIA. Calyx 4-cleft; lobes lanceolate, acuminate. Vexillum wedge-shaped. Keel bluntly 2-edged. Stamens diadelphous. Legume linear, compressed, many-seeded. Twining slender herbs, suffruticose at the base, with trifoliate leaves, and purple flowers.

178 MACRANTHUS. Calyx tubular, 4-cleft; lobes acute, 2 lateral ones shortest. Vexillum emarginate, concave. Stamens diadelphous. Style pilose. Stigma obtuse. Legume straight, nearly terete, thick, many-seeded. A twining herb, with trifoliate leaves, and white flowers.

179 ROTHIA. Calyx 5-cleft, 2 superior segments coadunate and arched. Vexillum deflexed. Keel 2-edged. Stamens monadelphous, with the sheath cleft behind. Legume linear-ensiform, many-seeded. A prostrate herb, with trifoliate leaves, and sulphur-coloured flowers.

180 TERAMNUS. Calyx bilabiate, upper lip longest and bifid, lower one 3-parted. Keel small. Stamens monadelphous, 5 alternate ones sterile. Stigma sessile, capitate. Legume linear, compressed, 2-valved, many-seeded. Twining subshrubs, with trifoliate leaves, and axillary racemes of small reddish flowers.

181 *AMPHICARPEA*. Calyx campanulate, 4-toothed; teeth equal, obtuse. Vexillum broad, incumbent. Stamens diadelphous. Style filiform, crowned by a capitate stigma. Legume compressed, stipitate, 1-4-seeded. Twining herbs, with trifoliate leaves, and apetalous flowers.

182 *KENNE'DYA*. Calyx bilabiate (f. 47. a.), upper lip bidentate, lower one trifid. Vexillum recurved (f. 47. b.). Stamens diadelphous (f. 47. g.). Stigma obtuse (f. 47. f.). Legume linear, compressed, transversely many-celled. Twining shrubs, with simple or trifoliate leaves, and scarlet, red, or purple flowers.

183 *RHYNCHOSIA*. Calyx 5-cleft, somewhat bilabiate. Corolla usually shorter than the calyx. Stamens diadelphous, free, filaments jointed at the base. Style filiform, bent. Legume sessile, compressed, rather falcate, 2-seeded. Climbing herbs or shrubs, with simple or trifoliate leaves, and yellow flowers.

184 *EURIOSMA*. Calyx 5-cleft, subbilabiate. Stamens diadelphous. Vexillum silky or villous. Legume straight, 1-celled. Subshrubs, with trifoliate leaves, and yellow flowers.

185 *PAGELIA*. Calyx 5-cleft; segments linear, acute, 2 upper ones adhering together a greater length than the others. Vexillum reflexed. Keel obtuse, longer than the wings. Stamens diadelphous. Legume ovate, cylindrical, turgid, 6-seeded. Decumbent or twining shrubs, beset with clammy hairs, having trifoliate leaves, and yellowish flowers.

186 *WISTARIA*. Calyx campanulate, somewhat bilabiate (f. 48. a.), upper lip with 2 short teeth, lower one with 3 subulate lobes. Vexillum bicallous. Wings conforming to the keel (f. 48. b.). Keel 2-edged. Stamens diadelphous (f. 48. c. f.). Legume coriaceous (f. 48. c.). Climbing shrubs, with imparipinnate leaves, and lilac-blue flowers.

187 *A'PIOS*. Calyx campanulate, 5-toothed, the tooth under the keel elongated and acute. Keel falcate, linear. Stamens diadelphous. Stigma emarginate. Legume many-seeded. Seeds intercepted by dissepiments. A climbing herb, with tuberous roots, imparipinnate leaves, and brownish-purple flowers.

188 *PHASEOLUS*. Calyx campanulate, bilabiate, upper lip bidentate, lower one 3-parted. Keel, as well as the diadelphous stamens and style, twisted together, rarely incurved. Legume compressed or cylindrical, many-seeded. Seeds intercepted by cellular substance. Twining herbs or subshrubs, with trifoliate leaves, and scarlet, red, or white flowers.

189 *CYTOTROPIS*. Calyx bilabiate, upper lip 1-toothed, lower one tridentate. Vexillum reflexed. Keel linear, falciform. Wings wedge-shaped, short. Stamens diadelphous. Legume sessile, linear, compressed, many-seeded. Seeds separated by spongy substance. A twining herb, with imparipinnate leaves, and pendulous racemes of flesh-coloured flowers.

190 *SÖJA*. Calyx bibracteate at the base, 5-cleft, with 2 of the teeth approximate or joined at the base. Vexillum ovate, with a short unguis. Keel oblong, straight. Stamens diadelphous. Legume 2-5-seeded. Seeds intercepted by cellular substance. Hispid climbing herbs, with trifoliate leaves, and violaceous flowers.

191 *DÖLICHOS*. Calyx bibracteolate at the base, campanu-

late, 5-toothed, 2 of which are approximate or joined. Vexillum roundish, having 2-4 callosities at the base. Wings oblong, obtuse. Keel obtuse. Stamens diadelphous. Style bearded above the middle. Legume compressed. Seeds intercepted by cellular substance. Climbing herbs or shrubs, with trifoliate leaves, and white or purple flowers.

192 *TENIOCARPUM*. Calyx bilabiate, 5-cleft, upper lip bidentate, lower one 3-parted. Vexillum ovate. Wings spurred. Keel obtuse, compressed. Stamens 10, diadelphous. Legume hispid, compressed, many-celled, somewhat articulated.

193 *VIGNA*. Calyx 4-cleft. Vexillum broad, reflexed, with callosities at the base. Wings rhomboid. Stamens diadelphous. Legume terete, incurved. Twining herbs, with trifoliate leaves, and yellow flowers.

194 *LABLAB*. Calyx tubular, 4-cleft, 3 lower ones acute. Vexillum with 4 callosities at the base. Stamens diadelphous. Style compressed, bearded below. Legume compressed. Seeds separated by cellular substance. Twining herbs, with trifoliate leaves, and white or purple flowers.

195 *PACHYRHIZUS*. Calyx urceolate, 4-lobed, upper lobe broader and emarginate. Vexillum roundish. Stamens diadelphous. Legume compressed, 7-8-seeded. Twining subshrubs, with trifoliate leaves, and violaceous flowers.

196 *PAROCHETUS*. Calyx 4-cleft. Vexillum 2-lobed. Keel obtuse, covering the wings. Stigma obtuse. Legume many-seeded. Creeping herbs, with trifoliate leaves, and shewy purple flowers.

197 *DIÖCLEA*. Calyx bibracteate at the base, 4-cleft, 2 lateral segments narrowest. Vexillum obovate-oblong, reflexed. Stamens diadelphous. Stigma subclavate. Legume linear, compressed, winged on the upper suture. Twining shrubs, with trifoliate leaves, and red flowers.

198 *PSORHOCARPUS*. Calyx urceolate, unequally bilabiate. Vexillum roundish, reflexed, bearing 2 callosities at the base. Wings stipitate. Keel oblong, 2-edged. Stamens diadelphous. Legume oblong, 4-winged, 7-8-seeded. A tuberous rooted herb, with trifoliate leaves, and bluish flowers.

199 *CANAVALLIA*. Calyx tubular, bilabiate (f. 49. b.), lower lip 3-toothed, upper lip with 2 large rounded lobes. Vexillum large (f. 49. d.), bicallous at the base. Wings stipitate, oblong, auriculate. Keel 2-petalled (f. 49. c.). Stamens monadelphous (f. 49. a.). Legume compressed (f. 49. e.), 3-keeled, with a membrane between each seed. Twining herbs or subshrubs, with trifoliate leaves, and large purplish flowers.

200 *AMPHODUS*. Calyx bilabiate, upper lip bidentate, lower one trifid. Vexillum reflexed, with a tooth on each side at the base. Wings and keel linear. Stamens diadelphous. Legume compressed, many-seeded. A climbing plant, with trifoliate leaves, and dark-red flowers.

201 *MUCUNA*. Calyx campanulate, bilabiate, lower lip trifid, upper one entire. Vexillum shorter than the wings and keel. Keel acute. Stamens diadelphous. Legume hispid, oblong, torose, having cellular substance between the seeds. Twining herbs or subshrubs, with trifoliate leaves, and large, purplish, white, or yellow flowers.

202 *CALOPOGONUM*. Calyx bractless, inclosing the corolla, 5-cleft; segments elongated, rather unequal, pinnately bearded. Legume straight, depressed, rather hooked, pilose, 8-seeded. A herbaceous twining plant, with trifoliate leaves.

203 *CAJANUS*. Calyx campanulate, 5-cleft. Segments awl-shaped. Vexillum large, obclavous at the base. Keel obtuse, straight. Stamens diadelphous. Legume oblong, compressed, torulose. Seeds each intercepted by a membrane. Shrubs, with trifoliate leaves, and yellow flowers.

204 *LURINUS*. Calyx bilabiate. Vexillum reflexed on the sides. Keel acuminate. Stamens monadelphous, the sheath entire, bearing 5 small round anthers, and 5 oblong ones, which are later of coming to perfection. Style filiform, crowned by a bearded roundish stigma. Legume coriaceous, compressed, torulose. Erect herbs, with digitate leaves, composed of 5-9 leaflets, rarely simple, and racemose-spikes of blue, white, or yellow flowers.

205 *CYLISTA*. Calyx 4-cleft, larger than the corolla, upper segment emarginated or bifid, lower one largest. Corolla shorter than the calyx. Keel 2-edged. Stamens diadelphous. Legume 2-seeded. Climbing shrubs, with trifoliate leaves, and yellow flowers.

206 *ERYTHRINA*. Calyx tubular (f. 50. a.), with a truncate subdentate mouth (f. 50. a.) or spathaceous. Vexillum oblong (f. 50. b.), very long. Wings and dipetalous keel shorter than the vexillum (f. 50. c.). Stamens diadelphous (f. 50. e.), straight. Legume long (f. 50. d.), torulose, many-seeded (f. 50. d.). Trees or shrubs, rarely herbs, with trifoliate leaves, and racemes of scarlet flowers.

207 *RUDOLPHIA*. Calyx tubular, bilabiate, upper segment obtuse, lower one acute, 2 lateral ones very short. Vexillum oblong-linear, very long. Wings shorter than the calyx, very narrow. Stamens diadelphous. Legume compressed, many-seeded. Climbing shrubs, with simple leaves, and scarlet flowers.

208 *BUTEA*. Calyx campanulate, 5-toothed, 2 upper teeth approximate. Vexillum lanceolate, spreading, equal in length to the wings and keel. Stamens diadelphous. Legume stipitate, compressed, membranous, 1-seeded at the apex. Trees, with trifoliate leaves, and large scarlet flowers.

#### TRIBE VI.

*DALBERGIEÆ*. Corolla papilionaceous (f. 51. b.), perigynous. Stamens variously connected. Embryo with the radicle bent back upon the edge of the cotyledons (f. 21. e. f.). Cotyledons fleshy (f. 21. c.). Legume 1-3-seeded (f. 51. d.), indehiscent. Usually climbing shrubs, with impari-pinnate, rarely trifoliate leaves, or reduced to the terminal leaflet.

209 *DERRIS*. Calyx tubular, 5-toothed. Keel lunate. Stamens 10, monadelphous. Legume membranous, compressed, 1-seeded. Climbing shrubs, with trifoliate or impari-pinnate leaves, and white flowers.

210 *ENDESME'RMUM*. Calyx hibracteate at the base, bilabiate, upper lip 2-lobed, lower one 3-toothed. Wings and keel unguiculate. Stamens 9, monadelphous. Legume stipitate,

leafy, indehiscent, 1-seeded. A climbing shrub, with abruptly or impari-pinnate leaves, and bluish flowers.

211 *PONGA'MIA*. Calyx cup-shaped, 5-toothed. Petals unguiculate. Stamens 10, monadelphous, with the tube cleft in front. Legume substipitate, compressed, indehiscent, beaked, 1-2-seeded. Trees, with impari-pinnate leaves, and white flowers.

212 *DALBERGIA*. Calyx campanulate, 5-toothed (f. 51. a.). Stamens 8-10, monadelphous, with the tube cleft in front, sometimes disposed in 2 equal bundles. Legume stipitate (f. 51. d.), membranous, compressed, tapering to both ends, 1-3-seeded (f. 51. d.). Usually climbing shrubs, with impari-pinnate leaves, and red, white, or blue flowers.

213 *PTEROCARPUS*. Calyx 5-toothed. Stamens 10, monadelphous or diadelphous. Legume indehiscent, suborbicular, girded by a wing, 1-seeded. Trees or shrubs, with impari-pinnate leaves, and usually yellow flowers.

214 *DREPANOCARPUS*. Calyx bibracteate at the base, 5-toothed. Stamens 10, monadelphous, with the tube cleft in front or equally diadelphous. Legume compressed, indehiscent, wingless, falcate, 1-seeded. Shrubs, with impari-pinnate leaves.

215 *ECASTAPHYLLUM*. Calyx campanulate, somewhat bilabiate, upper lip emarginate, lower one trifid. Stamens 8-10, equally diadelphous. Legume nearly orbicular, membranous, indehiscent, 1-seeded. Shrubs, with impari-pinnate or simple leaves.

216 *AMERIMNUM*. Calyx 5-toothed, somewhat bilabiate. Stamens 10, monadelphous, with the tube cleft in front. Legume 2-valved, 1-seeded, with the upper suture straight, and a little winged. Shrubs, with simple leaves, and whitish flowers.

217 *BRYA*. Calyx 5-toothed. Stamens monadelphous. Legume 2-jointed; joints 1-seeded. Trees with simple leaves.

218 *DEQUELIA*. Calyx bilabiate, upper lip entire, lower one trifid. Wings and keel equal in length, larger than the vexillum. Stamens 10, diadelphous, one of which is free. Legume globose, 2-valved, 1-seeded. Seeds covered with farina. A climbing shrub, with impari-pinnate leaves.

#### SUBORDER II. OR TRIBE VII.

*SWARTZIEÆ*. Sepals closely joined into a globose or oblong alabastrum before expansion (f. 52. b.), but at length ruptured, valvately (f. 52. g.). Petals few, irregular (f. 52. c.) or wanting, and are, as well as the stamens, hypogynous (f. 52. d.). Radicle incurved. Cotyledons thick. Germination unknown. Leaves simple or simply pinnate. This is a very distinct tribe, agreeing with *DETARIUM* in the valveless calyx, with *MIMOSEÆ* in the hypogynous stamens, and in habit with *DALBERGIEÆ*.

219 *SWARTZIA*. Calyx ovate, globose, ruptured valvately. Petals few or wanting. Stamens 10-15-25, 2-4 of which are larger and sterile, the rest connected at the base. Legume stipitate, 2-valved, few-seeded. Seeds arillate. Trees or shrubs, with simple or pinnate leaves, and white flowers.

220 *BA'PHIA*. Calyx calyptriform, ruptured under the keel. Vexillum spreading, somewhat roundish. Wings linear, length of vexillum. Stamens 10, distinct. Legume falciform, 6-seeded. A tree, with impari-pinnate leaves, and white flowers.

221 ZOLLERNIA. Calyx entire, cleft laterally, reflexed (f. 52. g.). Petals 5, nearly equal (f. 52. c.). Stamens 9 (f. 52. d.)-13. Legume stipitate (f. 52. e.), 1-celled, 2-valved (f. 52. h.), few-seeded. Trees or shrubs, with simple leaves, and axillary racemes of yellow flowers.

## DIVISION II.

RECTEMBRÆ. Radicle and cotyledons straight (f. 21. i. k. l. m.).

### SUBORDER III. OR TRIBE VIII.

MIMOSÆ. Embryo straight (f. 21. m.), with the radicle bent a little above the lobes. Flowers regular (f. 53. a.), usually polygamous (f. 53. b.), rarely all hermaphrodite (f. 54. b.). Sepals 4-5, equal, valvate in æstivation, usually connected at the base into a 4-5-toothed calyx (f. 54. a.). Petals 4-5, equal (f. 53. a.), also valvate in æstivation, usually hypogynous. Stamens inserted with the petals, rarely in the bottom of the calyx, sometimes free (f. 53. b. f. 54. b.), sometimes more or less connected at the base, equal in number to the petals, or multiple that number (f. 53. b.). Embryo straight. Funicle usually twisted. Leaves abruptly-pinnate or bipinnate. Cotyledons all foliaceous, except in ENTADA, and some species of INGA.

222 ENTADA. Flowers polygamous. Petals 5, distinct. Stamens 10-25. Anthers glandular at the apex. Legume compressed, 2-jointed; joints 1-seeded. Cotyledons fleshy. Climbing unarmed shrubs, with bipinnate or conjugately-pinnate leaves, with the rachis usually ending in a tendril, and numerous spikes of white flowers.

223 MIMOSA. Flowers polygamous. Corolla 4-5-cleft, funnel-shaped. Stamens 4-5-10-15, inserted in the bottom of the corolla, or in the stipe of the ovary. Legume compressed, one or many jointed; joints 1-seeded. Leaves conjugately digitate, or doubly pinnate. Flowers white or red, in small round heads.

224 GAGNENINA. Flowers hermaphrodite. Calyx 5-toothed. Petals 5, distinct. Stamens 10. Legume flat, indehiscent, winged on the sutures, transversely many-celled; cells 1-seeded. Elegant shrubs, with bipinnate leaves, and axillary cylindrical spikes of yellow flowers.

225 INGA. Flowers polygamous. Calyx 5-toothed. Corolla 5-cleft. Stamens indefinite, exerted, monadelphous. Legume compressed, 1-celled. Seeds covered with pulp or farina. Trees or shrubs, usually unarmed, with variously pinnate leaves, and spikes or heads of red or white flowers.

226 PARAKIA. Flowers hermaphrodite. Calyx tubular, bilabiate, imbricate in æstivation. Petals 5, nearly equal, rather imbricate in æstivation. Stamens 10, monadelphous. Legume compressed, many-seeded. Seeds covered with farinaceous substance. Trees, with bipinnate leaves, and pendulous globose heads of crimson flowers.

227 SCHIRANKIA. Flowers polygamous. Petals connected together into a 5-cleft corolla. Stamens 8-10 free. Legume echinated, tetragonal, and as if it were 4-valved, the valves separating lengthwise. Seeds numerous. Herbs, with bipinnate leaves, and globose heads of rose-coloured flowers.

228 DARLINGTONIA. Flowers hermaphrodite. Petals 5, distinct. Stamens 5. Legume lanceolate, few-seeded. Herbs, with bipinnate leaves, and heads of white flowers.

229 DESMANTHUS. Flowers polygamous. Calyx 5-toothed. Petals 5, distinct. Stamens 10, rarely 5, in the lower flowers sterile, membranous or filiform. Legume 2-valved. Herbs or shrubs, with bipinnate leaves, and pedunculated spikes of white flowers with yellow filaments.

230 ADENANTHERA. Flowers hermaphrodite. Calyx 5-toothed. Petals 5, sessile. Stamens 10; anthers each tipped with a deciduous pedicellate gland. Legume compressed, transversely many-celled, rather torulose, membranous. Trees or shrubs, with bipinnate leaves, and racemose spikes of flowers.

231 PRÓSOPIS. Flowers polygamous. Calyx 5-toothed. Petals 5, free. Stamens 10, hardly connate at the base. Legume filled with pulp, torulose. Unarmed or prickly trees or shrubs, with bipinnate leaves, and loose spikes of yellow flowers.

232 LAGONYCHIDM. Flowers hermaphrodite. Calyx 5-toothed. Petals free. Stamens 10, free. Legume stipitate, indehiscent, subdidymous, filled with pulp. A prickly shrub, with bipinnate leaves.

233 ACA'CIA. Flowers polygamous (f. 53. c. f. 54. b.). Calyx 4-5-toothed (f. 54. a.). Petals 4-5, connected or free (f. 53. a.) Stamens from 10 to 200. Legume dry, 2-valved. Unarmed or prickly trees or shrubs, with very variable leaves, and spikes or heads of white or yellow, rarely red, flowers.

234 ERYTHROPHLEUM. Flowers hermaphrodite, regular. Calyx 5-cleft. Petals 5, equal. Stamens perigynous. Legumen compressed, 2-valved, many-seeded. Large unarmed trees, with bipinnate leaves, and terminal racemes of flowers.

### SUBORDER IV.

CESALPINIÆ. Flowers more or less irregular, sometimes papilionaceous, but usually regular (f. 55. c. f. 56. b.). Petals irregularly imbricate in æstivation, sometimes wanting, always free (f. 55. c. f. 56. b.). Stamens more or less unequal (f. 56. c. f. 57. d.), always perigynous, usually free, rarely with the filaments concrete, as in tribe GEOFFRÆÆ. Embryo straight (f. 21. g. h. l. m.), with a large plumule.

### TRIBE IX.

GEOFFRÆÆ. Petals perigynous, unequal, disposed in a papilionaceous manner (f. 55. c.), imbricate in æstivation. Stamens monadelphous or diadelphous. Cotyledons fleshy or oily (f. 21. l.). This is an artificial tribe, and perhaps should have been brought in among the PAPILIONACEÆ, but it agrees with CASSIÆ in the embryo being straight.

235 ARACHIS. Calyx tubular, bilabiate. Corolla resupinate. Stamens inserted in the calyx with the petals, 9 joined and 1 free, the last is sterile. Legume ovate-oblong, obtuse, indehiscent, 2-4-seeded. Seeds thick. Herbs, with abruptly pinnate leaves, and yellow flowers.

236 VOANDZËIA. Flowers polygamous. Calyx campanulate. Wings horizontal. Stamens diadelphous. Legume roundish,

fleshy, 1-seeded. An herb, with trifoliate leaves and yellow flowers.

237 *PERALTEA*. Calyx bibracteolate, bilabiate, lower lip trifid, upper one bidentate. Stamens diadelphous. Legume compressed, 4-8-seeded. Subshrubs, with impari-pinnate leaves and large purplish flowers.

238 *BRONIA*. All as in *Peráltea*, but the legume has a longer stipe, and the seminiferous suture is without a margin.

239 *ANDIRA*. Calyx campanulate, 5-toothed. Vexillum roundish, emarginate, longer than the keel. Stamens diadelphous, 9 joined, and 1 free. Legume stipitate, orbicular, &c. hard, 1-celled, 1-seeded. Trees, with impari-pinnate leaves, and terminal panicles of purple flowers.

240 *GEOFFROYA*. Calyx campanulate, somewhat bilabiate, half 5-cleft. Wings and keel about equal in length, shorter than the vexillum. Stamens diadelphous, 9 joined, and 1 free. Legume drupaceous, egg-shaped, 1-celled, 1-seeded. Trees, with impari-pinnate leaves, and axillary racemes or panicles of yellowish flowers.

241 *BROWNIA*. Calyx with 2 connate bracteas at the base, constituting a sheath (f. 55. a.). Calyx 5-cleft (f. 55. b.). Petals 5 (f. 55. c.), unguiculate (f. 55. e.). Stamens 10-15, monadelphous, with the sheath cleft in front. Legume 1-celled, many-seeded, acinaciform, compressed. Trees, with abruptly pinnate leaves, and rose-coloured flowers, rising in fascicles from the buds.

242 *DIPTERIX*. Calyx 3-5-cleft, 2 upper segments largest, wing-formed, 1-3 lower ones small. Corolla papilionaceous. Stamens 8-10, monadelphous, with the sheath cleft in front. Legume somewhat compressed, thick, 2-valved, 1-seeded. Trees, with abruptly pinnate leaves and paniced flowers.

#### TRIBE X.

*CASSIEÆ*. Lobes of calyx imbricate before expansion (f. 57. a.). Petals perigynous (f. 56. b. f. 57. b.), nearly equal, rarely sub-papilionaceous, imbricate in æstivation. Stamens distinct (f. 57. c. f. 56. c.). Legume usually dry and 2-valved (f. 58. g. f. 56. e.). Cotyledons leafy, rarely fleshy. Leaves bi or tripinnate, sometimes abruptly or impari-pinnate, sometimes simple. Habit variable.

243 *MORINGA*. Petals 5, nearly equal. Stamens 10, unequal, sometimes 5 of which are sterile. Legume silique-formed, 3-valved. Trees, with bi-tripinnate leaves.

244 *GLEDITSCHIA*. Flowers unisexual or hermaphrodite. Calyx 3-4-5-cleft. Petals 3-4-5, the 2 lowest ones joined into a keel. Stamens equal in number to the petals, and opposite the sepals. Legume transversely many-celled, rarely 1-celled, 1-seeded. Spinose trees, with abruptly pinnate or bipinnate leaves, and spikes of greenish flowers.

245 *GYMNOCLADUS*. Flowers dioecious. Calyx tubular, 5-cleft. Petals 5, equal. Stamens 10, inclosed. Legume oblong, thick, pulpy inside. An unarmed tree, with bipinnate leaves, and racemes of white flowers.

246 *ANOMA*. Calyx 5-cleft. Petals 5, equal. Stamens 10,

the 5 alternate ones sterile. Legume oblong, thick, 2-valved, 1-celled, many-seeded. A tree, with opposite bipinnate leaves, and panicles of white flowers.

247 *GUILANDINA*. Calyx urceolate, 5-cleft. Petals 5, sessile, nearly equal. Stamens 10, villous at the base. Legume ovate, echinated, 2-valved, 1-3-seeded. Seeds bony, shining. Trees or shrubs, beset with hooked prickles, with abruptly bipinnate leaves, and racemose spikes of yellow flowers.

248 *COULTEA*. Calyx turbinate, 5-cleft, lower segment largest, edged with glandular teeth. Petals 5, upper one largest. Stamens 10, bearded at the base, with a nectariferous gland on the upper side of the ovary. Stigma ciliated with glands. Legume compressed, spongy, hardly dehiscent, transversely many-celled. Seeds 4-6. Spinose shrubs or trees, with abruptly pinnate leaves, and racemes of yellow flowers.

249 *CÆSALPINIA*. Calyx 5-cleft, lower segment largest and arched. Petals 5, unequal, unguiculate, upper one shortest. Stamens 10, villous at the base, ascending. Legume unarmed, compressed, 2-valved, many-seeded. Prickly or unarmed trees or shrubs, with abruptly bipinnate leaves, and yellow flowers.

250 *POINCIANA*. Calyx 5-cleft, unequal, lower segment arched. Petals 5, unguiculate, upper one disformed. Stamens 10, long, hairy at the base. Legume compressed, 2-valved, many-celled. Trees or shrubs, with abruptly bipinnate leaves, and usually with variegated flowers.

251 *MEZONEURUM*. Calyx 5-cleft; lower segment arched, the other suborbicular. Petals 5, unguiculate, upper one smallest. Stamens 10, declinate, villous at the base. Legume leafy, flat, ovate-oblong, indehiscent, 1-celled, many-seeded, expanded into a wing on the upper suture. Prickly trees, with abruptly bipinnate leaves.

252 *REICHA'DIA*. Calyx campanulate, 5-toothed. Petals 6-10, unequal, sub-papilionaceous. Stamens 10, declinate, cohering by a beard below the middle. Legume samaroid, expanded into a wing. A genus hardly known.

253 *LABICHEA*. Calyx 5-cleft, regular, deciduous. Petals 5, roundish, obovate, nearly equal. Stamens 2, hypogynous, very short. Anthers 2-celled, bursting by a sub-operculate pore. Ovary on a short stipe, ovate-oblong, 2-ovulate. Style subulate. Stigma simple. A shrub, with impari-pinnate leaves, and terminal racemes of flowers.

254 *HOFFMANSEGGIA*. Calyx 5-cleft. Petals 5, unguiculate, glandular at the base, upper one broadest. Stamens 10, covered with glandular hairs, one usually abortive. Legume linear, compressed, many-seeded. Herbs or subshrubs, with impari-bipinnate leaves, and racemes of yellow flowers.

255 *MELANOSTICTA*. Calyx 5-cleft. Petals 5, nearly equal, tapering to the base, length of calyx. Stamens 10, villous at the base. Legume compressed, ovate-oblong, hairy. Subshrubs, with impari-bipinnate leaves.

256 *POMARIA*. Calyx 5-cleft (f. 56. a.). Petals 5 (f. 56. b.), unguiculate, upper one concave and shorter. Stamens 10 (f. 56. c.), declinate, hairy at the base. Legume oblong (f. 56. d.), compressed, 2-seeded (f. 56. e.). Shrubs, with abruptly bipinnate leaves.

257 *HÆMATOXYLON*. Calyx 5-cleft. Petals 5, hardly longer than the calyx. Stamens 10, pilose at the base. Legume compressed, acuminate at both ends, 1-celled, 2-seeded, with the valves ruptured longitudinally in the middle. A tree, with abruptly pinnate or bipinnate leaves.

258 *PARKINSONIA*. Calyx 5-cleft. Petals 5, upper one roundish, unguiculate. Stamens 10, declinate. Legume linear, acuminate at both ends, torose. A spiny shrub, with pinnate leaves and yellow flowers.

259 *CADIA*. Calyx campanulate, 5-cleft, beset with glands on the inside of the tube. Petals 5, equal, inserted in the calyx. Stamens 10, joined at the base. Legume linear, many-seeded, stipitate. An unarmed shrub, with impari-pinnate leaves and whitish flowers.

260 *ZUCCAGNIA*. Calyx turbinate, 5-cleft, lower segment longest. Petals 5. Stamens 10, pilose at the base. Stigma funnel-shaped. Legume subovate, compressed, 1-seeded, hairy. A clammy shrub, with abruptly pinnate leaves and red flowers.

261 *CERATONIA*. Flowers polygamous or dioecious. Calyx 5-parted. Petals wanting. Stamens 5. Stigma sessile, orbicular. Legume broad, indehiscent, many-seeded, transversely many-celled, pulpy inside. Trees, with abruptly pinnate leaves.

262 *CASTANOSPERMUM*. Calyx coloured, somewhat bilabiate. Wings and keel about equal in length. Stamens 10, free. Legume large, 2-valved, 4-seeded, spongy inside, stipitate. Seeds large. A tree, with large impari-pinnate leaves, and racemes of coloured flowers.

263 *HARDWICKIA*. Sepals 4-5, hardly connected at the base. Corolla none. Stamens 8-10. Stigma peltate. Legume lanceolate, 1-seeded, dehiscent at the apex. Trees, with abruptly pinnate leaves and yellowish flowers.

264 *JONESIA*. Calyx bibracteate at the base, coloured, funnel-shaped, 4-lobed. Petals wanting. Stamens 8, sometimes only 6-7, exserted. Legume 4-8-seeded, compressed, acinaciform. Trees, with abruptly pinnate leaves, and orange-coloured flowers.

265 *TACHIGALIA*. Calyx 5-cleft, unequal, obtuse. Petals 5, inserted in the mouth of the calyx, unequal. Stamens 10, exserted, villous at the base, unequal. Legume compressed, membranous, indehiscent, 1-seeded. Trees, with abruptly-pinnate leaves and yellow flowers.

266 *BARYXYLUM*. Sepals 5, hardly connected at the base, equal. Petals 5, rather unguiculate. Stamens 10, unequal, hypogynous? Anthers 4-celled. Legume rather terete, curved, many-seeded. Trees, with abruptly-pinnate leaves and yellow flowers.

267 *MOLDENHAWERA*. Calyx 5-cleft. Petals 5, on long claws. Stamens 10, smooth, one of which is sterile, longer, and furnished with hairs. Legume linear-oblong. A tree, with pinnate and bipinnate leaves and yellow flowers.

268 *HUMBOLDTIA*. Calyx 4-cleft. Petals 5, inserted in the mouth of the calyx. Stamens 5, smooth. Legume oblong, compressed. Trees, with abruptly pinnate leaves.

269 *HETEROSTEMON*. Calyx 4-cleft, bibracteate at the base. Petals 3, inserted in the mouth of the calyx. Stamens 8, de-

clinate and monadelphous at the base, and pilose above, 3 lower ones longest and fertile, and 4 bearing barren 2-lobed anthers. Legume flat, tapering to both ends, many-seeded. Trees, with abruptly pinnate leaves, winged petioles, and large flowers.

270 *AMHURSTIA*. Calyx tubular, 5-toothed, with the stamens inserted in it near the apex, bibracteate at the base, valvate in aestivation. Petals unequal, upper one large, unguiculate, obcordate, lateral ones wedge-shaped, 2 lower ones awl-shaped. Stamens diadelphous, 9 joined, and 1 free, adhering to the pedicel of the ovary. Anthers versatile. Legume stalked, flat, oblong, few-seeded. A tree, with abruptly pinnate leaves, and pendulous racemes of shewy scarlet flowers, some of the petals tipped with yellow.

271 *TAMARINDUS*. Calyx 5-cleft, unequal. Petals 3, 2 of which are ovate, and the middle one cucullate. Stamens 9-10, 2 or 3 longer, monadelphous, and fertile, 7 short and sterile. Legume stalked, acinaciform, compressed, 3-6-seeded, pulpy inside. Trees, with abruptly pinnate leaves.

272 *CASSIA*. Sepals hardly connected at the base (f. 57. a.), more or less unequal. Petals 5, unequal (f. 57. b.). Stamens 10, free (f. 57. c. d.), unequal, 3 upper ones abortive (f. 57. d.); anthers bursting by 2 pores at the apex (f. 57. f.). Legume compressed, transversely many-celled; cells 1-seeded. Shrubs or herbs, with abruptly pinnate leaves and yellow flowers.

273 *DELAIRIA*. Calyx 5-toothed, spathaceous. Vexillum large, spreading. Stamens 10. Stigma acute. Legume elongated, few-seeded. Shrubs, with simple leaves.

274 *CHAMÆISTULA*. The same as *Cassia*, but the legume is terete, and hardly dehiscent and pulpy inside. Trees and shrubs, with abruptly-pinnate leaves and yellow flowers.

275 *CATHARTOCARPUS*. The same as *Cassia*, but differs in the long terete, woody, indehiscent pod, which is filled with pulp inside. Trees, with abruptly-pinnate leaves and racemes of yellow flowers.

276 *EXOSTYLIS*. Calyx clavate, 5-cleft, 3 of the segments revolute. Petals 5, nearly equal, imbricately conniving, inserted in the middle of the calyx. Stamens 10, nearly equal, dilated at the base; anthers sagittate, cuspidate. Style elongated, simple. Legume thick, many-seeded. A tree, with impari-pinnate leaves, and racemes of rose-coloured flowers.

277 *METROCYNIA*. Calyx 5-cleft. Petals 5. Stamens 10, hairy. Legume short, somewhat reniform, 1-seeded, warted or plicate. A tree, with abruptly-pinnate leaves.

278 *AFZELIA*. Calyx 4-cleft. Petals 4, unguiculate, upper one largest. Stamens 10, 2 upper ones sterile. Legume woody, many-celled. Seeds arillate. A genus hardly known.

279 *MELANÓXYLON*. Calyx deeply 5-cleft. Petals 5, nearly equal. Stamens 10, hairy. Legume compressed, falcate. Seeds with winged aril. A tree, with impari-pinnate leaves, and panicled racemes of rusty flowers.

280 *ACOSMIUM*. Calyx campanulate, 4-5-cleft. Petals 5, spreading. Stamens 10, inserted in the bottom of the calyx. Ovary elongated, perhaps a legume. A tree, with impari-pinnate leaves, and racemes of yellow flowers.

281 *SCHOTIA*. Calyx 5-cleft. Petals 5, lateral ones incur-

bent. Stamens 10, smooth. Ovary pedicellate. Trees, with abruptly-pinnate leaves, and racemes of vermillion flowers.

282 COPAIFERA. Calyx 4-cleft, unequal. Petals wanting. Stamens 10. Legume stipitate, coriaceous, compressed, 2-valved, 1-seeded. Seed arillate. Trees, with abruptly-pinnate leaves.

283 CYNOMÉTRA. Calyx 4-parted; segments reflexed, pencilled at the apex. Petals 5, equal. Stamens 10; anthers bifid at the apex. Legume roundish, fleshy, indehiscent, tubercled, 1-seeded. Trees, with bifoliate leaves, and red flowers, rising from the trunk.

284 IN'TSIA. Calyx campanulate, 5-parted. Petal one, unguiculate. Stamens 9, 3 of which are fertile, longer, and declinate. Legume compressed, 3-4-seeded. Trees, with abruptly or impari-pinnate leaves.

285 EPE'RIA. Calyx urceolate, 4-cleft. Petal one, fringed, inserted in the middle of the calyx. Stamens 10, long, villous, and rather monadelphous at the base. Legume compressed, falciform, 1-4-seeded. A tree, with abruptly-pinnate leaves and red flowers.

286 PARIVÔA. Calyx bibracteolate, 3-5-parted. Petal one, large, convolute, inserted in the calyx. Stamens 10, 9 joined at the base, and 1 free. Legume thick, compressed, 1-seeded. A tree, with abruptly-pinnate leaves and purple flowers.

287 ANTHONÔTA. Calyx 4-cleft, unequal, girded by a 2-lobed bractea at the base. Petal one, on a long claw, emarginate. Stamens 10, 3 of which are very long. Legume compressed, hardly dehiscent, 1-celled, many-seeded. A tree, with abruptly-pinnate leaves.

288 OÛTEA. Calyx 5-cleft, bibracteate at the base. Petals 5, one of which is very large and undulated. Stamens 3-4, free, one sterile. Legume compressed, 1-seeded. Trees, with abruptly-pinnate leaves.

289 VOUA'PA. Calyx 4-cleft, bibracteate at the base. Petal one, flat. Stamens 3. Legume stalked, 1-seeded. Trees, with bifoliate leaves.

290 HYMENÆA. Calyx bibracteate at the base, 4-5-parted. Petals 5, glandular. Stamens 10, distinct, inflated in the middle. Legume woody, mealy inside, 1-celled, many-seeded. Trees, with bifoliate leaves.

291 SCHNE'LLA. Calyx 5-toothed. Petals 5, unguiculate, nearly equal. Stamens 10. Style none. Legume truncate. Shrubs, with 2-lobed leaves and white flowers.

292 BAUH'NIA. Calyx 5-cleft. Petals 5, upper one distant from the rest. Stamens 10, sometimes 9 of which are sterile (f. 58. c.), and joined, and 1 free (f. 58. e.) and bearing an anther, sometimes all monadelphous at the base and fertile, or 5 or 3 fertile. Legume (f. 58. g.) 2-valved, 1-celled, many-seeded (f. 58. h.). Shrubs, with 2-lobed leaves.

293 CÉRCIS. Calyx urceolate, 5-toothed. Petals 5, unguiculate, sub-papilionaceous, all distinct, the wings largest. Stamens 10, free, unequal. Legume oblong, compressed, 1-celled, many-seeded. Trees, with simple cordate leaves.

294 PALQ'VEA. Calyx girded by a 2-lobed bractea, 4-5-lobed. Petals 3-4. Stamens 9, rising from the tube of the

calyx. Legume compressed, 6-7-seeded. A shrub, with simple leaves.

295 ALOE'XYLON. Calyx 4-parted; lower lobe falcate and longer than the rest. Petals 5, unequal. Stamens 10, distinct. Style filiform. Legume woody, falcate, 1-seeded. A tree, with simple, alternate leaves, and terminal flowers.

296 AMA'RIA. Calyx 5-cleft. Petals 5, equal, keeled. Stamens 10, monadelphous. Legume long, compressed, torose, many-seeded. Shrubs, with simple leaves.

297 BOWD'CHIA. Calyx 5-toothed. Petals 5, free, lateral ones longest, therefore disposed in a papilionaceous manner. Stamens 10, free. Legume compressed, membranous, winged, many-seeded, indehiscent. A tree, with impari-pinnate leaves and violaceous flowers.

298 CRU'DYA. Calyx bibracteate at the base, 4-cleft. Petals wanting. Stamens 8-10, inserted in the tube of the calyx, free. Legume coriaceous, 1-2-seeded. Trees, with impari-pinnate leaves.

299 DIA'LUM. Calyx 5-parted, 2 exterior lobes rather broadest. Petals wanting. Stamens 2, inserted in the upper side of the receptacle. Legume velvety, 1-2-seeded, pulpy inside. Trees, with impari-pinnate leaves.

300 CODA'RUM. Calyx 5-parted. Petal one, linear-lanceolate. Stamens 2, inserted in the calyx. Legume velvety, 1-seeded, filled with mealy pulp inside. Trees, with impari-pinnate leaves.

301 VATA'IREA. Flowers unknown. Legume coriaceous, roundish, compressed, 1-celled, 1-seeded. Seed large, flat. A tree, with impari-pinnate leaves.

#### TRIBE XI.

DETARIEÆ. Calyx 4-lobed, globose before expansion, with valvate lobes. Petals wanting. Stamens 10-25, perigynous, nearly free. Legume fleshy. Cotyledons thick. Trees, with impari-pinnate leaves. It differs from all the other tribes of this order in the drupaceous fruit, and therefore comes near to ROSACEÆ.

302 DETA'RUM. Stamens 10, distinct. Drupe orbicular, 1-celled, 1-seeded. A tree, with impari-pinnate leaves.

303 CORDY'LA. Stamens 30-35, somewhat monadelphous at the base. Legume stipitate, 1-celled, many-seeded. A tree, with impari-pinnate leaves.

+ Genera belonging to Leguminosæ, but they are not sufficiently known, and are therefore not received among the tribes.

304 CRUM'NIUM. Calyx cup-shaped, truncate. Legume compressed, flat, many-seeded, margined on both sides.

305 PHYLLOLÔBIUM. Calyx campanulate, 5-cleft; teeth equal, awl-shaped. Corolla papilionaceous, the vexillum a little larger than the other petals. Legume turgid, compressed at the sutures, falcate, 6-10-seeded, opening at one of the sutures. A flexuous herb, with impari-pinnate leaves and whitish flowers.

306 AMPHINÔMIA. Calyx ventricose, 5-cleft; segments lan-

ceolate, spreading. Petals 5, unguiculate. Stamens 10, monadelphous. Style lateral. Legume roundish, 1-celled, 2-valved, many-seeded, the most of which are abortive. A decumbent hairy herb, with trifoliate leaves.

307 SARCODUM. Calyx cup-shaped, 3-toothed. Vexillum ovate, ascending. Wings short. Keel falcate. Stamens diadelphous. Legume fleshy, terete, many-seeded. A climbing shrub, with pinnate leaves, and spikes of rose-coloured flowers.

308 VARENNEA. Calyx tubular, 5-toothed, unequal. Vexillum wedge-shaped, emarginate. Wings falcate, concave above. Keel of 2 spatulate petals, concave above. Stamens 10, diadelphous, 9 joined, and one free. Legume compressed, rather falcate, 1-seeded. A shrub, with impari-pinnate leaves, and racemes of white flowers.

309 CRAFORDIA. Calyx campanulate, 5-cleft. Vexillum large, reflexed. Wings adpressed, auricled at the base. Keel obtuse, longer than the wings. Stamens 10, diadelphous. Legume linear, torulose, usually 2-seeded. Leaves impari-pinnate. Flowers white.

310 AMMODENDRON. Calyx calyculate. Legume flat, membranous, winged, 1-seeded in the middle. A spinx shrub, with bifoliate leaves.

311 IACARA. Calyx campanulate, 5-toothed. Petals 5, unequal, unguiculate. Stamens 10, free, inserted at the bottom of the calyx, pilose at the base. Legume? pilose. A shrub, with simple leaves.

312 HARPALYCE. Calyx bilabiate, deciduous, bibracteolate at the base; lips equal, entire. Corolla papilionaceous. Vexillum obovate. Wings auricled. Keel 2-edged, twisted. Legume compressed, narrow at the base, 4-5-seeded. A subshrub, with impari-pinnate leaves, and large rose-coloured flowers.

313 DIPLOPRION. Calyx tubular, 5-toothed. Corolla papilionaceous. Stamens 10, monadelphous. Legume 1-celled, many-seeded, spirally involute. A hairy annual herb, with trifoliate leaves and heads of yellow flowers.

314 RIVERIA. Flowers unknown. Legume stipitate, obliquely-elliptic, flattish, mucronate, 2-valved, 1-seeded. Cotyledons thick. A tree, with impari-pinnate leaves, with the rachis winged.

#### Division I.

CURVEMBRIÆ (from *curvus*, curved, and embryo, (f. 21. b. c. f.)). Radicle curved back upon the edge of the cotyledons.

#### Suborder I.

PAPILIONACEÆ (from *papilio*, a butterfly; in allusion to the disposition of the petals resembling that of a butterfly f. 22. f. 23. &c.). Lin. ord. nat. 32. D. C. prod. 2. p. 94. Curvembryæ, Bronn. dis. p. 131. Cyteophytum, Neck. elem. 3. p. 1. Leguminosæ, Batsch. tabl. aff. 95.

Embryo with the radicle curved back upon the edge of the cotyledons, lying above the commissure formed by the lobes (f. 21. b. c. f.). Sepals usually imbricate in æstivation, rarely somewhat valvate. Petals disposed into a papilionaceous corolla or a pea flower (f. 24. b. f. 25. b., &c.), therefore always irregular. Stamens inserted in the bottom of the calyx (f. 22. c.), or perigynous.—Plants with simple, trifoliate or simply pinnate leaves.

§ 1. *Phyllolobæ* (from *φυλλον*, *phyllon*, a leaf, and *λοβος*, *lobos*, a lobe; in reference to the lobes of embryo or cotyledons being foliaceous). D. C. *Cotyledons thin, foliaceous* (f. 21. a. f.).

#### Tribe I.

SOPHOREÆ (plants agreeing with *Sophora* in important characters). Spreng. anl. 2. p. 741. Bronn. diss. p. 131. D. C. legum. mem. V. prod. 2. p. 94.

Corolla papilionaceous (f. 22. c. f. 24. b.). Stamens free (f. 23. f. f. 24. c.). Legume continuous (f. 22. d.), never articulated. Cotyledons flat, leafy (f. 21. a. b.). This is a very natural tribe, known by its papilionaceous flowers, free stamens, and unarticulated pods.

I. MYROSPERMUM (from *μυρον*, *myron*, myrrh, and *σπέρμα*, *sperma*, a seed; the seeds and cells yield a balsam that has a strong smell). Jacq. amer. (1736) p. 120. Lam. ill. 341. D. C. leg. mem. V. prod. 2. p. 94. Myroxylon, Lin. fil. suppl. 233. but not of Forst. et Toluifera, Lin. gen. 524.

Lin. syst. *Decandria, Monogynia*. Calyx campanulate, 5-toothed. Petals 5, the upper one larger than the rest. Stamens 10, free. Ovary stipitate, oblong, membranous, 2-6-ovulate, bearing a lateral, ascending, filiform style towards the apex. Legume with a naked stipe at the base, but amply winged at the apex, samaroid, indehiscent, 1-celled, 1-2-seeded, bearing the style laterally towards the apex. Seed enwrapped in balsamic resin. Radicle incurved in the first section, in the rest unknown. Cotyledons thick and flat.—American trees, with abruptly-pinnate leaves, and with the leaflets usually full of pellucid dots, the glands or dots are oblong-linear, as in *Samydeæ*. The terminal leaflet usually solitary. Perhaps a proper tribe.

SECT. I. CALUSIA (meaning unknown). Bert. ined. D. C. prod. 2. p. 94. Myrosperrum, H. B. et Kunth. nov. gen. amer. 6. p. 572. Stamens with permanent filaments.

1 M. FRUTESCENS (Jacq. amer. 120. t. 174. f. 34.) leaves membranous, deciduous; legume with a reticulately-veined wing; style permanent. h. S. Native of South America, in bushy places at Carthagena and St. Martha, on the declivities of mountains in Caraccas, as well as on the banks of the Rio Guarico. H. B. et Kunth, nov. gen. amer. t. 570. and 571. Leaflets 7-8 pairs, alternate, somewhat crenulated, oval, emarginate, marked with pellucid lines. Legume nearly 2 inches long, with the stipe inclosed in the calyx. According to Jacquin this is an inelegant shrub. Leaves alternate, pinnate, deciduous, with commonly 3 pairs of leaflets and an odd one, which are quite entire and smooth. Flowers of a whitish rose-colour, disposed in terminal, simple, or bifid racemes. The seeds and the cell of the legume yield a balsam that has a strong unpleasant smell.

Shrubby Balsam-seed. Shrub 10 feet.

SECT. II. MYROXYLON (from *μυρον*, *myron*, myrrh, and *ξύλον*, *xyton*, wood; the wood is resinous and sweet-scented). Mutis, Lin. fil. et Kunth. Stamens deciduous.

2 M. PUBESCENS (D. C. prod. 2. p. 95.) branches and petioles hairy; leaflets ovate-lanceolate or oblong, rather membranous, smooth above and pubescent beneath, rather acuminate, emarginate. h. S. Native of South America, near Carthagena and Popayan. Myroxylon pubescens, H. B. et Kunth, nov. gen. amer. 6. p. 374. M. periferum, Lamb. ill. cinch. 92. t. 1. Leaves rather membranous, marked with line-like dots. An elegant tree, with white flowers disposed in terminal racemes. The bark is filled with white resin, which, according as it abounds more or less, changes the colour to citron-yellow, red, or dark chesnut; the smell and taste are grateful, balsamic, and aromatic, resembling those of Red Peruvian Balsam, and sold in druggists' shops under the name of white balsam. The legume contains 1

seed, which is crescent-shaped, projecting from the cell, and between this and the lining of the pericarp is filled with a yellow liquid balsam, which in time dries and becomes a hard resin. The tree grows in the mountains of Panatahuas, in the forests of Puzuzo, Muna, Cuchero, and in many other countries near the river Marañon, in low, warm, and sunny situations. The natives of these countries call the tree by the name of *Quinquino*, and its bark and fruit by that of *Quinquina*, a plant very different to the Quina. The Indians of Puzuzo and the above-mentioned countries do not collect the balsam of this tree, they only collect the barks most filled with resin, condensed into drops and lumps, and the fruits, in order to sell them in the neighbouring provinces, both of which are used for the purpose of perfuming cloth and apartments. It is called perfume of quinquina, to distinguish it from the true perfume, which is a composition of Benzoin, storax, and ambergris, these substances being formed into a paste, from which they make pastiles. The fruit as well as the bark being reduced to a coarse powder, they mix it with oil of maria, carana, jacamaca, lera, or sebo, and make with it little plasters, which they apply upon the temples and behind the ears, to mitigate the pains of the head-ache and the tooth-ache. It closes recent wounds, strengthens the brain, mitigates pains proceeding from agues, and dissipates the shivering produced by fevers. The balsam of quinquino is procured by incision at the beginning of spring, when the showers are gentle, frequent, and short; it is collected into bottles, where it keeps liquid for some years, in which state it is called white liquid balsam. But when the Indians deposit this liquid in mats or calabashes, which is commonly done in Carthagena, it hardens into a resin and is then denominated dry white balsam. The wood of the quinquino is compact, heavy, and durable, but is difficult to work on account of its uneven grain. It is never exposed to attacks of worms, wherefore the Indians make use of the trunks for beams and stanchions.

*Pubescent Myrrh-seed, White Balsam, or Quinquino.* Fl. Aug. Sept. Tree 40 feet.

3 *M. PERUÍFERUM* (D. C. prod. 2. p. 95.) leaflets coriaceous, permanent, and are as well as the branches glabrous; legume with a very thick wing; style deciduous. *h. S.* Native of Peru, New Granada, Colombia, Mexico. *Myroxylon peruiferum*, Lin. fil. suppl. 233. Bert. amcn. p. 26. t. 1. H. B. et Kunth, nov. gen. amer. 6. p. 374. *M. pedicellatum*, Lam. dict. 4. p. 191. ill. t. 341. f. 1. Flowers white, disposed in axillary racemes. Legume coriaceous, with the stipe inclosed in the calyx, about 3 inches long. There are varieties of this tree, or perhaps distinct species, differing in having quite entire or crenated, oval, or ovate, obtuse or emarginate leaflets, marked with oblong or roundish pellucid dots. The lower leaflets alternate, and the upper ones more or less opposite, to the number of 2-5 pairs. It is a very beautiful tree, with a smooth bark full of resin, as are all parts of the plant. The leaves are abruptly pinnate, usually with about 2 pairs of ovate-lanceolate, entire, emarginate leaflets, which are full of transparent, linear, resinous dots. The balsam of Peru is the produce of this tree, according to Joseph Cælestine Mutis. This balsam, when brought to us, is of the consistence of thin honey, of a reddish-brown colour, inclining to black, an agreeable aromatic smell, and a very hot biting taste. It is said to be obtained by boiling the cuttings of the twigs in water, and skimming off with a spoon the balsam, which swims on the top. Peruvian balsam consists of a volatile oil, resin, and benzoic acid; it is accordingly entirely soluble in alcohol and in essential oils. Water dissolves part of the benzoic acid, and fixed oil combines with the resin. It may be suspended in water by trituration with mucilage and yolk of eggs. Balsam of Peru is a very warm aromatic medicine, considerably hotter and more acrid than

copaiva. Its effects are stimulating and tonic. Hence its use in some kinds of asthmas, gonorrhœas, dysenteries, suppressions of the uterine discharges, and other disorders proceeding from debility. It is also employed externally for cleansing and healing wounds and ulcers, and sometimes against palsies, and rheumatic pains.

*Balsam of Peru-tree.* Tree 40 feet.

4 *M. TOLUÍFERUM* (Ach. Rich. ann. sc. nat. 1824. jun. p. 172.) branches and leaves glabrous; leaflets oblong, acuminate, equal-sided, rounded at the base. *h. S.* Native of South America, on the mountains of Tolu, Turbaco, and on the banks of the river Magdalena, between Carapata and Mompos. *Balsamum Tolutanum*, C. Bauh. pin. 401. *Toluifera Balsamum*, Mill. dict. Lin. mat. med. 201. Woodv. med. bot. 3. p. 526. t. 193. *Myroxylon toluiferum*, H. B. et Kunth, nov. gen. amer. 6. p. 375. A large spreading tree, with very thick, rough, brown bark. Leaves oblong-ovate. Flowers yellowish, disposed in small axillary racemes. The balsam of Tolu is the produce of this tree; it flows from incisions made in the bark, during the hot season, and is brought to us in little gourd shells. It is of a yellowish-brown colour, inclining to red; in consistence thick and tenacious; by age it grows hard and brittle. The smell of this balsam is extremely fragrant, somewhat resembling that of lemon, its taste warm and sweetish. Lewis says that he has sometimes procured benzoic acid from it. It yields very little volatile oil, although it impregnates the distilled water strongly with its flavour. By dissolving a proper quantity of sugar in this water a more elegant syrup is obtained than that prepared in the common way with a decoction of the balsam; in its medical virtues it agrees with other balsams.

*Balsam of Tolu-tree.* Clt. 1733 Tree 40 feet.

*Cult.* Fresh imported seeds of any of the species will grow, if sown in a pot immediately on their arrival in this country, and placed in a hot-bed. The plants are to be potted off separately when they are 3 inches high, in a mixture of peat and loam; young cuttings will also root, if planted in sand, with a hand-glass placed over them, in heat.

II. *SOPHORA* (altered from *sophora*, the Arabic name of a papilionaceous flowering tree). R. Br. hort. kew. ed. 2. vol. 3. p. 2. D. C. leg. mem. 5. prod. 2. p. 95.—*Sophoræ*, spec. Lin. gen. no. 508. exclusive of some anomalous species.

Lin. syst. *Decandria, Monogynia*. Calyx 5-toothed (f. 22. a.), campanulate at the base, or somewhat attenuated. Petals of the keel usually concrete at the apex. Legume somewhat moniliform (f. 22. d.), wingless, many-seeded.—Trees, shrubs, or herbs, with impari-pinnate leaves, which are usually exstipulate and terminal, simple racemes or panicles of yellow, white, or blue flowers.

SECT. I. *EUSOPHORA* (from *eu*, *eu*, well or good, and *sophora*: genuine species). D. C. prod. 2. p. 95. Stamens 10, free.

1 *S. JAPONICA* (Lin. mant. 68.) arboreous; leaflets 11-13, oblong-ovate, acute, glabrous; panicle terminal, loose; legumes glabrous. *h. H.* Native of Japan. Red. in Duh. ed. nov. 3. t. 21. *S. Sinica*, Rosier. journ. phys. 14. p. 248. D. C. leg. t. 4. f. 1. germ. Flowers beautiful cream-coloured. Legume with from 1-7 rather distant contractions, when young replete with an austere pulp inside. An elegant tree when in flower, and well fitted for ornamental plantations.

*Var. β, variegata*; leaves variegated.

*Var. γ, pendula*; branches pendulous.

*Japan Sophora.* Fl. Aug. Sept. Clt. 1763. Tr. 30 to 40 ft. 2 *S. CHINEŒNSIS* (Lodd. cat. Loud. hort. brit. p. 162.). We have not been able to obtain a description of this species. It is

usually confounded in gardens with the preceding. *h. H.* Native of China.

*China Sophora.* Fl. Aug. Sept. Clt. 1763. Tr. 30 to 40 ft.  
 \*3 *S. GLAU'CA* (Lesch. ined. D. C. ann. sci. nat. 4. p. 98.) shrubby; leaflets 19-23, elliptic, mucronate, velvety, and glaucous on the upper surface, but villous beneath; racemes terminal, crowded. *h. S.* Native of the East Indies, on the mountains of Nelligery, where it is called by the natives *Houbbey*. Branches, petioles, and peduncles velvety. Flowers purplish.

*Glaucous Sophora.* Clt. 1818. Shrub 7 feet.

4 *S. TOMENTOSA* (Lin. spec. 533.) arboreous; leaflets 15-19, oval-roundish, clothed with hoary tomentum on both surfaces, as well as the calyxes; racemes terminal, elongated. *h. S.* Native of the Caribbee Islands and the East Indies? Lam. ill. t. 325. f. 2. *S. occidentalis*, Lin. spec. 533.—Plum. ed. Burm. t. 101. Trew. ehr. t. 59.—Brown, jam. 289. t. 31. f. 1.—Sloane, jam. 2. p. 40. t. 107. f. 3. Flowers yellow.

*Tomentose Sophora.* Fl. June, Jul. Clt. 1739. Sh. 7 to 8 ft.

5 *S. CRASSIFOLIA* (Jaume, in Duh. ed. nov. 3. p. 87.) arboreous; leaflets 15-19, oblong, obtuse, oblique at the base, dilated on the inner side, pubescent beneath; racemes terminal, elongated. *h. S.* Native of Senegal. Very like *S. tomentosa*. Leaves coriaceous, pale.

*Thick-leaved Sophora.* Clt. 1818. Tree.

6 *S. HAVANENSIS* (Jacq. amer. 118. t. 173. f. 1. a flower) shrubby; leaflets 25, oblong-ovate, obtuse, emarginate, and are as well as the branches villous; raceme terminal, elongated. *h. S.* Native of Cuba, about the Havannah, in bushy places. Flowers yellow.

*Havannah Sophora.* Fl. Aug. Clt. 1823. Shrub 6 feet.

7 *S. SECUNDIFLORA* (Lag. in D. C. cat. hort. monsp. 148.) shrubby; leaflets 9-13, elliptic-oblong, obtuse, coriaceous, smoothish; racemes terminal, crowded with secund flowers. *h. S.* Native of New Spain. Broussonetia secundiflora, Ort. dec. 5. p. 61. t. 7. Virgilia secundiflora, Cav. icon. 5. t. 401. Flowers rather large, blue. Legume, according to Lagasca is moniliform. A beautiful shrub.

*Side-flowered Sophora.* Clt. 1820. Shrub 6 feet.

8 *S. MACROCARPA* (Smith, in Rees' cycl. no. 6.) arboreous; leaves with 13-19 elliptic-oblong, obtuse, coriaceous leaflets, which are silky beneath; racemes short, axillary. *h. G.* Native of Chili, where it is called *Mayo*. Lodd. bot. cab. t. 1125. Legume silky, wingless. An elegant shrub with yellow flowers. Allied to *Edwardsia*.

*Long-fruited Sophora.* Clt. 1822. Shrub 8 to 10 feet.

9 *S. LITTORALIS* (Schrader, in Neuw. reis. no. 9. goett. anz. 1821. p. 709.) shrubby; leaflets few pairs, roundish-elliptic, glabrous above, but strigosely-canescens beneath; racemes terminal. *h. S.* Native of Brazil. Pluk. alm. t. 104. f. 3. *S. arc-nicola*, Nees, in flora, 1821. p. 297. Flowers probably yellow.

*Sea-shore Sophora.* Clt. 1820. Shrub 6 feet.

10 *S. HEPTAPHYLLA* (Lin. spec. 533.) arboreous; leaflets 7, glabrous. *h. S.* Native of the East Indies. This is a very obscure species and perhaps the same as *S. flavescens*.—Rumph. amb. 4. p. 50. t. 22. Flowers yellow.

*Seven-leafletted Sophora.* Shrub 6 feet.

11 *S. FLAVESCENS* (Ait. hort. kew. 2. p. 43.) herbaceous; leaflets 9-13, ovate-oblong, smoothish; racemes terminal. *h. H.* Native of Siberia. *S. macrocarpa*, Jaume, in Duh. ed. nov. 3.

p. 87. ex herb. Juss. *S. glabra*, Moench. ex Steud. Stipulas awl-shaped. Flowers yellowish. Stamens distinct. Legume slender, tomentose.

*Yellowish-flowered Sophora.* Fl. June, July. Clt. 1785. Pl. 2 to 3 feet.

12 *S. GALEGOIDES* (Pall. astrag. p. 118. t. 88.) herbaceous; leaflets 9-13, ovate, acute, rather large, smoothish; racemes terminal. *h. H.* Native of Eastern Siberia, particularly at Lake Baikal. Flowers of a violet colour.

*Galega-like Sophora.* Fl. June, Jul. Clt. 1817. Pl. 2 to 3 ft.

SECT. II. *DISEMÆA* (ἐτε, *dis*, twice, and *σημα*, *sema*, a standard; vexillum bifid). Lindl. bot. reg. 1185. Petals imbricate. Calyx 5-toothed, equal. Stamens irregularly monadelphous at the base.

13 *S. VELUTINA* (Lindl. bot. reg. 1185.) shrubby; leaflets 23, alternate, elliptic, mucronate, velvety on both surfaces, as well as the peduncles and branches; racemes cylindrical, terminal; petals imbricate; vexillum bifid. *h. F.* Native of Nipaul. Flowers in long racemose spikes, pale-purple. This species being very shewy, it would be worth attention to graft it on the common *Sophora Japonica*, by which means it would be rendered so hardly as to stand our winters in open shrubberies, for which purpose it would be a very desirable addition.

*Velvety Sophora.* Fl. May, Jun. Clt. 1820. Shrub 4 to 6 ft.

SECT. III. *PSEUDOSOPHORA* (from ψευδης, *pseudēs*, false, *sophōra*; called false sophoras because the stamens are diadelphous, and not monadelphous, as in the preceding section). D. C. prod. 2. p. 96. Stamens 10, somewhat diadelphous, that is 9 joined at the base and the tenth free.

14 *S. ALOPECUROIDES* (Lin. spec. 533.) herbaceous; leaflets 15-25, oblong, young ones silky on both surfaces, adult ones only on the under surface; racemes terminal. *h. H.* Native of Siberia, Iberia, Tauria, and Persia. Pall. astr. t. 87.—Dill. hort. elth. f. 136.—Buxb. cent. 3. t. 46. *S. albicans*, Jaume, in Duh. ed. nov. 3. p. 86. There is a variety of this plant with the leaves less villous. Racemes many-flowered. Flowers yellowish. Legume moniliform, tapering to both ends, sometimes only 1-seeded from abortion. Root creeping much. The plant seldom or ever flowers in England from the shortness of the summer.

*Fox-tail Sophora.* Fl. Sept. Oct. Pl. 3 to 4 feet.

15 *S. SERICEA* (Nutt. gen. amer. 1. p. 280.) herbaceous, dwarf; leaflets 21, cuneate-oval, or subelliptic, silky below; spikes nearly sessile. *h. H.* Native of elevated plains on the banks of the Missouri. Astragalus carnosus, Pursh, fl. sept. amer. 2. p. 740. ex Nutt. Patrinia sericea, Rafin. in journ. phys. aug. 1819. p. 97. ? Calyx 5-toothed and stamens diadelphous. ex Nutt. 4-toothed, and stamens free, ex Rafin. Keel mucronate, Nutt. Flowers white.

*Silky Sophora.* Fl. June, July. Clt. 1820. Pl. 1 foot.

† *A species not sufficiently known.*

16 *S. ACUMINATA* (Desf. journ. bot. 1814. 1. p. 75.) leaflets 39-41, lanceolate, acute, pubescent, rather emereous; legume tomentose, moniliform. *h. ? H.* Native of North America.

*Acuminated-leafletted Sophora.* Pl. ?

*Cult.* The *S. Japonica* and *S. Chinensis* are very handsome trees, well adapted to stand singly in lawns; while young they require a little protection in winter. These may be raised from layers, but they are generally increased by seeds. The stove species will thrive well in a light loamy soil, and cuttings will root if planted in a pot of sand, with a hand-glass placed over them, in heat. The hardy herbaceous kinds will grow well in a dry light soil, and they are easily increased

by dividing them at the root in spring, or by seed, which sometimes ripen.

**III. EDWARDSIA** (in honour of Sydenham Edwards, a celebrated English botanical draughtsman, who executed most of the drawings in the first volumes of the Botanical Register). Salisb. Lin. trans. 9. p. 299.\*

**LIN. SYST.** *Decándria, Monogýnia*. Calyx obliquely 5-toothed, with the upper side cleft. Petals 5, distinct, conniving into a papilionaceous corolla. Keel long. Stamens 10, with the filaments deciduous, according to Salisbury, and inserted into a cup-shaped, 10-angled torus. Legume moniliform, 1-celled, 2-valved, 4-winged, many-seeded. Shrubs or little trees, with impari-pinnate, exstipulate leaves, having numerous pairs of leaflets, which fall off late in the autumn. Flowers golden, axillary, disposed in short racemose spikes. •

1 *E. MICROPHYLLA* (Salisb. l. c.) leaves with 12-15 pairs of obovate-roundish, emarginate leaflets, smooth or pubescent beneath; petals of keel elliptic, hooked on the back. *h. F.* Native of New Zealand. *Sophora microphylla*, Ait. hort. kew. 2. p. 43. Lam. ill. t. 325. Jacq. hort. schœnbr. t. 269. *Sophora tetráptera*, Lin. fil. suppl. 230. Leaflets 25-41, 2-3 lines long. This is a magnificent shrub when in flower, displaying large pendulous bunches of golden flowers.

*Small-leaved Edwardsia*. Fl. May, June. Clt. 1722. Shrub 6 to 10 feet.

2 *E. GRANDIFLORA* (Salisb. l. c.) leaflets 17-21, oblong-linear, somewhat lanceolate, rather villous beneath; petals of keel broadly falcate. *h. F.* Native of New Zealand. *Sophora tetráptera*, Ait. hort. kew. 2. p. 43. Mill. icon. 1. Curt. bot. mag. 167. Lam. ill. t. 325. f. 3. Red. in Duh. ed. nov. 3. t. 20. *E. macrophylla*, Wanderoth, l. c. Leaflets 13-19, 5-10 lines long. This is an elegant tree when in flower, bearing large pendulous clusters of golden flowers, which rise in spring before the leaves.

*Great-flowered Edwardsia*. Fl. April, May. Clt. 1772. Shrub 6 to 10 feet.

3 *E. MYRIOPHYLLA* (Wanderoth, in Schlecht. Linnæa 5. p. 202.) arborescent; leaves having 20 pairs of obovate, entire, emarginate leaflets, the odd one emarginate, smooth, or pubescent beneath. *h. F.* Native of New Zealand. *E. minima*, Lodd. cat. Flowers yellow.

*Many-leafletted Edwardsia*. Fl. May, June. Clt. 1818. Shrub 4 to 6 feet.

4 *E. CHRYSOPHYLLA* (Salisb. l. c. t. 26. f. 1.) leaflets 17, obovate, younger ones clothed with yellow pubescence; petals of keel elliptic, with the dorsal margin straight. *h. G.* Native of the Sandwich Islands. Leaflets 8-10 lines long. Ker. bot. reg. 738. Flowers smaller than those of the preceding species, yellow.

*Golden-leaved Edwardsia*. Fl. May, June. Clt. ? Shrub 6 to 10 feet.

5 *E. NITIDA* (D. C. prod. 2. p. 97.) leaflets 21-25, elliptic, somewhat obovate, retusely emarginate, silky on both surfaces; wings of flower oblong, with the dorsal margin straight; legume villous. *h. S.* Native of the Island of Bourbon. *Sophora nitida*, Smith, in Rees' cycl. no. 7. *S. sericea*, Jaume, in Duh. ed. nov. 3. p. 86.

*Shining Edwardsia*. Clt. 1820. Shrub 8 feet.

6 *E. DENUDATA* (D. C. prod. 2. p. 97.) leaflets 17-21, elliptic, obtuse, retusely emarginate, pale beneath, and clothed with silky pubescence, smooth above, younger ones as well as branchlets sericeous. *h. S.* Native of the Island of Bourbon. *Sophora denudata*, Bouy. voy. 2. p. 399. *Sophora retusa*, Pers. ench. 2. p. 452. Calyx clothed with rusty shining wool, and the legume tomentose.

*Naked Edwardsia*. Shrub.

*Cult.* This is a genus of elegant shrubs. The four first species are hardy enough to survive our winters, in the open air, when they are not too severe, but it is much better to protect them under a frame in winter; they are generally propagated by seeds, which usually ripen; they may also be increased by young cuttings planted in sand, with a hand-glass placed over them. The stove species, or those natives of the Island of Bourbon, will grow freely in a mixture of loam, peat, and sand, and young cuttings of them will root readily if planted in a pot of sand, with a hand-glass placed over them, in heat.

**IV. ORMOSIA** (from *oppus*, *ormos*, a necklace; the seeds of *O. coccinea*, are strung for necklaces; they are red, and have a black spot at one end). Jacks. in Lin. trans. 10. p. 360. R. Br. in hort. kew. ed. 2. vol. 3. p. 3.

**LIN. SYST.** *Decándria, Monogýnia*. Calyx bilabiate, upper lip 2-lobed, lower one 3-parted. Vexillum roundish, hardly longer than the wings and keel. Stamens 10, with the filaments dilated at the base. Style incurved, crowned by 2 approximate stigmas. Legume woody, compressed, 2-valved, young ones 5-6-ovulate, 1-2-seeded. South American trees, with the branches clothed with rusty villi. Leaves large, impari-pinnate, usually with 4 or 6 pairs of leaflets. Stipulas distinct from the petioles. Flowers panicle, blue, or purplish.

1 *O. DASYCARPA* (Jacks. l. c. t. 26.) leaflets acuminate, glabrous on both surfaces; legumes tomentose. *h. S.* Native of the Caribbee Islands. *Sophora monosperma*, Swartz. fl. ind. occ. 2. p. 722. Podalyria, Poir. dict. 5. p. 440. Flowers large, blue. Legume containing only 1 large, round, spherical, scarlet seed, which has a large black spot at one end. Browne calls the tree the Red Bead-tree.

*Thick-fruited Bead-tree*. Fl. June, July. Clt. 1793. Tree 10 to 20 feet.

2 *O. COCCINEA* (Jacks. l. c. t. 25.) leaflets somewhat ovate, thick, with revolute margins, glabrous on both surfaces; legume glabrous, shining. *h. S.* Native of Guiana and Brazil. *Robinia coccinea*, Aubl. guian. 2. p. 773. Flowers blue. Seeds scarlet, with a black spot at one end, as in the preceding.

*Scarlet-seeded Bead-tree*. Fl. June, July. Clt. 1823. Tree 10 to 20 feet.

3 *O. COARCTATA* (Jacks. l. c. t. 27.) leaflets unequal, glabrous above, but covered with rusty hairs beneath. *h. S.* Native of Guiana. Seeds colour and shape of those of the two preceding, but much smaller.

*Coarctate Bead-tree*. Tree.

*Cult.* For culture and propagation see stove species of *Edwardsia*.

**V. VIRGILIA** (dedicated to the poet Virgil, whose Georgics contain many things interesting to botanists). Lam. ill. t. 326. Pers. ench. 1. p. 453. R. Brown, in hort. kew. ed. 2. vol. 3. p. 4.

**LIN. SYST.** *Decándria, Monogýnia*. Calyx 5-cleft. Petals 5, about equal in length. Vexillum with the edges not reflexed. Stigma beardless. Legume compressed, oblong, 2-valved, many-seeded.—Trees or shrubs with impari-pinnate leaves, and with the flowers disposed in racemes.

1 *V. CAPENSIS* (Lam. ill. 326. f. 2.) stamens deciduous, woolly at the base; ovaries as well as legumes tomentose; keel acuminate; leaflets numerous, opposite, linear-lanceolate, mucronate, pubescent beneath. *h. G.* Native of the Cape of Good Hope. *Sophora Capensis*, Burm. fl. cap. prod. 12. Lin. mant. 67. *Sophora oroboides*, Berg. cap. 142. *Hypocalyptus Capensis*, Thunb. fl. cap. 570. *Galèga sericea* *β.* Lam. ex herb. Juss. Podalyria Capensis, Andr. bot. rep. 347. *Virgilia Capensis*, Sims. bot. mag. 1590. Flowers large pink, rather

darker towards the base of the vexillum, disposed in dense racemes.

*Cape Virgilia.* Fl. July, Aug. Clt. 1767. Sh. 3 to 10 feet.

2 *V. INTRUSA* (R. Br. in Ait. hort. kew. 3. p. 4.) stamens permanent; ovaries smooth; calyx thrust in at the base; leaflets oval, obtuse, mucronate. *h. G.* Native of the Cape of Good Hope. Flowers pale-yellow.

*Thrust-in-calyxed Virgilia.* Fl. May, June. Clt. 1790. Shrub 4 to 8 feet.

3 *V. AU'REA* (Lam. ill. t. 326. f. 1.) stamens permanent; ovaries tomentose; legumes glabrous; leaflets opposite, oval, obtuse, mutic, smoothish. *h. G.* Native of Abyssinia. *Robinia subdecandra*, Lher. stirp. nov. t. 75. *Podalyria aurea*, Willd. spec. 2. p. 502. D. C. leg. t. 4. f. 2. germ. Flowers large, golden, drooping. The roots taste like liquorice. The bark affords a yellow dye.

*Golden-flowered Virgilia.* Fl. July. Clt. 1777. Shrub 6 ft.

4 *V. SYLVATICA* (D. C. prod. 2. p. 98.) stamens permanent; ovaries glabrous; leaflets opposite, 6-7 pairs, oval, obtuse, glabrous; panicle terminal. *h. G.* Native of the Cape of Good Hope. *Sophora sylvatica*, Burch. cat. geogr. 3138. Legume plano-compressed, glabrous, tapering to both ends. Flowers yellow.

*Wood Virgilia.* Fl. June, Aug. Clt. 1816. Shrub 6 feet.

5 *V. LUTEA* (Michx. fil. arb. amer. 3. p. 266. t. 3.) stamens deciduous, smooth; ovaries puberulous; legumes stipitate, glabrous; leaflets 9-11, alternate, ovate, acuminate, glabrous. *h. H.* Native of North America, between the mountains of Cumberland and the Mississippi. Delaun. herb. amat. t. 197. Flowers yellow, disposed in pendulous racemes. The whole tree strongly resembles the *Robinia pseudacacia*. The bark affords a yellow dye.

*Yellow-flowered Virgilia.* Fl. June, July. Clt. 1812. Tree 10 to 16 feet.

6 *V. ROBINOIDES* (D. C. prod. 2. p. 98.) leaves with 3 pairs of leaflets and an odd one, obovate, obtuse, glaucous, smooth; racemes axillary, length of leaves, clothed with adpressed pubescence; pedicels very short. *h. G.* Native of the Cape of Good Hope. *Robinia Capensis*, Burm. fl. cap. 22. Branches glabrous, terete. Stipulas callous, small. Flowers yellow.

*Robinia-like Virgilia.* Fl. June, Aug. Clt. 1818. Shrub 6 ft.

7 *V. ? RUBIGINOSA* (D. C. in ann. sc. nat. 4. p. 98.) stamens permanent; ovaries tomentose; leaflets oval-oblong, acuminate, opposite, glabrous; racemes panicle, and are, as well as the branches, rusty and velvety. *h. S.* Native of Guadaloupe. Flowers violaceous. Leaflets 3-4 inches long. Young legumes compressed, oblong, not moniliform.

*Rusty Virgilia.* Tree.

*Cult.* *Virgilia lutea* being an elegant hardy tree, is well adapted for shrubberies or pleasure-grounds, as it is covered with innumerable pendulous racemes of flowers early in summer. It is generally propagated by laying down the shoots in autumn or spring, and sometimes by seeds, which are annually received from the places of its natural growth by some nurserymen. It may also be propagated by young cuttings planted in a shady situation under a hand-glass. The green-house kinds are elegant plants when in flower; they will grow freely in a mixture of loam, peat, and sand, and young cuttings will root readily if planted in a pot of sand, with a hand-glass placed over them.

VI. MACROTROPIS (from *μακρος*, *macro*, long, and *τροπις*, *tropis*, a keel; keel of flower long). D. C. leg. mem. v. prod. 2. p. 98. — *Anagyris*, Lour. coch. p. 260. but not of Lin.

*Lin. syst. Decandria, Monogynia.* Calyx cup-shaped or inflated, 5-toothed. Keel petals 2, equal in length to the wings, but much exceeding the vexillum. Legume straight, com-

pressed or somewhat terete, many-seeded. — Shrubs, with imparipinnate glabrous leaves, and racemes of white flowers.

1 *M. FÆTIDA* (D. C. prod. 2. p. 98.) leaflets lanceolate-ovate; flowers panicle; calyx cup-shaped; legume somewhat terete. *h. F.* Native of China, near Canton. *Anagyris fœtida*, Lour. coch. p. 260. *A. Sinensis*, Steud. nom. Panicle terminal. Flowers white. Wood and leaves fetid.

*Fetid Macrotropis.* Fl. April, May. Clt. 1820. Shrub 8 ft.

2 *M. INODORA* (D. C. prod. 2. p. 99.) leaflets oblong, acuminate, glabrous; flowers racemose; calyx inflated; legume straight, compressed. *h. F.* Native of Cochinchina, in woods. *Anagyris inodora*, Lour. l. c. Racemes terminal. Flowers white. Branches somewhat scandent. Wood, leaves, and bark scentless.

*Scentless Macrotropis.* Shrub 10 feet.

*Cult.* Beautiful shrubs, which will thrive in a mixture of loam, sand, and peat; and young cuttings will strike root if planted in a pot of sand placed under a hand-glass. The shrubs only require to be protected from frost.

VII. ANAGYRIS (from *ανα*, *ana*, backwards, and *γυρος*, *gyros*, a circle; in allusion to the pods being curved backwards at their extremities). Tourn. inst. t. 415. Lin. gen. no. 509. Lam. ill. t. 325.

*Lin. syst. Decandria, Monogynia.* Calyx 5-toothed, somewhat bilabiate. Wings longer than the vexillum, but shorter than the 2-petalled keel. Legume on a short stipe, compressed, many-seeded, 2-valved, irregularly interrupted by a kind of spongy substance. — Shrubs, with trifoliate leaves and entire leaflets. Stipulas 2, concrete in one, placed opposite the leaves. Flowers disposed in short racemes, yellow.

1 *A. FÆTIDA* (Lin. spec. 534.) leaflets lanceolate, acute; legume acuminate. *h. F.* Native of the south of Europe, on hills in dry places. Lodd. bot. cab. 740. D. C. leg. t. 4. f. 3. germ. — Clus. hist. 1. p. 93. with a figure. The shrub is fetid in every part when bruised. The flowers hairy, like those of the *Laburnum*.

*Var. β, glauca* (Hortul. D. C. prod. 2. p. 99.) leaves more glaucous on both surfaces.

*Fetid Bean-Trefoil.* Fl. May, June. Clt. 1570. Sh. 6 to 8 ft.

2 *A. LATIFOLIA* (Willd. enum. 489.) leaflets elliptic, obtuse; legumes torose, obtuse, apiculated by the style. *h. F.* Native of Teneriffe.

*Broad-leaved Bean-Trefoil.* Fl. April, May. Clt. 1815. Shrub 6 to 10 feet.

*Cult.* See *Macrotropis* for culture and propagation.

VIII. PIPTANTHUS (from *πιπτο*, *pipto*, to fall, and *ανθος*, *anthos*, a flower; the teeth of the calyx fall off, as well as the petals and stamens very soon). Sweet. fl. gard. 264.

*Lin. syst. Decandria, Monogynia.* Calyx bilabiate, lower lip trifid, with the middle segment reflexed, upper lip 2-lobed; all the segments soon falling off. Petals deciduous. Vexillum large, obcordate, rufescent. Wings cuneate, somewhat cordate at the base. Keel cucullate, accumbent. Stamens 10, free, deciduous. Stigma minute. Legume broad-linear, compressed, 6-seeded, stipitate. — An elegant shrub, with trifoliate leaves, young ones rather silky; leaflets elliptical-oblong, acute, broad. Stipulas 2, large, joined together, entire, bicuspidate at the apex, placed opposite the leaves. Peduncles tern, 1-flowered. Flowers large, yellow.

1 *P. NIPAULENSIS* (Sweet, fl. gard. 264.) *h. H.* Native of Nipaul, on Shreenugur. *Thermopsis laburnifolia*, D. Don, prod. fl. nep. p. 239. *Anagyris Indica*, Wall. mss. *Baptisia Nipaulensis*, Hook. exot. fl. t. 131.

*Nipaul Piptanthus.* Fl. May, June. Clt. 1821. Sh. 8 to 10 ft.

*Cult.* This is an elegant shrub when in flower, being clothed with beautiful yellow flowers during the months of May and June. It is sufficiently hardy to stand our climate without any protection, and therefore is a great acquisition to hardy flowering shrubs. It is increased by laying down the shoots, or young cuttings will root if planted in sand under a hand-glass.

IX. THERMOPSIS (from *θερμος*, *thermos*, a lupine, and *opsis*, resemblance; so named on account of the resemblance of the species to lupines). R. Br. in Ait. hort. kew. ed. 2. vol. 3. p. 3. D. C. prod. 2. p. 99. *Thermia*, Nutt. gen. amer. 1. p. 282.

LIN. SYST. *Decandria*, *Monogynia*. Calyx oblong or campanulate, 4-5-toothed, somewhat bilabiate, convex behind, and attenuated at the base. Petals 5, about equal in length. Vexillum with reflexed sides. Keel obtuse. Stamens permanent. Legume compressed, falcate or linear, many-seeded.—Perennial herbs, clothed with silky villi. Leaves trifoliate. Stipulas ovate-lanceolate, leafy. Racemes terminal. Flowers pedicellate, twin, or somewhat verticillate, yellow.

1 T. RHOMBIFOLIA (Nutt. gen. amer. 1. p. 283. under *Thermia*.) leaves stalked; leaflets rhomb-ovate, somewhat cuneated, rather silky-pubescent; stipulas obliquely ovate, acute, shorter than the petiole; lower flowers of the raceme twin, on very short pedicels. *U. H.* Native of North America, on naked hills, near Fort Mandan. *Cytisus rhombifolius*, Fras. cat. 1813. Pursh, fl. sept. amer. 2. p. 741. Roots creeping horizontally. Racemes interrupted. Flowers yellow. Legume falcate, compressed.

*Rhomb-leaved Thermopsis*. Fl. June, Jul. Clt. 1841. Pl. 1 ft.

2 T. FABACEA (D. C. prod. 2. p. 99.) leaves stalked; leaflets broad-oval; stipulas broad-ovate, obtuse, shorter than the petioles; racemes with alternate flowers. *U. H.* Native of Kamtschatka. *Sophora fabacea*, Pall. astr. p. 122. t. 90. f. 2. *S. lupinoides* var. *a*, Lin. amœn. 2. p. 250. Flowers yellow.

*Bean-like Thermopsis*. Fl. Ju. July. Clt. 1818. Pl. 1 to 2 ft.

3 T. LANCEOLATA (R. Br. in Ait. hort. kew. ed. 2. vol. 3. p. 3.) leaves nearly sessile, lower and upper ones simple, like stipulas, the rest trifoliate; leaflets oblong-lanceolate; stipulas twice the length of the petioles or more; flowers twin on the racemes; pedicels shorter than the calyx. *U. F.* Native of Siberia, Dahuria, Kamtschatka, and Nootka Sound. *Sophora lupinoides*, Pall. astr. t. 89. *Podalyria lupinoides*, Willd. spec. 2. p. 504. Flowers yellow.

*Lanceolate-leaved Thermopsis*. Fl. June, July. Clt. 1779. Pl. 1 foot.

4 T. CORGONENSIS (D. C. prod. 2. p. 99.) leaves sessile, or on very short stalks; leaflets ovate, acute; stipulas like the leaves, and with them constituting a kind of half whorl; flowers twin on the racemes, nearly sessile; calyx villous. *U. H.* Native of the Corgon mountains, contiguous to the Altaian chain. *Sophora alpina*, Pall. astr. p. 121. t. 90. f. 1. *Podalyria alpina*, Willd. enum. suppl. 22.

*Corgon Thermopsis*. Fl. June, July. Clt. 1820. Pl. 1 to 2 ft.

*Cult.* The species of this genus are very elegant, but preserved with difficulty. They grow best in light soils, and they should be increased by seed, as dividing the plants at the root, is apt to injure them.

X. BAPTISIA (from *βαπτω*, *bapto*, to dye; so named from the economical use of some of the species). Vent. dec. p. 9. R. Br. in Ait. hort. kew. ed. 2. vol. 3. p. 5. *Podalyria*, Michx. fl. amer. bor. 1. p. 263, but not of R. Br. *Crotalopsis*, Michx. herb.

LIN. SYST. *Decandria*, *Monogynia*. Calyx semi 4-5-cleft, bilabiate. Petals 5, nearly equal in length. Vexillum with re-

flexed sides. Stamens deciduous. Legume ventricose, pedicellate, many-seeded.—North American herbs, with trifoliate, rarely simple leaves, and racemes of yellowish or blue flowers.

\* *Leaves simple.*

1 B. PERFOLIATA (R. Br. in Ait. hort. kew. 3. p. 4.) quite smooth; leaves perfoliate, roundish, quite entire, rather glaucous; flowers axillary, solitary. *U. H.* Native of Georgia and Carolina, on dry sandy hills. *Crotalaria perfoliata*, Lin. spec. 1003. *Rafnia*, Willd. spec. 3. p. 949. *Sophora*, Walt. car. 135. *Podalyria*, Michx. fl. 1. p. 263.—Dill. elth. f. 122. Flowers small, yellow.

*Perfoliate-leaved Baptisia*. Fl. Aug. Clt. 1793. Pl. 3 feet.

\* \* *Leaves trifoliate.*

2 B. LANCEOLATA (Ell. sketch. 167.) leaves sessile, and are, as well as the branches, rather pubescent; leaflets stalked, cuneate-lanceolate, obtuse; flowers axillary, solitary, on short pedicels, upper ones disposed in a raceme. *U. H.* Native of Carolina and Georgia, in sandy places. *Sophora lanceolata*, Walt. car. 135. *P. uniflora*, Mich. fl. bor. amer. 1. p. 263. Flowers yellow.

*Lanceolate-leafletted Baptisia*. Pl. 1 foot.

3 B. LEUCOPILATA (Nutt. gen. amer. 1. p. 282.) leaves sessile, and are, as well as the stem, somewhat villous; leaflets rhomboid-obovate; stipulas and bracteas ovate, acute, broad, leafy; racemes many-flowered, lateral, with the flowers leaning to one side; legumes acuminate. *U. H.* Native of Georgia and Louisiana, abundant about St. Lewis. Flowers cream-coloured. Plant divaricate, but not very high, dichotomous.

*Cream-coloured-flowered Baptisia*. Pl. 1 foot.

4 B. BRACTEATA (Muhl. ex Ell. sketch. 469.) leaves stalked, and are, as well as the branches, pubescent; leaflets broad-lanceolate, rather obtuse; stipulas longer than the petioles; racemes axillary, reclinate; bracteas large, broad-subulate, permanent. *U. H.* Native of Georgia, in a bog about Writtsborough. Flowers rather large, greyish.

*Bracteate Baptisia*. Pl. 1 to 2 feet.

5 B. AUSTRALIS (R. Br. in Ait. hort. kew. 3. p. 6.) stem branched, diffuse; leaves stalked, and are, as well as the branches, smooth; leaflets oblong-cuneated, obtuse, 4 times longer than the petiole; stipulas lanceolate, acute, twice the length of the petioles; racemes few-flowered, elongated, shorter than the branches; calyx quadrifid, lower segment obtuse; legumes apiculated. *U. H.* Native of Western Carolina, along rivulet banks. D. C. leg. t. 4. f. 4. germ. *Sophora australis*, Sims, bot. mag. 509. *Podalyria australis*, Vent. cels. t. 56. *P. cærulea*, Pursh, fl. sept. amer. 1. p. 307. Flowers blue.

*Southern Baptisia*. Fl. June, July. Clt. 1758. Pl. 2½ feet.

6 B. CONFUSA (Sweet, fl. gard. ined.) stem branched; leaves stalked, and are, as well as the branches, smooth; leaflets oblong-cuneated or obovate; stipulas linear-lanceolate, twice the length of the petioles; racemes elongated; flowers alternate, bracteate; bracteas permanent, lanceolate, acuminate, a little longer than the pedicels. *U. H.* Native of North America. Like *B. australis*. Flowers dark-blue.

*Confused Baptisia*. Fl. Ju. July. Clt. 1758. Pl. 1 to 2 ft.

7 B. EXALTATA (Sweet, fl. gard. 97.) stem erect, branched; leaves ternate, stalked; leaflets lanceolate-obovate, 5 times longer than the petioles; stipulas lanceolate, acuminate, 3 times longer than the petioles; racemes many-flowered, elongated, twice the length of the branches; flowers scattered, distinct; calyx 4-cleft, lower division acute. *U. H.* Native of North America. Flowers deep-blue.

*Exalted Baptisia*. Fl. June, Aug. Clt. 1812. Pl. 3 to 4 ft.

8 B. MINOR (Lehm. in nov. act. bom. vol. 14. This

plant we believe has not yet been described, and as we have no specimen the description must remain a desideratum. *Æ. H.* Native of North America.

*Small Baptisia.* Fl. June, July. Clt. 1828. Pl. 1 foot.

9 *B. MOLLIS* (Nutt. gen. amer. 1. p. 281.) leaves stalked, and are, as well as the stem and calyxes, minutely pubescent; leaflets somewhat rhomboid-lanceolate; stipulas foliaceous, linear-lanceolate; racemes spicate, terminal; teeth of calyx acute. *Æ. H.* Native of Upper Carolina, principally on the Catawba ridge, where it occurs abundantly in the open bushy forests. Stems purplish, decumbent. Leaves often 2 inches long and 1 broad. Flowers blue. Legume subulate, apiculated.

*Soft Baptisia.* Fl. June, July. Clt. 1824. Pl. decumbent.

10 *B. VILLOSA* (Ell. sketch. 168.) leaves nearly sessile, pubescent; stems and calyxes clothed with appressed pubescence; leaflets lanceolate, obtuse; stipulas linear, longer than the petioles; racemes terminal. *Æ. H.* Native of Virginia and North Carolina, in low sandy grounds. *Sophora villosa*, Walt. *Podalyria villosa*, Michx. fl. bor. amer. 1. p. 264. Flowers yellow, resembling a lupine. Calyx semi 4-cleft. Legume oblong, obtuse, cylindrical.

*Villous Baptisia.* Fl. June, July. Clt. 1811. Pl. 1 to 2 ft.

11 *B. ALBA* (R. Br. in Ait. hort. kew. 3. p. 6.) leaves stalked, and are, as well as the branches, glabrous; leaflets elliptic-oblong, obtuse; stipulas deciduous, subulate, shorter than the petioles; racemes terminal; ovaries glabrous. *Æ. H.* Native in the western parts of Virginia and Carolina, on the banks of rivers. *Sophora alba*, Walt. car. 134. *Podalyria alba*, Willd. spec. 2. p. 503. Sims, bot. mag. 1177. *Crotalaria alba*, Lin. spec. 1006. Branches divaricate. Flowers white.

*White-flowered Baptisia.* Fl. June, July. Clt. 1724. Pl. 2 ft.

12 *B. TINCTORIA* (R. Br. in Ait. hort. kew. 3. p. 6.) leaves stalked, and are, as well as the branches, glabrous, upper ones nearly sessile; leaflets roundish-obovate; stipulas setaceous, almost obsolete; racemes terminal. *Æ. H.* Native from Canada to Carolina, on dry hills in woods. Flowers yellow, with wings each furnished with a callosity or a lateral tooth. This plant was formerly used as Indigo by dyers. The root and herbage have been found to possess antiseptic and substringent properties. They have also a cathartic and emetic effect. Barton, 2. p. 57.

*Dyers' Baptisia* or Wild Indigo. Fl. June, July. Clt. 1759. Pl. 1½ foot.

*Cult.* This genus contains very ornamental border flowers of easy culture. The species are usually increased by dividing the plants at the root.

**XI. CYCLOPIA** (from *κύκλος*, *kyklos*, a circle, and *πους*, *pous*, a foot; in allusion to the replicate circle, which is found round the base or foot of the pods). Vent. dec. p. 8. R. Br. in Ait. hort. kew. ed. 2. vol. 3. p. 5.—*Ibbetsonia*, Sims, bot. mag. t. 1259.

**LIN. SYST.** *Decandria, Monogynia.* Calyx 5-cleft, unequal, thrust in at the base, the lowest tooth longest. Vexillum large, with longitudinal wrinkles. Wings having a transverse plait. Keel inflexedly mucronate. Stamens deciduous. Stigma bearded. Legume compressed, pedicellate, 1-celled, many-seeded, coriaceous.—Smooth broom-like shrubs, with sessile trifoliate leaves, and axillary, bracteate, yellow flowers.

1 *C. GENISTOIDES* (R. Br. l. c.) smooth; leaflets awl-shaped; calyx mutic; bracteas oblong-ovate. *h. F.* Native of the Cape of Good Hope. Sims, bot. mag. 1259. *Gompholobium maculatum*, Andr. bot. rep. t. 427. *Podalyria genistoides*, Thunb. *Sophora*, Berg. cap. 140. *Sophora genistoides*, Burm. cap. 12.—Pluk. phyt. t. 413. f. 5.

*Genista-like Cyclopia.* Fl. July, Aug. Clt. 1787. Shrub 8 ft. 2 *C. GALIOIDES* (D. C. prod. 2. p. 101.) plant smooth below, but the branches are hairy at the top, as well as the upper leaves; leaflets awl-shaped, mucronate; segments of calyx ending in an acuminate mucrone; bracteas ovate-lanceolate. *h. G.* Native of the Cape of Good Hope. *Sophora galioides*, Berg. cap. 141.—Pluk. alm. t. 413. f. 4. *Aspalathus callosa*, Burm. fl. cap. prod. 21.

*Galium-like Cyclopia.* Fl. July, Aug. Clt. 1820. Shrub 4 ft. 3 *C. TENUIFOLIA* (Lehm. in cat. sem. hort. hamb.) smooth; leaflets setaceous, acute; segments of the calyx obtuse; bracteas roundish, keeled. *h. G.* Native of the Cape of Good Hope.

*Fine-leaved Cyclopia.* Fl. July, Aug. Clt. 1826. Shrub 2 to 4 feet.

4 *C. LATIFOLIA* (D. C. in ann. sc. nat. 4. p. 98.) smooth; leaflets almost sessile, elliptic or ovate, somewhat mucronulate; lobes of calyx acute. *h. G.* Native of the Cape of Good Hope. *Genista buxifolia*, Burm. cap. prod. 21. Upper leaves simple. Flowers few, pedicellate; pedicels bibracteate at the base.

*Broad-leaved Cyclopia.* Fl. July, Aug. Clt. 1820. Shrub 3 to 6 feet.

*Cult.* An elegant genus of greenhouse shrubs, which will thrive in an equal mixture of loam and peat, and very young cuttings, planted in a pot of sand with a bell-glass placed over them, will root.

**XII. PODALYRIA** (*Podalyrius* was the son of *Æsculapius* in mythology). Lam. ill. t. 327. exclusive of some species. Salish. par. 7. R. Br. in hort. kew. ed. 2. vol. 3. p. 6. but not of Michx.—*Aphora*, Neck. elem. no. 1370.

**LIN. SYST.** *Decandria, Monogynia.* Calyx 5-cleft, with unequal lobes, thrust in at the base. Vexillum large, covering the keel and wings. Stamens 10, permanent, somewhat connate at the base. Stigma capitate. Legume sessile, ventricose, many-seeded.—Cape shrubs, usually clothed with silky hairs, with simple alternate leaves, and with narrow adpressed stipulas. Peduncles axillary, 1 or many-flowered. Bracteas caducous. Flowers purplish, rose-coloured or white.

\* *Peduncles 1-fl. nered.*

1 *P. BURCHELLII* (D. C. prod. 2. p. 101.) leaves elliptic or oblong, obtuse or emarginate, pubescent above, and rather hairy beneath; peduncles very short, 1-flowered, and are, as well as the calyxes, very hairy; wings of flower longer than the calyx. *h. G.* Native of the Cape of Good Hope. Burch. cat. no. 3475. *Sophora cordata*, Thunb. prod. 79. ? *Hypocalýptus cordatus*, Thunb. fl. cap. 569. ? Flowers of a rose-purplish colour. Calyx clothed with straight rufous hairs.

*Burchell's Podalyria.* Fl. May, July. Clt. 1816. Sh. 4 to 8 ft.

2 *P. HIRSUTA* (Willd. spec. 2. p. 505.) leaves villous, stalked, upper ones ovate, lower ones roundish; peduncles 1-flowered; segments of calyx villous, length of wings. *h. G.* Native of the Cape of Good Hope. *Sophora hirsuta*, Ait. hort. kew. 2. p. 46. Flowers red.

*Hairy Podalyria.* Fl. July, Aug. Clt. 1774. Shrub 2 to 4 ft.

3 *P. SERICEA* (R. Br. in Ait. hort. kew. ed. 2. vol. 3. p. 6.) leaves oblong-ovate, mucronate, silky on both surfaces; pedicels 1-flowered, much shorter than the leaves, and are, as well as the calyxes, clothed with appressed silky pubescence. *h. G.* Native of the Cape of Good Hope. Sims, bot. mag. t. 1923. *Sophora sericea*, Andr. bot. rep. t. 440. *Hypocalýptus sericeus*, Thunb. fl. cap. 569. ? Flowers pale-purple.

*Silky Podalyria.* Fl. Jan. Oct. Clt. 1778. Shrub 4 to 6 feet.

4 *P. CUNEIFOLIA* (Vent. cels. 99.) leaves cuneiform, obtuse, somewhat emarginate, silky on both surfaces, nearly sessile;

pedicels 1-flowered, one-half shorter than the leaves, and are, as well as the calyxes, clothed with appressed silky pubescence. *h. G.* Native of the Cape of Good Hope. Flowers white.

*Wedge-leaved Podalyria.* Fl. May, Aug. Clt. 1804. Shrub 4 to 6 feet.

5 *P. MYRTILLIFOLIA* (Willd. spec. 2. p. 505.) leaves oblong-obovate, bluntish, silky on both surfaces; pedicels 1-flowered, about equal in length to the leaves, and are, as well as the calyxes, clothed with silky appressed pubescence. *h. G.* Native of the Cape of Good Hope. *Sophora myrtillifolia*, Retz. obs. 1. p. 56. *Sophora rotundifolia*, Berg. cap. 138. Flowers purple, with a paler keel.

*Whortle-berry-leaved Podalyria.* Fl. April, Oct. Clt. 1795. Shrub 4 to 6 feet.

6 *P. BUXIFOLIA* (Willd. spec. 2. p. 505 ?) leaves oval or obovate, bluntish, glabrous above, and silky beneath; pedicels 1-flowered, about the length of the leaves; calyxes clothed with rusty villi. *h. G.* Native of the Cape of Good Hope. *Ker. bot. reg.* 869. *Sophora buxifolia*, Retz. obs. 1. p. 35. Flowers purple, with paler wings.

*Box-leaved Podalyria.* Fl. May, July. Clt. 1790. Shrub 2 to 4 feet.

7 *P. STYRACIFOLIA* (Sims, bot. mag. 1580.) leaves oval or obovate, mucronate, pubescent, reticulated beneath; pedicels 1-flowered, about equal in length to the leaves; calyx clothed with rusty tomentum; vexillum reflexed, broadly emarginate. *h. G.* Native of the Cape of Good Hope. *P. calyptata*, Willd. spec. 2. p. 504. *Sophora calyptata*, Retz. obs. 1. p. 36. *Hypocalyptus calyptatus*, Thunb. fl. cap. 568. Flowers pale-purple.

*Styrax-leaved Podalyria.* Fl. May, July. Clt. 1792. Sh. 6 ft.

8 *P. GLAUCA* (D. C. prod. 2. p. 102.) leaves oval, glabrous above, and silky beneath; pedicels 1-flowered, much longer than the leaves. *h. G.* Native of the Cape of Good Hope. *Hypocalyptus glaucus*, Thunb. fl. cap. 569. *P. buxifolia*, Lam. dict. 5. p. 445. ill. 327. f. 4. Flowers pale-purple.

*Glaucous Podalyria.* Fl. May, July. Clt. 1810. Shrub 4 to 6 feet.

9 *P. CORUSCANS* (Reichb. ex Spreng. syst. append. p. 171.) leaves nearly sessile, crowded, ovate-lanceolate, acute, clothed on both surfaces with silky villi; flowers axillary, nearly sessile. *h. G.* Native of the Cape of Good Hope.

*Glittering Podalyria.* Fl. July, Aug. Shrub 2 to 4 feet.

\* \* *Peduncles 2-flowered.*

10 *P. ARGENTEA* (Salisb. par. lond. t. 7.) leaves oval, acute, silky on both surfaces, marginate; peduncles 2-3-flowered, longer than the leaves; calyxes tomentose, rather scabrous. *h. G.* Native of the Cape of Good Hope. *P. biflora*, Sims, bot. mag. 753. *Sophora biflora* var. Retz. obs. 1. p. 36. *Burm. fl. cap. prod.* p. 12. *Lam. ill.* 327. f. 3. *Hypocalyptus pedunculatus*, Thunb. fl. cap. 569. Flowers white, according to Sims, or purplish at the margin of the vexillum, or pale-pink.

*Silvery Podalyria.* Fl. Feb. June. Clt. 1789. Shrub 3 to 6 ft.

11 *P. LIPARIOIDES* (D. C. prod. 2. p. 102.) leaves oval, acutish, silky on both surfaces; peduncles 2-flowered, much longer than the leaves; calyx clothed with appressed silky down. *h. G.* Native of the Cape of Good Hope. Very like the preceding species, but differs in the leaves being much more silky, by the calyx being clothed with appressed pubescence, not hairy, and by the corolla being flesh-coloured.

*Liparia-like Podalyria.* Fl. Feb. June. Clt. 1820. Shrub 3 to 6 feet.

12 *P. SUBBIFLORA* (D. C. prod. 2. p. 102.) leaves oval, mucronulate, pubescent on both surfaces, and reticulated beneath; peduncles 1-2-flowered, longer than the leaves; calyxes clothed

with rusty appressed pubescence. *h. G.* Native of the Cape of Good Hope. *Sophora biflora*, var. Retz. l. c. Flowers pale-purple. Perhaps the three last species are merely varieties of one plant.

*Somewhat-two-flowered Podalyria.* Fl. Feb. July. Clt. 1810. Shrub 3 to 6 feet.

13 *P. CORDATA* (R. Br. in hort. kew. ed. 2. vol. 3. p. 8.) leaves cordate, roundish, nearly sessile, very villous; peduncles 2-flowered, calyxes villous, with the segments shorter than the wings. *h. G.* Native of the Cape of Good Hope. Flowers purplish.

*Cordate-leaved Podalyria.* Fl. May, July. Clt. 1794. Shrub 3 to 4 feet.

14 *P. RACEMULOSA* (D. C. prod. 2. p. 102.) leaves oval, mucronulate, clothed with appressed silky pubescence on both surfaces; peduncles twice the length of the leaves, 2-4-flowered; calyxes clothed with appressed, silky, rusty pubescence. *h. G.* Native of the Cape of Good Hope. Lobes of calyx bluntish. Corolla pale-purple.

*Racemulose-flowered Podalyria.* Shrub 3 to 4 feet.

15 *P. PARVIFLORA* (D. C. prod. 2. p. 102.) leaves ovate, acute, tomentose; peduncles very short, 1-2-flowered; legume ovate, tumid. *h. G.* Native of the Cape of Good Hope. *Crotalaria parviflora*, Thunb. fl. cap. 571.

*Small-flowered Podalyria.* Shrub.

*Cult.* A genus of elegant silky shrubs. The species thrive best in a mixture of loam and peat, and young cuttings will root if planted in a pot of sand, with a bell or hand-glass placed over them, but they are usually increased by seeds.

XIII. CHORIZEMA (derived from *χορος*, *choros*, a dance, and *ζεμα*, *zema*, a drink. This plant was originally discovered by Labillardiere upon the south-west coast of New Holland, at the foot of the mountains near a spot where, after being tantalized with finding many salt springs, his party had just met with an ample supply of fresh water. This welcome refreshment, of which he speaks feelingly in his book, seems to have suggested the name). *Labill. voy.* 1. p. 405. *R. Br. in hort. kew.* p. 8. *D. C. prod.* 2. p. 102. *Chorozematis* spec. Smith in *Lin. soc. trans.* 9. p. 251.

*LIN. SYST. Decandria, Monogynia.* Calyx half 5-cleft, bilabiate, upper lip bifid, lower one 3-parted. Keel of flower ventricose, shorter than the wings. Style short, hooked, crowned by an obliquely-obtuse stigma. Legume ventricose, 1-celled, many-seeded, sessile or subsessile.—Australian subshrubs, with alternate, simple, sinuately-toothed, or entire leaves.

1 *C. ILICIFOLIA* (Labill. voy. 1. p. 105. t. 21.) leaves pinnatifidly-toothed, spinose, oblong-lanceolate, with an entire acumen, which is longer than the teeth; bracteoles at the top of the pedicels. *h. G.* Native of New Holland, on the south-west coast. A diffuse spreading shrub, pubescent on the branches and lower surface of the leaves. Flowers red, with the vexillum yellow at the base.

*Holly-leaved Chorizema.* Fl. Mar. Oct. Clt. 1803. Shrub 1 foot, straggling.

2 *C. NANA* (Sims, bot. mag. 1032.) leaves sinuately-toothed, spiny, oblong, with an entire acumen, which is equal in length with the teeth, rather obtuse; bracteoles below the apex of the pedicel. *h. G.* Native with the first. *Pultenaea nana*, Andr. bot. rep. 434. Flowers red, with the vexillum yellow at the base.

*Dwarf Chorizema.* Fl. Mar. Oct. Shrub straggling.

3 *C. RHOMBEA* (R. Br. in hort. kew. 3. p. 9.) leaves quite entire, flat, mucronate, lower ones rhomboidal-orbicular, upper ones elliptic-lanceolate; peduncles few-flowered; legumes large, oblong, reticulated. *h. G.* Native with the two preceding. Sweet, fl. aust. 40. Flowers with dark copper-coloured wings

and keel, and with the vexillum orange-coloured, with a yellow base.

*Rhomboid-leaved Chorizema*. Fl. April, July. Clt. 1803. Shrub procumbent.

4 *C. PLATYLOBIODES* (D. C. prod. 2. p. 103.) leaves quite entire, flat, ovate, acuminate, reticulated, smooth above, younger ones as well as calyxes clothed with hoary villi; flowers 2-3, axillary, nearly sessile; ovary very villous. *h. G.* Native of New Holland. *Platylöbium reticulatum*, Sieb. pl. exsic. nov. holl. no. 371. Calyx 5-cleft. Stamens 10, distinct. Perhaps a proper genus.

*Platylöbium-like Chorizema*. Shrub 2 feet.

5 *C. BAXTERI* (Graham, in edinb. new phil. journ. june, 1831.) leaves somewhat crenate, oblong-lanceolate, farinose above, but beset with adpressed villi beneath; flowers terminal, disposed in verticillate heads. *h. G.* Native of New Holland. *Mirbëlia Baxteri Hortulan.* Lindl. bot. reg. 1434. Stems numerous, much branched, diffuse, slender, covered with adpressed hairs. Corolla yellow. Vexillum reniform, with a dark base.

*Baxter's Chorizema*. Fl. April, Ju. Clt. 1824. Sh. diffuse.

6 *C. HENCHMANNII* (R. Br. in bot. reg. 986.) plant hoary; leaves acicular; flowers axillary. *h. G.* Native of New Holland. Flowers beautiful scarlet.

*Henchmann's Chorizema*. Fl. April, Ju. Clt. 1824. Shrub 2 to 3 feet.

*Cult.* A genus of pretty little shrubs. An equal mixture of loam, peat, and sand will suit the species. Young cuttings, planted in a pot of sand with a bell-glass placed over them, will strike root. Seeds of many of the species ripen in abundance, by which the plants may easily be increased.

XIV. PODOLOBIUM (from *πους ποδος*, *pous podos*, a foot, and *λοφος*, *lobos*, a pod; in allusion to the legume standing on a stalk within the calyx). R. Br. in hort. kew. ed. 2. vol. 3. p. 9. D. C. Leg. mem. V. *Chorozematis*, spec. Smith.

LIN. SYST. *Decandria*, *Monogynia*. Calyx 5-cleft, bilabiate, upper lip bifid, lower lip 3-parted. Carina compressed, length of wings, and about equal to the wide vexillum. Ovary 4-seeded. Style ascending. Stigma simple. Legume pedicellate, linear-oblong, rather ventricose, smooth inside.—Small shrubs, with the habit of *Chorizema*.

§ 1. *Leaves opposite, lobed, spiny.*—*False Chorizemas*.

1 *P. TRILOBATUM* (R. Br. l. c. Sims, bot. mag. 1477.) leaves opposite, spiny-toothed, somewhat 3-lobed, with a transverse base; lateral lobes much shorter than the terminal one, which is entire or toothed; ovary silky. *h. G.* Native of New South Wales. *Chorozema trilobatum*, Smith, in Lin. trans. 9. p. 253. *Pultenaea ilicifolia*, Andr. bot. rep. 320. Racemes axillary, shorter than the leaves. Flowers yellow, with the keel and vexillum red at the base. Leaves coriaceous, usually pubescent beneath.

*Three-lobed-leaved Podolobium*. Fl. April, July. Clt. 1792. Shrub 1 to 2 feet.

2 *P. STAUROPHYLLUM* (Sieb. pl. exsic. nov. holl. no. 393.) leaves opposite, trifid; lobes about equal, entire, spiny at the apex; ovary smooth. *h. G.* Native of New Holland, on the eastern coast. Lindl. bot. reg. 959. *P. aquifolium*, Lodd. cat. Leaves coriaceous, quite smooth. This plant is sometimes confused with the preceding in herbaria.

*Cross-leaved Podolobium*. Fl. Mar. April. Clt. 1822. Sh. 1 to 3 feet.

§ 2. *Leaves opposite, quite entire, unarmed.*—*False Daviesias*.

3 *P. SCA'NDENS* (D. C. prod. 2. p. 103.) leaves opposite, ob-

long-elliptic, quite entire, mucronate; ovary villous. *h. G.* Native of New Holland, on the eastern coast. *Chorozema scandens*, Smith, in Lin. soc. trans. 9. p. 253. A smooth climbing shrub, with terminal racemes of flowers, and with the calyx clothed with adpressed pubescence. Wings equal in length to the carina, but shorter than the vexillum. *Daviesia umbellata*, Sieb. pl. exsic. nov. holl. no. 392, but not of Smith. Flowers yellow.

*Climbing Podolobium*. Fl. June. Clt. 1824. Shrub cl.

4 *P. HUMIFUSUM*; leaves opposite; ovate-elliptic, quite entire; stems procumbent; ovary villous. *h. G.* Native of New Holland. *Daviesia humifusa*, Sieb. pl. exsic. nov. holl. no. 392, but not of Smith. Flowers yellow.

*Trailing Podolobium*. Fl. April, Ju. Clt. 1824. Sh. proc.

5 *P. SERICEUM* (D. C. prod. 2. p. 103.) leaves somewhat alternate, elliptic; racemes axillary, length of leaves; calyx silky; vexillum narrow; ovary bristly. *h. G.* Native of New Holland, at King George's Sound. *Chorozema sericeum*, Smith, in Lin. trans. 9. p. 253. Shrub climbing, with the upper leaves opposite. Calyx campanulate. Flowers yellow.

*Silky-calyxed Podolobium*. Shrub cl.

§ 3. *Leaves alternate.*—*False Oxylobiums*.

6 *P. CORIACEUM* (D. C. prod. 2. p. 103.) leaves alternate, roundish-elliptic, retuse, coriaceous; umbels axillary, stalked; calyx hairy. *h. G.* Native of New Holland, with the preceding species. *Chorozema coriaceum*, Smith, l. c. An erect stiff shrub. Leaves with cartilaginous margins and reticulately veined above. Flowers yellow.

*Coriaceous-leaved Podolobium*. Fl. April, June. Clt. 1824. Shrub 1 to 2 feet.

7 *P. ? ACICULARE* (D. C. in ann. sc. nat. 4. p. 98.) leaves alternate, linear, with a pungent taper-point, and with revolute edges, glabrous, reticulated with transverse veins above; branches and pedicels pubescent. *h. G.* Native of New Holland, on the eastern coast. A much-branched shrub, with stiffly spreading leaves, bearing small branches and leaves in the axillæ, hence the leaves appear ternate. Legume stipitate, ovate, 12-16-seeded, pubescent outside and smooth inside. Calyx 5-cleft, tapering to the base, bibracteolate. Perhaps a proper genus, but the corolla is unknown. Perhaps a species of *Oxylobium*.

*Acicular-leaved Podolobium*. Shrub 1 foot.

*Cult.* An elegant genus of small shrubs. The species will thrive best in an equal mixture of peat, loam, and sand, and young cuttings will root if planted in a pot of sand, with a bell-glass placed over them. Seeds sometimes ripen, by which the plants may also be propagated. The plants grow much better and flower more freely if planted in the ground in a conservatory, than if grown in pots.

XV. OXYLOBIUM (from *οξύς*, *oxys*, sharp, and *λοφος*, *lobos*, a pod; in allusion to the pods or legumes having a sharp point). Andr. bot. rep. 492. B. Br. in hort. kew. ed. 2. vol. 3. p. 9.

LIN. SYST. *Decandria*, *Monogynia*. Calyx profoundly 5-cleft (f. 23. a.), somewhat bilabiate. Carina compressed, length of wings (f. 23. b.), but about equal in length to the broad vexillum. Stamens inserted in the torus or in the bottom of the calyx. Style ascending, crowned by a simple stigma (f. 23. c.). Legume sessile or subsessile, many-seeded, ventricose, ovate, acute. Small Australian shrubs, with 3 or 4 entire leaves in a whorl. Flowers disposed in corymbs, yellow.

1 *O. ARBORESCENS* (R. Br. l. c.) leaves linear-lanceolate;

pedicels having permanent bracteas at their apex; corymbs of flowers crowded; legume hardly longer than the calyx. *h. G.* Native of Van Diemen's Land. Ker. bot. reg. 392. Lodd. bot. cab. 163. Sims, bot. mag. 2442. Flowers yellow.

*Arborescent Oxylodium.* Fl. April, June. Clt. 1805. Shrub 3 to 6 feet.

2 *O. ELLIPTICUM* (R. Br. l. c.) leaves oval-oblong, mucronate; pedicels having caducous bracteoles beneath their apex; corymbs crowded; legume twice the length of the calyx on a short stipe. *h. G.* Native of Van Diemen's Land. *Gompholobium ellipticum*, Labill. nov. holl. spec. 1. p. 166. 135. *Callistachys elliptica*, Vent. malm. 115. Flowers yellow. Legume villous.

*Elliptic-leaved Oxylodium.* Fl. May, Sept. Clt. 1805. Shrub 2 to 3 feet.

3 *O. RETUSUM* (R. Br. in bot. reg. 913.) leaves oblong, retuse, coriaceous, reticulated, glabrous; corymbs axillary, stalked, crowded, shorter than the leaves. *h. G.* Native of New Holland. Flowers orange-coloured. *Chorozema coriaceum*, Smith. *Podolobium*, D. C.?

*Retuse-leaved Oxylodium.* Fl. April, May. Clt. 1823. Sh. 1 to 3 feet.

4 *O. CORDIFOLIUM* (Andr. bot. rep. 492.) leaves ovate, cordate, rather pilose; umbels terminal, sessile. *h. G.* Native of New South Wales. Sims, bot. mag. 1544. Lodd. bot. cab. 937. Flowers of a coppery-red colour.

*Cordate-leaved Oxylodium.* Fl. April, Sept. Clt. 1807. Shrub 1 to 2 feet.

5 *O. OBTUSIFOLIUM* (Sweet, fl. austr. 5.) leaves oblong-linear, obtuse, smooth above, but clothed with silky tomentum beneath, with revolute edges; corymbs loose, verticillately racemose; pedicels with permanent bracteoles at the apex; calyx clothed with silky tomentum; wings of corolla reflexed. *h. G.* Native of New Holland, at King George's Sound. Flowers with carina and wings crimson, and with the vexillum deep orange-coloured, and yellow at the base.

*Obtuse-leaved Oxylodium.* Fl. April, May. Clt. 1825. Shrub 1 to 3 feet.

6 *O. SPINOSUM* (D. C. prod. 2. p. 104.) leaves broadly-ovate, with the middle nerve terminating in a long spine; stipulas spiny, short. *h. G.* Native of New Holland. Leaves 3 in a whorl, glabrous. Bracteoles 2, pressed to the base of the 5-cleft calyx. Keel, wings, and vexillum about equal in length.

*Spiny Oxylodium.* Fl. April, July. Clt. 1825. Sh. 1 to 2 ft.

7 *O. PULTENÆ* (D. C. leg. mem. 5. prod. 2. p. 104.) leaves 3 or 4 in a whorl, or alternate, linear, rather obtuse, with revolute margins, glabrous, but with the middle nerve as well as branches pubescent; flowers pedicellate, umbellate; pedicels furnished with deciduous bracteoles in the middle. *h. G.* Native of New Holland. *Pultenæa sylvatica*, Sieb. pl. exsicc. nov. holl. no. 403. Calyx 5-cleft, permanent, with the short tube girdling the fruit, the lobes reflexed. Stamens and petals deciduous, hypogynous. Ovary sessile, containing 8 ovula. Funicle dilated into a strophiole. Perhaps a proper genus. Flowers dark-orange.

*Pulteney's Oxylodium.* Fl. Mar. Clt. 1824. Sh. 1 to 2 ft.

*Cult.* Elegant shrubs, requiring the same treatment as that recommended for *Podolobium*, see p. 116.

XVI. CALLISTACHYS (from *καλλος*, *callos*, beauty, and *σταχυς*, *stachys*, a spike; in allusion to the fine spikes of yellow flowers). Vent. malm. 115. D. C. prod. 2. p. 104. *Callistachya*, Smith, in Lin. trans. 9. p. 266.

*LIN. SYST.* *Decandria, Monogynia.* Calyx bilabiate; upper lip bifid, lower one 3-parted. Vexillum erect, longer than the keel and wings, which are about equal in length. Stamens inserted in the disk. Style incurved. Stigma simple, acute. Legume stipitate, woody, dehiscent at the apex, young ones many-celled, but with the transverse dissepiments at length vanishing.—Elegant Australian shrubs, with entire leaves, which are either scattered or disposed in whorls, silky on the under surface, and with long terminal racemes of yellow flowers. Calyxes and fruit very villous.

1 *C. LANCEOLATA* (Vent. malm. t. 115.) leaves lanceolate, acuminate, scattered, opposite, or 3 or 4 disposed in a whorl. *h. G.* Native of New Holland, on the eastern coast. Ker. bot. reg. 216.

*Lanceolate-leaved Callistachys.* Fl. June, Aug. Clt. 1815. Shrub 3 to 4 feet.

2 *C. OVATA* (Sims, bot. mag. 1925.) leaves obovate, mucronate, usually disposed 3 in a whorl. *h. G.* Native of New Holland.

*Ovate-leaved Callistachys.* Fl. June, Aug. Clt. 1815. Shrub 3 to 6 feet.

3 *C. LINEARIFOLIA* (Hortulan.) leaves linear-lanceolate, scattered, or disposed in whorls. *h. G.* Native of New Holland.

*Toad-flat-leaved Callistachys.* Fl. June, Aug. Clt. 1824. Shrub 3 to 4 feet.

4 *C. CUNEATA* (Smith, in Lin. trans. 9. p. 267.) leaves wedge-shaped, emarginate; peduncles axillary, solitary, longer than the leaves. *h. G.* Native of New Holland. An herbaceous dwarf plant. Calyx pilose. Flowers large, yellow, but with the keel purple. This species, according to Mr. R. Brown, should be removed from this genus, but its real situation in the order is uncertain.

*Wedge-leaved Callistachys.* Fl. Ju. Aug. Clt. 1824. Pl. 1 ft. *Cult.* See *Podolobium* for culture and propagation, p. 116.

XVII. BRACHYSEMA (from *βραχυς*, *brachys*, short, and *σῆμα*, *sema*, a standard; the standard of the flower is very short). R. Br. in hort. kew. vol. 3. p. 10. D. C. prod. 2. p. 105.

*LIN. SYST.* *Decandria, Monogynia.* Calyx 5-cleft, a little unequal, with a ventricose tube. Vexillum shorter than the wings and keel, which are compressed and about equal in length. Ovary with its pedicel girded by a little sheath at the base. Style filiform, elongated. Legume ventricose, many-seeded.—Elegant Australian, procumbent, or climbing shrubs, with alternate, oval, or ovate, entire, mucronate leaves, which are silky on the under surface, and axillary and terminal few-flowered racemes.

1 *B. LATIFOLIUM* (R. Br. l. c.) leaves ovate, flat, silky beneath; calyx bractless at the base, 4-times shorter than the petals; vexillum oblong-obovate. *h. G.* Native of New Holland, on the south-west coast. Ker. bot. reg. 118. Sims, bot. mag. 2008. Flowers large, scarlet.

*Broad-leaved Brachysema.* Fl. April, July. Clt. 1803. Shrub procumbent or climbing.

2 *B. UNDULATUM* (Ker. bot. reg. 642.) leaves elliptic, undulated; calyx bracteolate under the base, 3-times shorter than the petals; vexillum oblong, cordate, convolute, and bluntish above. *h. G.* Native of New South Wales, in the interior of the country. Lodd. bot. cab. 778. Ker. bot. reg. 642. Flowers greenish-yellow, inconspicuous.

*Waved-leaved Brachysema.* Fl. Mar. May. Clt. 1820. Sh. pr.

*Cult.* For culture and propagation see *Podolobium*, p. 116. however, the species of this genus are easiest propagated by layers.

XVIII. GOMPHOLOBIUM (from *γομφος*, *gomphos*, a club, and *λοβος*, *lobos*, a pod; in reference to the shape of the pod being like that of a club or wedge). Smith, in Lin. trans. 4. p. 220. 9. p. 249. R. Br. in hort. kew. ed. 2. vol. 3. p. 11.

LIN. SYST. *Decandria*, *Monogynia*. Calyx 5-parted, nearly equal. Carina of 2 concrete petals. Vexillum broad. Stigma simple. Legume many-seeded, nearly spherical, very blunt.—Australian stiff shrubs, with alternate, compound leaves, standing on short petioles. Pods glabrous both inside and outside. Pedicels furnished with 2 bracteoles in the middle, or at the base. Calyx usually finely fringed with wool. Flowers yellow.

1 *G. GLAUCESCENS* (Cung, in Fields' new south wales, p. 346.) leaves ternate; leaflets linear, mucronate, with revolute margins; branchlets angular, glabrous; keel of flower beardless; calyx length of corolla before the expansion of the vexillum. *h. G.* Native of New Holland, on the Blue Mountains.

*Glaucescent Gompholobium.* Fl. April, Jul. Clt. 1824. Sh.  $\frac{1}{2}$  ft.

2 *G. BARBICERUM* (D. C. prod. 2. p. 105.) leaves ternate; leaflets linear, acutish; stem erect; branches angular; keel bearded along the suture; vexillum large, longer than the calyx and keel. *h. G.* Native of New Holland. *G. simbriatum*, Sieb. pl. exsic. nov. holl. no. 36. but not of Smith. Flowers golden-yellow, about an inch in length, larger than those of *G. grandiflorum*.

*Bearded-keeled Gompholobium.* Fl. April, Aug. Clt. 1824. Shrub 1 to 2 feet.

3 *G. GRANDIFLORUM* (Smith, in Lin. trans. 9. p. 249. exot. bot. t. 5.) leaflets 3, linear, acute; stem erect; branches angular; keel beardless; vexillum twice the length of the calyx and carina. *h. G.* Native of New Holland, on the eastern coast. Ker. bot. reg. 484. Flowers large, yellow. Leaflets hardly a line broad, but nearly an inch long.

*Var. β, setifolium* (Sieb. pl. exsic. nov. holl. no. 363.) leaflets narrow-linear, somewhat revolute and bristle-formed. *h. G.* Native of New Holland, on the eastern coast.

*Great-flowered Gompholobium.* Fl. Mar. Sept. Clt. 1803. Shrub 1 to 3 feet.

4 *G. VIRGATUM* (Sieb. pl. exsic. nov. holl. no. 360.) leaflets 3, linear, obtuse; stem erect; branches nearly terete; carina of flower beardless; vexillum hardly longer than the calyx and keel. *h. G.* Native of New Holland, on the eastern coast. The habit of the plant is that of *G. latifolium*, but the keel of the flower is beardless.

*Twiggy Gompholobium.* Fl. Mar. Dec. Clt. 1820. Shrub 1 to 3 feet.

5 *G. LATIFOLIUM* (Smith, in Lin. soc. trans. 9. p. 249.) leaflets 3, cuneate-linear, or oblong-linear; stem erect; keel fringed; calyx reflexed when in fruit. *h. G.* Native of New Holland, on the eastern coast. R. Br. in hort. kew. 3. p. 11. Labill. nov. holl. t. 133. *G. simbriatum*, Smith, exot. bot. t. 58. *G. psoralaceifolium*, Salisb. par. t. 6. Leaflets 1-2 lines broad, and 6-12 lines long. Flowers large, yellow.

*Broad-leaved Gompholobium.* Fl. Mar. Sept. Clt. 1803. Shrub 1 to 2 feet.

6 *G. MARGINATUM* (R. Br. l. c.) leaflets 3, obovate, marginated, flat; stipulas equal in length to the petioles; corolla length of calyx. *h. G.* Native of New Holland, on the southern coast.

*Marginate-leaved Gompholobium.* Fl. March, Sept. Clt. 1803. Shrub 1 foot.

7 *G. PEDUNCULARE* (D. C. prod. 2. p. 105.) leaflets 3, with somewhat revolute margins, lower ones obovate, mucronate, upper ones lanceolate-linear, acuminate; stipulas length of

petioles; stems diffuse; pedicels much longer than the leaves, and bibracteolate at the apex; corolla longer than the calyx. *h. G.* Native of the eastern coast of New Holland. Stems somewhat herbaceous. Legume oval, rather compressed. This plant, along with the following species, will probably form a distinct genus.

*Pedunculate-flowered Gompholobium.* Fl. April, July. Clt. 1824. Pl.  $\frac{1}{2}$  foot.

8 *G. TETRATHECOIDES* (Sieb. pl. exsic. nov. holl. 359.) leaflets 3, linear, with subrevolute margins; branches terete, hispid from short down; pedicels scarcely longer than the leaves; carina beardless, and is as well as the vexillum hardly longer than the calyx. *h. G.* Native of New Holland, on the eastern coast. Leaves on short stalks; leaflets 2 lines long.

*Tetrathecoid-like Gompholobium.* Fl. April, July. Clt. 1824. Shrub  $\frac{1}{2}$  to  $\frac{3}{4}$  foot.

9 *G. POLYMORPHUM* (R. Br. in hort. kew. ed. 2. vol. 3. p. 11.) leaflets 3-5, linear, or oblong-cuneate, mucronate, with recurved margins; stem procumbent, weak, twining; stipulas shorter than the petioles; pedicels much longer than the leaves, bibracteolate, both at the base and the apex or in the middle. *h. G.* Native of New Holland, on the south-west coast. Vexillum large, scarlet on the inside with a yellow base, and purplish on the outside. *G. grandiflorum*, Andr. bot. rep. 642. ex Sims, bot. mag. 1533.

*Polymorphous Gompholobium.* Fl. Mar. Aug. Clt. 1803. Shrub  $\frac{1}{2}$  to 1 foot.

\* \* *Leaves impari-pinnate.*

10 *G. TOMENTOSUM* (Labill. nov. holl. 1. p. 106. t. 134.) leaves impari-pinnate, with 2-4 pairs of leaflets; leaflets awl-shaped-linear, mucronate, scabrous above; peduncles usually solitary; calyx hairy, shorter than the legume; keel ciliated, with silky hairs. *h. G.* Native of New Holland, on the south coast, and in Van Diemen's Land. R. Br. in hort. kew. 3. p. 12. Shrub tomentose.

*Tomentose Gompholobium.* Fl. April, Jul. Clt. 1803. Sh. 1 ft.

11 *G. LANATUM* (Cung, mss. ex G. Don, in Loud. hort. brit. p. 163.) branches and leaves villous; leaves impari-pinnate; leaflets linear-subulate, with revolute edges; pedicels solitary, shorter than the leaves, terminal or axillary at the tops of the branches; keel bearded. *h. G.* Native of New Holland. Corolla twice the length of the calyx, of a coppery-yellow colour.

*Woolly Gompholobium.* Fl. Mar. Jun. Clt. 1824. Sh.  $\frac{1}{2}$  to 1 ft.

12 *G. GLABRATUM* (D. C. prod. 2. p. 106.) leaves impari-pinnate, with 2-3 pairs of linear-subulate leaflets, with revolute edges; peduncles usually solitary; calyx glabrous, one-half shorter than the legume. *h. G.* Native of New Holland. Branches lepidotied with tubercles. Leaflets approximate along the petiole. Legume ovate. Calyx glabrous on the outside, ciliated along the margins of the lobes with fine wool. Corolla unknown.

*Smooth Gompholobium.* Fl. April, Aug. Clt. 1820. Sh.  $\frac{1}{2}$  to 1 foot.

13 *G. HETEROPHYLLUM* (Cung, mss.) leaves trifoliate or impari-pinnate, usually with 3-5 or 7 leaflets, which are obovate, lanceolate, or linear, all mucronate, terminal one broadest, perfectly glabrous; racemes short, terminal; pedicels rather longer than the bracteas, which are linear. *h. G.* Native of New Holland. Keel beardless? Flowers reddish.

*Variable-leaved Gompholobium.* Fl. April, June. Clt. 1823. Shrub  $\frac{1}{2}$  foot.

14 *G. VENUSTUM* (R. Br. in hort. kew. ed. 2. vol. 3. p. 12.) leaves impari-pinnate, with many pairs of leaflets; leaflets awl-

shaped, veiny, with revolute margins, and are as well as the calyxes glabrous; corymb stalked, many-flowered. *h. G.* Native of New Holland, on the south-west coast. Corolla purple.

*Beautiful Gompholobium.* Fl. April, July. Clt. 1803. Sh. 1 to 3 feet.

15 *G. PINNATUM* (Smith, in Lin. soc. trans. 9. p. 251.) leaves impari-pinnate, with many pairs of smooth leaflets; stem terete, flexuous, glabrous. *h. G.* Native of New Holland, near Port Jackson. Plant very small, and probably an annual.

*Pinnate-leaved Gompholobium.* Fl. April, July. Clt. 1820. Pl.  $\frac{1}{2}$  foot.

*Cult.* *Gompholobium* is a genus of most elegant plants: its species thrive well in an equal mixture of loam, peat, and sand, but care must be taken not to give them too much water, as they are extremely tenacious of moisture, and difficult to preserve in a living state. Young cuttings will root freely if planted in a pot of sand, with a bell-glass placed over them, but some of the species produce seed in abundance, which is the best way of increasing them, as they make better plants from seeds than from cuttings.

XIX. *BURTONIA* (Burton, evidently the name of some botanist). R. Brown, in hort. kew. ed. 2. vol. 3. p. 13. D. C. prod. 2. p. 106.

LIN. SYST. *Decandria, Monogynia.* Calyx profoundly 5-cleft. Petals 5, deciduous, about equal in length, 2 of which are concrete into a keel on the back. Ovary 2-seeded. Style subulate, dilated at the base. Stigma obtuse, bearded. Legume roundish, ventricose. Seeds without a strophiole.—Australian subshrubs, with subulate leaflets or leaves; branches usually puberulous, and pedicels solitary. Flowers of all yellow.

1 *B. SCABRA* (R. Br. l. c.) leaflets 3, linear-subulate, scabrous, rather hooked at the points, and mutic; branches terete, pubescent. *h. G.* Native of New Holland, on the south-west coast. *Gompholobium scabrum*, Smith, in Lin. trans. 9. p. 250. Calyx smooth. Style beardless beyond the middle. Keel beardless.

*Scabrous Burtonia.* Fl. May, July. Clt. 1803. Sh.  $\frac{1}{2}$  to 1 ft.

2 *B. MINOR* (D. C. prod. 2. p. 106.) common petiole almost wanting; leaflets 3, glabrous, hooked, mucronate, erect; branches terete, hairy. *h. G.* Native of New Holland. *Gompholobium minus*, Smith, in Lin. soc. trans. 9. p. 251. Flowers yellow, with the keel beardless.

*Small Burtonia.* Fl. Mar. July. Clt. 1812. Shrub  $\frac{1}{2}$  foot.

3 *B. SESSILIFOLIA* (D. C. prod. 2. p. 106.) leaflets 3, sessile, or 3 leaflets ternately approximate, linear-subulate, smooth, mucronate, and somewhat hooked; branches terete, pubescently-hairy. *h. G.* Native of New Holland, on the eastern coast. Calyx smooth, but ciliated on the edges of the lobes. Vexillum deeply obcordate. Keel beardless. This plant hardly differs from the preceding species unless in the length of the leaves.

*Sessile-leaved Burtonia.* Fl. May, Jul. Clt. 1824. Sh.  $\frac{1}{2}$  to 1 ft.

4 *B. CONFERTA* (D. C. prod. 2. p. 106.) leaves simple, crowded very much, linear-subulate, with revolute margins, and are as well as the branches smooth. *h. G.* Native of New Holland, on the southern coast. Calyx glabrous, with the lobes much acuminate. Leaves 6-8 lines long, usually incurved. The plant is in habit like *Dillwynia*, but the calyx is that of *Burtonia*.

*Crowded-leaved Burtonia.* Shrub 1 foot.

*Cult.* See *Gompholobium* for culture, propagation, and management.

XX. *JACKSONIA* (in honour of George Jackson, an acute

Scotch botanist, once Librarian to A. B. Lambert, Esq. F.R.S. V.P.L.S. &c.). R. Br. in hort. kew. ed. 2. vol. 3. p. 12.

LIN. SYST. *Decandria, Monogynia.* Calyx 5-parted, nearly equal. Petals and stamens deciduous. Ovary 2-seeded. Style filiform and subulate, crowned by a simple stigma. Legume a little ventricose, ovate, or oblong; valves pubescent inside. Seeds without a strophiole.—Australian shrubs, and when in an adult state they are usually leafless; branches usually angular, and with the branchlets branched, very like leaves in form. Flowers of all yellow.

1 *J. SCOPARIA* (R. Br. l. c.) arborescent, unarmed; branches angular; racemes terminal. *h. G.* Native of New South Wales. Lodd. bot. cab. 427. Habit nearly of *Genista monosperma*.

*Broom Jacksonia.* Fl. Ju. Aug. Clt. 1803. Sh. 2 to 6 ft.

2 *J. SPINOSA* (R. Br. l. c.) shrubby; branches pubescent, dichotomous, and trichotomous, spreading, angular; flowers usually solitary; bracteoles at the tops of the pedicels, adpressed and very short. *h. G.* Native of New Holland, on the south-west coast. *Gompholobium spinosum*, Labill. nov. holl. 1. p. 107. t. 136.

*Spiny Jacksonia.* Fl. April, Sept. Clt. 1803. Sh. 2 to 4 ft.

3 *J. HORRIDA* (D. C. prod. 2. p. 107.) shrubby; branches angularly compressed, branched, spinescent, leaf-formed; racemes terminal; pedicels furnished with bracteoles in the middle. *h. G.* Native of New Holland, on the eastern coast. Branches terete, furnished with prominent angles; branchlets glabrous or pubescent at the flowers. Rachis angularly compressed.

*Horrid Jacksonia.* Shrub 1 to 3 feet.

4 *J. FURCELLATA* (D. C. prod. 2. p. 107.) shrubby; branches terete; branchlets compressed and striated, forked, linear, unarmed; racemes terminal; pedicels furnished with bracteoles at the apex. *h. G.* Native of New Holland, on the eastern coast. *Gompholobium furcellatum*, Bonpl. nov. p. 30. t. 11. Branches and branchlets pubescent.

*Forked-branched Jacksonia.* Fl. April, Sept. Clt. 1824. Shrub 1 to 2 feet.

5 *J. RETICULATA* (D. C. prod. 2. p. 107.) shrubby; branches and branchlets terete; leaves lanceolate, pungent, reticately-veined on both surfaces; flowers axillary, solitary. *h. G.* Native of New Holland, on the eastern coast. *Daviesia reticulata*, Smith, in Lin. soc. trans. 9. p. 256. In this and the two preceding species the legumes are villous on the outside, and clothed with velvety pubescence on the inside.

*Reticulated-leaved Jacksonia.* Fl. April, Sept. Clt. 1820. Shrub 1 to 2 feet.

*Cult.* Loam and peat is the best mixture for the species of this genus, and young cuttings are easily struck in sand under a bell-glass, or ripened ones under a hand-glass.

XXI. *VIMINARIA* (from *vimen*, a twig; the appearance of the species is that of a bundle of naked twigs, being destitute of leaves). Smith, ann. bot. 1. p. 507. Lin. trans. 9. p. 261. R. Br. in hort. kew. ed. 2. vol. 3. p. 13. D. C. prod. 2. p. 107.

LIN. SYST. *Decandria, Monogynia.* Calyx 5-toothed, angular. Petals of unequal length. Style capillary, longer than the ovary, which is 2-seeded. Stigma simple. Legume valveless, ovate. Seeds without a strophiole.—Australian shrubs, with twiggy branches, with simple or trifoliate leaves on the young plants, but the adult plants are without leaves. Flowers disposed in racemes, yellow, with the pedicels destitute of bracteas.

1 *V. DENUDATA* (Smith, exot. bot. t. 27.) flowers racemose; teeth of calyx erect, short. *h. G.* Native of New Holland and Van Diemen's Land. Sims, bot. nag. 1190. *Daviesia denudata*, Vent. choix. t. 6. *Sophora juncea*, Schrad. sert. hann. t. 3.

*Naked Viminaria*. Fl. June, Sept. Clt. 1780. Sh. 2 to 4 ft.  
 2 *V. LATRIFLORA* (Link. enum. 1. p. 403.) flowers subracemose; teeth of calyx lanceolate, reflexed. *h. G.* Native of New Holland. Flowers larger than those of *V. decudata*. Leaves wanting. Fruit unknown.

*Side-flowered Viminaria*. Fl. June, Sept. Clt. 1824. Shrub 2 to 3 feet.

*Cult.* Elegant shrubs when in flower. For culture and propagation see *Jacksonia*, p. 119.

**XXII. SPHÆROLOBIUM** (from *σφαῖρα*, *sphaîra*, a sphere, and *λοβος*, *lobos*, a pod; in allusion to the spherical legumes). Smith, ann. bot. 1. p. 509. Lin. trans. 9. p. 261. R. Br. in hort. kew. ed. 2. vol. 3. p. 14. D. C. prod. 2. p. 107.

**LIN. SYST.** *Decandria, Monogynia*. Calyx 5-cleft, bilabiate, bractless at the base. Style furnished with a membrane at the apex, beardless. Stigma terminal. Legume spherical, 1-2-seeded, pedicellate.—Little Australian shrubs, with twiggly few-leaved branches, but the adult ones are perfectly leafless. Leaves simple. Flowers disposed in loose racemose spikes.

1 *S. VIMINEUM* (Smith, l. c.) tube of calyx a little shorter than the lips; style inclosed, arched at the base. *h. G.* Native of New Holland and Van Diemen's Land. Sims, bot. mag. 969. *S. minus*, Labill. nov. holl. t. 138. Flowers yellow.

*Twiggy Sphærolobium*. Fl. May, Aug. Clt. 1802. Sh. 1 ft.

2 *V. MEDIUM* (R. Br. l. c.) tube of calyx one-half shorter than the lips. *h. G.* Native of New Holland, on the south-west coast. Flowers red.

*Intermediate Sphærolobium*. Fl. July, Aug. Clt. 1803. Sh. 1 to 3 feet.

*Cult.* The species of this genus are elegant when in flower; their culture and propagation are the same as that for *Jacksonia*, p. 119.

**XXIII. AOTUS** (from *a* priv. and *ωτα*, *ota*, ears; in allusion to the want of appendages in the calyx, which in *Pultenæa* are very distinct, a genus which is most nearly allied). Smith, ann. bot. 1. p. 504. in Lin. trans. 9. p. 249. R. Br. in hort. kew. ed. 2. vol. 3. p. 14. D. C. prod. 2. p. 108.

**LIN. SYST.** *Decandria, Monogynia*. Calyx 5-cleft, bilabiate, bractless at the base. Petals and stamens deciduous. Ovary 2-seeded. Style filiform. Legume 2-valved. Seeds without a strophiole.—Australian shrubs, with simple, linear-subulate leaves, revolute at the margins, alternate or nearly opposite, or 3 in a whorl. Flowers axillary, yellow.

1 *A. VILLOSA* (Smith, l. c.) leaves smoothish on the upper surface; flowers axillary, disposed in racemose spikes along the branches. *h. G.* Native of New Holland. Calyx clothed with silky appressed villi. Legume pedicellate. Seeds covered with wrinkled dots.

*Filious Aotus*. Fl. April, June. Clt. 1790. Sh. 1 to 2 ft.

2 *A. ERICOIDES*; leaves linear, very acute, hairy; flowers solitary, axillary, appearing in axillary racemose spikes along the branches; branches clothed with cinereous spreading hairs. *h. G.* Native of New Holland. *Pultenæa ericoides*, Vent. mahn. t. 35. *A. villosa*, Sims, bot. mag. 949. *Pultenæa rosmarinifolia*, Sieb. pl. exsic. nov. holl. no. 387? *A. villosa* var. *α*, *ericoides*, D. C. prod. 2. p. 108.

*Heath-like Aotus*. Fl. April, June. Clt. 1810. Sh. 1 to 2 ft.

3 *A. FERRUGINEA* (Labill. nov. holl. 1. t. 132.) leaves linear, obtuse, scabrous from tubercles above; flowers twin, axillary, rising along the branches; branches clothed with rusty down, when young with silky rusty down. *h. G.* Native of Van Diemen's Land. *A. villosa* var. *β*, *ferruginea*, D. C. prod. 2. p. 108.

*Rusty Aotus*. Fl. April, June. Clt. 1820. Sh. 2 to 4 feet.

4 *A. VIRGATA* (D. C. prod. 2. p. 108.) leaves scabrous from tubercles above; flowers axillary, disposed into ovate, capitate, terminal spikes. *h. G.* Native of New Holland. *Pultenæa virgata*, Sieb. pl. exsic. nov. holl. no. 389. Branches grey from velvety pubescence. Leaves disposed 3 in a whorl. Bracteas wanting. Calyx clothed with appressed pubescence.

*Twiggy Aotus*. Fl. April, June. Clt. 1824. Sh. 1 to 2 feet.

*Cult.* Elegant little shrubs when in flower. For culture and propagation see next genus.

**XXIV. DILLWYNIA** (in honour of Lewis Weston Dillwyn, F.R.S. F.L.S. whose labours on British *Conferæ* are well known). Smith, ann. bot. 1. p. 510. Lin. trans. 9. p. 262. R. Br. in hort. kew. ed. 2. vol. 3. p. 15. D. C. prod. 2. p. 108.

**LIN. SYST.** *Decandria, Monogynia*. Calyx 5-cleft, bilabiate, tapering at the base. Petals inserted in the middle of the tube of the calyx. Lamina of vexillum twice the breadth of the length, 2-lobed; lobes spreading. Ovary 2-seeded. Style hooked. Stigma capitate. Legume ventricose. Seeds strophiole.—Australian subshrubs, with simple leaves and yellow flowers on short pedicels. Stipulas wanting or very small, deciduous.

**SECT. I. DILLWYNIASTRUM** (see genus for derivation). Petals and stamens deciduous.

1 *D. FLORIBUNDA* (Smith, exot. bot. t. 26.) flowers crowded, axillary, twin; leaves crowded, subulate, mucronulate, scabrous from tubercles. *h. G.* Native of New Holland, on the south and east coasts. *D. ericifolia*, Sims, bot. mag. 1544.

*Bundle-flowered Dillwynia*. Fl. April, July. Clt. 1794. Sh. 2 to 6 feet.

2 *D. ERICIFOLIA* (Smith, exot. bot. t. 25.) corymbs of flowers terminal; leaves subulate, pungent, scabrous from points, divaricate, scattered; branches pubescent. *h. G.* Native of New Holland, on the eastern coast. *Pultenæa retorta*, Wendl. hort. herrenh. 2. p. 13. t. 9.

*Heath-leaved Dillwynia*. Fl. March, July. Clt. 1794. Sh. 2 to 4 feet.

3 *D. JUNIPERINA* (Lodd. bot. cab. 401.) leaves nearly filiform, smooth, ending in a pungent mucrone, spreading, straight, serrated; heads of flowers terminal; pedicels bibracteate; branches twiggly, spreading, pubescent. *h. G.* Native of New Holland and Van Diemen's Land. Corolla orange-coloured, with the vexillum and wings streaked in their lower part with red.

*Juniper-like Dillwynia*. Fl. March, May. Clt. 1818. Sh. 1 to 3 feet.

4 *D. GLABERRIMA* (Smith in Lin. trans. 9. p. 263.) corymbs terminal; leaves filiform, erect, smooth, ending in a soft recurved mucrone. *h. G.* Native of New Holland, on the eastern coast. Sims, bot. mag. 944. Lodd. bot. cab. 582. Labill. nov. holl. 1. p. 109. t. 139. Legumes puberulous.

*Very smooth Dillwynia*. Fl. March, July. Clt. 1800. Sh. 2 to 4 feet.

5 *D. PARVIFOLIA* (R. Br. in Sims, bot. mag. t. 1527.) corymbs terminal, few-flowered, rather capitate; leaves short, crowded in a decussate manner, and spreading; pedicels bibracteate; stigma capitate. *h. G.* Native of New Holland. Lodd. bot. cab. 559. *D. microphylla*, Sieb. l. c. no. 410 and 553.

*Small-leaved Dillwynia*. Fl. March, July. Clt. 1800. Sh. 1 to 3 feet.

6 *D. ACICULARIS* (Sieb. pl. exsic. nov. holl. no. 401.) racemes naked, terminal; branches and pedicels covered with adpressed canescent down; leaves ascicular, straight, rather mucronate, smooth. *h. G.* Native of New Holland. Leaves 8-10 lines long. Racemes 8-12-flowered. Calyx rather pubescent.

*Acicular-leaved Dillwynia.* Fl. April, June. Clt. 1826. Sh. 1 to 4 feet.

7 *D. rudis* (Sieb. pl. exsic. nov. holl. no. 400.) racemes terminal, leafy; branches villous; leaves acicular, straight, rather mucronate, and scabrous from tubercles, glabrous. *h. G.* Native of New Holland. Flowers axillary, on short pedicels, approximate, and therefore disposed in racemose spikes. Bractes 2, at the base of each pedicel, and 2 smaller along the pedicels, all deciduous. Leaves 5-6 lines long. Flowers yellow, but with the base of the vexillum purple.

*Var. β, brevifolia* (D. C. prod. 2. p. 109.) leaves a little shorter, and distinctly mucronate. Sieb. l. c. no. 402.

*Var. γ, teretifolia* (D. C. prod. 1. c.) leaves evidently tubercled; glabrous; branches with a few hairs; calyx glabrous. *D. teretifolia*, Sieb. l. c. no. 404.

*Var. δ, hispida* (D. C. prod. 1. c.) leaves distinctly tubercled; tubercles for the most part bearing tufts of hairs; calyx pubescent.

*Rustic Dillwynia.* Fl. April, June. Clt. 1824. Sh. 2 to 4 ft.

8 *D. tenuifolia* (Sieb. pl. exsic. nov. holl. no. 409.) flowers subterminal, and usually solitary; leaves linear, very slender, rather obtuse, straight; branches puberulous. *h. G.* Native of New Holland. Legume pubescent. Leaves much less stiff and acute than in the rest of the species.

*Fine-leaved Dillwynia.* Fl. April, June. Clt. 1824. Shrub 1 to 3 feet.

9 *D. phylloides* (Cung. in Field's new south wales, p. 347.) flowers corymbose, terminal, pedicellate; leaves linear, short, mucronate, erectly-spreading, with reflexed, somewhat twisted margins; calyxes and branches villous; stem reclinate. *h. G.* Native of New Holland, on hills about Bathurst. This species is nearly allied to *D. ericifolia*.

*Phylla-like Dillwynia.* Fl. April, June. Clt. 1824. Shrub 2 to 3 feet.

10 *D. sericea* (Cung. l. c.) canescent; flowers usually twin, axillary; leaves linear, straight, rather terete. *h. G.* Native of New Holland, around Bathurst.

*Silky Dillwynia.* Fl. April, June. Clt. 1824. Sh. 2 to 3 feet.

SECT. II. XEROPE'TALUM (from ξηρος, xeros, dry, and πεταλον, petalon, a petal; in reference to the petals and stamens being permanent, even when dry). R. Br. in bot. mag. 2247. Petals and stamens permanent even when dry.

11 *D. cinerascens* (R. Br. ex Sims, bot. mag. t. 2247.) corymbs terminal, sessile; leaves filiform, spreading, ending in a short innocuous mucrone; branches and calyxes silky. *h. G.* Native of Van Diemen's Land. Lodd. bot. cab. 527. *D. juniperina*, Sieb. pl. exsic. nov. holl. no. 411. Mucrone of leaves straight.

*Var. β, recurva*; leaves erect, mucrone of leaves somewhat recurved. R. Br. l. c.

*Greyish Dillwynia.* Fl. March, July. Clt. 1819. Sh. 2 to 4 ft.

† *A species not sufficiently known, and the genus to which it should be referred is extremely doubtful.*

12 *D. glycinifolia* (Smith in Lin. trans. 9. p. 264.) flowers disposed in racemes; leaves ovate and linear, reticulated, with revolute edges. *h. G.* Native of New Holland, at King George's Sound. Flowers purple. Style curved so much as to form a circle. Stems decumbent. Leaves pungent. Fruit unknown. Perhaps a species of *Chorizema*, or perhaps a proper genus.

*Glycine-leaved Dillwynia.* Pl. procumbent.

*Cult.* The species of *Dillwynia* are very elegant shrubs when in flower, and deserve to be cultivated in every collection of

greenhouse plants. They should be grown in an equal mixture of loam, sand, and peat, and the pots should be well drained with sherds. Young cuttings root freely in a pot of sand, with a bell-glass placed over them.

XXV. EUTAXIA (from ευταξία, eutaxia, modesty; in allusion to the delicate and modest appearance of the plants when in bloom). R. Br. in hort. kew. ed. 2. vol. 3. p. 16. D. C. prod. 2. p. 109.

LIN. SYST. *Decandria, Monogynia.* Calyx bilabiate, upper lip somewhat emarginate, lower lip trifid. Vexillum broader than long. Ovary 2-seeded. Style hooked. Stigma capitate. Legume a little ventricose. Seeds strophiliolate. Smooth Australian shrubs, with simple opposite leaves, and golden flowers.

1 *E. myrtifolia* (R. Br. l. c.) leaves lanceolate or obovate-lanceolate, mucronate; pedicels axillary, twin; appendages of wings very short. *h. G.* Native of New Holland. *Dillwynia myrtifolia*, Smith in Lin. trans. 9. p. 263. *D. obovata*, Labill. nov. holl. t. 140. Sims, bot. mag. 1274. Flowers numerous along the branches, elegant. Stipulas small.

*Myrtle-leaved Eutaxia.* Fl. Aug. Clt. 1803. Sh. 2 to 6 feet.

2 *E. pungens* (Sweet, fl. austr. 28.) leaves scattered or verticillate, acicular, somewhat recurved, ending in a pungent mucrone, glabrous, with revolute margins; peduncles few-flowered, axillary, crowded; ovary villous; branches and pedicels clothed with adpressed emescent down. *h. G.* Native of New Holland. *Dillwynia pungens*, Cung. mss. Branches slender, thickly clothed with acrose leaves. Flowers crowded towards the tops of the branches, yellow, but with a dark-orange circle round the base of the vexillum.

*Pungent-leaved Eutaxia.* Fl. April, June. Clt. 1825. Shrub 2 to 4 feet.

*Cult.* The species of *Eutaxia* are very elegant plants when in flower. For culture and propagation see *Dillwynia*.

XXVI. SCLEROTHAMNUS (from σκληρος, skleros, hard, and θάμνος, thamnus, a shrub; rigid shrubs, with stiff hard leaves). R. Br. in hort. kew. ed. 2. vol. 3. p. 16. D. C. prod. 2. p. 109.

LIN. SYST. *Decandria, Monogynia.* Calyx 5-cleft, bilabiate, bibracteate at the base. Carina of flower length of wings. Ovary 2-seeded, pedicellate. Style ascending, filiform. Stigma simple. Legume ventricose. Flowers yellow.

1 *S. microphyllus* (R. Br. l. c.) *h. G.* Native of New Holland, on the southern coast.

*Small-leaved Sclerothamnus.* Fl. May, July. Clt. 1803. Shrub 1 to 2 feet.

*Cult.* An elegant plant when in flower. For its culture and propagation see *Dillwynia*.

XXVII. GASTROLOBIMUM (from γαστήρ, gaster, the belly, and λοβός, lobos, a pod; in reference to the pods being inflated). R. Br. in hort. kew. ed. 2. vol. 3. p. 16. D. C. prod. 2. p. 110.

LIN. SYST. *Decandria, Monogynia.* Calyx 5-cleft, bilabiate, bractless. Petals about equal in length. Ovary 2-seeded, pedicellate. Style subulate, ascending. Stigma simple. Legume ventricose. Seeds strophiliolate. Australian shrubs, with simple leaves, disposed 4 in a whorl. Stipulas subulate, distinct. Flowers yellow, disposed in a terminal ovate raceme.

1 *G. bilobum* (R. Br. l. c.) *h. G.* Native of New Holland, on the south-west coast. Ker. bot. reg. t. 411. Lodd. bot. cab. 70. Turp. dict. sc. nat. with a figure. Leaves uncinat, wedge-shaped, retuse or emarginately 2-lobed, with a mucrone in the notch, silky on the under surface. Legume pedicellate, about equal in length to the tube of the calyx.

*Two-lobed-leaved Gastrolobium.* Fl. March, May. Clt. 1803. Shrub 1 to 2 feet.

*Cult.* A pretty plant when in flower. For its culture and propagation see *Pultenæa*.

**XXVIII. EUCHILUS** (from *eu*, *eu*, well or good, and *χελος*, *cheilos*, a lip; well-lipped, the upper lip of the calyx is very large). R. Br. in hort. kew. ed. 2. vol. 3. p. 17. D. C. prod. 2. p. 110.

**LIN. SYST.** *Decándria, Monogýnia*. Calyx profoundly 5-cleft, bibracteolate at the base, bilabiate; lobes of the upper lip ovate and large, of the lower one setaceous. Carina length of wings. Ovary 2-seeded, pedicellate. Style subulate, ascending. Stigma simple. Legume compressed. Seeds strophiole, with the lobes of the strophiole entire behind.—An Australian shrub, with opposite, simple, minutely-stipulate leaves. Flowers axillary, pedicellate. Pedicels furnished with 2 setaceous bracteoles at their base.

1 *E. OBCORDATUS* (R. Br. l. c.) *h. G.* Native of New Holland, on the south-west coast. Ker. bot. reg. t. 403. Lodd. bot. cab. t. 60. Branches terete, canescent. Leaves obcordate or wedge-shaped, villous beneath. Flowers yellow, with a purplish keel.

*Obcordate-leaved Euchilus.* Fl. March, June. Clt. 1803. Shrub 1 to 3 feet.

*Cult.* A very elegant plant when in flower. For its culture and propagation see *Pultenæa*.

**XXIX. PULTENÆA** (in honour of William Pulteney, M.D. author of a view of the writings of Linnaeus, and various other works of merit). Smith, ann. bot. 1. p. 501. Lin. trans. 9. p. 245. R. Br. in hort. kew. ed. 2. vol. 3. p. 17. D. C. mem. leg. v. prod. 2. p. 110.

**LIN. SYST.** *Decándria, Monogýnia*. Calyx 5-cleft, bilabiate (f. 24. a.); lips equal in length, bibracteolate at the base; bracteoles sometimes adhering to the tube. Ovary sessile (f. 24. d.), 2-seeded. Style subulate, ascending (f. 24. e.). Stigma simple. Strophiole of seed with the lobes cut behind.—Small neat Australian shrubs, with simple alternate leaves. Stipulas usually ~~concrete~~ between the leaves. Flowers yellow, usually disposed in heads at the tops of the branches.

**SECT. I. HYMENOTA** (from *ὑμν*, *hymen*, a membrane, *οτος*, *ous otos*, an ear; in reference to the membranous stipulas). D. C. prod. 2. p. 110. Stipulas setaceous, scarious or membranous, upper ones usually concrete or dilated. Bracteoles conforming to the upper stipulas.

1 *P. DAPHNOIDES* (Smith, l. c.) heads of flowers terminal; leaves obovate-oblong, flat, quite glabrous, smooth, 3 times longer than broad, ending in a pungent mucrone. *h. G.* Native of New Holland, on the eastern coast. Andr. bot. rep. 98. Wendl. hort. herrenh. 3. t. 17. Sims, bot. mag. 1394. Leaves nearly an inch long.

*Daphne-like Pultenæa.* Fl. June, July. Clt. 1792. Shrub 2 to 3 feet.

2 *P. OBCORDATA* (Andr. bot. rep. t. 574.) heads of flowers terminal; leaves cuneate and obcordate, retuse, flat, quite glabrous, smooth, scarcely twice longer than broad, ending in a pungent mucrone. *h. G.* Native of Van Diemen's Land and New Holland, on the south coast. Leaves half an inch long. R. Br. in hort. kew. ed. 2. vol. 3. p. 18.

*Obcordate-leaved Pultenæa.* Fl. May, July. Clt. 1808. Sh. 1 to 3 feet.

3 *P. BILoba* (R. Br. in bot. mag. 2091.) heads terminal, few-flowered; leaves cuneiform, dilated and 2-lobed at the apex,

scabrous from tubercles on the upper surface, but silky beneath, ending in a short mucrone, and with the margins recurved. *h. G.* Native of New Holland, on the eastern coast. P. scabra, R. Br. in hort. kew. ed. 2. vol. 3. p. 18. P. deltoidea, Sieb. pl. exsic. nov. holl. no. 388. Flowers yellow, with a purplish keel.

*Var. β, scabra* (Sieb. pl. exsic. nov. holl. no. 386.) branches and calyxes clothed with hairy down, not with adpressed villi. *h. G.* Native of New Holland. Leaves a little larger than those of the species.

*Two-lobed-leaved Pultenæa.* Fl. April, May. Clt. 1817. Shrub 1 to 3 feet.

4 *P. FERRUGINEA* (Rudge in Lin. trans. 11. p. 300. t. 23.) flowers axillary and terminal; leaves obovate, and appearing emarginate in consequence of the point being curved back, pilose. *h. G.* Native of New Holland, near Port Jackson. Stipulas subulate, dilated into a membrane. Leaves apparently dotted under a microscope. Branches villous. Ovary pilose. P. lanata, Sieb. pl. exsic. nov. holl. no. 420.

*Rusty-haired Pultenæa.* Fl. April, June. Clt. 1810. Shrub 1 to 3 feet.

5 *P. INCURVATA* (Cung. in Field's new south wales, p. 346.) heads of flowers terminal, and are, as well as the branches, villous; leaves lanceolate, obtuse, concave, incurved. *h. G.* Native of New Holland, on the margins of peat bogs, on King's Table Land. A slender shrubby plant.

*Incurved-leaved Pultenæa.* Fl. May, June. Clt. 1823. Sh. 1 to 2 feet.

6 *P. RACEMULOSA* (D. C. prod. 2. p. 111.) flowers axillary, forming a leafy raceme; leaves obovate-elliptic, obtuse, smooth beneath, but scabrous above; branches hairy-pubescent. *h. G.* Native of New Holland. The leaves appear full of dots under a microscope, hardly 2 lines long. Like *P. ferruginea*, but differs from it in the disposition of the flowers, as well as from all the rest. Sieb. pl. exsic. nov. holl. no. 594.

*Racemulose-flowered Pultenæa.* Fl. April, June. Clt. 1820. Shrub 1 to 3 feet.

7 *P. PARVIFLORA* (Sieb. pl. exsic. nov. holl. no. 399.) heads terminal, few-flowered; leaves obovate-cuneate, almost veinless, glabrous, younger ones clothed with adpressed villi, as well as the branches, all terminating in a short, callose, somewhat recurved point. *h. G.* Native of New Holland. Stipulas rufous, oblong, membranous, adpressed, a line or more long. Leaves 2-3 lines long.

*Small-flowered Pultenæa.* Fl. April, July. Clt. 1824. Sh. 1 to 3 feet.

8 *P. STRICTA* (Sims, bot. mag. 1588.) heads of flowers terminal; leaves obovate, mucronate, quite glabrous; stem straight; calyxes and legumes pilose. *h. G.* Native of Van Diemen's Land. Lodd. bot. cab. 974.

*Straight Pultenæa.* Fl. April, July. Clt. 1803. Sh. 1 to 3 ft.

9 *P. ELLIPTICA* (Smith in Lin. trans. 9. p. 246.) heads of flowers terminal, roundish, and with oblong ones along the branches; stem straight; leaves elliptic or obovate-oblong, concave, rather pilose; stipulas 2, joined in one; bracteas and calyxes membranous and ciliated; legume glabrous. *h. G.* Native of New Holland, on the eastern coast. Rudge in Lin. trans. 1. t. 24. Sieb. pl. exsic. nov. holl. no. 394. P. tuberculata, Pers. ench. 1. p. 454.

*Var. β, oblongifolia* (Sieb. l. c. no. 397.) leaves oblong.

*Elliptic-leaved Pultenæa.* Fl. April, June. Clt. 1810. Sh. 1 to 3 feet.

10 *P. PLUMOSA* (Sieb. pl. exsic. nov. holl. no. 385.) heads of flowers terminal, roundish; stem straight, clothed with velvety villi between the leaves; leaves oblong, concave, veinless, lower ones nearly glabrous, superior ones, especially the floral ones, clothed with silky velvety villi. *h. G.* Native of New Hol-

land. Stipulas brown, membranous, erect, adpressed. Like *P. elliptica*.

*Feathered Pultenæa*. Fl. April, Jul. Clt. 1824. Sh. 1 to 2 ft.

11 *P. THYMIFOLIA* (Sieb. pl. exsic. nov. holl. no. 398.) heads of flowers terminal, roundish; stem branched, and rather villous; leaves elliptic-oblong, rather concave and veinless, stalked, for the most part glabrous, floral ones clothed with soft villi, oval, and on longer petioles. *h. G.* Native of New Holland. Calyx clothed with silky, long, white hairs.

*Thyme-leaved Pultenæa*. Fl. April, June. Clt. 1810. Sh. 1 to 3 feet.

12 *P. HYPOLAMPRA* (Sieb. pl. exsic. nov. holl. no. 396.) heads of flowers terminal, leafy, protruding beyond the branches, and somewhat verticillate; leaves elliptic-oblong, stalked, rather acute, usually 3-nerved, shining below, and glabrous on both surfaces; floral ones ciliated, with long white hairs. *h. G.* Native of New Holland. Stipulas brown, membranous, longer than the petioles, pressed to the stem, hiding the branches. Consistence and form of leaves very like that of *Eulalia myrtifolia*.

*Brightish Pultenæa*. Fl. April, June. Clt. 1824. Shrub 1 to 3 feet.

13 *P. VILLIFERA* (Sieb. pl. exsic. no. 396.) flowers axillary or subcapitate at the tops of the branches; leaves lanceolate-oblong, acuminate, somewhat 3-nerved, shining beneath, bearing long white hairs on the margins. *h. G.* Native of New Holland, near Port Jackson. Leaves rusty.

*Hair-bearing Pultenæa*. Fl. April, June. Clt. 1824. Shrub 1 to 3 feet.

14 *P. POLYGALÆFOLIA* (Rudge in Lin. trans. 11. p. 303. t. 25.) flowers axillary and terminal; leaves linear-oblong, obtuse, mucronulate, concave above, and glabrous, rather pilose beneath, as well as the calyxes; stipulas lanceolate-subulate, adpressed; branches and branchlets clothed with rusty villi; bractæas subulate, shorter than the calyx. *h. G.* Native of New Holland, in the neighbourhood of Sydney. Sweet, fl. austr. 37.

*Polygala-leaved Pultenæa*. Fl. April, June. Clt. 1824. Sh. 2 to 4 feet.

15 *P. FLEXILIS* (Smith in Lin. trans. 9. p. 248.) racemes terminal, rather leafy; leaves obovate-linear, mucronate, flat, glabrous above, and rather glaucous; calyx glabrous on the outside, bibracteate at the base, with the segments ovate, acute, and ciliated; stipulas setaceous, longer than the petioles. *h. G.* Native of New Holland. Sweet, fl. austr. t. 35. *Dillwynia tenacrioides*, Sieb. l. c. no. 423. (f. 24.)

*Flexile Pultenæa*. Fl. April, Ju. Clt. 1801. Sh. 1 to 2 feet.

16 *P. EUCHILA* (D. C. prod. 2. p. 112.) flowers axillary and racemose; leaves cuneate-linear, obtuse, pale beneath, and 1-nerved, glaucous above, glabrous on both surfaces, as well as the branches and calyxes; upper lobes of calyx ovate, obliquely and bluntly apiculated; stipulas and bractæas small and setaceous. *h. G.* Native of New Holland. Calyx almost like that of *Euchilus*. Corolla and style of *Pultenæa*. Pedicels length of calyx. *Dillwynia cuneata*, Sieb. pl. exsic. nov. holl. 422.

*Well-lipped Pultenæa*. Fl. April, June. Clt. 1820. Sh. 1 to 3 feet. •

17 *P. RETUSA* (Smith in Lin. trans. 9. p. 248.) heads ter-

minal, few-flowered; leaves linear, retuse, mutic, flat, glabrous; bractæas a little longer than the calyx. *h. G.* Native of New Holland, on the eastern coast. Ker. bot. reg. 378. Sims, bot. mag. 2081. Stipulas minute. Bractæoles inserted in the middle of the tube of the calyx.

*Retuse-leaved Pultenæa*. Fl. April, May. Clt. 1789. Sh. 1 to 2 feet.

18 *P. CAPITELLATA* (Sieb. pl. exsic. nov. holl. no. 413.) heads of flowers terminal, imbricated with bractæas, villous; leaves cuneate, rather acute, glabrous above, and canescent from adpressed villi beneath. *h. G.* Native of New Holland. Flowers broader and heads smaller than in *P. linophylla*.

*Capitellate-flowered Pultenæa*. Fl. April, June. Clt. 1823. Shrub 1 to 2 feet.

19 *P. LINOPHYLLA* (Smith in Lin. trans. 9. p. 248.) bractæas shorter than the few-flowered terminal head; leaves linear, with edges and mucrone recurved, silky beneath; stipulas shorter than the petioles; calyxes villous. *h. G.* Native of New Holland, on the eastern coast. Schrad. sert. hannov. 3. t. 18. *P. glaucescens*, Sieb. pl. exsic. nov. holl. no. 417. Stem much branched. Leaves half an inch long.

*Var. β, amœna* (Sieb. l. c. no. 414.) branches more loose; heads few-flowered.

*Flax-leaved Pultenæa*. Fl. May, July. Clt. 1789. Shrub 1 to 3 feet.

20 *P. CANESCENS* (Cung. in Field's new south wales, p. 346.) heads many-flowered; bractæas a little shorter than the calyx; leaves linear-oblong, concave and glabrous above, but canescent beneath, as well as the bractæas and calyx; stems tufted. *h. G.* Native of New Holland, on the Blue Mountains, in barren woods on the verge of swamps.

*Canescent Pultenæa*. Fl. April, May. Clt. 1822. Sh. 1 ft.

21 *P. POLIFOLIA* (Cung. l. c.) heads many-flowered; leaves ovate-lanceolate or oblong-linear, mucronate, with revolute margins; branches and heads of flowers villous; bractæas a little shorter than the calyx. *h. G.* Native of New Holland, on bushy hills.

*Polium-leaved Pultenæa*. Fl. April, June. Clt. 1824. Sh. 1 to 2 feet.

22 *P. MICROPHYLLA* (Sieb. pl. exsic. nov. holl. no. 418.) flowers axillary and somewhat capitate at the tops of the branches; leaves linear and somewhat cuneate, terminated by a short, callous, somewhat incurved mucrone, glabrous above, but clothed with minute, pressed pubescence beneath as well as the calyxes; branches hoary from adpressed down. *h. G.* Native of New Holland.

*Small-leaved Pultenæa*. Fl. April, June. Clt. 1810. Shrub 1 to 3 feet.

23 *P. PALEACEA* (Smith, in Lin. trans. 9. p. 246.) heads terminal, few-flowered; bractæas membranous, very much acuminate, exceeding the calyx; leaves linear, glabrous, with revolute margins, ending in a recurved point; stipulas concrete, membranous, somewhat sheathing. *h. G.* Native of New Holland, on the east coast. Lodd. bot. cab. 3. t. 291.

*Chaffy Pultenæa*. Fl. May, July. Clt. 1789. Sh. 1 to 2 ft.

24 *P. ARISTATA* (Sieb. pl. exs. nov. holl. no. 283.) heads of flowers terminal; leaves linear, convolute, nerveless, scabrous from tubercles beneath and ciliated at the base, bracteate at apex, and each as well as the calycine lobes ending in a stiff bristle; calyxes villous. *h. G.* Native of New Holland. Leaves crowded, erect. Stipulas long, subulate, and are as well as the bristles fuscous.

*Arched-leaved Pultenæa*. Fl. April, June. Clt. 1824. Shrub 1 to 2 feet.

25 *P. ECHINULA* (Sieb. pl. exs. nov. holl. no. 384.) heads of flowers terminal; leaves crowded, rather incurved, terete, and

FIG. 24.

subulate, mucronate, scabrous from tubercles, with one furrow above, floral ones bearing long hairs. *h. G.* Native of New Holland. Stipulas subulate, permanent, black, and stiff, particularly on the old heads, in which they appear like spines. Stipulas and bracteas crowded.

*Small prickly Pultenæa.* Fl. April, June. Clt. 1823. Shrub 1 to 2 feet.

26 *P. ARGENTEA* (Cung. in Field's new south wales, p. 347.) heads terminal, villous; leaves linear-lanceolate, mutic, acute, rather concave above and glabrous, but silvery beneath. *h. G.* Native of New Holland, on hills at Cox's River.

*Silvery-leaved Pultenæa.* Fl. April, June. Clt. 1824. Shrub 1 to 2 feet.

27 *P. PROCUMBENS* (Cung. l. c.) branches prostrate, stipulaceous; racemes leafy; leaves ovate-lanceolate, acute, rather concave above, ending in a refracted mucrone, but villous beneath as well as the calyxes. *h. G.* Native of New Holland, on exposed hills on the western interior. Allied to *P. villosa*. A reclining shrub.

*Procumbent Pultenæa.* Fl. April, May. Clt. 1823. Sh. pr.

28 *P. VESTITA* (R. Br. in hort. kew. ed. 2. vol. 3. p. 19.) flowers axillary; leaves linear-lanceolate, mucronate, glabrous, with inflexed margins; stipulas imbricate, ciliated; calyxes and bracteas awned. *h. G.* Native of New Holland, on the southern coast.

*Clothed Pultenæa.* Fl. April, Ju. Clt. 1803. Pl. 1 to 2 ft.

29 *P. DENTATA* (Labill. nov. holl. 1. p. 103. t. 131.) heads of flowers terminal; bracteas rather orbicular, toothed, length of calyx; leaves linear, tubercled, glabrous; stipulas distinct, minute. *h. G.* Native of New Holland in Van Leuwin's Land. Legume ovate, acuminate, gibbous.

*Toothed-bracteate Pultenæa.* Shrub 1 foot.

30 *P. JUNIPERINA* (Labill. l. c. t. 130.) flowers axillary and terminal; bracteas entire, hardly longer than the pedicels; leaves linear, somewhat triquetrous, acuminate, pungent, glabrous; stipulas subulate, a little longer than the petioles. *h. G.* Native of Van Diemen's Land and New Holland. Leaves 3 or 4 lines long.

*Juniper-like Pultenæa.* Fl. April, Ju. Clt. 1824. Sh. 2 to 8 ft.

31 *P. TENUIFOLIA* (R. Br. in bot. mag. t. 2086.) heads terminal, usually 2-flowered; fruit lateral; leaves linear-subulate, mutic, concave above and convex beneath, and are as well as the branches rather pilose. *h. G.* Native of New Holland, on the southern coast.

*Fine-leaved Pultenæa.* Fl. April, Ju. Clt. 1817. Sh. 1 to 3 ft.

32 *P. VILLOSA* (Smith, in ann. bot. 1. p. 503.) racemes leafy; leaves linear-oblong, pilose beneath as well as the branches and calyxes. *h. G.* Native of New Holland, on the eastern coast. Sims, bot. mag. 967. Stipulas setaceous, length of petioles. Leaves spreading, 2-3 lines long. Flowers pure yellow.

*Villous Pultenæa.* Fl. April, May. Clt. 1790. Sh. 1 to 3 ft.

33 *P. STIPULARIS* (Smith, l. c. et nov. holl. spec. t. 12.) heads many-flowered; bracteas about equal in length to the calyxes; leaves linear, flat, acute, younger ones ciliated; stipulas 2 joined in one, which is bifid at the apex, flat, imbricate, much longer than the petioles. *h. G.* Native of New Holland, on the eastern and southern coast. Curt. bot. mag. 435. *P. protæoides*, Sieb. pl. exsic. nov. holl. no. 382.

*Stipular Pultenæa.* Fl. April, Jul. Clt. 1792. Sh. 1 to 3 ft.

34 *P. PEDUNCULATA* (Hook, bot. mag. 2860.) pedicels axillary, twin, elongated; stipulas setaceous, twin at the base of the leaves; leaves linear-lanceolate, flat, and are as well as the branches clothed with adpressed pili. *h. G.* Native of New Holland. A weak shrub. Flowers yellow, but with the keel and edges of calyx reddish.

*Stalked-flowered Pultenæa.* Fl. May, Ju. Clt. 1820. Sh. 1 ft.

35 *P. STENOPHYLLA* (Cung. mss.) heads few-flowered, terminal; leaves linear, mucronate; stipulas numerous; calyx villous; branches villous. *h. G.* Native of New Holland.

*Narrow-leaved Pultenæa.* Fl. April, June. Clt. 1824. Shrub 1 to 3 feet.

36 *P. STAPHYLEOIDES* (Cung. mss.) flowers sessile, solitary, axillary; leaves ovate, acute, stiff, ending in a pungent mucrone, reflexed, rather villous beneath when young, but only at the edges in the adult state; stipulas twin, linear; branches pubescent or villous. *h. G.* Native of New Holland. Habit of *Sprengelia incarnata*.

*Staphylea-like Pultenæa.* Fl. April, Jul. Clt. 1824. Sh. 1 ft.

SECT. II. *PHYLLŌTA* (*φυλλον*, *phyllon*, a leaf, and *οὐς ωτος*, *ous o'tos*, an ear; in allusion to the twin leafy bracteas). D. C. prod. 2. p. 113. Stipulas wanting. Flowers bearing opposite or twin, leafy bracteas at the base, which are usually longer than the calyx. Pods unknown. Perhaps a proper genus.

37 *P. ASPERA* (Sieb. pl. exsic. nov. holl. no. 408.) flowers axillary at the tops of the branches, disposed in terminal, capitate, leafy spikes; bracteoles length of calyx; leaves linear, with revolute margins, smoothish above but scabrous beneath from tubercles, without stipulas; branches and calyxes pubescent. *h. G.* Native of New Holland, on the eastern coast. Bracteoles oval-oblong, glabrous. Lobes of calyx acute. Shrub, with the habit of *Dillwynia floribunda*.

*Rough Pultenæa.* Fl. April, July. Clt. 1824. Sh. 1 to 3 ft.

38 *P. COMOSA* (Sieb. pl. exsic. nov. holl. no. 407.) flowers axillary, disposed in a somewhat terminal leafy spike; bracteoles longer than the calyx; leaves exstipulate, linear, with revolute margins, scabrous from tubercles above, but clothed beneath with adpressed pubescence as well as the calyxes and branches. *h. G.* Native of New Holland. Shrub almost with the habit of *Aëtus virgata*.

*Tufted Pultenæa.* Fl. April, June. Clt. 1825. Sh. 1 to 3 ft.

39 *P. SQUARROSA* (Sieb. pl. exsic. nov. holl. no. 406.) flowers axillary, disposed in a leafy terminal head; leaves exstipulate, linear, acute, with revolute margins, scabrous from tubercles above, young and floral ones villous and mucronate; bracteoles longer than the calyx; lobes of calyx ending in spiny mucrones. *h. G.* Native of New Holland.

*Squarrose Pultenæa.* Fl. April, July. Clt. 1825. Sh. 1 to 3 ft.

40 *P. PHYLLICOIDES* (Sieb. pl. exsic. nov. holl. no. 405.) heads terminal, roundish; leaves linear, bluntish, with revolute margins, scabrous from tubercles above, but pubescent beneath on the nerves and on the branches; bracteoles length of calyx; lobes of calyx short, bluntish. *h. G.* Native of New Holland.

*Phyllica-like Pultenæa.* Fl. April, Ju. Clt. 1822. Sh. 1 to 3 ft.

41 *P. CANADICA* (Lodd. bot. cab. 1236.) flowers axillary, very small; leaves linear, obtuse, crowded, beset with long hairs, as well as the branches, giving the whole plant a white or hoary aspect. *h. G.* Native of New South Wales. Flowers yellow, tinged with red.

*White-leaved Pultenæa.* Fl. April, July. Clt. 1825. Shrub 1 to 2 feet.

*Cult.* *Pultenæa* is a genus of elegant small shrubs; they succeed best in an equal mixture of leam, peat, and sand, and cuttings root readily in a pot of sand, with a bell-glass placed over them. The species shew to most advantage when planted out into a border or conservatory.

XXX. DAVIESIA (in honour of the Rev. Hugh Davies, F.L.S. a Welsh botanist). Smith, in Lin. trans. 4. p. 222. 9. p. 255. R. Br. in hort. kew. ed. 2. vol. 3. p. 20.

LIN. SYST. *Decandria*, *Monogynia*. Calyx angular, bractless, 5-toothed, somewhat bilabiate. Carina shorter than the

vexillum. Ovary pedicellate, 2-seeded. Style straight. Stigma simple. Legume compressed, angular, bursting elastically at the lower suture, which is dilated, almost semi-trapezoid. Strophiola of seeds entire behind.—Smooth Australian, spiny, or unarmed shrubs, with the appearance of furze. Leaves either simple or wanting. Pedicels axillary, bibracteate at the base. Flowers usually yellow.

\* *Leaves oval, oblong, or lanceolate, unarmed.*

1 *D. LATIFOLIA* (R. Br. in hort. kew. 3. p. 20.) leaves elliptic or oval, veiny, rather tapering to the base, mucronate, and are unarmed as well as the branches; racemes axillary, many-flowered, a little shorter than the leaves. *h. G.* Native of Van Diemen's Land. Sims, bot. mag. 1757. Flowers yellow, with the vexillum copper-coloured, spotted. Bracteoles numerous along the peduncles under the raceme.

*Broad-leaved Daviesia.* Fl. May, Aug. Clt. 1805. Sh. 2 to 4 ft.

2 *D. CORYMBOSA* (Smith, in Lin. trans. 9. p. 258.) leaves linear-oblong, flat, apiculated by a callous mucrone, and are as well as the branches unarmed; racemes solitary or twin, 3-times shorter than the leaves, having many bracteas at the base, and bearing a corymb of flowers at the apex. *h. G.* Native of New Holland, on the eastern coast. Flowers white, with a violet keel. Leaves 1-2 inches long and 4 lines broad, with few veins.

*Corymbous-flowered Daviesia.* Fl. May, Aug. Clt. 1804. Shrub 2 to 4 feet.

3 *D. MIMOSOIDES* (R. Br. in hort. kew. 3. p. 20.) leaves linear, lanceolate, apiculated by an innocuous point, and are as well as the branches unarmed; racemes solitary or twin, 4-times shorter than the leaves, having many bracteas at the base, and corymbiferous at the apex. *h. G.* Native of New Holland, on the south coast. Andr. bot. rep. 526. *D. glauca*, Lodd. bot. cab. t. 43. Flowers yellow. Leaves nerved at the base; the nerves irregularly pinnate.

*Mimosa-like Daviesia.* Fl. Ju. Aug. Clt. 1809. Sh. 2 to 4 ft.

4 *D. LEPTOPHYLLA* (Cung. mss.) leaves linear-lanceolate, strongly nerved, obtuse and mucronate, quite smooth, coriaceous; branches furrowed; peduncles few-flowered, axillary. *h. G.* Native of New Holland.

*Slender-leaved Daviesia.* Fl. April, June. Clt. 1824. Sh. 1 to 3 feet.

\*\* *Leaves lanceolate or linear, spiny at the apex.*

5 *D. PHYSODES* (Cung. mss.) leaves sessile, somewhat falcate, broadest at the apex and blunt, having 2 strong nerves, and furnished with a spiny beak on the lower side; branches furrowed. *h. G.* Native of New Holland.

*Bladdery Daviesia.* Fl. April, Jul. Clt. 1824. Sh. 2 to 4 ft.

6 *D. RACEMULOSA* (D. C. prod. 2. p. 114.) leaves sublanceolate-linear, acuminate, pungent; racemes solitary, bracteate, a little shorter than the leaves and somewhat corymbous at the apex. *h. G.* Native of New Holland. Leaves 9-10 lines long and 2 lines broad.

*Racemose-flowered Daviesia.* Fl. June, Aug. Clt. 1823. Shrub 2 to 3 feet.

7 *D. UMBELLULATA* (Smith, in Lin. trans. 9. p. 258.) leaves lanceolate, terminated by a pungent point; branches spinose at the apex; peduncles axillary, very short, bearing a few-flowered umbel at the apex. *h. G.* Native of New Holland, on the eastern coast.

*Var. β, angustifolia* (D. C. prod. 2. p. 114.) leaves linear-lanceolate. *D. umbellata*, Labill. nov. holl. 1. p. 107. t. 137.

*Umbellulate-flowered Daviesia.* Fl. April, June. Clt. 1816. Shrub 2 to 4 feet.

8 *D. INCRASSATA* (Smith, in Lin. trans. 9. p. 253.) leaves cuneate-linear, compressed, vertical, oblique, thick, spiny;

flowers axillary, solitary. *h. G.* Native of New Holland, at King George's Sound.

*Thickened-leaved Daviesia.* Fl. May, Ju. Clt. 1820. Sh. 1 to 3 feet.

9 *D. ACICULARIS* (Smith, l. c.) leaves linear, with callous somewhat revolute margins, pungent, straight, denticulately scabrous; flowers axillary, solitary, on very short pedicels. *h. G.* Native of New Holland, about Port Jackson. Lodd. bot. cab. 1234. Flowers yellow, variegated with scarlet.

*Acicular-leaved Daviesia.* Fl. Ju. Jul. Clt. 1804. Sh. 2 to 3 ft.

10 *D. ULICINA* (Smith, l. c.) leaves lanceolate or linear, with smooth margins, and are as well as the branches spinescent at the apex, spreading; flowers axillary, solitary, on very short pedicels. *h. G.* Native of New Holland, on the eastern coast. *D. ulicifolia*, Andr. bot. rep. t. 304. Leaves half an inch long. Flowers yellow, with the vexillum copper-coloured at the base.

*Furze-like Daviesia.* Fl. April, Aug. Clt. 1792. Sh. 1 to 3 ft.

\*\*\* *Leaves cordate at the base.*

11 *D. SQUARROSA* (Smith, l. c.) leaves cordate, acuminate, pungent, with scabrous margins, which are either reflexed or spreading; peduncles axillary, 1-flowered, nearly the length of the leaves. *h. G.* Native of New Holland, at Port Jackson. Pedicels furnished with concave obtuse bracteas at the base.

*Squarrose Daviesia.* Fl. May, July. Clt. 1824. Sh. 2 to 3 ft.

12 *D. CORDATA* (Smith, l. c.) leaves cordate, stem-clasping, reticulated with veins; peduncles axillary, aggregate, corymbous, many-flowered. *h. G.* Native of New Holland, at King George's Sound. Lindl. bot. reg. 1005. Stem angular. Bracteas broad, usually subcordate.

*Cordate-leaved Daviesia.* Fl. Ju. Jul. Clt. 1824. Sh. 1 to 3 ft.

\*\*\*\* *Leaves wanting.*

13 *D. ALATA* (Smith, l. c.) stem leafless, winged; umbels lateral; calyx and bracteas fringed; legume 1-seeded, compressed, dolabriform. *h. G.* Native of New Holland, at Port Jackson. Ker. bot. reg. 728. Stem having 3 wings, nearly like those in *Genista sagittalis* or in *Bossia scolopendria*.

*Winged-stemmed Daviesia.* Fl. May, Aug. Clt. 1818. Shrub 1 to 3 feet.

14 *D. JU'NCEA* (Smith, l. c.) stem leafless, terete, furrowed, naked; umbels lateral; calyx and bracteas beardless. *h. G.* Native of New Holland, at King George's Sound. Bracteas concave, lower ones imbricate. Teeth of calyx short.

*Rush-like Daviesia.* Fl. April, July. Clt. 1823. Sh. 1 to 2 ft.

*Cult.* See *Pultenaea* for culture and propagation. The species are very elegant plants when in flower. The cuttings require to be nearly ripened.

XXXI. MIRBELIA (in honour of M. Mirbel, a distinguished French physiological botanist, whose elucidations of the reticulated structure of vegetables are well known). Smith, ann. bot. 1. p. 511. Lin. trans. soc. 9. p. 265. R. Br. in hort. kew. ed. 2. vol. 3. p. 21. D. C. prod. 2. p. 114.

LIN. SYST. *Decandria, Monogynia.* Calyx 5-cleft, bilabiate. Legume 2-seeded, longitudinally 2-celled, from the sutures on the upper side being so much bent in.—Australian subshrubs, having the fruit of *Astragalus*, and the stamens and habit agreeing with the present tribe. Leaves 3 in a whorl. Flowers purple.

1 *M. RETICULATA* (Smith, l. c.) leaves lanceolate-linear, reticulately-veined, quite entire, apiculated by a stiff mucrone. *h. G.* Native of New South Wales. Vent. malm. 119. Sims, bot. mag. 1211. *Gompholobium reticulatum*, Hort. Smooth, with twiggy branches. Leaves opposite or ternately verticillate. Flowers lilac, terminal, capitate, or axillary verticillate.

*Reticulated-leaved Mirbelia.* Fl. May, Aug. Clt. 1792. Shrub 1 to 3 feet.

2 *M. RUBIÆFOLIA*; leaves lanceolate, acute, serrated, stiff, 3 in a whorl; flowers terminal, capitate, and axillary verticillate. *h. G.* Native of New South Wales. Flowers bluish-purple. *Pultenæa rubiæfolia*, Andr. bot. rep. 351.

*Rubia-leaved Mirbelia.* Fl. June, Jul. Clt. 1792. Sh. 1 to 2 ft.

3 *M. SPECIOSA* (Sieb. pl. exsicc. nov. holl. no. 367.) leaves linear, acutish, with revolute quite entire margins; flowers disposed in a terminal, interrupted, leafy spike. *h. G.* Native of New Holland. Flowers purple.

*Sherry Mirbelia.* Fl. May, July. Clt. 1824. Sh. 1 to 2 ft.

4 *M. DILATATA* (R. Br. in hort. kew. 3. p. 21.) leaves cuneiform, dilated and trifid at the apex. *h. G.* Native of New Holland, on the south-west coast. Flowers purplish. Lindl. bot. reg. 1041.

*Dilated-leaved Mirbelia.* Fl. May, Aug. Clt. 1803. Sh.

5 *M. GRANDIFLORA* (Cung. mss. Sieb. Hook. bot. mag. 2771.) pubescent; leaves alternate, ovate, lanceolate; flowers axillary, twin. *h. G.* Native of New Holland. Perhaps *Chorizema platylobioides*, D. C. prod. and *Platylobium reticulatum*. Flowers yellow, having a red zonate mark on the upper side of the vexillum, and streaked with the same on the outer surface, and the wings have a red blotch on one side.

*Great-flowered Mirbelia.* Fl. May, Ju. Clt. 1823. Sh. 1 to 2 ft.

6 *M. ru'NGENS* (Cung. mss.) leaves linear, ending in a long, spiny mucrone, scattered; flowers nearly sessile, axillary, smooth. *h. G.* Native of New Holland.

*Pungent Mirbelia.* Fl. May, July. Clt. 1823. Sh. 1 to 2 ft.

*Cult.* Elegant plants when in flower, the flowers of all being purplish or deep orange. Their culture and propagation are the same as that for *Pultenæa*, p. 126; the cuttings require to be young.

### Tribe II.

*LOTEÆ* (plants agreeing with *Lôtus* in important characters). D. C. Leg. mem. vi.—*Genisteæ*, et *Astragali*, Adans. fam. 2. p. 320, 324.—*Genisteæ*, *Trifolietæ* et *Galêgeæ*, Bronn. l. c. Embryo with its radicle curved back upon the edge of the cotyledons. Corolla papilionaceous. Stamens monadelphous, or diadelphous, 9 joined and 1 free. Legume continuous, 1-celled, rarely 2-celled, in consequence of the upper sutures being bent. Cotyledons flattish, furnished with cortical pores, and changing at once into leaves at the time of germination, for the purpose of elaborating food for the young plants. However, the germination of some of the genera contained in this tribe being unknown, a few of them may at some future time be placed in tribe *Phaseôleæ*.

*SUBTRIBE I. GENISTEÆ* (plants agreeing with *Genista* in important characters). Bronn. diss. l. c. Legume 1-celled. Stamens usually monadelphous. Leaves simple or palmately trifoliate, rarely pinnate. Stems usually shrubby.

XXXII. HOVEA (in honour of Anthony Pantaleon Hove, a Polish botanist, who travelled in the Crimea and Persia, whence many plants were sent to Kew Gardens). R. Br. in hort. kew. ed. 2. vol. 4. p. 275. D. C. prod. 2. p. 115.—*Poirêtia*, Smith, Lin. trans. 9. p. 304. but not of Cav.—*Physicárpos*, Poir. suppl.

*LIN. SYST.* *Diadélphia*, *Decándria*. Calyx bilabiate (f. 25. a.); upper lip semibifid, broad, and retuse, lower one 3-parted. Keel obtuse (f. 25. f.). Stamens all connected (f. 25. c.), the tenth or upper one only more or less free. Legume sessile (f. 25. d.), roundish, ventricose, 2-seeded. Seeds strophiolate.—Australian shrubs, with alternate simple leaves, and axillary, purple, or violaceous flowers, which stand on short pedicels.

1 *H. LONGIFOLIA* (R. Br. l. c.) leaves linear and elongated,

mucronate, with somewhat revolute margins, veiny beneath, and are as well as the legumes tomentose. *h. G.* Native of New Holland, on the eastern coast. Ker. bot. reg. 614. Flowers purplish-violet.

*Long-leaved Hovea.* Fl. Ju. Sept. Clt. 1805. Sh. 2 to 4 ft.

2 *H. LINEARIS* (R. Br. l. c.) leaves linear, mucronate, rather pilose beneath; legumes smooth. *h. G.* Native of New Holland, on the eastern coast. Ker. bot. reg. 463. *Poirêtia linearis*, Smith, in Lin. trans. 9. p. 304. Flowers purplish-violet.

*Linear-leaved Hovea.* Fl. Mar. Jul. Clt. 1796. Sh. 2 to 4 ft.

3 *H. ELLIPTICA* (D. C. prod. 2. p. 115.) leaves elliptic-oblong, emarginate, rather pubescent beneath, shining above, reticulated on both surfaces; pedicels 3-times shorter than the leaves, twin. *h. G.* Native of New Holland, at King George's Sound. *Poirêtia elliptica*, Smith, l. c. Flowers purplish-violet.

*Elliptic-leaved Hovea.* Fl. Mar. Jul. Clt. 1817. Sh. 2 to 4 ft.

4 *H. LANCEOLATA* (Sims, bot. mag. t. 1624.) leaves lanceolate, mucronate, pubescent beneath; flowers axillary, twin; branches twiggy. *h. G.* Native of New Holland. Flowers purplish-blue. Lindl. bot. reg. 1427.

*Lanceolate-leaved Hovea.* Fl. Mar. July. Clt. 1805. Sh. 2 to 3 feet.

5 *H. APICULATA* (Cung. mss.) leaves lanceolate, with revolute edges, tomentose beneath, but smooth above, coriaceous, with a strong middle nerve, tapering to the apex and mucronate. *h. G.* Native of New Holland. Flowers purplish-violet.

*Apiculated-leaved Hovea.* Fl. Mar. July. Clt. 1824. Sh. 2 to 4 feet.

6 *H. MUCRONATA* (Cung. mss.) leaves ovate-lanceolate, tapering to the apex, mucronate, tomentose beneath, but smooth above; branches villous; peduncles very short, few-flowered. *h. G.* Native of New Holland. Flowers small, purplish-blue.

*Mucronate-leaved Hovea.* Fl. Mar. July. Clt. 1824. Sh. 2 to 4 feet.

7 *H. ACUTIFOLIA* (Cung. mss.) leaves lanceolate, tapering to both ends, mucronate at the apex, clothed with a kind of rusty tomentum on the under surface as well as on the branches, but glabrous above; peduncles short, 2-3-flowered, with the pedicels longer than the peduncles. *h. G.* Native of New Holland. Flowers purplish-blue.

*Acute-leaved Hovea.* Fl. Mar. July. Clt. 1823. Shrub 2 to 4 feet.

8 *H. PURPUREA* (Sweet, fl. aust. 13.) leaves oblong-linear, obtuse, mucronate, with revolute margins, smooth above, but reticulately veined and tomentose beneath; stipulas subulate, small; peduncles axillary, twin; branches clothed with rusty tomentum as well as the calyxes. *h. G.* Native of New Holland. Flowers purple, the vexillum having a pale base.

*Purple-flowered Hovea.* Fl. May, June. Clt. 1820. Sh. 2 to 4 feet.

9 *H. PANNOSA* (Cung. mss.) leaves lanceolate, obtuse, terminating in a tuft of hairs, coriaceous, with rather revolute edges, smooth above, but clothed with dense long tomentum beneath; branches villous, as well as the pods and calyx; peduncles very short, almost sessile, 1-2-3-flowered. *h. G.* Native of New Holland. *H. lanigera*, Lodd. cat. A very woolly shrub, with small pale-purple flowers.

*Cloth-leaved Hovea*. Fl. March, July. Clt. 1824. Shrub 3 to 6 feet.

10 *H. LATIFOLIA* (Lodd. bot. cab. t. 30.) leaves elliptic-oblong, acute, and are, as well as the branches, smooth; pedicels axillary, solitary, hardly longer than the petioles. *h. G.* Native of New Holland, on the east coast. Flowers with a large blue vexillum, and a purple keel.

*Broad-leaved Hovea*. Fl. March, July. Clt. 1820. Shrub 2 to 4 feet.

11 *H. CELSI* (Bonp. nav. t. 51.) leaves lanceolate, and somewhat rhomboid, bluntish, mucronate; peduncles axillary, many-flowered; branches, calyxes, and bractees rather pilose. *h. G.* Native of New Holland. Ker. bot. reg. 280. *Platychilum Celsianum*, Delaun. herb. amat. t. 187. Flowers beautiful blue. Filaments monadelphous with a dorsal fissure, or diadelphous. This is a most elegant plant when in flower.

*Cels's Hovea*. Fl. March, July. Clt. 1818. Sh. 2 to 4 feet.

12 *H. ROSMARINIFOLIA* (Cung. in Field's new south wales, p. 348.) leaves linear, reticulated, revolute, covered with rusty tomentum beneath, as well as on the legumes. *h. G.* Native of New Holland, frequent on the rocky pine hills north-west of Bathurst.

*Rosemary-leaved Hovea*. Fl. March, July. Clt. 1824. Sh. 1 to 3 feet.

*Cult.* *Hovea* is a genus of very elegant plants when in flower. The species are most readily increased by seeds, which usually ripen in our greenhouses; they also may be propagated by young cuttings planted in a pot of sand, with a bell-glass placed over them. A mixture of sand, loam, and peat is the soil best adapted for them.

XXXIII. PLAGIOLOBIUM (from *πλαγιος*, *plagios*, transverse or oblique, and *λοβος*, *lobos*, a pod; in reference to the shape of the pod). Sweet, fl. austr. no. 2.

LIN. SYST. *Diadelphia*, *Decandria*. Calyx bilabiate (f. 26. a), upper lip broad and retuse, lower one 3-parted. Keel obtuse (f. 26. c.). Stamens diadelphous. Ovary sessile. Style permanent, unilateral. Legume inflated, coriaceous, obliquely-transverse (f. 26. d.), 2-seeded. Seeds strophiolate.—Australian shrub, with alternate, simple, spiny-toothed leaves, resembling those of the Holly. Stipulas spinose. Flowers axillary, blue or purple, standing on short pedicels.

1 *P. CHORIZEMEFOLIUM* (Sweet, fl. austr. no. 2.) leaves oblong-lanceolate, spiny-toothed, mucronate, coriaceous, glabrous; pedicels axillary, usually 3 or 4 together; legume transverse, glabrous both inside and outside. *h. G.* Native of New Holland, on the eastern coast, as well as at King George's Sound. *Hovea chORIZEMEFOLIA*, D. C. prod. 2. p. 116. Branches thickly clothed with rusty pubescence. Calyx and pedicels villous. Flowers large, bluish-purple, the vexillum having a white base.

*Chorizema-leaved Plagiolobium*. Fl. Feb. April. Clt. 1824. Shrub 1 to 2 feet.

2 *P. ILICIFOLIUM* (Sweet, l. c. in a note,) leaves ovate or elliptic, spiny-toothed, mucronate, glabrous; peduncles axillary, twin; legume somewhat kidney-shaped, pubescent both on the inside and outside. *h. G.* Native of New Holland, at King George's Sound. Flowers purplish-blue. *Hovea ilicifolia*, Cunn. mss.

FIG. 26.

*Holly-leaved Plagiolobium*. Fl. Feb. May. Clt. 1824. Sh. 1 to 2 feet.

*Cult.* The species of *Plagiolobium* are worth cultivating for the sake of their beauty in every collection of greenhouse plants. Their culture and propagation are the same as that recommended for *Hovea*.

XXXIV. PLATYLOBIUM (from *πλατυς*, *platys*, broad, and *λοβος*, *lobos*, a pod; in reference to the broad legumes). Smith in Lin. trans. vol. 2. p. 350. vol. 9. p. 302. R. Br. in hort. kew. ed. 2. vol. 4. p. 266. D. C. prod. 2. p. 116.—*Cheilococca*, Salisb. prod. p. 112.

LIN. SYST. *Monadelphia*, *Decandria*. Calyx bilabiate, upper lip bifid, roundish, large. Stamens all connected. Legume pedicellate, compressed, flat, winged on the back, many-seeded.—Australian shrubs, with opposite, simple, bistipulate leaves, and axillary yellow flowers, but with the vexillum red at the base.

1 *P. FORMOSUM* (Smith, nov. holl. 17. t. 6.) leaves ovate, somewhat cordate; ovary villous; bractees silky; stipe of legume shorter than the calyx. *h. G.* Native of New Holland, on the eastern coast. Vent. malm. t. 31. Curt. bot. mag. 469. *Cheilococca apocynifolia*, Salisb. l. c. Flowers large.

*Beautiful Platylobium*. Fl. June, Aug. Clt. 1790. Shrub 2 to 4 feet.

2 *P. PARVIFLORUM* (Smith, nov. holl. 18.) leaves ovate-lanceolate; ovary ciliated, smoothish; bractees glabrous; stipe of legume exceeding the calyx. *h. G.* Native with the preceding. Sims, bot. mag. 1520.

*Small-flowered Platylobium*. Fl. May, Sept. Clt. 1792. Shrub 2 to 4 feet.

3 *P. OVATUM* (Andr. ex Sieb. pl. exsicc. nov. holl. no. 574.) leaves ovate-lanceolate, acuminate, glabrous on both surfaces, pale beneath; bractees and ovaries glabrous; ovary with a very short stipe. *h. G.* Native of New Holland. Very like *P. parviflorum*, but it differs in the leaves being more ovate-oblong, paler beneath, and by the ovary being perfectly smooth, about twice the length of the stipe.

*Ovate-leaved Platylobium*. Fl. May, Sept. Clt. 1792. Sh. 2 to 4 feet.

4 *P. TRIANGULARE* (R. Br. in hort. kew. 4. p. 266.) leaves deltoid, somewhat hastate, with the angles spinose; peduncles bracteat both at the base and apex, but naked in the middle; legume exceeding the calyx. *h. G.* Native of Van Diemen's Land, as well as of New Holland. Sims, bot. mag. 1508.

*Triangular-leaved Platylobium*. Fl. June, Sept. Clt. 1805. Sh. 2 to 4 feet.

5 *P. ? OBCORDATUM* (D. C. prod. 2. p. 116.) leaves obcordate, cuneate at the base, retusely-emarginate at the apex, pubescent on both surfaces, as well as the branches. *h. G.* Native of New Holland. Leaves 4 lines long. Very like *Bossia microphylla*, but the leaves are opposite.

*Obcordate-leaved Platylobium*. Shrub 1 to 2 feet.

*Cult.* See *Hovea*, and *Pultenaea*, p. 127, for culture and propagation.

XXXV. BOSSIEA (in honour of M. Bossieu Lamartinière, a French botanist, who accompanied the unfortunate La Peyrouse round the world). Vent. cels. t. 7. Smith in Lin. trans. 9. p. 302. R. Br. in hort. kew. ed. 2. vol. 4. p. 266. D. C. prod. 2. p. 116.

LIN. SYST. *Monadelphia*, *Decandria*. Calyx bilabiate (f. 27. a), upper lip large, semi-bifid, obtuse. Stamens all connected (f. 27. d. f. 28. b.). Legume compressed (f. 27. e. f. 28. c.), flat, pedicellate, many-seeded, with the margins thickened on both sides. Seeds strophiolate.—Australian shrubs, with

usually compressed (f. 27.), rarely with terete branches (f. 27. f. 28.). Leaves absent, but when present simple and alternate. Flowers yellow, with the keel usually purplish or dark-brown.

*Branches compressed, leafless.*

1 *B. SCOLOP'ENDRIA* (Smith, et R. Br. l. c.) branches flat, linear, leafless, toothed, with the teeth bearing the flowers; keel naked; superior bractæas permanent, imbricate, equal in length to the peduncles. *h. G.* Native of New Holland, on the eastern coast. *Platylōbium scolopendrium*, Andr. bot. rep. 191. Vent. malm. t. 55. Stems erect. Calyxes very smooth. Flowers yellow, with the back of the vexillum and keel brownish red. The leaves when present are ovate and smooth.

*Plank-plant* Bossiæa. Fl. May, July. Clt. 1792. Shrub 3 to 10 feet.

2 *B. ENSA'TA* (Sieb. pl. exsic. nov. holl. no. 434.) branches flat, linear, leafless, toothed, the teeth bearing the flowers; keel almost naked; upper bractæas distant from the lower ones, shorter than the pedicel. *h. G.* Native of New Holland. Sweet, fl. austr. 51. *B. rufa*, Lodd. bot. cab. 1119. but not of others. Flowers yellow, with the back and base of the vexillum of a brownish orange-purple colour, and with the keel brownish-purple.

*Sword-branched* Bossiæa. Fl. April, June. Clt. 1825. Sh. 1 to 2 feet.

3 *B. RU'FA* (R. Br. l. c.) branches flat, linear, leafless, toothed, with the teeth bearing the flowers; keel fringed; upper bractæas caducous, remote from the lower ones. *h. G.* Native of New Holland, on the south-west coast. Sims, bot. mag. 1508. Calyxes quite smooth. Flowers colour of the preceding.

*Rufous* Bossiæa. Fl. Ju. Sept. Clt. 1805. Shrub 1 to 3 ft.

*\* \* Branches compressed, leafy.*

4 *B. LINOPHY'LLA* (R. Br. l. c.) branches compressed, leafy; leaves linear, with recurved margins; legume 1-seeded. *h. G.* Native of New Holland, on the south-west coast. Lodd. bot. cab. 174. Sims, bot. mag. 491.

*Flax-leaved* Bossiæa. Fl. July, Sept. Clt. 1803. Shrub 1 to 4 feet.

5 *B. HETEROPHY'LLA* (Vent. hort. cels. t. 7.) branches flat, leafy; leaves obovate, linear or lanceolate, flat; legume many-celled, in consequence of spongy transverse dissepiments. *h. G.* Native of New Holland, on the eastern coast. *Platylōbium lanceolatum*, Andr. *B. lanceolata*, Sims, bot. mag. 1144.

*Variable-leaved* Bossiæa. Fl. May, Dec. Clt. 1792. Shrub 1 to 4 feet.

6 *B. ROTUNDIFŌLIA* (D. C. prod. 2. p. 117.) branches and branchlets leafy, compressed; leaves roundish or broadly obovate, somewhat mucronate, flat. *h. G.* Native of New Holland, on the eastern coast. Leaves 4-5 lines long, and 5-6 broad, reticulately-veined. The whole plant very smooth.

*Round-leaved* Bossiæa. Fl. May, June. Clt. 1824. Shrub 1 to 2 feet.

7 *B. RHOMNIFŌLIA* (Sieb. pl. exsic. nov. holl. no. 354.) branchlets compressed, leafy; branches terete; leaves rhomboidal-orbicular, somewhat emarginate and mucronate; legume on a long stipe, falcate. *h. G.* Native of New Holland. Plant

quite smooth, and rather glaucous. Flowers yellow, the vexillum having a red zonate mark at the base. Wings red at the base. Keel brownish-purple.

*Rhomb-leaved* Bossiæa. Fl. April, June. Clt. 1820. Shrub 1 to 3 feet.

*\* \* \* Branches terete, leafy.*

8 *B. MICROPHY'LLA* (Smith in Lin. trans. 9. p. 303.) branches terete, leafy, spinescent; leaves cuneiformly obcordate, glabrous. *h. G.* Native of New Holland, on the eastern and southern coast. Lodd. bot. cab. 656. *Platylōbium microphyllum*, Sims, bot. mag. 863. *Platylōbium obcordatum*, Vent. malm. no. 31. in a note. Young branches rather compressed and pubescent. Flowers colour of the rest.

*Small-leaved* Bossiæa. Fl. May, Aug. Clt. 1803. Shrub 1 to 2 feet.

9 *B. LENTICUL'ARIS* (Sieb. pl. exsic. nov. holl. no. 425.) branches terete, leafy, at length spinescent; leaves glabrous, exactly orbicular. *h. G.* Native of New Holland. Lodd. bot. cab. 1238. Leaves hardly 2 lines in diameter. Flowers like the rest in colour.

*Lentil leaved* Bossiæa. Fl. May, June. Clt. 1820. Sh. 1 to 3 feet.

10 *B. FOLIŌSA* (Cung. in Field's new south wales, p. 347.) branches straight, terete, villous; leaves alternate, small, orbicular, retuse, scabrous, with revolute margins, silky beneath; stipulas permanent, hooked, longer than the petioles. *h. G.* Native of New Holland, in brushy forest land near Bathurst.

*Leafy* Bossiæa. Fl. May, June. Clt. 1824. Sh. 1 to 3 feet.

11 *B. OVA'TA*; branches straight, terete, smooth; leaves ovate, distich, alternate, quite glabrous. *h. G.* Native of New South Wales. *Platylōbium ovatum*, Andr. bot. rep. 263. The flowers yellow, but with the keel purple.

*Orate-leaved* Bossiæa. Fl. May, Dec. Clt. 1792. Shrub 1 to 3 feet.

12 *B. BUXIFŌLIA* (Cung. in Field's new south wales, p. 348.) branches leafy, attenuated, procumbent; leaves broad-elliptic, obtuse, mucronate, rather villous, with recurved margins, cinereous beneath, as well as the branches; stipulas longer than the petioles. *h. G.* Native of New Holland, upon rocky brushy hills. A diffuse reclining shrub.

*Box-leaved* Bossiæa. Fl. April, June. Clt. 1824. Sh. diffuse.

13 *B. CORDIFŌLIA* (Sweet, fl. austr. no. 20.) branches terete, crowded with leaves, villous; leaves nearly sessile, cordate, acute, ending in a spiny mucrone, scabrous above, but pilose on the nerves beneath, with recurved margins; peduncles hibracteate, about equal in length to the leaves. *h. G.* Native of New Holland. Flowers yellow, the vexillum furnished with a purple circle at the base, and the keel is dark-purple.

*Cordate-leaved* Bossiæa. Fl. May, June. Clt. 1824. Sh. 1 to 3 feet.

14 *B. CINE'REA* (R. Br. l. c.) branches terete, leafy, clothed with woolly villi; stem erect, much branched; leaves ovate-lanceolate, scabrous above, and pubescent beneath, with recurved margins. *h. G.* Native of Van Diemen's Land. Ker. bot. reg. 306.

*Grey* Bossiæa. Fl. May, July. Clt. 1802. Sh. 1 to 3 feet.

FIG. 27.

FIG. 28.

15 *B. PROSTRATA* (R. Br. l. c.) branches filiform, leafy; stems procumbent; leaves oval, glabrous; stipulas shorter than the petioles; legume 1-seeded. *h. G.* Native of New Holland, on the eastern coast. Sims, bot. mag. 1493.

*Prostrate Bossiæa.* Fl. Ju. July. Clt. 1803. Sh. prostrate.

16 *B. LINNÆOIDES*; branches terete, leafy, prostrate, puberulous; leaves elliptic, mucronate; pedicels solitary, 1-flowered, elongated; bracteas puberulous; corolla about twice the length of the calyx. *h. G.* Native of New Holland. Flowers yellow. Keel dark-brown.

*Linnæa-like Bossiæa.* Fl. May, June. Clt. 1824. Shrub procumbent.

*Cult.* The species of *Bossiæa* are neat elegant plants when in flower; they thrive best in a mixture of turfy loam, peat, and sand, but the pots in which they are grown must be well drained with sherds, as nothing injures them more than too much water. Cuttings, neither too ripe nor too young, will strike root if planted in a pot of sand with a bell-glass over them.

XXXVI. *GOODIA* (in memory of Peter Good, a diligent botanical collector, who was employed in collecting seeds in New Holland for the botanic garden at Kew, where he died). Salisb. par. t. 41. R. Br. in hort. kew. ed. 2. vol. 4. p. 269. D. C. prod. 2. p. 117.

LIN. SYST. *Monadelphica, Decándria.* Calyx bilabiate, both lips about equal in length, upper one semibifid, acute. Vexillum flat, large. Stamens all connected. Carina truncate, 2-edged. Legume pedicellate, compressed. Seeds strophiliolate.—Much-branched Australian subshrubs, with terete branches, alternate, stalked, trifoliate leaves, and racemes of yellow flowers.

1 *G. LOTIFOLIA* (Salisb. par. t. 41.) leaflets obovate, and are, as well as the calyxes, smooth; legume varicose, 2-4-seeded. *h. G.* Native of Van Diemen's Land. Sims, bot. mag. 958. Flowers yellow, but with the base of the vexillum red. Glands 5 between the stamens and pistil, they are sessile and globose. Stamens monadelphous, with the sheath cleft in front.

*Lotus-leaved Goodia.* Fl. Ap. July. Clt. 1733. Sh. 2 to 4 ft.

2 *G. PUBESCENS* (Sims, bot. mag. 1310.) leaflets obovately-cuneated, and are, as well as the calyxes, pubescent; legume smooth, 2-seeded. *h. G.* Native of Van Diemen's Land. R. Br. in hort. kew. ed. 2. vol. 4. p. 270. Branches and peduncles rather hispid. Flowers yellow, spotted with red. Pedicels longer than the calyx.

*Pubescent Goodia.* Fl. April, July. Clt. 1805. Sh. 1 to 3 ft.

3 *G. ? POLYSPERMA* (D. C. mem. soc. hort. gen. 2. p. 2. p. 193.) leaflets oval, acutish at both ends, and are, as well as the calyxes, pubescent; legume 8-10-seeded. *h. G.* Native of Van Diemen's Land or New Holland. *Cytisus tomentosus*, Andr. bot. rep. 237. The plant is frequently to be met with in gardens under the name of *Goodia lotifolia*, but differs from that plant in the legume being many-seeded and linear. Upper lip of calyx bipartite, lower lip tridentate. Flowers pure yellow, with the stamens monadelphous, and with the habit of the other species of this genus.

*Many-seeded Goodia.* Fl. Ap. July. Clt. 1798. Sh. 1 to 2 ft.

*Cult.* A mixture of sandy loam and peat suits the species, and young cuttings will root if planted in a pot of sand with a bell-glass placed over them. Seeds usually ripen in this country, by which young plants may be raised in abundance.

XXXVII. *SCOTTEA* (in memory of Robert Scott, M.D., formerly professor of botany at Dublin). D. C. prod. 2. p. 118. —*Scôtia*, R. Br. in hort. kew. ed. 2. vol. 4. p. 268.

VOL. II.

LIN. SYST. *Monadelphica, Decándria.* Calyx 5-toothed, imbricated with bracteas, with the teeth rather unequal. Vexillum complicated, short. Wings equal in length to the keel. Stamens all connected. Legume pedicellate, compressed, with the margin thickened on both sides. Seeds 3-4, strophiliolate.

1 *S. DENTATA* (R. Br. in hort. kew. ed. 2. vol. 4. p. 268.) leaves opposite, sessile, cordate, triangular, toothed; flowers solitary, axillary, on very short pedicels. *h. G.* Native of New Holland, on the south-west coast. Lindl. bot. reg. 1233. Flowers mixed with red and green. A diffuse shrub.

*Toothed-leaved Scottea.* Clt. 1803. Fl. Dec. Feb. Sh. 2 to 4 ft.

2 *S. ANGUSTIFOLIA* (Lindl. bot. reg. 1266.) leaves opposite, linear-oblong, truncate at the base; flowers solitary, on very short pedicels. *h. G.* Native of New Holland. Flowers greenish yellow, with the wings red on the upper side.

*Narrow-leaved Scottea.* Fl. Jan. June. Clt. 1825. Shrub 2 to 4 feet.

*Cult.* *Scôttea* is a genus of elegant shrubs, usually flowering in the winter; their culture and propagation is the same as that for *Goodia*.

XXXVIII. *TEMPLETONIA* (in honour of John Templeton, of Orange Grove, near Belfast, a gentleman to whom the editor of English Botany was under frequent obligations for Irish plants during the progress of that work). R. Br. in hort. kew. ed. 2. vol. 4. p. 269.

LIN. SYST. *Monadelphica, Decándria.* Calyx 5-toothed, with the teeth rather unequal. Keel oblong, a little longer than the wings. Stamens all connected, the tenth one sometimes rather shorter, and nearly free; anthers uniform. Legume pedicellate, plano-compressed, many-seeded. Seeds strophiliolate.—Smooth Australian shrubs, with alternate, simple, cuneiform, retuse, mucronate leaves. Flowers axillary, solitary, large, crimson.

1 *T. RETUSA* (R. Br. l. c.) bracteoles rather remote from the calyx; stamens all connected. *h. G.* Native of New Holland, on the south-west coast. Sims, bot. mag. 2338. *Rafnia retusa*, Vent. malm. t. 53. Leaves coriaceous, green.

*Retuse-leaved Templetonia.* Fl. March, June. Clt. 1803. Sh. 1 to 3 feet.

2 *T. GLAUCA* (Sims, bot. mag. 2088.) bracteoles approximating the calyx; uppermost stamen shorter than the others, and nearly free. *h. G.* Native of New Holland, on the south-west coast. Lodd. bot. cab. 644. Lindl. bot. reg. 859. Leaves glaucous.

*Glaucous Templetonia.* Fl. Ap. May. Clt. 1818. Sh. 1 to 3 ft.

*Cult.* This is a genus of very showy shrubs when in bloom; their culture and propagation is the same as that for *Goodia*, which see, p. 129.

XXXIX. *RAFNIA* (in honour of C. G. Rafn, of Copenhagen, author of a Flora of Denmark and Holstein, 8vo. 1796 and 1800. in 2 vols. &c.) Thunb. prod. præf. p. post. fl. cap. 563. Willd. spec. 3. p. 949. D. C. prod. 2. p. 118. (*Edmännia*, Thunb. et Willd.)

LIN. SYST. *Monadelphica, Decándria.* Calyx cleft into 5 to the middle, 4 upper lobes broadest, sometimes distinct, sometimes variously connected, lower lobe setaceous and very acute. Corolla smooth, with an obtuse keel, and a roundish vexillum. Stamens monadelphous, with the sheath cleft in front at length. Legume lanceolate, compressed, many-seeded.—Smooth Cape shrubs, usually becoming of a lurid black colour on drying. Leaves simple, entire, not stem-clasping, alternate, but with the floral ones sometimes opposite. Flowers of all yellow.

1 *R. CORDATA* (Mart. acad. mun. 6. p. 189.) leaves rather orbicular, cordate, ciliated, nearly sessile; stipulas scarious;

S

flowers axillary, shorter than the leaves. *h. G.* Native of the Cape of Good Hope.

*Cordate-leaved Rafnia.* Shrub 2 to 3 feet.

2 *R. ELLIPTICA* (Thunb. l. c.) leaves ovate-elliptic, acute, cauline ones alternate, floral ones opposite. *h. G.* Native of the Cape of Good Hope. Flowers axillary. Legume drooping.

*Elliptic-leaved Rafnia.* Fl. Ju. July. Clt. 1819. Sh. 2 to 3 ft.

3 *R. CUNEIFOLIA* (Thunb. l. c.) leaves cuneiformly-obovate; branches angular. *h. G.* Native of the Cape of Good Hope. *Spärtium ovatum*, Berg. cap. 197. *Crotalaria cuneiformis*, Lam. dict. 2. p. 195. Leaves acuminate, succulent. Flowers yellowish-purple, disposed in racemose corymbs. Stamiferous tube gaping above.

*Wedge-leaved Rafnia.* Fl. Ju. July. Clt. 1816. Sh. 2 to 3 ft.

4 *R. TRIFLORA* (Thunb. l. c.) leaves ovate; branches angular; peduncles usually tern in the axils of the upper leaves, 1-flowered, and hibracteate. *h. G.* Native of the Cape of Good Hope. Vent. malin. t. 48. *Crotalaria triflora*, Berg. cap. 193. Lin. spec. 1004. *Borbônia cordata*, Andr. bot. rep. t. 31. exclusive of the synonym, Sims, bot. mag. 859. Flowers large, yellow, sometimes only 1 or 2 together in the axils of the leaves.

*Three-flowered Rafnia.* Fl. June, July. Clt. 1786. Shrub 2 to 4 feet.

5 *R. LA'NCEA* (D. C. prod. 2. p. 119.) leaves lanceolate, erect, imbricated; stems ascending, terete; flowers axillary, solitary, on short pedicels; the 4 upper lobes of the calyx connected into a bifid 4-toothed lip, lower lobe setaceous. *h. G.* Native of the Cape of Good Hope. *Edmännia lancea*, Thunb. prod. 2. fl. cap. 561. act. holm. 1800. p. 281. t. 4.

*Lance-leaved Rafnia.* Fl. Ju. July. Clt. 1823. Sh. ascending.

6 *R. OPPÓSITA* (Thunb. l. c.) leaves linear-lanceolate, alternate; branches terete; branchlets axillary, bearing at the apex 2 opposite leaves and 1-2-flowers. *h. G.* Native of the Cape of Good Hope. *Cytisus Capensis*, Berg. cap. 217. *Spärtium Capense*, Lin. spec. 995. *Crotalaria opposita*, Lin. fil. suppl. 322. *Liparia opposita*, Murr. syst. 554.

*Opposite-leaved Rafnia.* Fl. Ju. July. Clt. 1824. Sh. 2 to 3 ft.

7 *R. AXILLARIS* (Thunb. l. c.) leaves lanceolate, alternate and opposite; flowers terminal, solitary; branches axillary. *h. G.* Native of the Cape of Good Hope. Leaves like those of hyssop. Legume drooping.

*Axillary-branched Rafnia.* Shrub 1 to 2 feet.

8 *R. ANGULATA* (Thunb. l. c.) leaves lanceolate, alternate; peduncles lateral, 1-flowered; stem angular. *h. G.* Native of the Cape of Good Hope. *Ráfnia*, Burch. cat. 777. has a terete stem and angular branches. Leaves lanceolate, acute, 6-9 lines long, and 1-2 broad. Pedicels naked, reflexed after flowering. Legume pedicellate, compressed, mucronate by the style.

*Angular-branched Rafnia.* Shrub 2 to 3 feet.

9 *R. SPICATA* (Thunb. l. c.) leaves lanceolate, alternate; flowers axillary, racemose. *h. G.* Native of the Cape of Good Hope. Stem somewhat herbaceous. Spikes or racemes of flowers leafy, therefore the flowers may be called axillary.

*Spiked-flowered Rafnia.* Shrub 1 to 3 feet.

10 *R. ANGUSTIFOLIA* (Thunb. l. c.) leaves lanceolate, alternate; pedicels lateral, 1-flowered; stem terete. *h. G.* Native of the Cape of Good Hope. Stem purplish.

*Narrow-leaved Rafnia.* Shrub 1 to 3 feet.

11 *R. FILIFOLIA* (Thunb. l. c.) leaves linear-lanceolate, alternate; flowers axillary. *h. G.* Native of the Cape of Good Hope. *Ráfnia*, no. 228. Burch. cat. is perhaps referable to this species, of which the branches are roundish, and the leaves linear, also having axillary floriferous branchlets, bearing 2-3 leaves, and 1 flower each; legume pedicellate, inflexed, pendulous.

*Thread-leaved Rafnia.* Shrub 1 to 3 feet.

12 *R. RETROFLEXA* (Thunb. l. c.) leaves obovate; branches reflexed and retroflexed. *h. G.* Native of the Cape of Good Hope. Stem much branched. Branches flexuous. Leaves opposite, sessile, obtuse. Flowers axillary, on very short pedicels. There is a specimen in the Linnaean Herbarium from Thunberg, which answers to the above name and character, but the leaves are rather more linear-lanceolate than obovate, and their colour is somewhat glaucous, and the flowers mostly terminal.

*Retroflexed-branched Rafnia.* Shrub 1 to 3 feet.

13 *R. ERECTA* (Thunb. l. c.) leaves oblong; flowers lateral; stem erect. *h. G.* Native of the Cape of Good Hope. Stem branched, terete. Leaves ovate. Flowers axillary, pedicellate.

*Erect Rafnia.* Shrub 2 to 3 feet.

14 *R. DIFFUSA* (Thunb. l. c.) leaves ovate; stems decumbent. *h. G.* Native of the Cape of Good Hope. Root fusiform. Branches diffuse. Leaves alternate. Flowers axillary. Legume pedicellate, crowned by a recurved style.

*Diffuse Rafnia.* Shrub procumbent.

*Cult.* The species are all worth cultivating, as they are rather elegant when in flower; their culture and propagation is the same as that recommended for the species of *Borbônia*. See p. 131.

**XL. VASCOA** (in honour of Vasco de Gama, the celebrated Portuguese circumnavigator). D. C. leg. mem. vi. prod. 2. p. 119.—*Ráfnia* et *Borbônia*, spec. Thunb. and Willd.—*Crotalaria*, spec. Lin.

*LIN. SYST. Monadelphica, Decandria.* Calyx semi-5-cleft, with the lobes nearly equal, broadest at the base, and rather acute at the apex, but not spinose. Corolla smooth, with an obtuse keel, and a roundish vexillum. Stamens monadelphous, with the sheath cleft in front. Legume compressed, sessile, many-seeded.—Smooth Cape subshrubs, with simple, sessile, stem-clasping leaves, which are cordate at the base, the cauline ones alternate, and the floral ones opposite. The flowers disposed in fascicles in the upper axils of the leaves, and somewhat corymbose, on short pedicels, all yellow, and without any bracteas.

1 *V. AMPLEXICAULIS* (D. C. l. c.) leaves orbicular, cordate, very obtuse, floral ones coloured. *h. G.* Native of the Cape of Good Hope. *Crotalaria amplexicaulis*, Lin. spec. 1103. Burm. prod. *Ráfnia amplexicaulis*, Thunb. fl. cap. 568. *Crotalaria reniformis*, Lam. dict. 2. p. 194.

*Stem-clasping-leaved Vascoa.* Fl. July, Aug. Clt. 1816. Shrub 3 to 5 feet.

2 *V. PERFOLIATA* (D. C. l. c.) leaves cordate, orbicular, bluntly-mucronated. *h. G.* Native of the Cape of Good Hope.—Seb. thes. 1. t. 24. f. 5. *Borbônia perfoliata*, Thunb. prod. f. cap. 122. *Crotalaria amplexicaulis*, Lam. dict. 2. p. 194. This species differs from the preceding in the leaves being one half smaller, more rigid, distinctly reticulated, and mucronate at the apex.

*Perfoliate-leaved Vascoa.* Fl. July, Aug. Clt. 1812. Shrub 2 to 3 feet.

*Cult.* For culture and propagation see *Borbônia*. The plants are rather elegant when in flower.

**XLI. BORBONIA** (in memory of Gaston de Bourbon, duke of Orleans, son of Henry IV. of France, a great lover and patron of botany; see also *Gastonia*). Lin. gen. no. 857. Lam. ill. 619. D. C. leg. mem. vi. but not of Plum. prod. 2. p. 120.

*LIN. SYST. Monadelphica, Decandria.* Calyx attenuated at the base, 5-cleft, with the lobes about equal in length, terminating each in a spiny acumen. Corolla villous on the outside, with the vexillum emarginate at the apex, and the keel obtuse.

tamens all connected into a sheath, which is cleft in front. stigma capitate, somewhat emarginate. Legume linear, plano-compressed, much longer than the calyx, many-seeded.—Cape shrubs, with simple, alternate, exstipulate, pungent leaves, which are stem-clasping, and many-nerved at the base. Flowers of a yellow, disposed in heads at the tops of the branches or axillary.

1 *B. BARBATA* (Lam. dict. 2. p. 436. ill. 610. f. 2.) leaves arrow, lanceolate, many-nerved, complicated, ciliate-bearded, and very much acuminate. *h. G.* Native of the Cape of Good Hope. Branches diverging. Flowers sessile, villous on the outside.

*Bearded-leaved Borbonia.* Fl. July, Aug. Clt. 1823. Sh. 2 to 4 feet.

2 *B. TRINEURVIA* (Lin. spec. 994.) leaves lanceolate, 3-nerved, quite entire, glabrous. *h. G.* Native of the Cape of Good Hope. Berg. fl. cap. 188.—Pluk. alm. t. 297. f. 4. and perhaps *B. angustifolia*, Lam. dict. 2. p. 436.

*Three-nerved-leaved Borbonia.* Fl. July, Aug. Clt. 1759. Shrub 3 to 6 feet.

3 *B. LANCEOLATA* (Lin. spec. 994.) leaves ovate-lanceolate, pungent, many-nerved, quite entire, sessile, glabrous, as well as the stem. *h. G.* Native of the Cape of Good Hope. Burm. cap. prod. 21. Jacq. schœnbr. 2. p. 217. Flowers densely villous.

*Lanceolate-leaved Borbonia.* Fl. July, Aug. Clt. 1752. Shrub 2 to 3 feet.

4 *B. CORDATA* (Lin. spec. 994.) leaves cordate, many-nerved, quite entire, glabrous, but the branches are villous. *h. G.* Native of the Cape of Good Hope. Jacq. schœnbr. 2. t. 218. *B. cordifolia*, Lam. dict. 2. p. 436. Burm. prod. fl. cap. 21. Corolla densely villous, with the vexillum obcordate.

*Cordate-leaved Borbonia.* Fl. July, Aug. Clt. 1759. Sh. 3 to 6 feet.

5 *B. RUSCIFOLIA* (Sims, bot. mag. t. 2128.) leaves cordate, many-nerved, minutely-ciliated, but are otherwise glabrous, as well as the branches. *h. G.* Native of the Cape of Good Hope.—Breyne, cent. 1. t. 28.—Seb. thes. 1. t. 24. f. 3. and Lam. ill. t. 610. f. 1. Flowers sparingly villous.

*Butcher's-broom-leaved Borbonia.* Fl. July, Aug. Clt. 1790. Shrub 2 to 4 feet.

6 *B. PARVIFLORA* (Lam. dict. 2. p. 437.) leaves cordate, many-nerved, minutely denticulated, and are, as well as the branches, glabrous. *h. G.* Native of the Cape of Good Hope. Flowers small, sessile, few, usually terminal.

*Small-flowered Borbonia.* Shrub 2 to 3 feet.

7 *B. CRENATA* (Lin. spec. 994.) leaves cordate, roundish, acute, denticulated, many-nerved, and reticulated between the nerves, and are, as well as the branches, glabrous. *h. G.* Native of the Cape of Good Hope. Curt. bot. mag. 274. Burm. cap. 21. Lois. herb. amat. t. 222. Flowers less villous than in the rest of the species.

*Crenated-leaved Borbonia.* Fl. July, Aug. Clt. 1774. Sh. 3 to 6 feet.

8 *B. CILIATA* (Willd. spec. 3. p. 923.) leaves cordate, rather orbicular, obtuse or acute, many-nerved, reticulated, denticulated, with the nerves and margin ciliated with long hairs; branches piliferous. *h. G.* Native of the Cape of Good Hope. Flowers small, few. The hairs on the leaves when young are frequently long and spreading.

*Ciliated-leaved Borbonia.* Fl. July, Aug. Clt. 1816. Sh. 2 to 6 feet.

† *Species not sufficiently known.*

9 *B. ? MONOSPERMA* (D. C. prod. 2. p. 120.) leaves lanceolate, 3-nerved, very acute; pedicels 1-flowered, reflexed after flower-

ing; legume 1-seeded, pendulous. *h. G.* Native of the Cape of Good Hope.

*One-seeded Borbonia.* Shrub.

10 *B. ? UNDULATA* (Thunb. prod. 122.) leaves stem-clasping, undulated, ending in a reflexed mucrone. *h. G.* Native of the Cape of Good Hope. Perhaps this is a species of *Vasda* allied to *V. amplexicaulis* or *V. perfoliata*.

*Waved-leaved Borbonia.* Shrub 2 to 4 feet.

11 *B. ? VILLOSA* (Thunb. fl. cap. 560.) leaves lanceolate, veinless; stem hairy; flowers terminal, sessile; corolla hairy. *h. G.* Native of the Cape of Good Hope. Perhaps a species of *Priestleya*.

*Villous Borbonia.* Shrub 2 to 3 feet.

*Cult.* The species of *Borbonia* are showy when in flower. They thrive best in a mixture of loam and peat, and young cuttings strike root freely in sand, under a bell-glass.

**XLII. ACHYRONIA** (from *αχυρον*, *achyron*, chaff; in reference to the branches and leaves being covered with chaffy hairs). Wendl. obs. bot. 39. D. C. prod. 2. p. 120.

*Lin. syst.* *Diadelphia, Decandria.* Calyx 5-toothed, lower tooth elongated and bifid. Stamens diadelphous. Legume compressed, many-seeded.—A shrub, with the appearance of *Borbonia*.

1 *A. VILLOSA* (Wendl. l. c. et hort. herrenh. 1. t. 12.). *h. G.* Native of New Holland. Erect, with the branches beset with silky hairs. Leaves lanceolate, acute, smooth, with the margins beset with silky villi. Flowers yellow, axillary, pedicellate.

*Villous Achyronia.* Fl. July, Aug. Clt. 1819. Sh. 2 to 3 ft.

*Cult.* See *Borbonia* for culture and propagation.

**XLIII. LIPARIA** (from *λίπαρος*, *liparos*, brilliant; in allusion to the surface of the leaves being shining). Lin. mant. 156. exclusive of numerous species. D. C. leg. mem. vi. prod. 2. p. 121.

*Lin. syst.* *Diadelphia, Decandria.* Calyx thrust in at the base, with a short tube and a 5-lobed limb, the 4 superior lobes lanceolate and acute, and about equal in length, lower one very long, elliptic, and petaloid. Corolla glabrous, with an oval-oblong vexillum and oblong wings, the one involving the other in aestivation. Keel straight, acute, narrow, 2-edged. Stamens diadelphous. Ovary sessile, very short. Style filiform. Legume ovate, few-seeded.—Cape shrubs, smooth in every part except the pedicels, which are very short, and the ovary, which is very villous. Leaves lanceolate, exstipulate, quite entire, thin, many-nerved, pungent at the apex. Flowers disposed in subspherical heads, of a yellowish-brown colour, drying black.

1 *L. SPHÆRICA* (Lin. mant. 268.). *h. G.* Native of the Cape of Good Hope. Lodd. bot. cab. 642. Sims, bot. mag. 1241. *Borbonia sphærica*, Lam. dict. 2. p. 437. *Leucadendron splendens*, Burm. fl. cap. prod. 4.

*Globe-flowered Liparia.* Fl. Jul. Aug. Clt. 1794. Sh. 3 to 6 ft.

*Cult.* See *Priestleya* for culture and propagation.

**XLIV. PRIESTLEYA** (in honour of M. Priestley, a physiological botanist). D. C. leg. mem. vi. D. C. prod. 2. p. 121.—*Lipariæ*, spec. of authors.

*Lin. syst.* *Diadelphia, Decandria.* Calyx nearly equally 5-lobed, somewhat bilabiate. Corolla glabrous, with a roundish vexillum, which stands on a short stipe, falcate obtuse wings, and a 2-edged convex keel which is curved on the back. Stamens diadelphous. Style filiform. Stigma capitate, sometimes furnished with an acute tooth behind. Legume sessile, plano-compressed, oval-oblong, apiculated by the style, 4-6-seeded.—Cape shrubs, with simple, quite entire, exstipulate leaves, and

with yellow flowers, which are disposed either in heads, umbels, or spikes. This genus differs from *Borbônia* and *Aspalathus* in the stamens being diadelphous, and from *Lipària* in the calycine lobes being nearly equal, and in the form and aestivation of the petals.

SECT. I. EISO'THEA (from *εἰσω*, *eiso*, within, or in, and *θεω*, *theo*, to run; in reference to the calyx being run or thrust in at the base, and therefore becoming in consequence diminished). D. C. prod. 2. p. 121. Calyx thrust in at the base.

1 *P. MYRTIFOLIA* (D. C. l. c. t. 29.) leaves quite smooth, ovate-lanceolate, acute, almost nerveless; bracteas shorter than the pedicels, and involving them at the base, and are as well as the calyxes glabrous; legumes clothed with adpressed villi. *h. G.* Native of the Cape of Good Hope. *Lipària myrtifolia*, Thunb. fl. cap. 565. Calyx yellowish when dry, very much thrust in at the base, having equal, ovate, rather acute lobes. Heads of flowers rather loose; pedicels elongating after flowering.

*Myrtle-leaved Priestleya*. Fl. April, Dec. Clt. 1823. Sh. 2 to 4 feet.

2 *P. HIRSUTA* (D. C. l. c.) leaves obovate-oblong, acute, glabrous, but with the branches, bracteas, and calyxes hairy; stigma bifurcate. *h. G.* Native of the Cape of Good Hope. *Lipària hirsuta*, Thunb. fl. cap. 557. Ker. bot. reg. t. 8. but not of Mœnch. Racemes of flowers somewhat capitate, usually twin. Bracteas inclosing the pedicels and longer than them, spiculate at the apex.

*Hairy Priestleya*. Fl. April, Dec. Clt. 1792. Sh. 2 to 4 ft.

3 *P. LÆVIGATA* (D. C. l. c. t. 30.) leaves oblong-linear, acutish, nerveless, lower ones glabrous, the upper and floral ones clothed with adpressed silky pubescence; flowers disposed in capitate umbels; calyxes obtuse, clothed with adpressed villi; ovary villous. *h. G.* Native of the Cape of Good Hope. *Lipària lævigata*, Thunb. fl. cap. 566. *Borbônia lævigata*, Lin. mant. 100. *L. umbellata*, Lin. mant. 110. Calyx at length thrust in at the base, with obtuse lobes.

*Smooth Priestleya*. Fl. July, Aug. Clt. 1820. Sh. 2 to 4 ft.

SECT. II. ANEISO'THEA (from *α* priv. *εἰσω*, *eiso*, within or in, *θεω*, *theo*, to run; the calyx in the species of this section are not thrust in at the base, as in the preceding). D. C. prod. 2. p. 121. Calyx not thrust in at the base but ovate or obconically attenuated.

4 *P. CAPITATA* (D. C. prod. 2. p. 121.) leaves oblong-linear, acute, somewhat convolute, nerveless, and are as well as the branches quite glabrous; bracteas, calyxes, and legumes very hairy. *h. G.* Native of the Cape of Good Hope. *Lipària capitata*, Thunb. prod. 124. fl. cap. 566. Burch, cat. no. 591. Flowers capitate. Calyx ovate at the base. Stamens diadelphous, permanent around the fruit.

*Capitate-flowered Priestleya*. Fl. July, Aug. Clt. 1812. Shrub 2 to 4 feet.

5 *P. GRAMINIFOLIA* (D. C. prod. 2. p. 122.) leaves lanceolate, and are as well as the angular stems glabrous; flowers spicate, hairy. *h. G.* Native of the Cape of Good Hope. *Lipària graminifolia*, Lin. mant. 268. Thunb. fl. cap. 566. Leaves 1-nerved beneath. Perhaps sufficiently distinct from *P. capitata*.

*Grass-leaved Priestleya*. Fl. Ju. Jul. Clt. 1800. Sh. 2 to 4 ft.

6 *P. TERES* (D. C. l. c.) leaves obovate-oblong, and are as well as the stem glabrous; stem terete; flowers racemose, hairy. *h. G.* Native of the Cape of Good Hope.

*Terete-stemmed Priestleya*. Fl. July, Aug. Clt. 1816. Sh. 2 to 4 feet.

7 *P. ERICIFOLIA* (D. C. l. c.) leaves linear-lanceolate, rather acute, with somewhat revolute margins, hairy beneath, but at length glabrous above; branches and calyxes silky; flowers

capitate, terminal, or in fascicles in the upper axils of the leaves. *h. G.* Native of the Cape of Good Hope. *Borbônia ericifolia*, Lin. amœn. 6. p. 92. Burm. cap. 20. Keel of a fuscous purple colour at the apex. Ovary very villous. Leaves 3 lines long.

*Var.* leaves silky on the upper surface. *h. G.* The plant, when dry, has the habit of *Chenopodium diffusa*, D. C. leg. mem. t. 31.

*Heath-leaved Priestleya*. Fl. Ju. Jul. Clt. 1812. Sh. 1 to 3 ft.

8 *P. SERICEA* (D. C. l. c.) leaves ovate, acute, flat, 1-nerved, clothed with silky adpressed pubescence on both surfaces as well as on the branchlets; flowers disposed in a short terminal spike, clothed with adpressed pubescence; legumes hairy. *h. G.* Native of the Cape of Good Hope. *Lipària sericea*, Lin. syst. 555. *Borbônia sericea*, Lam. dict. 1. p. 438.—Pluk. alm. t. 388. f. 3. *Indigofera sericea*, Lin. mant. 271. ? ex Lam. dict. 3. p. 252. *Crotalaria imbricata*, Burm. cap. 21. Lin. spec. 1001. ?

*Silky Priestleya*. Fl. June, July. Clt. 1794. Sh. 2 to 3 ft.

9 *P. AXILLARIS* (D. C. leg. vi. t. 32.) leaves ovate, acute, flat, 1-nerved, clothed with adpressed villi on both surfaces as well as on the branchlets; flowers solitary in the axils of the upper leaves; calyx and legumes hairy. *h. G.* Native of the Cape of Good Hope. *Borbônia axillaris*, Lam. dict. 1. p. 438.

*Axillary-flowered Priestleya*. Fl. June, July. Clt. 1822. Shrub 2 to 3 feet.

10 *P. ELLIPTICA* (D. C. leg. mem. vi. t. 33.) leaves elliptic, flat, 1-nerved, ending in a callous mucrone, covered with adpressed villi on both surfaces; flowers capitate, and are as well as the calyxes and branchlets velvety. *h. G.* Native of the Cape of Good Hope. Flowers 5-6, umbellately capitate at the tops of the branches. Calyx clothed with silky pubescence. Branches rather hairy. Leaves rather canescent.

*Elliptic-leaved Priestleya*. Clt. 1825. Shrub 2 to 4 feet.

11 *P. VILLOSA* (D. C. prod. 2. p. 122.) leaves ovate-elliptic, acute, 1-nerved, flat, hairy on both surfaces, as well as the branchlets, calyxes, and legumes; flowers capitate. *h. G.* Native of the Cape of Good Hope. *Borbônia tomentosa*, Lin. spec. 994. *Lipària villosa*, Lin. mant. 438.—Seba, thes. 1. t. 24. f. 2.—*Lötus fruticosus*, Houtt. p. fl. syst. 10. p. 1179.

*Villous Priestleya*. Fl. June, July. Clt. 1774. Sh. 2 to 4 ft.

12 *P. VESTITA* (D. C. prod. 2. p. 122.) leaves ovate, concave, obtuse, nerveless, glabrous above, but clothed with hairy wool beneath as well as the calyxes and branches; flowers capitate. *h. G.* Native of the Cape of Good Hope. *Lipària vestita*, Thunb. fl. cap. 568. Sims, bot. mag. 2223. *Lipària villosa*, Andr. bot. rep. 382.—Seba, thes. 1. t. 24. f. 1.

*Clothed Priestleya*. Fl. May, June. Clt. 1800. Sh. 2 to 4 ft.

† The calyx of the following species being unknown, consequently are not arranged in any section.

13 *P. TECTA* (D. C. prod. 2. p. 122.) leaves ovate, concave, spreading, tomentose; flowers axillary, stalked. *h. G.* Native of the Cape of Good Hope. *Lipària tecta*, Thunb. prod. 124. fl. cap. 568.

*Covered Priestleya*. Shrub 2 to 3 feet.

14 *P. TOMENTOSA* (D. C. prod. 2. p. 122.) leaves lanceolate, and are as well as the calyxes tomentose; flowers capitate. *h. G.* Native of the Cape of Good Hope. *Lipària tomentosa*, Thunb. l. c. Corolla glabrous.

*Tomentose Priestleya*. Fl. Jul. Aug. Clt. 1812. Sh. 2 to 4 ft.

15 *P. UMBELLIFERA* (D. C. l. c.) leaves lanceolate, villous; branches umbellate; flowers somewhat umbellately capitate, tomentose. *h. G.* Native of the Cape of Good Hope. *Lipària umbellifera*, Thunb. l. c.

*Umbelliferous Priestleya*. Shrub 2 to 4 feet.

*Cult.* The species of this genus thrive very well in a mixture

of sandy loam and peat, but they do not require to be watered so freely as many other plants of this order; for if they are watered too much over their leaves, it is certain to kill them. The very young tops taken off and made into cuttings, and planted in a pot of sand, with a bell-glass placed over them, are not difficult to root, if the bell-glasses are taken off and wiped regularly to prevent damp. They are all elegant plants when in flower.

**XLV. HALLIA** (named after Berger Martin Hall, a pupil of Linnæus, and the student under whose name the thesis called *Nectaria forum* stands in the *Amœnitates Academicæ*). Thunb. prod. in præf. 2. fl. cap. 593. Desf. journ. bot. 3. p. 125. t. 6. f. 30. but not of Jaume. D. C. prod. 2. p. 122.

**LIN. SYST.** *Monadelphica, Decandria*. Calyx 5-cleft, with the segments about equal. Keel obtuse. Stamens monadelphous, with the sheath complete. Legume compressed, membranous, 2-valved, 1-seeded.—Cape herbs or subshrubs, with simple leaves and with the stipulas adhering to the petioles, and purple flowers standing on solitary axillary pedicels. This genus is allied to *Psoralea* or *Anthyllis*, not to *Hedysarum*.

1 **H. ALATA** (Thunb. fl. cap. 593.) stem 2-edged; stipulas rather decurrent, adnate to the petioles and longer than them; leaves lanceolate or oblong, younger ones rather villous and complicated, adult ones glabrous; flowers on short pedicels, ultimate ones according to Thunberg disposed in a terminal raceme.  $\mathcal{U}$ . G. Native of the Cape of Good Hope beyond Cape Town, a little to the westward.

*Winged-stemmed Hallia*. Fl. July, Aug. Clt. 1818. Pl. 1 ft.

2 **H. FLACCIDA** (Thunb. l. c.) stem filiform, trigonal at the apex; stipulas ovate, acute, striated, hardly adnate to the petioles at the base, and rather longer than them; leaves lanceolate, mucronate, glabrous; peduncles 1-flowered, length of leaves.  $\mathcal{U}$ . G. Native of the Cape of Good Hope. The stipulas according to Thunberg are reflexed, but in the specimen they are obviously erect.

*Flaccid Hallia*. Fl. Aug. Sept. Clt. 1789. Pl. 1 to 2 feet.

3 **H. ANGUSTIFOLIA** (D. C. prod. 1. p. 123.) stem filiform; stipulas lanceolate, erect, adnate even to the middle of the very short petioles and longer than them; leaves linear, acute, glabrous; pedicels 1-flowered, a little shorter than the leaves.  $\mathcal{U}$ . G. Native of the Cape of Good Hope. Hallia, no. 181. Burch, cat. pl. afr. aust.

*Narrow-leaved Hallia*. Pl. 1 foot.

4 **H. VIRGATA** (Thunb. fl. cap. l. c.) stem terete; stipulas lanceolate, erect; petioles very short; leaves lanceolate, mucronate, glabrous; pedicels much shorter than the leaves.  $\mathcal{U}$ . G. Native of the Cape of Good Hope.

*Twiggy Hallia*. Pl. 1 foot.

5 **H. CORDATA** (Thunb. l. c.) stem filiform, trigonal, pilose; stipulas lanceolate, spreading, reflexed, about equal with the petioles in length; leaves cordate, acuminate, pilose; pedicels 1-flowered, 3-times longer than the petioles.  $\mathcal{U}$ . G. Native of the Cape of Good Hope, in grassy places. *Hedysarum cordatum*, Thunb. nov. act. ups. 6. p. 41. t. 1. *Glycine monophylla*, Jacq. schœnbr. 3. t. 296.

*Var.  $\beta$ , Burchellii* (D. C. prod. 2. p. 123.) petioles twice or thrice longer than the stipulas; leaves cordate, rather obtuse, mucronate.  $\mathcal{U}$ . G. Burch. cat. no. 371.

*Cordate-leaved Hallia*. Fl. Aug. Clt. 1787. Pl. 1 foot.

6 **H. ASARINA** (Thunb. l. c.) stem filiform, striated, pilose; stipulas ovate, acute, reflexed, longer than the very short petioles; leaves cordate, roundish, mucronate, villous; pedicels 1-flowered, length of leaves.  $\mathcal{U}$ . G. Native of the Cape of Good Hope. *Crotalaria asarina*, Berg. cap. 194.

*Asarum-like Hallia*. Fl. Julv. Aug. Clt. 1810. Pl. 1 ft.

7 **H. IMBRICATA** (Thunb. l. c.) stems terete, striated; branches villous; stipulas ovate-oblong, acute, membranous, deflexed; leaves nearly sessile, cordate, acute, complicated.  $\mathcal{U}$ .?  $\mathcal{H}$ .? G. Native of the Cape of Good Hope. Sims, bot. mag. 1850. *Hedysarum imbricatum*, Lin. fil. suppl. 330. Thunb. nov. act. ups. 6. p. 42. t. 1. f. 2. Flowers sessile.

*Imbricate-leaved Hallia*. Fl. Aug. Clt. 1812. Pl. 1 to 2 ft.

*Cult.* The species of *Hallia* are very pretty plants, with purple flowers; they thrive well in a mixture of sandy loam and peat, and young cuttings strike freely in sand under a bell-glass, or they may be raised from seeds, which sometimes ripen.

**XLVI. HEYLANDIA** (in honour of M. Heyland, an artist employed by De Candolle). D. C. leg. mem. vi. prod. 2. p. 123.

**LIN. SYST.** *Monadelphica, Decandria*. Calyx 5-cleft, with the lobes about equal. Keel obliquely truncate and acuminate, as in *Ononis*. Stamens monadelphous, with the sheath cleft in front. Style filiform, bent, almost forming a straight angle. Legume compressed, 1-celled, 1-seeded.—East Indian herbs or subshrubs, slender, dichotomous, and hairy, without stipulas. Leaves on short petioles, cordate, roundish. Flowers axillary, solitary, nearly sessile, yellow, and small.

1 **H. HERCAMPRA** (D. C. leg. mem. vi. t. 34.) legumes covered with long scattered hairs; leaves on very short stalks, roundish and cordate.  $\mathcal{H}$ .?  $\mathcal{U}$ .? S. Native of Ceylon, in the interior of the country. Ovary very hairy. Leaves 4-5-lines long.

*Hairy-fruited Heylandia*. Fl. Jul. Aug. Clt. 1820. Shrub procumbent.

2 **H. LEOCARPA** (D. C. l. c.) legumes smooth; leaves on very short petioles, roundish, and cordate.  $\mathcal{U}$ .?  $\mathcal{H}$ .? S. Native of the East Indies. Hallia hirta, Willd. spec. 3. p. 1169. Pluk. alm. t. 454. f. 8. Lens Madraspatana, Elatines folio, Petiv. gaz. t. 30. f. 11. Hallia monophylla, Desv. in herb. Desf. Leaves 2-3 lines long.

*Smooth-fruited Heylandia*. Fl. July, Aug. Clt. 1820. Sh. pr.

3 **H. LATEBROSA** (D. C. l. c.) legumes rather pilose; leaves sessile, ovate, cordate, acute.  $\mathcal{H}$ . S. Native of the East Indies. *Hedysarum latebrorum*, Lin. mant. 270. exclusive of the synonym of Petiv. *Lespedeza latebrorsa*, Pers. ench. Branches and bracteas ciliated with long hairs.

*Latebrose Heylandia*. Shrub procumbent.

*Cult.* The culture and propagation of this genus is the same as that recommended for *Hallia*, but being stove plants require heat.

**XLVII. CROTALARIA** (from *κροτάλον*, *krotalon*, a castanet; the pods of this genus are inflated, and the seeds rattle when the pods are shaken.). Lin. gen. 862. Gært. fruct. 2. t. 148. Lam. ill. t. 67. D. C. prod. 2. p. 124.

**LIN. SYST.** *Monadelphica, Decandria*. Calyx 5-lobed, somewhat bilabiate, upper lip bifid, lower one trifid. Vexillum large, cordate. Keel falcate, acuminate. Filaments all connected with the sheath, cleft in front. Style bearded laterally, pubescent. Legume turgid, with the valves ventricose, usually many-seeded, pedicellate.—Herbs or subshrubs, with simple or palmately compound leaves, these last have usually 3 leaflets, very rarely 5-foliate. Flowers usually yellow, with small bracteas along the pedicels, or at the base of the calyx. The greater number of the species being not sufficiently known, the whole are disposed in an artificial order.

#### § 1. Leaves simple.

\* *Stipulas decurrent. Flowers disposed in racemes, the*

*racemes terminal or opposite the leaves. Stems all herbaceous. Corolla smaller than the calyx, or about equal in length to it.*

1 *C. ALATA* (Hamilt. ex Roxb. in D. Don, prod. fl. nep. 241.) stipulas ovate, acute, rather convex on the inner side, running down the stem a great way in a wing; leaves oval or oval-oblong, retuse, pubescent as well as the stem, which is ascendent; bracteas ovate. ☉. F. Native of Nipaul, at Suembu. Racemes few-flowered. Bracteas and bracteoles ovate. Calycine lobes acuminate. Flowers pale-yellow.

*Winged-stemmed Crotalaria.* Fl. Jul. Aug. Clt. 1818. Pl. 1 ft.

2 *C. STIPULARIA* (Desv. journ. bot. 1814. 2. p. 76.) stipulas ovate, acuminate, rather cut on the inner side, ending in a long broad wing; leaves oval, obtuse, and are villous as well as the stem, which is erect; bracteas linear, acuminate. ☉. ? S. Native of Cayenne. Legume smooth, an inch long.

*Var. β, serpyllifolia* (D. C. prod. 2. p. 124.) leaves oval-oblong, smaller than those of the species. ☉. ? S. Native of? *C. serpyllifolia*, herb. Lamb.

*Stipular Crotalaria.* Fl. July, Aug. Clt. 1823. Pl. 1 foot.

3 *C. GENISTELLA* (H. B. et Kunth, nov. gen. amer. 6. p. 398.) plant covered with strigose silky hairs, herbaceous, erect; stipulas short, decurrent, acute; leaves lanceolate, acute, silvery beneath; racemes axillary and terminal, many-flowered, panicled; legume many-seeded, smooth. ♀. S. Native on the Andes, about Popayan.

*Genista-like Crotalaria.* Pl. 1 foot.

4 *C. PTEROCAULA* (Desf. l. c.) stipulas obtuse, decurrent; leaves linear-lanceolate, acute, silky from adpressed hairs; legume oblong, smooth. ☉. ? S. Native of South America.

*Winged-stemmed Crotalaria.* Pl. 1 foot.

5 *C. PLATYCARPA* (Link. enum. 2. p. 227.) branches winged above, from the decurrent stipulas, lower leaves oblong, upper ones lanceolate, acute, hairy; racemes lateral, bracteoles linear. ☉. II. Native of North America. Corolla yellow, but with the vexillum brownish.

*Broad-podded Crotalaria.* Fl. July. Clt. 1823. Pl. 1 foot.

6 *C. PURSHII* (D. C. prod. 2. p. 124.) stipulas lanceolate, acuminate, decurrent; leaves lanceolate-oblong, glabrous; stem erect, simple, clothed with adpressed villi; racemes usually 3-flowered. ☉. II. Native of North America, in Virginia and Carolina. *C. laevigata*, Pursh, fl. sept. amer. 2. p. 469. but not of Lam.—Pluk. alm. t. 277. f. 2.

*Pursh's Crotalaria.* Fl. June, July. Clt. 1800. Pl. 1 foot.

7 *C. PARVIFLORA* (Roth. cat. 2. p. 83.) stipulas oblong, acute, short, superior ones decurrent; leaves linear-lanceolate, very hairy as well as the stem, which is erect and branched. ☉. H. Native of North America, from New York to Carolina. Willd. spec. 3. p. 973. Pursh, l. c.

*Small-flowered Crotalaria.* Fl. Aug. Sept. Clt. 1817. Pl. 2 ft.

8 *C. SAGITTALIS* (Lin. spec. 1003. var. α.) stipulas lanceolate, acuminate, decurrent; leaves oblong-lanceolate, hairy as well as the stem which is branched and erect; racemes usually 3-flowered. ☉. II. Native of North America, from Virginia to Georgia, in pine barrens. Herm. lugd. bot. p. 203. icon. *C. bialata*, Schrank. ex Ræusch.

*Arrow Crotalaria.* Fl. June, July. Clt. 1731. Pl. 1 foot.

9 *C. ESPADILLA* (H. B. et Kunth, l. c.) stipulas large, acuminate, triangularly falcate, decurrent; leaves lanceolate or oblong, obtuse, younger ones golden-yellow, and are as well as the erect stem beset with strigose silky hairs; racemes opposite the leaves, few-flowered; legume many-seeded, glabrous. ☉. ? S. Native of South America, in sandy places near Caricnana, where it is called *Espadilla*. Very like *C. sagittalis*.

*Espadilla Crotalaria.* Pl. 1 foot.

10 *C. OVALIS* (Pursh, l. c.) stipulas acuminate, upper ones

decurrent; leaves almost sessile, oval, hairy as well as the stems, which are diffuse; racemes elongated, 4-6-flowered, opposite the leaves. ♀. F. Native of Georgia and Carolina, in pine barrens. Hook. bot. mag. 3006. *C. sagittalis*, var. *ovalifolia*, Michx. fl. bor. amer. p. 55. *Anonymos rotundifolia*, Walt. no. 278. *C. rotundifolia*, Poir. suppl. 2. p. 402. The leaves are sometimes exstipulate, as has been noticed by Nuttall.

*Oval-leaved Crotalaria.* Fl. July, Aug. Clt. 1810. Pl. 1 ft.

11 *C. RUBIGINOSA* (Willd. spec. 3. p. 973.) stipulas linear, acuminate, upper ones decurrent; leaves oval-lanceolate, mucronate, villous, as well as the stem, which is branched and diffuse; racemes usually 3-flowered and elongated. ☉. S. Native of the East Indies. This is very like the preceding species.

*Rusty Crotalaria.* Fl. July. Clt. 1807. Pl.  $\frac{1}{2}$  to 1 foot.

*\*\* Stipulas not decurrent, and sometimes wanting altogether. Flowers disposed in racemes, which are either terminal or opposite the leaves.*

12 *C. VERRUCOSA* (Lin. spec. 1005.) stipulas lunate, declinate; leaves oval, obtuse; branches acutely tetragonal; racemes terminal; ovaries villous. ☉. S. Native of the East Indies. Andr. bot. rep. t. 308. Lindl. bot. reg. 1137. Hook. bot. mag. 3034. *C. corulea*, Jacq. icon. rar. t. 144. *C. angulosa*, Lam. dict. 2. p. 195. Cav. icon. 4. t. 321. Corolla with the vexillum greenish-white, streaked with pale-blue inside and with the wings obovate, yellowish white at the base, the rest blue, and with the keel whitish, but yellowish at the point. Anthers yellow.

*Warted Crotalaria.* Fl. June, July. Clt. 1731. Pl. 1 to 2 ft.

13 *C. ACUMINATA*; stipulas lunate, declinate; leaves ovate, but rather hastate at the base, and acuminate at the apex; branches tetragonal; racemes terminal; ovaries villous? ☉. S. Native of the Mauritius and the islands in the East Indies. *C. verrucosa β*, hastata, Pers. ench. no. 20. *C. verrucosa*, var. α, acuminata, D. C. prod. 2. p. 125.—Burm. zeyl. t. 34. Leaves acute at both ends. Flowers bluish.

*Acuminate-leaved Crotalaria.* Fl. June, July. Clt. 1731. Pl. 1 foot.

14 *C. SEMPERFLORENS* (Vent. hort. cels. t. 17.) stipulas lunate, nearly lanceolate, declinate; leaves oval, emarginate, mucronate; stems terete, striated, suffrutescent at the base; ovaries clothed with adpressed pubescence. ♀. ? h. S. Native of the East Indies. Flowers golden-yellow, crowded at the tops of the racemes. Leaves clothed with adpressed pubescence beneath, and usually a little warted, as in *C. verrucosa*.

*Ever-flowering Crotalaria.* Fl. Mar. Sept. Clt. 1816. Pl. 1 to 2 feet.

15 *C. RETUSA* (Lin. spec. 1004.) stipulas setaceous, straight; leaves oblong-cuneiform, retuse, full of very minute, pellucid dots; racemes terminal; ovaries glabrous. ☉. S. Native of the East Indies, from whence it has been introduced to the Mauritius and to the West India Islands. Ker. bot. reg. 253. Flowers yellow but with the vexillum usually purplish. Leaves variable, more or less villous beneath, sometimes mucronate at the apex, with the mucrone either straight or recurved.—Rumph. amb. 5. t. 96. f. 1.—Rheed. mal. 9. t. 25. Burm. ind. 155.

*Retuse-leaved Crotalaria.* Fl. Jun. Jul. Clt. 1731. Pl. 2 to 3 ft.

16 *C. LESCHENAU'LTII* (D. C. prod. 2. p. 125.) stipulas triangular, acuminate, cuneate-elliptic, mucronate, clothed with silky villi beneath and full of pellucid dots; racemes terminal; ovaries glabrous. ☉. S. Native of the East Indies, on the Nelligerry mountains, where it is called *Guli-guedje* by the natives. Flowers yellow. This is an intermediate species between *C. retusa* and *C. spectabilis*.

*Leschenault's Crotalaria*. Pl. 8 to 9 feet.

17 *C. SPECTABILIS* (Roth. nov. spec. 341.) stipulas lanceolate, cordate, somewhat sagittate; leaves cuneate, mucronate, clothed with hoary tomentum beneath, full of pellucid dots; lower leaves obovate and obtuse, middle ones oblong-elliptic, superior ones nearly linear; stem obtuse-angled; ovaries glabrous. ☉. S. Native of the East Indies. Flowers of a dusky-purple colour. Allied to *C. retusa*, but differs in the stipulas being dilated at the base, not setaceous.

*Shemy Crotalaria*. Fl. June, Aug. Clt. 1820. Pl. 1 to 1½ ft.

18 *C. PULCHERRIMA* (Roxb. cat. calc. 54. ex Sims, bot. mag. 2027.) leaves cuneate-obovate, clothed with silky pubescence on both surfaces; bracteas and calyxes coloured; legume sessile, few-seeded, covered by the permanent calyx; stem shrubby, with the branches terete. ♀. S. Native of Mysore. Flowers yellow, very like those of *Spartium juncum*.

*Fairest Crotalaria*. Fl. June, July. Clt. 1814. Sh. 1 to 3 ft.

19 *C. BENGALENSIS* (Lam. dict. 2. p. 196.) leaves lanceolate, mucronate, almost sessile, pubescent; stem twiggy; racemes loose, elongated, terminal; legume clothed with rufous tomentum or villi. ☉. S. Native of Bengal.—Pluk. alm. t. 169. Allied to *C. juncæ*, and perhaps the *C. tenuifolia* of Horn. cat. hort. hafn. suppl. 151. Flowers yellow.

*Bengal Crotalaria*. Fl. June, July. Clt. 1806. Pl. 2 to 3 ft.

20 *C. JUNCÆ* (Lin. spec. 1004.) stipulas setaceous, almost wanting; leaves cuneately lanceolate, on short petioles, clothed with adpressed pubescence, as well as the furrowed stems; racemes terminal; legume clothed with villous tomentum. ☉. S. Native of the East Indies. Roxb. cor. 2. t. 193. Andr. bot. rep. 422.—Burm. ind. 155.—Rheed. mal. 9. t. 26. Flowers yellow, resembling those of *Genista juncæ*. Legume pendulous, 12-15 lines long and 6 broad, 6-10-seeded. This plant is cultivated in India for its fibre, as a substitute for hemp; it is prepared in the same way. It is also very nourishing food for cows, when young.

*Var. β, punctulata* (D. C. prod. 2. p. 126.) vexillum and wings marked at the apex with black lines and dots.

*Rushy Crotalaria*. Fl. June, July. Clt. 1700. Pl. 4 to 8 ft.

21 *C. TENUIFOLIA* (Roxb. hort. beng. 54.) leaves linear, acute, clothed with silky pubescence; stem twiggy, simple; raceme loose, elongated, terminal; calyxes and ovaries silky. ♀. S. Native of Coromandel. Ker. bot. reg. 982. Flowers yellow. Allied to *C. Bengalensis* and *C. acuminata*.

*Fine-leaved Crotalaria*. Fl. Ju. Jul. Clt. 1816. Sh. 1 to 2 ft.

22 *C. FENISTRATA* (Sims, bot. mag. 1933.) stipulas setaceous; leaves ovate-lanceolate, silky beneath and ciliated; stems pubescent, furrowed; vexillum rather orbicular, acuminate. ☉. S. Native of the East Indies. Lower segments of the calyx cohering at the apex.

*Windowed Crotalaria*. Fl. June, Jul. Clt. 1815. Pl. 1 to 2 ft.

23 *C. SERICEA* (Retz. obs. 3. p. 26.) stipulas semi-cordate; leaves lanceolate, acute, silky beneath as well as the legumes; stem furrowed; racemes terminal, elongated. ☉. S. Native of the East Indies. Allied to *C. juncæ*. Flowers yellow.

*Silky Crotalaria*. Fl. June, July. Clt. 1807. Pl. 1 to 2 ft.

24 *C. RECTA* (Roth. nov. spec. 334.) plant exstipulate, clothed with silky pubescence; leaves oblong, mucronate, approximate, sessile, lower ones obovate, superior ones linear; stem straight, divided at the apex; legumes and styles glabrous. ☉. ? S. Native of the East Indies. Flowers about the size of those of *C. parviflora*, yellow and striped with blackish-brown.

*Covered Crotalaria*. Pl. 1 to 2 feet.

25 *C. BURMANNI* (D. C. prod. 2. p. 126.) stipulas and bracteas setaceous; branches and leaves villous or clothed with silky pubescence beneath; lower leaves obovate, emarginate, superior ones oblong, mucronate; stem straight, divided at the apex;

racemes usually terminal, simple. ☉. S. Native of the East Indies. *C. sericea*, Burm. ind. 156. t. 48. f. 1. but not of Retz. Flowers yellow, one half smaller than those of *C. juncæ*, pubescent on the outside.

*Burmah's Crotalaria*. Fl. June, Jul. Clt. 1800. Pl. 1 to 2 ft.

26 *C. HIRSU'TA* (Willd. spec. 3. p. 978.) stipulas subulate, reflexed; leaves ovate, acute, glabrous above and pubescent beneath; stem hairy; raceme subterminal; legume hairy. ☉. S. Native of the East Indies, near Hydrabad. Flowers yellow.

*Hairy Crotalaria*. Fl. July, Aug. Clt. 1818. Pl. 1 to 2 ft.

27 *C. MYSORENSIS* (Roth. nov. spec. 338.) plant hairy; stipulas linear-lanceolate; leaves oblong, obtuse, stalked; racemes terminal, elongated; bracteas length of calyx; legumes ovate, glabrous. ☉. S. Native of Mysore, in the East Indies. Flowers yellow.

*Var. β, pauciflora* (D. C. prod. 2. p. 126.) stems slenderer, having a few long hairs as well as the leaves. Roth, l. c.

*Var. γ, angustifolia* (D. C. prod. 2. p. 126.) leaves narrower, and are as well as the stem densely clothed with rusty silky hairs. Roth, l. c.

*Mysore Crotalaria*. Pl. 1 to 2 feet.

28 *C. MONTANA* (Roth, l. c.) plant exstipulate, covered with silky brown strigæ; leaves oblong, obtuse, almost sessile; stem terete; racemes terminal; legume nearly globose, dotted, glabrous, one half shorter than the style, which is pilose at the apex. ☉. ? S. Native of the East Indies. Corolla length of calyx.

*Mountain Crotalaria*. Pl. 1 to 2 feet.

29 *C. ALBIDA* (Roth, l. c.) plant exstipulate; leaves oblong-obtuse, mucronate, petiolate, clothed with hoary tomentum beneath; stem terete; racemes elongated; calyx strigose; legume oblong-ovate, longer than the pilose style. ☉. ? S. Native of the East Indies. Corolla white, a little smaller than the calyx.

*White-flowered Crotalaria*. Pl. 1 to 2 feet.

30 *C. PANICULATA* (Willd. spec. 3. p. 982.) stipulas and bracteas linear-subulate, reflexed; leaves oblong, obtuse, mucronate, silky-villous; panicle terminal, bracteate. ♀. S. Native of Malabar, Java, and China. *C. Chinensis*, Lam. dict. 2. p. 195. but not of Lin. Vexillum silky on the outside. Keel acuminate. Style plicate, the upper plait deciduous. Legume ovate, villous, length of calyx.

*Panicled Crotalaria*. Fl. June, July. Clt. 1820. Sh. 2 to 3 ft.

31 *C. PULCHRA* (Andr. bot. rep. t. 601. Ait. hort. kew. 4. p. 272.) stipulas setaceous, erect; leaves oval-oblong, acute, silky on both surfaces, as well as the calyxes and vexillum; racemes terminal, bracteate. ♀. S. Native of the East Indies. Flowers large, yellow. Legume, according to Andrews, length of calyx, and 4-seeded, and hence perhaps the same as *C. tetrasperma*, Dietr. Ovary villous. Vexillum acuminate. Bracteas 2, ovate.

*Pair Crotalaria*. Fl. March, May. Clt. 1807. Sh. 2 feet.

32 *C. NITENS* (H. B. et Kunth, nov. gen. amer. 6. p. 399.) suffruticose, silky; branches rather angular; leaves oblong, obtuse, cuneated at the base, younger ones clothed with golden rusty down; racemes terminal or opposite the leaves, many-flowered; legume many-seeded, glabrous. ♀. S. Native of New Granada, near Mariquita and Honda. The plant from Honda is more densely pilose, the bracteas smaller, and the flowers larger than those of the plant from Mariquita.

*Shining Crotalaria*. Shrub 1 to 3 feet.

33 *C. BERTERIANA* (D. C. prod. 2. p. 127.) stipulas subulate, small; leaves elliptic, obtuse, mucronate, clothed on both surfaces with shining silky villi; racemes terminal. ♀. S. Native of Guadaloupe, in gardens. Branches villous. Bracteas ovate, acute. Flowers yellow. Legume pubescent, 3-4-seeded, length of calyx.

*Bertero's Crotalaria*. Fl. May, July. Clt. 1818. Sh. 2 to 3 ft.  
 34 *C. NÖVÆ-HOLLANDIÆ* (D. C. prod. 2. p. 127.) stipulas wanting; leaves elliptic-obovate, tapering to the base, obtuse at the apex, clothed beneath with adpressed silky pubescence, as well as the petioles and branches; racemes terminal.  $\mathcal{A}$ . G. Native of New Holland, on the eastern coast. Branches terete. Petioles nodose and articulated at the apex; hence its affinity to the trifoliate species of the genus. The flowers purplish in the dried state, and middle-sized.

*New Holland Crotalaria*. Fl. May, July. Clt. 1823. Pl. 1 to 2 feet.

35 *C. PAULINA* (Schränk, pl. rar. mon. t. 88.) stipulas wanting; leaves oblong-lanceolate, attenuated at the base, bluntish, mucronulate, hoary and sericeous beneath; racemes terminal; bracteas linear, much shorter than the pedicel.  $\mathcal{A}$ . S. Native of Brazil, at the town of St. Paulo. Link. enum. 2. p. 227. Flowers yellow, about the size of those of *Spártium juncum*.

*St. Paulo Crotalaria*. Fl. Aug. Sept. Clt. 1823. Pl. 1 to 2 ft.

36 *C. BREVIFLORA* (D. C. prod. 2. p. 127.) stipulas wanting; leaves elliptic, attenuated at both ends, acute and mucronate, pubescent on both surfaces, palest beneath, the nerves and branches silky-villous; racemes terminal; bracteas linear, about equal in length to the pedicels.  $\mathcal{A}$ .? S. Native of Brazil. Very like the preceding species, but the corolla is very much smaller, hardly exceeding the calyx in length.

*Short-flowered Crotalaria*. Pl. 1 to 2 feet.

37 *C. BIFARIA* (Lin. fil. suppl. 422.) stipulas reflexed; lower leaves orbicular, superior ones oblong; peduncles terminal, 1-flowered; stems diffuse, pubescent.  $\mathcal{A}$ .? S. Native of the East Indies, where it is cultivated in gardens. The stipulas, according to Linneus the younger, are ovate-subulate, and the legume oblong and hispid or pubescent. Corolla large, bluish.

*Bifarious Crotalaria*. Fl. July, Aug. Clt. 1817. Sh. 1 to 3 ft.

38 *C. DICHOTOMA* (Roth. nov. spec. 340. but not of Graham.) stipulas linear-subulate, horizontal; leaves ovate, acuminate, rather scabrous, petiolate, superior ones lanceolate; stem erect, dichotomous; peduncles opposite the leaves, usually 2-flowered; flowers nodding; legumes ovate, pilose.  $\mathcal{A}$ .? S. Native of the East Indies. Like *C. bifaria*.

*Dichotomous-stemmed Crotalaria*. Shrub 1 to 3 feet.

39 *C. ROTHIANA* (D. C. prod. 2. p. 127.) plant exstipulate, pilose; leaves ovate, obtuse, rather mucronate, distich, petiolate; stems prostrate; peduncles opposite the leaves, 2-flowered; legume subglobose, hairy.  $\mathcal{A}$ .? S. Native of the East Indies. *C. hirta*, Roth. nov. spec. 339. but not of Willd. Flowers yellowish.

*Var.  $\beta$ , ferruginea* (D. C. l. c.) plant beset with long, spreading, rusty pili.

*Roth's Crotalaria*. Shrub prostrate.

40 *C. DIFFUSA* (Link. enum. 2. p. 228.) leaves lanceolate, obtuse, hairy, on short petioles; flowers terminal; calyx pilose, about equal in length to the corolla.  $\odot$ . S. Native of? Flowers yellow.

*Diffuse Crotalaria*. Fl. June, July. Clt. 1818. Pl. diffuse.

41 *C. NA'NA* (Burm. fl. ind. 156. t. 48. f. 2.) leaves oblong, nearly sessile, glabrous, obtuse, mucronate; stems diffuse; peduncles opposite the leaves, 3-flowered; calyxes pilose; legume oblong, obtuse, hardly twice the length of the calyx.  $\odot$ . S. Native of Malabar. Flowers yellow. Lam. dict. 2. p. 196. *C. Malabárica*, Garcin, in herb. Burm. *C. biflora*, Lin. mant.

*Dwarf Crotalaria*. Pl.  $\frac{1}{2}$  foot.

42 *C. BIFLORA* (Lin. mant. 570.) stem prostrate, herbaceous; leaves oval-oblong, obtuse or suborbicular, pilose; peduncles opposite the leaves, and terminal, and longer than the stem, 2-8-flowered; legume tumid, globose, rather villous.  $\odot$ . S. Native of the East Indies. Pet. gaz. t. 30. f. 10. *Astrágalus biflorus*,

Lin. mant. 273. This species differs from the preceding in the legumes being globose, not oblong. Corolla yellow.

*Two-flowered Crotalaria*. Fl. July, Aug. Clt. 1790. Pl. prostrate.

43 *C. GLAU'CA* (Willd. spec. 3. p. 974.) stem glabrous, erect; leaves linear-lanceolate, glabrous; peduncles opposite the leaves, usually 3-flowered, rather shorter than the leaves, filiform.  $\odot$ . S. Native of Guinea. Flowers yellow.

*Glaucous Crotalaria*. Fl. July, Aug. Clt. 1824. Pl. 1 to 2 ft.

44 *C. PUSILLA* (Roth. nov. spec. 335.) plant exstipulate, clothed with greyish hairs; leaves linear, obtuse, rather mucronate, petiolate; stem much branched from the base, filiform; branches approximate; racemes terminal, rather secund; legume oblong-oval, obtusely-mucronate, hairy.  $\odot$ .? S. Native of the East Indies. Flowers small.

*Small Crotalaria*. Pl.  $\frac{1}{2}$  foot.

45 *C. PU'MILA* (Schränk, acad. mun. 6. p. 188.) plant tomentosely hairy; leaves linear-lanceolate, almost sessile; stems nearly simple, decumbent; flowers axillary, disposed in a terminal few-flowered raceme.  $\odot$ .? S. Native of? Legume ovate, erect, minute, tomentose.

*Dwarf Crotalaria*. Fl. July, Aug. Clt. 1816. Sh.  $\frac{1}{2}$  foot.

46 *C. TETRAGO'NA* (Andr. bot. rep. 593.) leaves long, lanceolate, pubescent; stem tetragonal; raceme terminal; legume villous.  $\mathcal{A}$ . S. Native of the East Indies. Ait. hort. kew. ed. 2. vol. 4. p. 271. Stipulas lanceolate, horizontally deflexed, deciduous. Flowers pubescent, large, yellow; the vexillum dotted with black outside, and lined on the inside. Ovary and style villous.

*Tetragonal-stemmed Crotalaria*. Fl. Oct. Nov. Clt. 1806. Pl. 2 to 3 feet.

47 *C. LINIFOLIA* (Lin. fil. suppl. 328.) leaves linear, oblong, obtuse, mucronate, nearly sessile, pilose beneath, as well as the stem; raceme terminal; stem somewhat striated, erect; legume glabrous, hardly larger than the calyx.  $\odot$ . S. Native of the East Indies and Nipaul, ex D. Don, prod. p. 241. Flowers yellow, in long racemes, secund. Willd. spec. 4. p. 975. Stems diffuse, simple, and branched. Stipulas and bracteas small. Calyx silky.

*Flax-leaved Crotalaria*. Fl. July, Sept. Clt. 1820. Pl. 1 foot.

48 *C. PELLITA* (Bert. ined. ex D. C. prod. 2. p. 128.) leaves oblong-linear, mucronate, young ones hairy; stem terete, very much branched; racemes terminal; bracteas and calycine lobes callous, somewhat revolute; legume ovate, villous, length of calyx, 1-2-seeded.  $\mathcal{A}$ .? S. Native of Jamaica, in gardens. Peduncles, pedicels, and tube of calyx hispid. Bracteas and calycine lobes partly callous and glabrous.

*Clad Crotalaria*. Fl. July, Aug. Clt. 1820. Pl. 1 to 2 feet.

49 *C. GENISTOIDES* (Lam. dict. 2. p. 196.) leaves linear-lanceolate, mucronate, glabrous, scattered, sessile; racemes short, few-flowered; branches filiform, twiggy, glabrous; calyxes and legumes hairy.  $\mathcal{A}$ . G. Native of the Cape of Good Hope. The racemes are said to be both axillary and lateral.

*Genista-like Crotalaria*. Shrub 1 to 2 feet.

50 *C. VIRGULTA'LIS* (Burch. cat. no. 1752.) plant exstipulate; leaves oblong-linear, mucronate, stalked, young ones, calyxes, and branches clothed with adpressed silky pubescence; racemes opposite the leaves, elongated; flowers erect; legume pendulous, young ones clothed with adpressed villi.  $\mathcal{A}$ . G. Native of the Cape of Good Hope. Flowers resembling those of *Spártium juncum*, but a little smaller.

*Twiggy Crotalaria*. Shrub.

51 *C. ACUMINATA* (D. C. prod. 2. p. 128.) stipulas ovate, lanceolate, shorter than the petioles, acuminate; leaves stalked, linear, mucronately-acuminate, silky pubescent beneath, as well as the calyxes and branches; peduncles opposite the leaves, 1-

2-flowered; ovaries glabrous.  $\frac{1}{2}$ . G. Native of the Cape of Good Hope. Burch. cat. afr. aust. no. 2327. Flowers smaller than in the preceding species.

*Acuminated-leaved Crotalaria*. Shrub.

52 *C. SPARTIOIDES* (D. C. prod. 2. p. 128.) plant exstipulate; leaves linear-subulate, acute, distant, the young ones and branches pubescent, the adult ones glabrous; branches twiggy, striated; racemes terminal; ovaries pubescent.  $\frac{1}{2}$ . G. Native of the Cape of Good Hope. Burch. cat. no. 2336. Flowers yellow, about the size of those of *Spärtium juncum*. Bracteoles 2, small, deciduous at the base of the calyx.

*Spartium-like Crotalaria*. Shrub 2 to 3 feet.

53 *C. PERROTETII* (D. C. prod. 2. p. 128.) plant exstipulate; leaves linear-subulate, very few; branches and calyxes villously-hairy; stems much branched, twiggy, at length smooth and leafless; racemes crowded; corolla length of calyx; legume 3-4-seeded, ovate, somewhat compressed, villous.  $\frac{1}{2}$ . S. Native of Senegal. *C. tomentosa*, Perr. but not of Thunb. Stamens 10, 5 alternate ones sterile. Style thick at the base, bent abruptly. Perhaps a distinct genus between *Heglandia* and *Crotalaria*.

*Perrotet's Crotalaria*. Shrub 2 feet.

54 *C. THEBAICA* (D. C. prod. 2. p. 128.) plant exstipulate, pubescent, much branched; old branches spiny; leaves oval or oblong, villous, undulated; flowers few at the tops of the branches, distant, disposed in something like a spike; legume ovate, pubescent, 1-2-seeded.  $\frac{1}{2}$ . G. Native of the island of Phila, by way sides, and about Theba. Flowers yellow, lined with brown. *Spärtium Thebaicum*, Del. fl. egypt. p. 107. t. 37. f. 1.

*Theba Crotalaria*. Fl. May, July. Clt. 1818. Sh. 2 to 3 ft.

\*\*\* *Stipulas not decurrent, or wanting. Flowers disposed in terminal heads.*

55 *C. SPECIOSA* (Roth. nov. spec. 336.) plant exstipulate, clothed with silky rusty villi; leaves oblong, obtuse, nearly sessile; heads of flowers dense, ovate, roundish; bracteas broad-lanceolate, length of flowers, and are covered with silky hairs, as well as the calyxes, vexillum, and keel.  $\frac{1}{2}$ . S. Native of the East Indies.

*Sheny Crotalaria*. Shrub 2 to 3 feet.

56 *C. ? REFLEXA* (Thunb. fl. cap. 571.) leaves ovate, acute, tomentose, reflexed; heads of flowers crowded; branches retroflexed.  $\frac{1}{2}$ . G. Native of the Cape of Good Hope. Calyx woolly. Corolla purple, glabrous. Leaves imbricated downwards.

*Reflexed Crotalaria*. Shrub 2 to 3 feet.

57 *C. CAPITATA* (Lam. dict. 2. p. 195. ill. t. 617. f. 3.) villous; leaves lanceolate, scattered, crowded, sessile; heads terminal; ovaries villous.  $\frac{1}{2}$ . G. Native of the Cape of Good Hope. The stamens are said by Lamarck to be diadelphous, and therefore the plant ought, perhaps, to be removed from this genus. Flowers white or violet.

*Capitate-flowered Crotalaria*. Shrub 1 to 2 feet.

\*\*\*\* *Stipulas not decurrent, or wanting. Flowers axillary, pedunculate or sessile.*

58 *C. SCANDENS* (Lour. coch. p. 433.) stem shrubby, scandent; leaves oblong, acuminate, glabrous; peduncles many-flowered, axillary.  $\frac{1}{2}$ . G. Native of Cochinchina. Flowers white. Legume turgid, tapering to both ends.

*Climbing Crotalaria*. Shrub cl.

59 *C. PROCUMBENS* (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 129.) stems procumbent, herbaceous; leaves ovate, rather mucronate, pubescent; peduncles axillary, 2-flowered, 3 times longer than the leaves.  $\frac{1}{2}$ . ? G. Native of Mexico. Flowers yellow. Legume cylindrical.

VOL. II.

*Procumbent Crotalaria*. Fl. May, July. Clt. 1823. Pl. pr. 60 *C. NUMMULARIA* (Willd. spec. 3. p. 979.) procumbent; leaves roundish-ovate or lanceolate, obtuse, pilose beneath; peduncles axillary, 1-2-flowered, hairy, 4 times longer than the leaves.  $\frac{1}{2}$ . ? S. Native of the East Indies. Legume roundish, ovate.

*Money-wort-leaved Crotalaria*. Pl. procumbent.

61 *C. LANA'TA* (Thunb. fl. cap. 571.) leaves ovate, sessile, acute, woolly; flowers axillary, nearly sessile; legume ovate, acute.  $\frac{1}{2}$ . G. Native of the Cape of Good Hope.

*Woolly Crotalaria*. Shrub.

62 *C. SESSILIFLORA* (Lin. spec. 1004.) erect, herbaceous; leaves lanceolate, almost sessile, glabrous above, and pilose beneath; flowers sessile, axillary or lateral.  $\odot$ . G. Native of China. Flowers blue.

*Sessile-flowered Crotalaria*. Pl. 1 foot.

63 *C. TUBEROSA* (Hamilt. in D. Don, prod. fl. nep. 241.) root tuberous; stem branched, villous; leaves lanceolate-linear, acute, very villous at the base and beneath; pedicels axillary, 1-flowered, adpressed to the stem; legume compressed, villous.  $\frac{1}{2}$ . G. Native of Nipaul. Flowers bluish-purple in a dried state.

*Tuberous-rooted Crotalaria*. Fl. June, July. Clt. 1821. Pl. decumbent.

\*\*\*\*\* *Stipulas not decurrent or wanting. Flowers lateral and terminal. Calyx 5-parted, very hispid, with two of the lobes or segments wing-formed.*

64 *C. ANTHYLLOIDES* (Lam. dict. 2. p. 195.) leaves linear, acute, clothed with adpressed villi beneath; flowers subsessile, disposed in a short terminal raceme; pedicels and calyxes rusty, and very hispid.  $\odot$ . S. Native of Java. Leaves 2-lines broad, and 2 inches long. Sepals of calyx unequal in breadth, the 2 superior ones broadest, obtuse, and mucronate. Legume glabrous, many-seeded, length of calyx.

*Anthyllis-like Crotalaria*. Fl. Aug. Sept. Clt. 1789. Pl. 1 ft.

65 *C. CALYCINA* (Schränk, pl. rar. mon. t. 12.) leaves lanceolate, acute, canescently-pubescent beneath; flowers lateral, on short pedicels; calyx rusty and very hispid.  $\odot$ . S. Native of Bengal. *C. ramosissima*, Roxb. hort. beng. p. 54. Corolla sulphur-coloured, a little shorter than the calyx. Leaves 4-5 lines broad, and 2 inches long.

*Large-calyxed Crotalaria*. Pl. 1 foot.

66 *C. NIPAUENSIS* (Link. enum. 2. p. 228.) leaves lanceolate, hairy; flowers almost sessile, disposed in a short terminal raceme; calyx very hispid, and rusty.  $\odot$ . S. Native of Nipaul. Corolla blue, hardly larger than the calyx.

*Nipaul Crotalaria*. Fl. June, July. Clt. 1823. Pl. 1 foot.

67 *C. ROXBURGHIANA* (D. C. prod. 2. p. 129.) leaves oblong-linear, acute, clothed with adpressed pubescence beneath, as well as the branches; flowers lateral, on short stalks; calyx and bracteas very hispid and acuminate.  $\frac{1}{2}$ . S. Native of the East Indies and Nipaul. *C. stricta*, Roxb. hort. beng. p. 54. but not of Roth. *C. anthylloides*, D. Don, prod. fl. nep. 241. but Lamarck's plant from Java appears to be distinct.

*Roxburgh's Crotalaria*. Fl. Ju. July. Clt. 1820. Shrub 2 feet.

68 *C. CHINENSIS* (Lin. spec. 1003.) leaves ovate, on short petioles, bluntish, rather pilose on both surfaces; racemes few-flowered; calyx hairy.  $\frac{1}{2}$ . C. Native of China. Corolla yellow, length of calyx. Perhaps this and the two following species are referable to the present division, but they are too imperfectly known to speak with certainty.

*China Crotalaria*. Fl. June, July. Clt. 1818. Sh. 2 to 3 ft.

69 *C. HIRTA* (Willd. enum. 747.) leaves linear-lanceolate, pilose; peduncles subterminal, disposed in something like a raceme; stem branched, diffuse, pilose.  $\odot$ . S. Native of the

East Indies. *C. pilosa*, Roxb. Rottl. nov. act. nat. cur. 1808. *C. hirta*, Mart. acad. mun. 6. p. 156. t. F. Calyx densely clothed with rusty villi, hardly shorter than the corolla.

*Hairy Crotalaria*. Fl. Ju. Aug. Clt. 1816. Pl. 1 to 2 ft. 70 *C. PROSTRATA* (Rottl. in Willd. enum. 747.) leaves elliptic-lanceolate, obtuse, pubescent beneath; racemes opposite the leaves on long peduncles, few-flowered; stem prostrate, pubescent. ☉. S. Native of the East Indies. Mart. acad. mun. 6. p. 155. t. F. Calyx tomentose, about the length of the corolla, which is white. Legume glabrous, sessile. Perhaps *C. prostrata* of D. Don, in prod. fl. nep. 241. is the same plant.

*Prostrate Crotalaria*. Fl. July. Clt. 1804. Pl. prostrate.

§ 2. *Leaves composed of 3-7 leaflets.*

\* *Leaves trifoliate. Racemes terminal or opposite the leaves. Stipulas broad, leafy.*

71 *C. ARBORESCENS* (Lam. dict. 2. p. 199.) stipulas on short petioles, obovate, emarginate, deciduous; leaflets obovate; petioles and branchlets canescent; legume pedicellate. ♀. S. Native of the Mauritius and of the Cape of Good Hope. *C. incanescens*, Lin. fil. suppl. *C. Capensis*, Thunb. fl. cap. 572. Jacq. hort. vind. t. 64. Flowers yellow, about the size of those of *Colutea*.

*Arborescent Crotalaria*. Fl. Ju. Oct. Clt. 1774. Sh. 6 to 10 ft.

72 *C. LUNARIS* (Lin. spec. 1005.) stipulas semi-cordate, lunate; leaflets ovate, acuminate, clothed beneath with white villi; flowers terminal, solitary, girded by a 3-leaved involucre. ☉. ? G. Native of Africa. Lin. hort. cliff. 357. *C. lunaris*, Burm. cap. prod. 21.

*Moon-shaped-stipuled Crotalaria*. Pl.

73 *C. TURGIDA* (DeCaus. herb. amat. t. 238) stipulas roundish; leaflets ovate, glabrous; flowers terminal, somewhat corymbose. ♀. S. Native of ?

*Turgid Crotalaria*. Fl. July, Aug. Clt. 1820. Sh. 2 to 3 ft.

\*\* *Leaves trifoliate. Racemes opposite the leaves, rarely terminal. Stipulas setaceous or wanting.*

74 *C. OBOVATA*; suffruticose, branched; leaflets obovate, entire, somewhat emarginate at the apex, and rather pilose beneath; racemes terminal, spike-formed; legume hairy. ♀. S. Native of Guinea. Flowers yellow.

*Obovate-leafletted Crotalaria*. Shrub 1 to 2 feet.

75 *C. OCHROLEUCA*; shrubby, erect, branched; leaflets linear-lanceolate, entire, acuminate, clothed beneath with silky pili; racemes terminal, spike-formed, few-flowered. ♀. S. Native of Guinea. Flowers cream-coloured.

*Cream-coloured-flowered Crotalaria*. Shrub 2 to 3 feet.

76 *C. LABURNIFOLIA* (Lin. spec. 1005. fl. zeyl. p. 278.) stipulas wanting; leaflets oval, acute, glabrous; racemes opposite the leaves; legumes pendulous, on long stipes, which are 4-times longer than the calyx. ☉. S. Native of Malabar and Ceylon.—Rheed. mal. 9. t. 27. Burm. zeyl. t. 35. Legume cylindrical, glabrous, length of stipe. Corolla large, yellow. Keel acuminate, much longer than the wings.

*Laburnum-leaved Crotalaria*. Fl. July, Sept. Clt. 1739. Shrub 5 to 6 feet.

77 *C. PENDULA* (Bert. ined. D. C. prod. 2. p. 130.) stipulas wanting; leaflets oval, obtuse, glabrous; racemes opposite the leaves; legumes pendulous, stipitate; stipe twice the length of the calyx, but one-half shorter than the legume. ♀. S. Native of Jamaica. Very like the preceding species.

*Pendulous-legumed Crotalaria*. Fl. Jul. Sept. Clt. 1820. Sh.

78 *C. ANAGYROIDES* (H. B. et Kunth, nov. gen. amer. 6. p. 404.) arborescent; stipulas subulate, minute; leaflets lanceo-

late-oblong, acute, mucronate, cuneate at the base, clothed beneath with adpressed pubescence, younger ones with silky brown pubescence; racemes many-flowered, opposite the leaves; legumes many-seeded, and are, as well as the calyxes, pubescent. ♀. S. Native of Caraccas. Allied to *C. arborescens*.

*Anagyrus-like Crotalaria*. Fl. Ju. July. Clt. 1823. Sh. 6 ft.

79 *C. BROWNEI* (Bert. ined. D. C. prod. 2. p. 130.) stipulas deciduous or wanting; leaflets oval, attenuated at both ends, apiculate mucronate, adult ones glabrous; racemes terminal, opposite the leaves; legume pendulous, cylindrical, glabrous, on a very short stipe. ♀. S. Native of Jamaica, on the sides of rivulets frequent. Leaflets and young legumes clothed with shining, silky, appressed pubescence. Flowers yellowish-brown, striated.

*Browne's Crotalaria*. Fl. July, Aug. Clt. 1816. Shrub 4 ft.

80 *C. BRACTEATA* (Roxb. hort. beng. p. 54.) stipulas wanting; leaflets oval, tapering to the base, and acuminate at the apex, smooth above, but clothed with very minute pubescence beneath; racemes opposite the leaves; legumes pendulous, almost sessile, densely clothed with hairs. ♀. G. Native of the East Indies and Chittagong. Flowers smaller than in the two preceding species, but the bracteas are reflexed as in them. Perhaps *C. bracteata* of Fischer is the same.

*Bracteated Crotalaria*. Fl. July, Aug. Clt. 1820. Sh. 2 to 4 ft.

81 *C. CYTISOIDES* (Roxb. hort. beng. 54.) stipulas subulate, deciduous; leaflets elliptic, acuminate at both ends, glabrous above, but clothed with fine pubescence beneath; racemes opposite the leaves, nearly terminal; ovary pubescent, on a very short stipe. ♀. G. Native of Nipaul. *C. psoraleoides*, D. Don, prod. fl. nep. 242. This species comes very near to *C. bracteata*, but the ovary is pubescent, not as in that species densely hairy.

*Cytisus-like Crotalaria*. Fl. July, Aug. Clt. 1826. Shrub 2 to 4 feet.

82 *C. CAJANIFOLIA* (H. B. et Kunth, nov. gen. amer. 6. p. 405.) stipulas? leaflets oblong, obtuse, mucronate, cuneate at the base, glabrous above, puberulous beneath and canescent; racemes many-flowered, almost terminal; legumes many-seeded, and are, as well as the calyxes, clothed with appressed pubescence. ♀. G. Native of Mexico, on the declivity of mount Jorullo.

*Pigeon-pea-leaved Crotalaria*. Fl. July, Sept. Clt. 1824. Shrub 4 to 6 feet.

83 *C. GRAHAMII*; shrubby, diffuse; leaves ternate; leaflets cuneate-elliptic, rather pilose, mucronate; stipulas subulate, reflexed, permanent; racemes sub-capitate, opposite the leaves. ♀. S. Native of Mexico. *C. dichotoma*, Graham in edinb. new phil. journ. dec. 1826. Flowers yellow.

*Graham's Crotalaria*. Fl. Ju. July. Clt. 1824. Sh. 1 to 2 ft.

84 *C. STRIATA* (D. C. prod. 2. p. 131.) stipulas wanting; leaflets elliptic, obtuse, mucronate, nearly glabrous; racemes terminal, and nearly opposite the leaves; bracteas setaceous, deciduous. ☉. S. Native of the East Indies. Flowers yellow, pendulous. Keel acuminate, striped with black lines; the vexillum also striped a little.

*Striped-flowered Crotalaria*. Shrub 2 to 4 feet.

85 *C. LÆVIGATA* (Lam. dict. 2. p. 198.) glabrous; stipulas wanting; leaflets elliptic-oblong, obtuse; racemes opposite the leaves, 3-6-flowered; legume pedicellate. ♀. S. Native of Madagascar.

*Smooth Crotalaria*. Shrub 1 to 2 feet.

86 *C. HETEROPHYLLA* (Lip. fil. suppl. 323.) stipulas subulate, spreading; lower leaves simple, the rest trifoliate; leaflets elliptic, emarginate. ☉. S. Native of the East Indies. Corolla yellow, and striped. Legume smooth.

*Variable-leaved Crotalaria*. Pl. 1 foot.

87 *C. FOLIOSA* (Willd. enum. 747.) leaflets obovate, emarginate, covered beneath with strigose pili; racemes terminal, usually 4-flowered; stem diffuse, branched.  $\frac{1}{2}$ . S. Native of the East Indies. *Indigófera foliosa*, Rottl.

*Leafy Crotalaria*. Fl. Ju. July. Clt. 1818. Sh. 2 to 3 feet.

88 *C. HAVANE'NSIS* (Guss. ex Schlecht. Linnæa. 4. p. 36.) smooth; leaflets oblong, emarginate, tapering to the base; flowers racemose; legume oblong, cylindrical.  $\frac{1}{2}$ . S. Native of Cuba, about the Havannah.

*Havannah Crotalaria*. Shrub.

89 *C. ORIXE'NSIS* (Rottl. in Willd. enum. 747.) stipulas lanceolate, and bractæas ovate, both reflexed; leaflets obovate, covered beneath with strigose pili; racemes terminal; stems diffuse; legume stipitate, ovate, obtuse, glabrous.  $\odot$ . S. Native of the East Indies. Flowers more minute than in any other species of the genus. Mart. in acad. mun. 6. p. 157. t. II.

*Orixa Crotalaria*. Fl. July, Aug. Clt. 1816. Pl. 1 foot.

90 *C. VIRGATA* (Roxb. ex Mart. acad. mun. 6. p. 157. t. G.) stipulas small; leaflets obcordate, destitute of a mucrone, glabrous; raceme few-flowered, opposite the leaves, lateral; branches diffuse, rather twiggy.  $\frac{1}{2}$ . S. Native of Coromandel. Legume unknown.

*Twiggy Crotalaria*. Fl. Ju. Aug. Clt. 1816. Sh. 2 to 4 ft.

91 *C. CUBE'NSIS* (D. C. prod. 2. p. 131.) stipulas linear-setaceous; leaflets obovate-roundish; racemes nearly opposite the leaves; stem erect, hairy.  $\odot$ . S. Native of Cuba. *C. hirta*, Lag. nov. spec. hort. madr. p. 22. but not of Willd.

*Cuba Crotalaria*. Fl. July, Aug. Clt. 1820. Pl. 1 to 2 ft.

92 *C. SETIFERA* (Moc. et Sesse, fl. mex. ined. D. C. prod. 2. p. 131.) stipulas linear-setaceous; leaflets obovate, mucronate; racemes opposite the leaves, and are hairy, as well as the petioles and branches; legume pendulous, cylindrical, hairy, nearly sessile.  $\odot$ . H. Native of Mexico. Flowers yellow. Keel acute, shorter than the vexillum and wings.

*Bristle-bearing Crotalaria*. Pl. 1 to 2 feet.

93 *C. COLUTEROIDES* (Lam. dict. 2. p. 200.) leaflets obovate, obtuse, mucronate, rather pilose beneath, longer than the petioles; racemes terminal, loose; legume glabrous, stipitate, bladdery, destitute of a style.  $\frac{1}{2}$ . ? S. Native of Africa. Pluk. t. 185. f. 3.

*Colutea-like Crotalaria*. Shrub 3 to 4 feet.

94 *C. PURPURA'SCENS* (Lam. dict. 2. p. 200.) stipulas setaceous, villous; leaflets obovate-cuneiform, retuse, mucronate, glabrous; racemes opposite the leaves almost terminal; calyx villous, about equal in length to the corolla; legume pendulous, sessile, oblong, bladdery.  $\odot$ . S. Native of Madagascar, and the Mauritius. Vexillum purplish above. Branches and petioles clothed with hispid villi.

*Purplish-flowered Crotalaria*. Fl. July, Aug. Clt. 1824. Pl. 2 to 3 feet.

95 *C. INCANA* (Lin. spec. 1005.) stipulas and bractæas setaceous, villous, deciduous; leaflets oval or obovate, villous beneath; racemes spike-formed, opposite the leaves; calyxes glabrous; keel with a tomentose margin; legume pendulous, subsessile, hairy.  $\odot$ . S. Native of the Caribbee Islands. Flowers yellow. Jacq. obs. 4. t. 82. Cav. icon. 4. t. 322. Ker. bot. reg. 377. *C. pubescens*, Moench.

*Hoary Crotalaria*. Fl. Ju. July. Clt. 1714. Pl. 2 to 3 feet.

96 *C. DOMBEYANA* (D. C. prod. 2. p. 132.) stipulas and bractæas setaceous, villous, deciduous; leaflets oval-oblong, acute, pubescent beneath; racemes spike-formed, opposite the leaves; ovarium pubescent; legume pendulous, sessile, glabrous.  $\frac{1}{2}$ . ? S. Native of Peru. *C. incana*  $\beta$ , Lam. dict. 2. p. 200. Very near to *C. incana*, but the flowers are double the size, and disposed in dense spikes.

*Dombey's Crotalaria*. Shrub 2 to 3 feet.

97 *C. PU'BERA* (Vahl. eclog. 2. p. 55.) stipulas subulate, deciduous; leaflets oblong, obtuse, clothed beneath with adpressed canescent villi; racemes terminal and axillary; legume pendulous, oblong, villous.  $\frac{1}{2}$ . S. Native of the island of St. Martha. Branches rather villous. *C. púbera*, Schrank. pl. rar. mon. t. 14. differs from Vahl's plant in the racemes being opposite the leaves, and therefore the plant is more nearly allied to *C. incana*.

*Downy Crotalaria*. Shrub 2 to 3 feet.

98 *C. AFFINIS* (D. C. prod. 2. p. 132.) stipulas and bractæas setaceous and deciduous; leaflets obovate-cuneate, truncate, smoothish; petioles, branches, and legumes villous; racemes opposite the leaves.  $\frac{1}{2}$ . ? S. Native of the Mauritius. Allied to *C. incana*. Calyxes villous. Legume sessile, very hairy.

*Allied Crotalaria*. Shrub 2 to 3 feet.

99 *C. PU'MILA* (Ort. dec. 2. p. 23.) stipulas subulate, spreading; leaflets obovate, emarginate, glabrous, rather fleshy; racemes opposite the leaves and lateral; legumes nearly sessile, pendulous, pubescent; stem ascending.  $\odot$ . S. Native of Cuba. Flowers yellow, smaller than those of *C. incana*, to which the plant is very nearly allied. Stem and petioles hardly pubescent.

*Dwarf Crotalaria*. Fl. Ju. July. Clt. 1823. Pl.  $\frac{1}{2}$  to 1 foot.

100 *C. FALCATA* (Vahl. ined. ex herb. Puer. D. C. prod. 2. p. 132.) stipulas small, deciduous; leaflets elliptic, somewhat cuneate at the base, clothed with minute pubescence beneath, but glabrous above; racemes opposite the leaves; vexillum shorter than the keel, which is falcate.  $\frac{1}{2}$ . S. Native of Guinea. Flowers small. Young legumes pendulous and terete.

*Falcate-keeled Crotalaria*. Shrub 2 feet.

101 *C. MUCRONATA* (Desv. journ. bot. 1814. vol. 1. p. 76.) leaflets ovate, mucronate, clothed beneath with powdery pubescence; flowers sessile, spicate, terminal.  $\frac{1}{2}$ . ? S. Native of the Antilles.

*Mucronate-leaved Crotalaria*. Shrub.

102 *C. MICANS* (Link. enum. 2. p. 228.) stipulas wanting; leaflets oval, acute, beset with scattered shining hairs; racemes opposite the leaves; filaments of stamens hairy.  $\frac{1}{4}$ . S. Native of? Legume unknown.

*Glittering-haired Crotalaria*. Fl. July, Aug. Clt. 1820. Pl. 1 to 2 feet.

103 *C. CURTATA* (Link. l. c.) leaflets oval, obtuse, beset with scattered hairs; the nerves, petioles, and branches hoary; racemes terminal, elongated; keel shorter than the vexillum.  $\odot$ . S. Native of?

*Short-keeled Crotalaria*. Fl. April, May. Clt. ? Pl. 1 foot.

104 *C. PEDUNCULOSA* (Desv. journ. bot. 1814. vol. 1. p. 76.) leaflets somewhat ovate, acute; flowers in racemose spikes; racemes opposite the leaves, on long peduncles.  $\frac{1}{2}$ . ? S. Native of the East Indies.

*Peduncled Crotalaria*. Shrub.

105 *C. MOLLI'CU'LA* (H. B. et Kunth, nov. gen. amer. 6. p. 403.) branchlets terete; stipulas linear-subulate; leaflets lanceolate, obtuse, clothed with soft pubescence on both surfaces, but canescent beneath; racemes many-flowered, opposite the leaves, almost terminal; calyx clothed with adpressed pubescence. Ovary 16-ovulate, stipitate.  $\frac{1}{2}$ . G. Native of Mexico, near Guanajuato. Flowers about the size of those of *C. incana*.

*Soft Crotalaria*. Shrub 2 feet.

106 *C. MAYPURE'NSIS* (H. B. et Kunth, nov. gen. amer. 6. p. 403.) branchlets angular; stipulas capillary; leaflets lanceolate, obtuse, somewhat mucronate, glabrous above, and clothed with adpressed pubescence beneath; racemes many-flowered, almost terminal; calyxes clothed with adpressed pubescence; legume many-seeded, hairy.  $\frac{1}{2}$ . S. Native on the banks of the river Orinoco, near Maypures.

*Maypures Crotalaria*. Shrub 2 to 3 feet.

107 *C. VITELLI'NA* (Ker. bot. reg. t. 447.) plant exstipulate, pubescent; leaflets oval-lanceolate, acute, twice the length of the petioles, which are covered with hairs; legume oblong, pendulous, silky-pubescent.  $\frac{1}{2}$ . S. Native of Brazil. Racemes 3-5 inches long. Flowers of a fulvous-yellow colour, but with the vexillum spotted with violet at the base.

*Yolk-like Crotalaria.* Fl. May, June. Clt. 1819. Sh. 2 to 3 ft.

108 *C. HOLOSERICÆA* (Nees et Mart. nov. act. bonn. 12. p. 26.) the whole plant clothed with silky villi; stipulas subulate; leaflets rhomboidal, oval, obtuse, mucronate; racemes opposite the leaves; vexillum bicallous at the base; legume villous, elliptic, 5-6-seeded.  $\frac{1}{2}$ . S. Native of Brazil, in fields. Flowers yellow. An intermediate species between *C. vitellina* and *C. purpurascens*.

*Whole-silky Crotalaria.* Shrub 5 to 6 feet.

109 *C. CYLINDROCARPA* (D. C. prod. 2. p. 133.) stipulas dimidiate-oblong, acute at both ends, rather falcate; leaflets elliptic-oblong, rather pubescent beneath as well as the branchlets; racemes opposite the leaves; legumes sessile, cylindrical, 26-30-seeded, rather pubescent, apiculated by the style, rather spreading; stem erect, somewhat panicled.  $\frac{1}{2}$ . S. Native of Senegal. *C. paniculata*, Pers. in litt. but not of Willd.

*Cylindrical-fruited Crotalaria.* Shrub.

110 *C. SENEGALENSIS* (Bacle in litt. 1820.) stipulas small, subulate, spreading, deciduous; leaflets oval, obtuse, smoothish; racemes opposite the leaves; legumes sessile, pendulous, pubescent, obovate, 8-10-seeded, crowned by the hooked style; stem erect, much branched, pubescent.  $\odot$ . S. Native of Senegal. *C. uncinata*  $\gamma$ , Lam. Pers. l. c. *C. gracilis*, Perr. in litt. 1825.

*Senegal Crotalaria.* Fl. June, July. Clt. 1819. Pl. 1 foot.

111 *C. PODOCARPA* (D. C. prod. 2. p. 133.) plant erect, hispid all over from spreading hairs; stipulas dimidiate, oval-oblong, erect, leafy; leaflets obovate, obtuse, mucronate; racemes opposite the leaves; legume stipitate, turgid, ovate, glabrous, apiculated by the style, 12-18-seeded.  $\odot$ . S. Native of Senegal, in the Sahara desert. The plant has the habit of *Lötus hirsutus*.

*Foot-fruited Crotalaria.* Pl. 1 to 2 feet.

112 *C. UNCINELLA* (Lam. dict. 2. p. 200.) stipulas small or wanting; leaflets oval, mucronate, pubescent beneath; racemes opposite the leaves; legume stipitate, somewhat globose, hooked from the style, silky-velvety, 2-4-seeded; stem erect, much branched, pubescent.  $\odot$ . S. Native of the island of Bourbon.

*Var.  $\beta$ , glabra* (D. C. prod. 2. p. 133.) leaves and legumes glabrous; leaflets oblong, somewhat elliptic.  $\odot$ . S. Native of Bourbon. Perhaps a species.

*Hooked-styled Crotalaria.* Pl. 1 to 2 feet.

113 *C. SPHEROCARPA* (Perr. in litt. 1825.) stipulas small; leaflets oblong-obovate, pubescent beneath; racemes opposite the leaves; legumes sessile, ovate-globose, clothed with fine pubescence, apiculated by the filiform style, 2-4-seeded; stem erect, much branched, pubescent.  $\frac{1}{2}$ . S. Native of Senegal. An intermediate species between the preceding and the following. Stamens permanent, at the base of the legume.

*Round-fruited Crotalaria.* Shrub 1 to 2 feet.

114 *C. MEDICAGINEA* (Lam. dict. 2. p. 201.) stipulas subulate, spreading; leaflets obovate-cuneate, emarginate, clothed beneath with adpressed pubescence, shorter than the petioles; racemes opposite the leaves or terminal, elongated, and with some of the flowers disposed in axillary bundles; legume sessile, roundish, hooked from the thick base of the style, 2-4-seeded, minutely pubescent.  $\odot$ ? S. Native of the East Indies. *C. trifoliastrum*, Willd. spec. 3. p. 983. *Lupinus trifoliatus*, Rottl. nov. act. nat. cur. 4. 1803. p. 223. t. 5.

*Medick-like Crotalaria.* Fl. June, July. Clt. 1816. Pl. 1 ft.

115 *C. LUPULINA* (D. C. prod. 2. p. 133.) stipulas setaceous,

small; leaflets lanceolate, acute, mucronate, clothed with adpressed pubescence beneath as well as the calyxes; racemes 9-10-flowered, opposite the leaves; legume ovate, many-seeded, puberulous.  $\odot$ . G. Native of Mexico, on the burning Mount Jorullo.

*Hop Crotalaria.* Pl. 1 foot.

116 *C. STRICTA* (Roth. nov. spec. 342.) stipulas setaceous, adpressed; leaflets cuneate, emarginate, mucronate, canescent beneath, length of petioles; stem straight; lower flowers axillary, in fascicles, upper ones disposed in a terminal raceme; legume pilose, globose, hooked at the apex.  $\odot$ ? S. Native of the East Indies. Perhaps sufficiently distinct from the preceding species.

*Straight Crotalaria.* Pl. 1 to 2 feet.

117 *C. RIGIDA* (Roth. l. c.) stipulas lanceolate-subulate; leaflets cuneiform, emarginate, covered with hoary pili beneath, length of petioles; stem divaricate; lower flowers axillary, in fascicles, upper ones disposed in terminal racemes.  $\frac{1}{2}$ . S. Native of the East Indies.

*Stiff Crotalaria.* Shrub 1 to 2 feet.

118 *C. PURPUREA* (Vent. malm. t. 66.) stipulas subulate; leaflets obovate, retuse, somewhat emarginate, glabrous above, and minutely pubescent beneath; racemes terminal; legume ovate, glabrous, apiculated by the style, on a very short stipe, many-seeded.  $\frac{1}{2}$ . G. Native of the Cape of Good Hope. Ker. bot. reg. 128. *C. elegans*, Hortul. Flowers deep purple.

*Purple Crotalaria.* Fl. Mar. May. Clt. 1790. Sh. 3 to 6 ft.

119 *C. LITTORALIS* (H. B. et Kunth, nov. gen. amer. 6. p. 401.) suffruticose, procumbent; stipulas subulate, very minute; leaflets 3, obovate-oblong, emarginate, beset with adpressed pili; peduncles 5-7-flowered, opposite the leaves and terminal; legume usually 2-seeded, clothed with adpressed pubescence as well as the calyxes.  $\frac{1}{2}$ . S. Native of Cuba, near Havannah?

*Shore Crotalaria.* Shrub 2 to 3 feet.

120 *C. MICROPHYLLA* (Vahl. symb. 1. p. 52.) stipulas setaceous, spreading; leaflets oblong, glabrous, thickish, length of petioles; peduncles opposite the leaves and terminal, 2-flowered; legume glabrous, oblong, on a short stipe; stem decumbent.  $\frac{1}{2}$ . G. Native of Arabia Felix. Leaflets 2 lines long.

*Small-leaved Crotalaria.* Fl. June, Aug. Clt. 1820. Pl. 1 ft.

121 *C. MICRANTHA* (Link. enum. 2. p. 229.) leaflets oblong, obtuse, mucronulate, beset beneath with scattered adpressed pili; racemes short, terminal; calyxes silky.  $\odot$ . S. Native of Ceylon.

*Small-flowered Crotalaria.* Fl. July, Aug. Clt. 1823. Pl. 1 ft.

122 *C. PALLIDA* (Ait. hort. kew. ed. 1. vol. 3. p. 20.) leaflets lanceolate, glabrous; racemes terminal, spike-formed.  $\odot$ . G. Native of Africa.

*Pale-flowered Crotalaria.* Fl. Ju. Jul. Clt. 1775. Pl. 1 to 2 ft.

123 *C. ? ARGENTEA* (Jacq. hort. schœnbr. 2. p. 220.) clothed with white tomentum; leaflets lanceolate, shorter than the petiole; peduncles 1-flowered, opposite the leaves, nearly terminal; legume stipitate, compressed, clothed with silvery wool.  $\frac{1}{2}$ . G. Native of the Cape of Good Hope. Flowers yellow. Habit of *Lötus* or *Coronilla*. Calyx tripartite.

*Silvery Crotalaria.* Fl. June, July. Clt. 1823. Sh. 2 feet.

124 *C. PULCHELLA* (Andr. bot. rep. t. 417.) leaflets linear-lanceolate, acute, longer than the petioles, clothed with adpressed pubescence beneath, as well as the branches and petioles; racemes terminal; legume cylindrical, many-seeded, tapering into a stipe at the base.  $\frac{1}{2}$ . G. Native of the Cape of Good Hope. Sims, bot. mag. t. 1699. Flowers large, yellow, about the size of those of *Spärtium junctum*.

*Neat Crotalaria.* Fl. July, Aug. Clt. 1800. Sh. 2 to 4 ft.

125 *C. ANGUSTIFOLIA* (Jacq. hort. schœnbr. 2. p. 49. t. 219.) stipulas wanting; leaflets lanceolate, hoary, and silky, shorter

than the petioles; racemes terminal, elongated. *h. G.* Native of the Cape of Good Hope. Flowers cream-coloured, 6 lines long.

*Var. β, elongata* (Thunb. fl. cap. 571.) leaflets ovate, obtuse; flowers yellow.

*Narrow-leaved Crotalaria.* Fl. May, Sept. Clt. 1815. Sh. 4 to 6 feet.

126 *C. MACILENTA* (Gaillaud, fl. meroc. 2. t. 62.) branches somewhat dichotomous, slender; petiole about the length of the leaves; leaflets 3, ovate, clothed with short hairs beneath; spike elongated, not much crowded with flowers; fruit few-seeded. *⊙. ? H.* Native of Egypt, at the White River. The Chamois at Sennaar eat the herb.

*Lean Crotalaria.* Pl. 1 to 2 feet.

127 *C. WILDENOWIANA* (D. C. prod. 2. p. 134.) pubescent; stipulas subulate; leaflets linear, cuneated, emarginate; petioles very short; racemes terminal, 4-6-flowered; legume roundish-ovate, acuminate. *h. G.* Native of the Cape of Good Hope. *C. genistoides*, Willd. spec. 3. p. 987. but not of Lam. Flowers small, yellow. Habit of a species of *Genista*.

*Willdenow's Crotalaria.* Shrub 2 to 4 feet.

128 *C. ASPALATHOIDES* (Lam. dict. 2. p. 202.) plant exstipulate; leaflets linear, cuneated, hairy; racemes pedunculate, terminal, 3-6-flowered; ovary very villous. *h. G.* Native of the Cape of Good Hope. Leaflets very small.

*Aspalathus-like Crotalaria.* Shrub 1 to 2 feet.

129 *C. OBSCURA* (D. C. prod. 2. p. 134.) herbaceous, beset with rusty hairs; leaflets ovate, mucronate, glabrous above; flowers terminal, pedunculate; legume subcylindrical, villous. *⊙. G.* Native of the Cape of Good Hope. Legume an inch long. *C. pilosa*, Thunb. fl. cap. 572. but not of Mill.

*Obscure Crotalaria.* Fl. June, July. Clt. 1820. Pl. 1 foot.

130 *C. VILLOSA* (Thunb. fl. cap. 572.) herbaceous, decumbent; branches villous, diffusely retroflexed; leaflets obovate, mucronulate, hairy; stipulas lanceolate; spikes terminal; legume oblong, pubescent. *⊙. G.* Native of the Cape of Good Hope.

*Villous Crotalaria.* Pl. decumbent.

131 *C. SALTIANA* (Andr. bot. rep. 648.) branches downy; leaflets ovate, tomentose; stipulas wanting; racemes elongated, opposite the leaves. *h. G.* Native of Abyssinia. Flowers yellow. An elegant plant.

*Salt's Crotalaria.* Fl. June, July. Clt. 1810. Sh. 2 to 4 ft.

132 *C. DECUMBENS* (Pers. ench. no. 50.) herbaceous, decumbent, hairy; leaflets ovate-oblong, pubescent above, and clothed beneath with silky tomentum, nerved; flowers terminal, somewhat spicate; legume pubescent. *⊙. G.* Native of the Cape of Good Hope. *C. lineata*, Thunb. fl. cap. 572. but not of Lam.

*Decumbent Crotalaria.* Pl. decumbent.

\*\*\* *Leaves trifoliate. Flowers all axillary.*

133 *C. LOTIFOLIA* (Lin. spec. 1005.) leaflets oblong-cuneated, emarginate, clothed with silky villi beneath; peduncles axillary, solitary, 1-flowered; legume sessile. *h. S.* Native of Jamaica and Santa Cruz.—Sloane, hist. 2. t. 176. f. 1-2.—Dill. elth. t. 102. f. 131. The plant is said by many authors to be glabrous, but by Vahl the leaves are said to be silky beneath.

*Lotus-leaved Crotalaria.* Fl. June, July. Clt. 1732. Shrub 2 to 4 feet.

134 *C. VOLUBILIS* (Thunb. fl. cap. 572.) plant glabrous, between decumbent and twining; leaflets obovate, obtuse; flowers axillary, solitary, on short pedicels; legume ovate, pedicellate, glabrous. *h. G.* Native of the Cape of Good Hope.

*Twining Crotalaria.* Shrub decumbent.

135 *C. AXILLARIS* (Ait. hort. kew. ed. 2. vol. 3. p. 20.)

leaflets oblong-lanceolate, acute, covered beneath with silky pili; pedicels axillary, twin, 1-flowered. *⊙. S.* Native of Guinea. Willd. spec. 3. p. 984. Stipulas small, lanceolate-subulate. Flowers yellow. Legume pilose. In a specimen of this plant sent to M. De Candolle from the English gardens, the leaves were pubescent beneath, and the pedicels 2-4 together, not all twin.

*Axillary Crotalaria.* Fl. Ju. Jul. Clt. 1781. Pl. 1 to 2 ft.

136 *C. TRIANTHA* (Moc. et Sesse, fl. mex. ined. D. C. prod. 2. p. 135.) leaflets oblong, obtuse, somewhat emarginate, glabrous; peduncles 3-flowered, bearing bristles at the apex, longer than the leaves; legumes pendulous, oblong, cylindrical, sessile. *⊙. S.* Native of Mexico. Flowers yellow, reddish on the outside.

*Three-flowered Crotalaria.* Fl. Ju. Jul. Clt. 1824. Pl. 1 to 2 ft.

\*\*\* *Leaves having 5 or 7 leaflets.*

137 *C. QUINQUEFOLIA* (Lin. spec. 1006.) leaflets 5, narrow-lanceolate, obtuse, young ones silky-pubescent; racemes opposite the leaves, terminal; bractes linear, at length reflexed; legume glabrous, apiculated by the style, on a short stipe. *⊙. S.* Native of Malabar and Java.—Burm. fl. ind. 157. exclusive of the 3-leaved variety — Rheed. mal. 9. t. 28. Habit of a lupine.

*Five-leaved Crotalaria.* Fl. Ju. Jul. Clt. 1792. Pl. 1 to 2 ft.

† *Species not sufficiently known.*

138 *C. PILOSA* (Mill. dict. no. 2.) leaves simple, lanceolate, pilose; petioles decurrent. Native of New Spain, at Vera Cruz.

*Pilose Crotalaria.* Clt. ? Pl. 1 to 2 feet.

139 *C. FRUTICOSA* (Mill. dict. no. 4.) leaves simple, linear-lanceolate, hairy; petioles decurrent; stem fruticose. *h. S.* Native of Jamaica.

*Shrubby Crotalaria.* Fl. June, July. Clt. 1716. Tr. 28 ft.

140 *C. ANGULATA* (Mill. dict. no. 9.) leaves simple, ovate, sessile; branches angular, hairy; flowers lateral. *⊙. S.* Native of Campechy.

*Angular-stemmed Crotalaria.* Fl. June, July. Clt. 1700. Pl. 2 to 3 feet.

141 *C. STYRACIFOLIA* (Horn. hort. hafn. suppl. 151.) leaves simple, broad-ovate, nearly sessile, pubescent on both surfaces, hoary; stipulas subulate. *h. S.* Native of the Cape of Good Hope. Perhaps the same as *C. styracifolia* of Desf. hort. par. Perhaps a species of *Podalyria*.

*Styrax-leaved Crotalaria.* Shrub 2 to 4 feet.

142 *C. HEPAPHYLIA* (Lour. coch. p. 133.) leaves imparipinnate, with 3 pairs of leaflets; leaflets ovate-oblong, rather tomentose; spikes elongated, axillary, and terminal, legume stipitate, turgid, villous. *h. G.* Native of Cochin-china. Flowers white. Stamens monadelphous. This plant ought certainly to be removed from the genus in consequence of its pinnate leaves.

*Seren-leaved Crotalaria.* Shrub 10 feet.

143 *C. MACROSTYLA* (D. Don, prod. fl. nep. 242.) leaves trifoliate; leaflets obovate, retuse, coriaceous, mucronulate, clothed with silky villi beneath as well as the branches; racemes axillary; legume ovate, compressed, 1-seeded, very villous. *h. S.* Native of Shreenagur. In consequence of the stamens being diadelphous, and the style being very long and plumose, it recedes from the present genus.

*Long-styled Crotalaria.* Shrub 2 to 4 feet.

*Cult.* All the species of this genus are free flowerers, and several of them are very handsome when in bloom. All of them thrive well in any light rich soil, and young cuttings of the shrubby kinds root freely in a pot of sand, with a bell-glass placed over them, but this is generally unnecessary, as most of

them ripen their seeds in abundance. The seeds of the annual kinds should be sown on a hot-bed in spring, and when the plants have attained the height of 2 or 3 inches, they may be placed separately in pots, and some may be planted out into the open border in summer, especially those natives of colder countries.

**XLVIII. CLAVULUM** (diminutive of *clavus*, a club; form of legume). Desv. obs. legum. ex Schlecht. Linnæa, 2. p. 510.

**LIN. SYST.** *Monadelphica, Decandria*. Calyx 5-cleft, somewhat bilabiate; teeth broad, acute; vexillum somewhat plicate. Keel large, short. Wings short. Stamens monadelphous, with the sheath cleft in front. Style long, acute. Ovary stalked. Legume oblong, inflated, many-seeded. Shrubs, with trifoliate leaves and racemes of flowers, which are either opposite the leaves or terminal.

1 *C. MUCRONATUM* (Desv. l. c.) leaflets ovate, mucronate, covered beneath with powdery pubescence; flowers sessile, spicate, terminal. *h. S.* Native of the Antilles. *Crotalaria mucronata*, Desv. journ. bot. 1814. vol. 1. p. 76. *D. C. prod.* 2. p. 132.

*Mucronate-leaved Clavulum.* Shrub.

2 *C. PEDUNCULOSA* (Desv. l. c.) leaflets obovate, acute; flowers disposed in racemose spikes, which are opposite the leaves, and on very long peduncles. *h. S.* Native of the East Indies. *Crotalaria pedunculosa*, Desv. journ. bot. 1814. vol. 1. p. 76.

*Stalked-racemed Clavulum.* Shrub.

*Cult.* See shrubby stove species of *Crotalaria* for culture and propagation.

**XLIX. HYPOCALYPTUS** (*ὑπο*, *hypo*, under, and *καλυπτω*, *calypto*, to veil, meaning not evident). Thunb. prod. 124. *D. C. prod.* 2. p. 135.

**LIN. SYST.** *Monadelphica, Decandria*. Calyx with 5 short lobes, thrust in at the base. Stamens monadelphous. Legume compressed, lanceolate.—A smooth shrub, with trifoliate leaves and purple flowers. All the species of *Hypocalyptus* of Thunberg have been discovered to be either species of *Podalyria* or *Virgilia*, except the present plant.

1 *H. OBCORDATUS* (Thunb. l. c.). *h. G.* Native of the Cape of Good Hope. *Spartium sophoroides*, Berg. cap. 198. *Crotalaria cordifolia*, Lin. mant. 266. The plant has the habit of a species of *Podalyria* or *Rafnia*. Leaflets obcordate, mucronate, complicated, longer than the petiole.

*Obcordate-leaftletted Hypocalyptus.* Fl. Ju. July. Clt. 1823. Shrub 1 to 2 feet.

*Cult.* For culture and propagation see *Loddigèsia*.

**L. VIBORGIA** (in honour of Eric Viborg, an acute Danish botanist). Spreng. but not of Mœnch. *Wiborgia*, Thunb. fl. cap. p. 560. but not of Roth.

**LIN. SYST.** *Monadelphica, Decandria*. Calyx campanulately-tubular, permanent, 5-toothed, with the recesses round. Vexillum obovate. Keel 2-edged, obtuse. Stamens monadelphous, with the sheath at length cleft in front. Style filiform, smooth, crowned by a simple terminal stigma. Legume stipitate, compressed, ovate, indehiscent, mucronate from the style, 1-seeded, subulate at the upper suture; valves rather ventricose, coriaceous, transversely nerved.—Cape shrubs, about 2 or 3 feet high, with trifoliate leaves, the leaflets rather longer than the petioles. Flowers yellow, disposed in racemes, with the pedicels reflexed. Stipulas wanting or very small. Perhaps all the three species are sufficiently distinct from each other.

1 *V. OBCORDATA* (Thunb. fl. cap. p. 560.) leaflets glabrous, oblong-cuneate, obtusely emarginate; racemes elongated; branches loose. *h. G.* Native of the Cape of Good Hope, in sandy places. *Hedysarum Capense*, Burm. cap. p. 22. *Cro-*

*talària obcordata*, Berg. cap. 195. *Crotalaria floribunda*, Lodd. bot. cab. 509. Leaflets 2-3 lines long.

*Obcordate-leaftletted Viborgia.* Fl. July, Aug. Clt. 1810. Shrub 2 to 3 feet.

2 *V. FUSCA* (Thunb. l. c.) leaflets glabrous, ovate, mucronate; branches twiggy, erect. *h. G.* Native of the Cape of Good Hope.

*Brown Viborgia.* Shrub 2 to 3 feet.

3 *V. SERICEA* (Thunb. l. c.) leaflets clothed with silky pubescence, obovate, obtuse; branches twiggy. *h. G.* Native of the Cape of Good Hope. Leaves about a line long.

*Silky Viborgia.* Fl. July, Aug. Clt. 1810. Sh. 2 to 3 feet.

*Cult.* See *Loddigèsia* for culture and propagation.

**LI. LODDIGESIA** (in honour of Conrad Loddiges, nurseryman at Hackney, near London; died 1820). Sims, bot. mag. t. 956.

**LIN. SYST.** *Monadelphica, Decandria*. Calyx somewhat inflated, acutely 5-toothed. Vexillum much smaller than the wings and keel. Stamens all connected. Ovary oblong, 2-4-ovulate, compressed.—A Cape shrub, with trifoliate leaves, and pinkish flowers.

1 *L. OXALIDIFOLIA* (Sims, l. c.) *h. G.* Native of the Cape of Good Hope. Shrub much branched, smooth. Leaves stalked. Stipulas subulate. Leaflets obcordate, mucronate. Flowers 3-8, in an umbel. Keel dark-purple at the apex.

*Oxalis-leaved Loddigèsia.* Fl. May, Sept. Clt. 1802. Shrub 1 to 3 feet.

*Cult.* *Loddigèsia* is an elegant plant when in flower. An equal mixture of sandy loam and peat suits it best, and young cuttings strike freely if planted in a pot of sand, with a bell-glass placed over them.

**LII. DICHILUS** (from *dis*, twice, and *χειλος*, *cheilos*, a lip; in reference to the calyx being deeply two lipped).

**LIN. SYST.** *Monadelphica, Decandria*. Calyx attenuated at the base, profoundly bilabiate, upper lip bidentate, lower one tridentate, the teeth all acute. Vexillum shorter than the obtuse keel. Wings nearly equal, longer than the calyx. Stamens monadelphous, with the sheath cleft above. Style filiform. Ovary linear, erect, 8-ovulate.—Smoothish Cape subshrubs, with terete branches, and with hardly any stipulas. Leaves ternate. Pedicels 1-flowered, bibracteate.

1 *D. LEBECKIOIDES* (D. C. l. c. t. 35.) stem suffruticose, erect, smooth; leaves ternate, on short petioles, smooth; pedicels 1-flowered, bibracteolate. *h. G.* Native of the Cape of Good Hope.

*Lebeckia-like Dichilus.* Shrub 1 to 2 feet.

2 *D. SERICEUM* (Spreng. syst. tent. suppl. p. 20.) stem suffruticose, erect, silky; leaves ternate, stalked; leaflets obovate, smooth above, but with the margins fulvous and ciliated, and clothed with silky silvery-pubescence beneath; racemes stalked; legume linear-ensiform. *h. G.* Native of the Cape of Good Hope. Zeyher, no. 10.

*Silky Dichilus.* Shrub 1 to 2 feet.

3 *D. CILIATUM* (Spreng. l. c.) stem herbaceous, erect, smoothish; leaves ternate, on long stalks; leaflets ovate-rhomboid, rather oblique, ovate, acute, mucronate, smoothish above, ciliated with silky hairs, sparingly pilose beneath; peduncles axillary, leafy in the middle; racemes few-flowered. *h. G.* Native of the Cape of Good Hope. *D. hypotrichum*, Spreng. eur. post. p. 273. no. 2.

*Ciliated-leaved Dichilus.* Pl. 1 foot.

*Cult.* For culture and propagation see *Loddigèsia*.

**LIII. LEBECKIA** (from *Lêbeck*, some obscure botanist).

Thunb. prod. 2. præf. fl. cap. 561. Willd. spec. 3. p. 946. D. C. prod. 2. p. 136.

LIN. SYST. *Monadelphica*, *Decandria*. Calyx 5-cleft; lobes acute, nearly equal, with the recesses rounded. Stamens all connected, with the sheath cleft above. Legume cylindrical, many-seeded.—Shrubs or subshrubs, natives of the Cape of Good Hope, with simple or trifoliate leaves. Habit of *Genista*.

\* *Leaves simple.*

1 *L. SUBNU'DA* (D. C. prod. 2. p. 136.) leaves almost wanting, but at the tops of the branches they are few, linear, and deciduous, and are, as well as the branches, clothed with adpressed pubescence; flowers disposed in long racemes.  $\frac{1}{2}$ . G. Native of the Cape of Good Hope. Petals stipitate, with the stipes a little longer than the calyx. Perhaps the same as *L. aphylla*, Thunb. prod. 122. but omitted in his *Flora Capensis*.

*Nearly-naked Lebeckia*. Fl. April, May. Clt. 1824. Shrub 1 to 2 feet.

2 *L. CONTAMINATA* (D. C. prod. 2. p. 136.) leaves linear-filiform, scattered, glabrous; racemes axillary, pedunculated, and elongated.  $\frac{1}{2}$ . G. Native of the Cape of Good Hope, in sandy places. *Spártium contaminatum*, Lin. mant. 268. The bases of the leaflets are spotted with purple. Flowers yellow. Perhaps *L. contaminata* of Thunb. fl. cap. 561. Flowers said to be umbellate by Thunberg; it is therefore perhaps a distinct species from the plant of Linnæus.

*Contaminated Lebeckia*. Fl. April, May. Clt. 1787. Shrub 2 to 6 feet.

3 *L. SEPIARIA* (Thunb. l. c.) leaves filiform, rather crowded, glabrous; racemes subterminal, pedunculated, elongated, crowded.  $\frac{1}{2}$ . G. Native of the Cape of Good Hope.—Pluk. alm. t. 124. f. 1. *Spártium sepiarium*, Lin. spec. 995. *Genista sepiaria*, Lam. *Spártium pinastriifolium*, Burm. cap. p. 21.

*Hedge Lebeckia*. Fl. Ap. May. Clt. 1820. Sh. 3 to 6 feet.

4 *L. ? LINEARIS* (D. C. prod. 2. p. 137.) leaves in fascicles, linear-subulate, acute, glabrous, straight; flowers tern, somewhat pedicellate at the tops of the branches.  $\frac{1}{2}$ . G. Native of the Cape of Good Hope. *Psoralea linearis*, Burm. cap. 22.

*Linear-leaved Lebeckia*. Fl. April, May. Sh. 2 to 4 feet.

5 *L. PU'NGENS* (Thunb. l. c.) leaves obovate; branches and branchlets spinescent, tomentose; flowers solitary.  $\frac{1}{2}$ . G. Native of the Cape of Good Hope. Erect, clothed with fine tomentum, the branches terete. Legume oblong, falcate, tomentose.

*Pungent Lebeckia*. Shrub 2 to 4 feet.

\* \* *Leaves trifoliate.*

6 *L. SUBTERNA'TA* (Link. enum. 2. p. 225.) leaves 1-2 or trifoliate, sessile, lanceolate, acute, scabrous.  $\frac{1}{2}$ . G. Native of the Cape of Good Hope. Pedicels axillary, shorter than the leaves. Flowers yellow. Vexillum longer than the wings, and acute keel.

*Subternate-leaved Lebeckia*. Fl. June, July. Clt. 1824. Shrub 2 to 4 feet.

7 *L. ARMA'TA* (Thunb. fl. cap. 561.) leaves trifoliate, stalked, glabrous; leaflets oblong; branches numerous, rather spinescent, terete, grey; flowers racemose.  $\frac{1}{2}$ . G. Native of the Cape of Good Hope. *L. acorpius*, Thunb. prod. 122. in fl. cap. omitted. Stem very much branched.

*Armed Lebeckia*. Shrub 2 to 4 feet.

8 *L. DENSA* (Thunb. fl. cap. 562.) leaves trifoliate, clothed with adpressed silky-canescient down; leaflets oblong-linear, complicated; racemes few-flowered, on long peduncles, somewhat spicate; flowers erect, silky.  $\frac{1}{2}$ . G. Native of the Cape of Good Hope. Burch. cat. no. 2603. Leaflets 12-15 lines long, and 1 to 3 broad. Petioles, branches, and pedicels clothed with adpressed pubescence.

*Dense Lebeckia*. Shrub 2 to 4 feet.

9 *L. HUMILIS* (Thunb. fl. cap. 562.) leaves trifoliate, pubescently-villous; leaflets linear-oblong; flowers racemose, reflexed; branches incurved.  $\frac{1}{2}$ . G. Native of the Cape of Good Hope. Stem glabrous, hardly an inch in height.

*Humble Lebeckia*. Shrub  $\frac{1}{4}$  foot.

10 *L. SERICEA* (Thunb. fl. cap. 562.) leaves trifoliate, silky; leaflets linear-oblong, flat; racemes few-flowered, short; flowers erect; corolla glabrous.  $\frac{1}{2}$ . G. Native of the Cape of Good Hope. *Spártium sericeum*, Ait. hort. kew. 3. p. 12. *Cytisus sericeus*, Lam. dict.

*Silky Lebeckia*. Fl. April. Clt. 1774. Shrub 1 to 3 feet.

11 *L. CYTISOIDES* (Thunb. l. c.) leaves trifoliate, clothed with adpressed pubescence; leaflets linear-oblong; racemes elongated; flowers erect, smoothish.  $\frac{1}{2}$ . G. Native of the Cape of Good Hope.—Comm. hort. amst. 2. p. 107. *Spártium cytoides*, Lin. fil. suppl. 320. *Ebenus Capensis*, Lin. mant. 264. *Cytisus Capensis*, Lam. Flowers large, yellow, resembling those of a species of *Crotalaria*.

*Cytisus-like Lebeckia*. Fl. April. Clt. 1774. Sh. 2 to 4 ft.

*Cult.* For culture and propagation see *Loddigèsia*, p. 142.

LIV. SARCOPHYLLUM (from *σαρξ σαρκος*, *sarx*, flesh, and *φυλλον*, *phyllon*, a leaf; leaves fleshy). Lam. prod. part. 2. D. C. prod. 2. p. 137.—*Sarcophyllus*, Thunb. fl. cap. 2. p. 573.

LIN. SYST. *Monadelphica*, *Decandria*. Calyx campanulate, 5-parted, regular, 2 superior teeth divaricate. Carina obtuse. Stamens monadelphous. Legume compressed, elongated, falcate, many-seeded, acuminate by the style.—A smooth Cape shrub, with the appearance of *Lebeckia sepiaria*.

1 *S. CARNOSUM* (Thunb. l. c.)  $\frac{1}{2}$ . G. Native of the Cape of Good Hope, on the mountains near False Bay. Sims, bot. mag. 2502. Leaves fleshy, filiform, articulated above the middle, disposed in fascicles. Flowers yellow, pedicellate, lateral.

*Fleshy-leaved Sarcophyllum*. Fl. May, Aug. Clt. 1812. Sh. 2 to 4 feet.

*Cult.* This plant being of a rather succulent nature care must be taken not to over water it. A mixture of loam and peat is the best soil for it, and young cuttings root readily in a pot of sand under a bell-glass.

LV. ASPALATHUS (said to be derived from a privative and *σπαιω*, *spao*, to extract; in reference to the thorns). Lin. gen. no. 860. Lam. ill. t. 620. Thunb. fl. cap. 573. D. C. prod. 2. p. 137. *Aspalathus* and *Eriocylax*, Neck.

LIN. SYST. *Monadelphica*, *Decandria*. Calyx with the tube hardly attenuated at the base, 5-toothed or 5-cleft, with the lobes about equal. Vexillum on a short stipe. Carina 2-edged. Stamens monadelphous, having the sheath cleft above. Legume oblong, usually oblique, few-seeded.—Shrubs or subshrubs, all natives of the Cape of Good Hope, with the exception of one. Leaves at first sight in fascicles, but are compounded of 3-5 leaflets, disposed palmately, rarely pinnately, having scarcely any or very short petioles, therefore the leaflets are sessile. Flowers furnished each with 3 bracteoles, or a leaf composed of 3 leaflets. The species are mostly known from the descriptions of Thunberg. Flowers usually yellow.

§ 1. *Flowers almost sessile.*

\* *Leaves in fascicles.*

1 *A. SPINOSA* (Lin. spec. 1000.) leaves in fascicles, linear, glabrous; branches axillary, spiny; flowers axillary, solitary, glabrous.  $\frac{1}{2}$ . G. Breyn. cent. t. 26. Lam. ill. t. 620. f. 3.

Thunb. fl. cap. 584. Calyx 5-toothed. Carina longer than the wings and keel. Legume pubescent, rather oblique.

• *Spiny Aspalathus*. Fl. July, Aug. Clt. 1824. Sh. 1 to 2 ft.

2 *A. ACULEATA* (Thunb. fl. cap. 584.) leaves in fascicles, linear, hairy; flowers capitate; buds prickly. *h. G.* A villous shrub, with very short branches. Prickles yellowish under the fascicles of leaves. Flowers yellow, hairy.

*Prickly Aspalathus*. Shrub 2 to 3 feet.

3 *A. ACUMINATA* (Lam. dict. 1. p. 287. ill. 620. f. 4. but not of Thunb.) leaves in fascicles, very short, lanceolate, ending in a pungent acumen, rather puberulous; branchlets spinescent; flowers axillary, solitary. *h. G.*—Pluk. alm. t. 297. f. 6. Teeth of calyx spiny. Petals silky on the outside. Keel and vexillum about equal in length, but longer than the wings.

*Acuminated-leaved Aspalathus*. Shrub 1 foot.

4 *A. SPINESCENS* (Thunb. fl. cap. 584.) leaves in fascicles, filiform, rather fleshy; flowers lateral, solitary, glabrous; branches spinescent. *h. G.* Calyx acutely 5-cleft. Corolla 4 lines long. Petals equal among themselves. Ovary glabrous.

*Spinescent Aspalathus*. Shrub 2 to 4 feet.

5 *A. LARICIFOLIA* (Lam. dict. 1. p. 287. but not of Thunb.) leaves in fascicles, filiform-subulate, glabrous; branches and stipulas spinescent; flowers lateral, solitary, silky-pubescent. *h. G.* *A. pungens*, Thunb. prod. 129. Leaves length of those of *Pinus larix*. Calyx pubescent, acutely 5-cleft. Wings falcate. Carina very much curved. Legume clothed with short villi.

*Larch-leaved Aspalathus*. Shrub 2 to 4 feet.

6 *A. VERRUCOSA* (Lin. syst. veg. 537. Thunb. fl. cap. 583.) leaves in fascicles, filiform, mucronate, incurved, fleshy, glabrous; flowers lateral; buds warted. *h. G.* Calyx pubescent, acutely 5-cleft. Vexillum pilose. Legume villous, ovate-lanceolate, acuminate.

*Warted Aspalathus*. Shrub 2 to 3 feet.

7 *A. CAPITATA* (Lin. amæn. 6. p. 92.) leaves in fascicles, subulate, acute, much crowded, rather pilose; branches hairy; flowers capitate, terminal, glabrous. *h. G.*—Pluk. t. 397. f. 6. Lam. ill. 620. f. 2. *A. glomerata*, Lin. fil. suppl. 321. Bracteoles 3, deciduous, the middle one concave and largest. Calyx villous, 5-cleft, with the lobes broad and acute.

*Capitate-flowered Aspalathus*. Fl. July, Aug. Clt. 1823. Sh. 2 to 4 feet.

8 *A. ASTROITES* (Lin. spec. 1000.) leaves in fascicles, subulate, pungent, stiffly divaricate, glabrous; branchlets hairy; flowers lateral and terminal, somewhat capitate, smoothish. *h. G.*—Pluk. alm. t. 413. f. 2.—Seb. thes. t. 24. f. 6. Bracteoles spinescent. Calyx 5-cleft, the lobes subulate and spiny. Ovary glabrous.

*Starry Aspalathus*. Fl. July, Aug. Clt. 1818. Sh. 2 to 4 ft.

9 *A. CHENOPODA* (Lin. spec. 1000.) leaves in fascicles, subulate, trigonal, ending in a pungent mucrone, stiff, pilose; flowers capitate, and are, as well as the branches, hairy. *h. G.*—Breyn. cent. t. 11.—Seb. thes. 1. t. 24. f. 4. Sims, bot. mag. 2225. Lodd. bot. cab. t. 316. Bracteoles subulate, villous. Calyx 5-ribbed, cleft into 5 beyond the middle; the lobes subulate and villous. Wings straight, rather adnate to the keel. Legume terete, with short pili at the apex. Style long, permanent.

*Goose-foot Aspalathus*. Fl. July, Aug. Clt. 1759. Shrub 2 to 4 feet.

10 *A. ALBENS* (Thunb. fl. cap. 576.) leaves in fascicles, filiform, mutic, silvery from adpressed silky down; racemes leafy. *h. G.* Corolla glabrous, according to Thunberg, but in the specimen examined by M. De Candolle it is obviously tomentose. Calyx hoary from silky down. Flowers white.

*White-leaved Aspalathus*. Fl. July, Aug. Clt. 1774. Sh. 3 to 4 feet.

11 *A. ARGYREA* (D. C. prod. 2. p. 139.) leaves in fascicles, filiform, awnless, silky from adpressed down; flowers axillary, subterminal, solitary; calyx 5-toothed, and is, as well as the corolla, clothed with silky pubescence. *h. G.* Perhaps the same as *A. albens*, Lin. mant. 261.

*Silvery Aspalathus*. Shrub 2 to 4 feet.

12 *A. ARMATA* (Thunb. fl. cap. 577.) leaves in fascicles, filiform, silvery, mucronate; racemes leafless; corolla tomentose. *h. G.* Flowers white. Branches silky. Racemes terminal.

*Armed Aspalathus*. Shrub 2 to 4 feet.

13 *A. HYSTRIX* (Lin. fil. suppl. 322. Thunb. fl. cap. 577.) leaves in fascicles, filiform, silky, mucronate, stiff; flowers lateral, solitary; corolla villous. *h. G.* Lam. dict. 1. p. 287. ill. t. 620. f. 1.

*Porcupine Aspalathus*. Fl. July, Aug. Clt. 1824. Shrub 2 to 4 feet.

14 *A. SPICATA* (Thunb. fl. cap. 578.) leaves in fascicles, subulate, rather pilose; flowers disposed in ovate, terminal spikes; calyx hairy, with the lobes acuminate. *h. G.*

*Spike-flowered Aspalathus*. Shrub 2 to 4 feet.

15 *A. MICROCARPA* (D. C. prod. 2. p. 139.) leaves in fascicles, subulate, pilose; flowers axillary, solitary; legume ovate, pubescent, a little longer than the calyx. *h. G.* Burch. cat. no. 265 and 284. Branches rather hairy. Calyxes rather villous, 5-cleft, with the lobes awl-shaped. Corolla small. Wings oblong, shorter than the smooth keel and silky vexillum. Legume 1-2-seeded. Leaves 1-2 lines long.—Pluk. alm. t. 413. f. 3.?

*Small-fruited Aspalathus*. Shrub 2 to 4 feet.

16 *A. THYMIFOLIA* (Lin. spec. 1000.) leaves in fascicles, filiformly-subulate, pilose; flowers lateral, pubescent, solitary; branches incurved, hairy. *h. G.*—Pluk. alm. t. 413. f. 1. Bracteoles villous. Calyx villous, 5-cleft, with the tube striated, and the lobes subulate. Corolla small, the wings very small, and oblong.

*Thyme-leaved Aspalathus*. Fl. July, Aug. Clt. 1825. Sh. 2 to 4 feet.

17 *A. ERICÆFOLIA* (Lin. spec. 1000.) leaves in fascicles, filiform, rather obtuse, covered with soft hairs; flowers alternate, disposed in something like racemes; segments of the calyx linear, about the length of the corolla. *h. G.*—Pluk. alm. t. 413. f. 6. *A. mollis*, Lam. dict. 1. p. 290. Corolla with oblong smooth wings, equal in length to the keel, which is villous, as well as the vexillum. *A. ericæfolia*, Berg. cap. 205. differs in segments of the calyx being obtuse.

*Heath-leaved Aspalathus*. Fl. July, Aug. Clt. 1789. Sh. 2 to 4 feet.

18 *A. FRANKENIODES* (D. C. prod. 2. p. 139.) leaves in fascicles, terete, pubescently-hairy; branches canescent and velvety; flowers terminal and axillary, usually solitary, silky. *h. G.* Burch. cat. no. 3473. Calyx 5-toothed, 3 times shorter than the corolla. Leaves hardly more than a line long.

*Frankenia-like Aspalathus*. Shrub.

19 *A. HISPIDA* (Thunb. fl. cap. 579.) leaves in fascicles, filiform, obtuse, hispid from pili; flowers axillary; segments of the calyx shorter than the flower. *h. G.* A shrub, clothed with grey tomentum. Flowers sessile. Legume ovate, villous.

*Hispid Aspalathus*. Fl. July, Aug. Clt. 1818. Sh. 2 to 4 ft.

20 *A. FLEXUOSA* (Thunb. fl. cap. 579.) leaves in fascicles, filiform, obtuse, hispid from pili; flowers axillary; segments of the calyx longer than the flower. *h. G.*

*Flexuous Aspalathus*. Shrub 2 to 3 feet.

21 *A. PARVIFLORA* (Thunb. fl. cap. 579. but not of Berg.) leaves in fascicles, filiform, obtuse, pubescent; flowers terminal, tern. *h. G.* Shrub pubescent. Corolla with the helmet tomentose.

*Small-flowered Aspalathus.* Shrub 2 to 4 feet.

22 *A. INCOMPTA* (Thunb. fl. cap. 579.) leaves in fascicles, filiform, obtuse, silky; flowers lateral. *h. G.* Branches retroflexed, clothed with very fine pubescence. Leaves a nail long. Flowers yellow; the vexillum hairy.

*Ungightly Aspalathus.* Shrub 2 to 4 feet.

23 *A. ASPARAGOIDES* (Lin. fl. suppl. 321. Thunb. fl. cap. 579.) leaves in fascicles, subulate, trigonal, mucronate, rather pilose; flowers axillary; calycine segments subulate, rather pilose, about equal in length to the corolla. *h. G.* Vexillum and keel densely clothed with silky-velvety down, but with the wings glabrous. Hairs on the calyx tuberculate at the base.

*Asparagus-like Aspalathus.* Fl. July, Aug. Clt. 1812. Sh. 2 to 4 feet.

24 *A. CORRUDÆFOLIA* (Berg. cap. 207.) leaves in fascicles, filiform, mucronately pungent, smoothish, stiff; branches pubescent; flowers axillary, solitary; bracteas and calycine segments ending in a spiny mucrone. *h. G.* Burch. cat. no. 3320. Calyxes and legumes villous. Vexillum and keel rather puberulous.

*Wild Asparagus-leaved Aspalathus.* Shrub 2 to 4 feet.

25 *A. INCURVA* (Thunb. fl. cap. 578.) leaves in fascicles, subulate, mucronulate, rather pilose; flowers axillary, solitary; legume ovate-lanceolate, rather oblique, very hairy. *h. G.* Leaves sometimes almost smooth, 4 lines long. Legume 5 lines long, rather turgid. Calyx villous, with the teeth subulate.

*Incurved-leaved Aspalathus.* Shrub 2 to 4 feet.

26 *A. NIGRA* (Lin. mant. 262.) leaves in fascicles, filiform, glabrous; branches pubescent; flowers capitate, at length disposed in an ovate spike; calyx and corolla villous. *h. G.* Flowers yellow. Leaves bluntish.

*Black Aspalathus.* Shrub 2 to 4 feet.

27 *A. MULTIFLORA* (Thunb. fl. cap. 580.) leaves in fascicles, terete, obtuse, glabrous; flowers disposed in something like spikes; calyxes bractless; branches, calyx, and corolla pubescent. *h. G.* Leaves hardly a line in length. *A. multiflora*, Sieb. exsicc. cap. no. 49, is very different.

*Many-flowered Aspalathus.* Fl. July, Aug. Clt. 1818. Shrub 2 to 4 feet.

28 *A. CYMBÆFORMIS* (D. C. prod. 2. p. 140.) leaves in fascicles, terete, pubescently hairy; flowers terminal and axillary, usually solitary; segments of the calyx ovate, boat-shaped, obtuse. *h. G.* *A. uniflora*, Lam. dict. 1. p. 285, but not of Lin. Corolla clothed with silky villi.

*Var. a, hirta* (D. C. prod. 2. p. 140.) leaves hairy, much crowded; flowers smaller.

*Var. β, pubescens* (D. C. l. c.) leaves pubescent, rather distant; flowers larger.

*Boat-shaped-sepalled Aspalathus.* Shrub 2 to 4 feet.

29 *A. UNIFLORA* (Lin. spec. 1001. but not of Lam. ex mus. hort. par.) leaves in fascicles, filiform, mucronate, glabrous; flowers lateral, solitary; calycine segments ovate, boat-shaped, obtuse. *h. G.* — Pluk. mant. 88. t. 413. f. 7. ex Lin. Stipulas permanent, according to Lin. Keel of corolla tomentose.

*One-flowered Aspalathus.* Fl. July, Aug. Clt. 1812. Shrub 2 to 3 feet.

30 *A. CARNOSA* (Lin. mant. 261.) leaves in fascicles, fleshy, terete, obtuse, glabrous; flowers terminal, in fours, capitate, bracteate; calycine segments ovate, obtuse. *h. G.* Berg. cap. 206. Sims, bot. mag. 1289. Flowers very smooth, yellow. This species is allied to the two preceding in the calycine segments being obtuse.

*Fleshy Aspalathus.* Fl. May, June. Clt. 1795. Shrub 2 to 4 feet.

31 *A. RINGUIS* (Thunb. fl. cap. 580.) leaves in fascicles, fleshy, ovate, trigonal, obtuse, glabrous; flowers lateral, glabrous.

*h. G.* Branches tomentose. Leaves hardly 1 line long. Flowers yellow.

*Flat Aspalathus.* Shrub 2 to 4 feet.

32 *A. CRASSIFOLIA* (Andr. bot. rep. 351.) leaves in fascicles, fleshy, terete, glabrous, setaceous at the apex; flowers capitate, terminal; calyx bracteate. *h. G.* Ait. hort. kew. ed. 2. vol. 4. p. 263. Flowers yellow.

*Thick-leaved Aspalathus.* Fl. July, Aug. Clt. 1800. Shrub 2 to 4 feet.

33 *A. AFFINIS* (Thunb. fl. cap. 580.) leaves in fascicles, fleshy, terete, glabrous; flowers lateral, bractless; branches twiggy. *h. G.* Flowers yellow. Legume ovate, glabrous.

*Allied Aspalathus.* Fl. June, July. Clt. 1822. Sh. 2 to 4 ft.

34 *A. SANGUINEA* (Thunb. fl. cap. 580.) leaves in fascicles, fleshy, terete, glabrous; flowers lateral, bractless; branches fastigiate. *h. G.* Flowers blood-coloured, smooth, on very short pedicels. Leaves one line long.

*Blood-coloured-flowered Aspalathus.* Shrub 2 to 4 feet.

35 *A. LACTEA* (Thunb. fl. cap. 580.) leaves in fascicles, filiform, glabrous, retuse; flowers lateral, bractless. *h. G.* A pubescent shrub, with spreading leaves, and whitish-yellow, smooth flowers.

*Milk-coloured-flowered Aspalathus.* Shrub 2 to 4 feet.

36 *A. GENISTOIDES* (Lin. mant. 261.) leaves in fascicles, filiform, glabrous; flowers terminal, subracemose, glabrous; calycine teeth short. *h. G.* Flowers yellow. Leaves half an inch long. Calyx and corolla pubescent. Thunb. fl. cap. 581.

*Genista-like Aspalathus.* Shrub 9 feet.

37 *A. SQUARROSA* (Thunb. prod. 128.) leaves in fascicles, filiform, reflexed, glabrous; flowers solitary, terminal. *h. G.* *A. squamosa*, Thunb. fl. cap. 581. Flowers yellow. Bracteas 3, under the calyx filiform. Calyx and the vexillum pubescent.

*Squarrose Aspalathus.* Fl. Jul. Aug. Clt. 1823. Sh. 2 to 4 ft.

38 *A. GALIODES* (Berg. cap. 210.) leaves in fascicles, subulate, unarmed, glabrous; flowers twin, terminal, smooth; stem procumbent. *h. G.* *Gal. Berg.* Buds remote. Calyx smooth. Legume ovate-lanceolate, smoothish.

*Galium-like Aspalathus.* Fl. July, Aug. Clt. 1817. Shrub procumbent.

39 *A. RETROFLEXA* (Lin. spec. 1001.) leaves in fascicles, subulate, glabrous; branchlets filiform, retroflexed, or much spreading; flowers terminal, usually solitary. *h. G.* Calyx pubescent, 5-cleft; lobes subulate. Corolla glabrous; petals about equal. Legume 1-2-seeded, obliquely lanceolate, young ones rather villous, at length pubescent.

*Retroflected Aspalathus.* Shrub 2 to 4 feet.

40 *A. VULNERANS* (Thunb. fl. cap. 582.) leaves in fascicles, filiform, mucronate, spreading, glabrous; flowers lateral, drooping. *h. G.* Corolla yellow, smooth. Branches and calyxes pubescent.

*Healing Aspalathus.* Shrub 2 to 4 feet.

41 *A. PINEA* (Thunb. l. c.) leaves in fascicles, filiform, mucronate, erect, glabrous; flowers lateral, tufted. *h. G.* Shrub smooth. Calyx and vexillum hairy.

*Pine-like Aspalathus.* Shrub 2 to 4 feet.

42 *A. DIVARICATA* (Thunb. l. c.) leaves in fascicles, terete, acutely mucronate, glabrous; flowers in terminal racemes. *h. G.* Branches brown, divaricate. Branchlets pubescent. Flowers yellow, pubescent.

*Divaricate Aspalathus.* Shrub 2 to 4 feet.

43 *A. SUBULATA* (Thunb. l. c.) leaves in fascicles, rather fleshy, trigonal, mucronate, glabrous. *h. G.* Shrub branched above; branches tomentose. Flowers terminal, sessile, usually tern, glabrous, yellow. Calyx pubescent.

*Subulate-leaved Aspalathus.* Fl. July, Aug. Clt. 1789. Sh. 1 to 2 feet.

44 *A. LARICINA* (D. C. prod. 2. p. 141.) leaves in fascicles, terete, mucronate, glabrous; flowers lateral, woolly. *h. G.* *A. laricifolia*, Thunb. l. c. but not of Lam.—A pubescent shrub, with spreading leaves and yellow flowers.

*Larch-leaved Aspalathus.* Fl. July, Aug. Clt. 1823. Shrub 2 to 3 feet.

45 *A. GLOBOSA* (Andr. bot. rep. 510.) leaves in fascicles, linear, tomentose; flowers in terminal heads, villous; branches long, slender. *h. G.* Flowers fuscous.

*Globose-flowered Aspalathus.* Fl. June, July. Clt. 1801. Shrub 2 to 4 feet.

46 *A. JUNIPERINA* (Thunb. l. c.) leaves in fascicles, terete, mucronate, glabrous; flowers terminal, glabrous. *h. G.* Branches pubescent. Flowers solitary or twin.

*Juniper-like Aspalathus.* Shrub 2 to 4 feet.

47 *A. ABIETINA* (Thunb. l. c.) leaves in fascicles, filiform, and are as well as the calyxes ending in spiny mucrones, glabrous; flowers lateral and terminal, solitary, glabrous; branches striated. *h. G.* Flowers yellow. Segments of the calyx long, awl-shaped, pungent, about equal in length to the corolla.

*Fir-like Aspalathus.* Shrub 2 to 4 feet.

48 *A. TRIGONA* (Thunb. l. c.) leaves in fascicles, trigonal, mucronate, glabrous; flowers lateral. *h. G.* Branches pubescent. Flowers solitary, small, glabrous.

*Trigonal Aspalathus.* Shrub 2 to 4 feet.

49 *A. ARANEOSEA* (Lin. spec. 1001.) leaves in fascicles, filiform, acute, loose, hispid from spreading hairs; flowers capitate; calycine segments subulate, hispid from pili, about equal in length to the corolla, which is silky. *h. G.*—Pluk. alm. t. 414. f. 4.—Seb. thes. 1. t. 23. f. 6. Flowers yellow, but white according to Sims, in bot. mag. 829. and yellow when dry. *A. pilosa*, Sieb. pl. exsicc. cap. no. 48. Anthyllis quinquefolia, Lin. fil. suppl. 325. ex herb. Burm. Stamens truly monadelphous, with the sheath cleft above.

*Cobwebbed Aspalathus.* Fl. Ju. Jul. Clt. 1795. Sh. 2 to 4 ft.

50 *A. COMOSA* (Thunb. fl. cap. 577.) leaves in fascicles, filiform, pilose; flowers lateral, tufted. *h. G.* Corolla yellow, with the vexillum tomentose outside. Branches villous.

*Tufted Aspalathus.* Shrub 2 to 4 feet.

51 *A. CEPHALOTES* (Thunb. l. c.) leaves in fascicles, filiform, bluntish, rather villous; heads terminal, hairy. *h. G.* Calycine segments linear-subulate, hairy. Flowers larger than in any other species of the genus; the vexillum is oval and nearly an inch long, silky on the outside. Branches hairy. Leaves 2-3 lines long.

*Headed Aspalathus.* Shrub 2 to 4 feet.

52 *A. TRIQUETRA* (Thunb. fl. cap. 578.) leaves in fascicles, trigonal, obtuse, pilose, wrinkled; heads terminal. *h. G.* Branches rather umbellate. Corolla yellow, glabrous. Leaves hardly a line long.

*Triquetrous Aspalathus.* Shrub 2 to 4 feet.

53 *A. CANESCENS* (Lin. mant. 262.) leaves in fascicles, clothed with silky tomentum, subulate, mucronulate; flowers lateral, pubescent. *h. G.* Tube of calyx ventricose, rather hairy, acutely 5-toothed. Petals equal in length. Vexillum clothed with silky tomentum outside. Ovary villous.

*Canescent Aspalathus.* Shrub 2 to 4 feet.

54 *A. VERMICULATA* (Lam. dict. 1. p. 288.) leaves in fascicles, small, obtuse, glabrous; flowers lateral, racemose, rather hairy. *h. G.* Leaves hardly half a line in length.

*Vermiculate-leaved Aspalathus.* Shrub 2 to 4 feet.

55 *A. RUBENS* (Thunb. fl. cap. 576.) leaves in fascicles, subulate, silky; flowers solitary, silky. *h. G.* Branches reddish-brown; branchlets silky, spreading much. Leaves hardly half a line long.

*Reddish-branched Aspalathus.* Shrub 2 to 4 feet.

56 *A. CILIARIS* (Lin. mant. 262.) leaves in fascicles or trifoliate, trigonal, acute, ciliated; heads terminal; calyx equal in length to the corolla. *h. G.* Sims, bot. mag. 2293. Flowers yellow. Corolla tomentose. This and the five following species are perhaps more correctly referable to the following division, with the trifoliate leaves.

*Ciliary-leaved Aspalathus.* Fl. July, Aug. Clt. 1799. Sh. 2 to 3 feet.

57 *A. QUINQUEFOLIA* (Lin. mant. 6. p. 92.) leaves in fascicles, trifoliate, linear-oblong, flat, rather hairy; heads of flowers hairy; corolla glabrous. *h. G.*—Pluk. alm. t. 278. f. 4. ex Thunb. fl. cap. 575. The heads of flowers in D. C. specimen are large and round.

*Five-leaved Aspalathus.* Fl. Jul. Aug. Clt. 1816. Sh. 2 to 3 ft.

58 *A. CANADENSIS* (Ait. hort. kew. ed. 2. vol. 4. p. 264.) leaves in fascicles, trifoliate, filiform, silky; flowers sub-lateral with the vexillum naked. *h. G.*

*Whitened Aspalathus.* Fl. Ju. Jul. Clt. 1774. Sh. 2 to 4 ft.

59 *A. HETEROPHYLLA* (Lin. fil. suppl. 321. Thunb. fl. cap. 575.) leaves in fascicles or trifoliate, linear, pilose; flowers spicate; calyx and corolla villous. *h. G.* Leaves of branches in fascicles, of branchlets trifoliate. Vexillum tomentose on the back. Flowers yellow. Leaves and calycine segments acuminate, rather spinose.

*Variable-leaved Aspalathus.* Shrub 2 to 4 feet.

60 *A. ARGENTEA* (Lin. spec. 1001.) leaves in fascicles, trifoliate, ovate, clothed on both surfaces with appressed silky pubescence; heads of flowers tomentose; stem dichotomous. *h. G.* *A. sericea*, Berg. cap. 212. Flowers in spicate heads. Calyx and corolla clothed with rufous, velvety, soft down.

*Silvery Aspalathus.* Fl. Jul. Aug. Clt. 1759. Sh. 2 feet.

\* \* *Leaves trifoliate, hardly in fascicles.*

61 *A. VIRGATA* (Thunb. fl. cap. 576.) leaves in fascicles, and trifoliate, ovate, silky; heads of flowers hairy; stem twiggy. *h. G.* Branches tomentose. Spikes elongated, hairy, ex Thunb.

*Twiggy Aspalathus.* Shrub 2 to 4 feet.

62 *A. TRIDENTATA* (Thunb. l. c.) leaves trifoliate, lanceolate, villous; prickles trifid. *h. G.* Leaves glabrous. Flowers capitate, ex Lin. spec. 1002. Heads terminal, globose, hairy, ex Thunb. l. c.

*Tridentate-spined Aspalathus.* Shrub 2 to 4 feet.

63 *A. LOTOIDES* (Thunb. fl. cap. 575.) leaves trifoliate, lanceolate, acute, villous; buds unarmed; heads terminal; branchlets and calyxes hairy; keel and vexillum silky. *h. G.* Lobes of calyx acuminate. Petals about equal in length. Flowers yellow. *Crotalaria lunaris*, Burm. cap. prod. 21.?

*Lotus-like Aspalathus.* Shrub 1 to 2 feet.

64 *A. PILOSA* (Lin. mant. 263.) leaves trifoliate, linear, clothed with adpressed silky villi; heads terminal, stalked, very pilose; petals all pubescent. *h. G.* *A. villosa*, Thunb. prod. 125. fl. cap. 574. Branches with a few leaves at the apex.

*Pilose Aspalathus.* Shrub 2 to 4 feet.

65 *A. SERICEA* (Thunb. prod. 125. fl. 574. but not of Berg.) leaves trifoliate, oblong, acute, silky; racemes oblong, terminal; flowers silky-hairy. *h. G.* Perhaps the species in Lin. fil. suppl. 321. is the same as that of Thunb.

*Silky Aspalathus.* Fl. July, Aug. Clt. 1816. Sh. 2 to 4 ft.

66 *A. CINEREA* (Thunb. prod. 125. fl. 575.) leaves trifoliate, oblong, flat, acute, tomentose; heads terminal. *h. G.* Calyx and corolla hairy on the outside.

*Grey Aspalathus.* Shrub 2 to 4 feet.

67 *A. LINEARIFOLIA* (D. C. prod. 2. p. 142.) leaves trifoliate, sessile, ending in callous mucrones, equal, covered with very fine pubescence; heads terminal; bractees ovate-lanceolate, and

are as well as the branches hairy. *h. G.* *Aster linearifolius*, Burm. cap. 27. *Anthyllis linifolia*, Lin. mant. 265. Heads of flowers similar to the anthodium of an *Aster*.

*Linear-leaved Aspalathus.* Shrub 2 to 4 feet.

68 *A. ANTHYLLOIDES* (Lin. spec. 1002.) leaves trifoliate, ovate, rather pubescent; heads terminal. *h. G.* *Anthyllis aspalathoides*, Lin. amœn. 4. p. 326. *A. anthylloides*, Thunb. fl. cap. 574. according to which the flowers are globose. Corolla yellow, with the vexillum rather pubescent.

*Anthyllis-like Aspalathus.* Shrub 2 to 4 feet.

69 *A. LAXATA* (Lin. mant. 263.) leaves trifoliate, linear, villous; flowers terminal, 5 in a fascicle; calyxes woolly; stems prostrate, terete. *h. G.* Corolla smooth, yellow. Bracteoles wanting.

*Lax Aspalathus.* Shrub decumbent.

70 *A. AGARDHIANA* (D. C. prod. 2. p. 143.) leaves trifoliate, linear-subulate, acute, clothed with adpressed silky down; branches pubescent; racemes terminal, few-flowered; calyx and corolla villous. *h. G.* Calyx not attenuated at the base, but obtuse, and with 5 short teeth. Corolla a little longer than the calyx.

*Agardh's Aspalathus.* Shrub 2 to 4 feet.

71 *A. CALLOSA* (Lin. spec. 1002.) leaves trifoliate, erect, equal, glabrous, with the cicatrices round and callous; spikes ovate, terminal; flowers glabrous. *h. G.* Sims, bot. mag. 2329.—Pluk. alm. t. 345. f. 4. Flowers yellow. Bracteoles 3, subulate.

*Callous Aspalathus.* Fl. July, Aug. Clt. 1812. Sh. 2 to 4 ft.

72 *A. AMBIGUA* (D. C. prod. 2. p. 143.) leaves trifoliate, ovate, obtuse; branches and branchlets spinescent. *h. G.* *A. acuminata*, Thunb. fl. cap. 578. but not of Lam. A smooth shrub. Leaflets 3, concave, rising from the nodi.

*Ambiguous Aspalathus.* Shrub 2 to 4 feet.

73 *A. RUGOSA* (Thunb. prod. 125. fl. cap. 574.) leaves trifoliate, elliptic, rugose, glabrous; umbels terminal. *h. G.* Flowers whitish. Calyx and corolla clothed with grey pubescence.

*Wrinkled-leaved Aspalathus.* Shrub 2 to 4 feet.

74 *A. FUSCA* (Thunb. l. c.) leaves trifoliate, lanceolate, acute, spreading, crowded, and are as well as the branches glabrous; flowers terminal; calycine segments subulate, rather spiny, and are as well as the corolla smooth. *h. G.* Ovary linear, glabrous. Style incurved. Wings and keel equal. Cicatrices roundish, callous. This species is usually to be seen in herbaria under the name of *A. callosa*, but it is not the *A. callosa* figured in Sims, bot. mag. 2329.

*Brown Aspalathus.* Shrub 2 to 4 feet.

75 *A. MUCRONATA* (Lin. fil. suppl. 320. Thunb. prod. 125. fl. cap. 573.) leaves trifoliate, somewhat petiolate; leaflets lanceolate, obtuse; branches spinescent; racemes terminal; flowers glabrous. *h. G.* A smooth shrub, with yellow flowers.

*Mucronate-leaved Aspalathus.* Fl. June, July. Clt. 1796. Shrub 2 to 4 feet.

76 *A. CYTISOIDES* (Lam. dict. 1. p. 292.) leaves trifoliate, lanceolate, mucronate, pubescent on both surfaces; stem and branches panicled; flowers terminal, fascicled, villous. *h. G.* Leaves 3-4 lines long.

*Cytisus-like Aspalathus.* Shrub 1 to 2 feet.

77 *A. MICROPHYLLA* (D. C. prod. 2. p. 143.) leaves small, trifoliate, trigonal, mucronate, glabrous; branches somewhat pubescent; flowers scattered, solitary; segments of the calyx glabrous, subulate, rather pungent; legume obliquely lanceolate, pubescent. *h. G.* Stamens with a permanent tube, about equal in length to the legume.

*Small-leaved Aspalathus.* Shrub 2 to 4 feet.

78 *A. ORIENTALIS* (Lin. mant. 263.) leaves trifoliate, lanceolate, pubescent; flowers 5 in a fascicle; calyxes pubescent;

stems erect, angular. *h. G.* Native of the Levant. Corolla yellow, about the size of those of *Laburnum*. Stamens connate. Perhaps a species of *Crotalaria*.

*Oriental Aspalathus.* Shrub 2 to 4 feet.

§ 2. *Flowers distinctly pedicellate.*

\* *Leaves trifoliate.*

79 *A. TENUIFOLIA* (D. C. prod. 2. p. 143.) leaves trifoliate or simple; leaflets linear, very thin, and smoothish, straight, acutish; branchlets terete, rather pubescent at the apex; flowers loosely racemose or almost solitary, pedicellate; keel shorter than the vexillum. *h. G.* Leaves an inch long. Calyx smooth, 5-toothed, bractless, or pedicellate above the bracteoles. Stamens all connate, with the sheath cleft in front. Legume glabrous, linear-lanceolate.

*Thin-leaved Aspalathus.* Shrub 2 to 4 feet.

80 *A. OBTUSATA* (Thunb. prod. 125. fl. cap. 574.) leaves on very short stalks or sessile, trifoliate; leaflets obovate, obtuse, young ones clothed with adpressed villi, but at length becoming smooth; flowers axillary, solitary, pedicellate. *h. G.* Calyx bilabiate, bractless. Vexillum and carina equal in length, but the wings are oblong and longer. Stamens monadelphous. Legume compressed, linear, clothed with adpressed pubescence, mucronate by the style.

*Obtuse-leaved Aspalathus.* Shrub 2 to 4 feet.

\*\* *Leaves in fascicles.*

81 *A. PEDUNCULATA* (Lher. sert. angl. t. 26.) leaves in fascicles, filiform, glabrous, mucronulate; pedicels axillary, 1-flowered, longer than the leaves, almost bractless at the apex. *h. G.* Curt. bot. mag. 344. Legume linear, clothed with adpressed pubescence, shorter than the pedicel. Bracteoles small at the apex of the pedicel. *A. pedunculata*, Houtt. pl. syst. is probably different from the present plant.

*Pedunculated Aspalathus.* Fl. Jul. Aug. Clt. 1775. Sh. 6 ft.

82 *A. SUFFRUTICOSA* (D. C. prod. 2. p. 144.) leaves 3-5, linear, subulate, acute, rising from the same dot, pubescent from a few strigæ; peduncles axillary, longer than the leaves; flowers 2-3, borne in small racemes. *h. G.* *Lotus suffruticosus*, Burm. cap. prod. 22.

*Suffruticose Aspalathus.* Shrub 2 to 4 feet.

83 *A. BRACTEATA* (Thunb. fl. cap. 581.) leaves in fascicles, filiform, mucronulate, glabrous; pedicels axillary, length of leaves, bearing 3 bracteoles similar to leaves. *h. G.* Allied to the preceding, but the lobes of the calyx are longer, and the legumes are broader and on longer pedicels.

*Bracteate Aspalathus.* Shrub 2 to 4 feet.

84 *A. NIVEA* (Thunb. fl. cap. 576.) leaves in fascicles, linear, obtuse, silvery, loose; peduncles lateral, filiform, 1-flowered, bracteate; calyx and corolla silky. *h. G.* Native of the Cape of Good Hope. Flowers white.

*White Aspalathus.* Shrub 2 to 4 feet.

\*\*\* *Leaves stalked, pinnate.*

85 *A. ? PINNATA* (Lin. amœn. 6. p. 92.) leaves pinnate, with 5 obcordate leaflets, which are rather pilose and tomentose beneath; peduncles longer than the leaves; spike roundish; corolla tomentose on the outside. *h. G.* Perhaps a species of *Indigofera* allied to *I. coriacea*.

*Pinnate-leaved Aspalathus.* Shrub.

86 *A. ? ARBOREA* (Lour. coch. p. 431.) leaves pinnate; leaflets 5, ovate, smooth; racemes terminal. *h. G.* Native of Cochinchina, in woods. Flowers small, white. Stamens all connected, but perhaps with a dorsal fissure. Legume oblong-ovate, compressed, mutic, usually 2-seeded.

*Arboreous Aspalathus.* Tree.

*Cult.* All the species are rather ornamental when in flower. A mixture of loam, peat, and sand is the soil best adapted for them, and young cuttings of all will strike in sand, under bell-glasses, but the glasses must be wiped occasionally or the cuttings are very liable to damp off.

**LVI. U'LEX** (said to be derived from *ac*, a point, in Celtic, in reference to the prickly branches). Lin. gen. no. 881. Lam. ill. t. 621. D. C. prod. 2. p. 144.

**LIN. SYST.** *Monadelphica, Decandria*. Calyx bibracteate, bipartite, one of the lips 3-toothed, the other bidentate. Stamens all connected. Legume oval-oblong, turgid, many-ovulate, but few-seeded, hardly longer than the calyx.—European much-branched shrubs, with the branchlets and leaves spinescent. Flowers solitary, yellow. Legumes villous.

1 *U. EUROPEUS* (Lin. spec. 1045. var. *a.*) erect; leaves lanceolate-linear, and with the branchlets rather villous; bracteas ovate, loose; calyx pubescent, with the teeth nearly obsolete and converging. *h. H.* Native of commons, heaths, and waste places throughout Europe. Smith, engl. bot. t. 742. *U. grandiflorus*, Pourr. *U. vernalis*, Thore.

Provence appears to be the boundary, south, of furze; northwards it does not grow in Sweden or Russia. Linnæus lamented that he could hardly preserve it alive in a greenhouse. Many parts of Germany are perfectly destitute of this plant. The furze is either called whins or gorse in England. In France it is called *ajonc* or *jofe-marin*, contracted to *jomarin*.

Some years ago the seeds of furze were sown for hedges, and if the soil was light it soon became strong enough for a fence against cattle, but in a few years these hedges become naked. Duhamel speaks much in favour of furze as fodder for cattle. It has also been used for fodder in Scotland. Team horses may be supported by this shrub, if the tops are cut young and bruised in a mill to break the thorns. Goats, kine, sheep, and horses feed upon the tender tops. In some parts of Britain it is cultivated for fuel, where peat or coals are dear.

*Var. β, flore-pleno*; flowers double. This is a very showy plant when in flower, being profusely clothed with elegant double yellow flowers. It is well adapted for ornamenting shrubberies.

*European or Common Furze or Whin.* Fl. Feb. Jan. Britain. Shrub 3 to 6 feet.

2 *U. NANUS* (Smith, fl. brit. 757. engl. bot. t. 743.) decumbent; leaves linear, and are as well as the branches smooth; bracteas minute, adpressed; calyx glabrous, with spreading, lanceolate teeth. *h. H.* Native of England on heaths, and in the western parts of France. *U. minor*, Roth. cat. 1. p. 83. *U. Europeus β*, Lin. spec. 1045. *U. autumnalis*, Thore.

*Dwarf Furze.* Fl. Aug. Dec. Britain. Shrub decumbent.

3 *U. PROVINCIALIS* (Lois. not. 105. t. 6. f. 2.) erect; leaves lanceolate, linear, and are as well as the branches glabrous; bracteas minute, adpressed; calyx rather pubescent, with lanceolate distant teeth, hardly exceeding the corolla. *h. H.* Native of Provence, Andegavany, and Mauritania. D. C. fl. franc. suppl. no. 3799. The characters of this species, as well as the size, are intermediate between the two preceding.

*Provincial Furze.* Fl. Aug. Dec. Clt. 1820. Sh. 2 to 4 ft.

4 *U. HIBERNICA* (G. Don, in Loud. hort. brit. p. 280.) erect; leaves linear, ciliated; spines branched, pubescent as well as the branches, both furrowed. *h. H.* Native of Ireland. *H. stricta*, Hortul. This is a very upright plant, the spines more mild than in the other species. It is an excellent plant for forming hedges.

*Irish Furze.* Fl. July, Aug. Ireland. Shrub 6 to 10 feet.

*Cult.* This, although a very elegant genus of plants, is seldom cultivated unless for hedges, except the double variety of *U.*

*Europeus*, which is a very elegant plant when in bloom, and is increased by young cuttings, planted under a hand-glass. The rest are usually increased by seeds.

**LVII. STAURACANTHUS** (from *σταυρος*, *stauros*, a cross, and *ακανθα*, *akantha*, a spine; in reference to the spines each having 2 small spines at the side, giving the appearance of a cross). Link. in Schrad. neue journ. 2. p. 1. and 52.

**LIN. SYST.** *Monadelphica, Decandria*. Calyx bipartite; upper lip bifid, lower one tridentate. Stamens all connected. Legume compressed, many-seeded, exserted, a long way beyond the calyx. A leafless shrub, with the habit of *Ulex*, and from it not probably distinct.

1 *S. APHYLLUS* (Link. l. c.). *h. H.* Native of Portugal in sandy pine woods. *Ulex genistoides*, Brot. fl. lus. 2. p. 78. Bracteoles small, under the calyx. Branches divaricate. Legume quite smooth.

*Leafless Stauracanthus.* Fl. May, June. Clt. 1823. Shrub 2 to 3 feet.

*Cult.* This is a very elegant plant when in flower, and well fitted for the front of shrubberies. It may be either increased by young cuttings planted in sand under a hand-glass, or by seeds.

**LVIII. SPARTIUM** (from *σπαρτον*, *sparton*, cordage; use of plant in early ages). D. C. leg. mem. v. prod. 2. p. 145.—*Spartianthus*, Link. enum. 2. p. 223.—*Genista*, spec. Lam. Mœnch.—*Spartium*, spec. Lin.

**LIN. SYST.** *Monadelphica, Decandria*. Calyx membranous, spathaceous, cleft above, 5-toothed at the apex, somewhat bilabiate. Corolla with a roundish, complicated vexillum, and an acuminate keel, and the petals a little agglutinated, but partable. Stamens monadelphous. Legume compressed, many-seeded, glandless.—A smooth shrub, with twiggly terete branches, and a few lanceolate leaves. Flowers large, distant, yellow, disposed in terminal racemes.

1 *S. JUNCÆUM* (Lin. spec. 995.). *h. H.* Native of the South of Europe, in rugged dry places. Duham. arbr. ed. nov. 2. t. 22. Sims, bot. mag. 85. *Genista juncæa*, Lam. G. odorata, Mœnch. *Spartianthus juncæus*, Link. Flowers sweet-scented; sometimes the plant is to be found with double flowers in gardens. Bees are very fond of the flowers, and the same qualities which are attributed to the common broom belong also to this, although in an inferior degree. In Languedoc they make thread of it, and it is there used as a green food for sheep.

*Rush or Spanish Broom.* Fl. July, Sept. Clt. 1548. Shrub 6 to 10 feet.

*Cult.* Spanish Broom is a very ornamental plant when in bloom, and therefore well fitted for shrubberies. It is usually increased by seeds, which ripen in abundance; young cuttings will root if planted under a hand-glass.

**LIX. GENISTA** (from *gen*, Celtic, signifying a small bush). Lam. dict. 2. p. 616. ill. t. 619. D. C. leg. mem. VI. prod. 2. p. 145.). *Genista* et *Spartium*, spec. Lin.

**LIN. SYST.** *Monadelphica, Decandria*. Calyx bilabiate, upper lip bipartite, lower one tridentate, or 5-lobed, the 3 lower lobes nearly joined to the apex. Vexillum oblong-oval (f. 29. a.). Carina oblong, straight (f. 29. b.), not always containing the genitals. Stamens monadelphous (f. 29. c.). Legume compressed, rarely rather turgid (f. 29. d.), many-seeded, rarely few-seeded, glandless. Shrubs with yellow flowers.

\* *Unarmed.* Leaves all, or for the most part, trifoliate.

1 *G. PARVIFLORA* (D. C. prod. 2. p. 145.) leaves trifoliate, on very short petioles; leaflets linear-lanceolate, glabrous, usually

deciduous; racemes terminal, elongated; legumes compressed, 1-3-seeded, rather pubescent from small adpressed down, erectly spreading. *h. H.* Native of the Levant, near the Gulph of Mundania. *Spártium parviflorum*, Vent. hort. cels. t. 87. Flowers yellow.

*Small-flowered Genista.* Fl. May, Aug. Clt. 1817. Shrub 2 to 6 feet.

2 *G. CLAVATA* (Poir. suppl. 2. p. 717.) leaves trifoliate; leaflets linear-lanceolate, silky beneath; flowers terminal, capitate; legume compressed, 1-2-seeded, attenuated at the base. *h. H.* Native of Mogodor. *Spártium sericeum*, Vent. hort. cels. t. 17. but not of Ait. Flowers yellow, larger than those of the preceding species. Perhaps a species of *Cytisus*.

*Clavate-calyxed Genista.* Fl. May, Aug. Clt. 1812. Sh. 2 to 4 feet.

3 *G. CANARIENSIS* (Lin. spec. 997.) lower leaves on short petioles, upper ones sessile, trifoliate, and are as well as the branches and calyxes clothed with pubescence; leaflets obovate-oblong; branches angular; heads of flowers terminal; legume clothed with white villi. *h. F.* Native of the Canary Islands and Spain. Ker. bot. reg. 217.—Comm. hort. amst. 2. t. 52.—Pluk. t. 277. f. 6. *Spártium albicans*, Cav. ann. 1801. p. 64. *Cytisus paniculatus*, Lois. in Duham. ed. nov. et *Cytisus ramosissimus*, Poir. suppl. 2. p. 440. does not appear to differ from this species.

*Canary Island Genista.* Fl. April, Sept. Clt. 1656. Shrub 6 to 10 feet.

4 *G. MOLLIS* (D. C. prod. 2. p. 145.) leaves on short petioles, trifoliate, and are as well as the calyxes, branches, and legumes clothed with soft villi; flowers axillary, crowded. *h. H.* Native of Mogodor. *Spártium molle*, Cav. ann. 1801. p. 57.

*Soft Genista.* Shrub.

5 *G. CANDICANS* (Lin. amœn. 4. p. 284.) leaves stalked, trifoliate; leaflets obovate, clothed with adpressed down; branches angular; heads terminal, few-flowered; legume hairy. *h. F.* Native of Mogodor, Italy, and the Levant. Wats. dend. brit. 80. *Cytisus candicans*, Lin. spec. 740. *Cyt. pubescens*, Mœnch. Allied to *G. Canariensis*, but the leaves are larger and the flowers scentless.

*Whitened Genista.* Fl. April, July. Clt. 1735. Sh. 4 to 5 ft.

6 *G. PATENS* (D. C. prod. 2. p. 145.) branches striated, twiggy, glabrous; leaves stalked, trifoliate; leaflets obovate, pubescent beneath; flowers in fours, pedicellate, nearly terminal; legume glabrous, 3-6-seeded. *h. H.* Native of Spain, on mountains near Albayda. *Spártium patens*, Cav. icon. 2. p. 58. t. 176. exclusive of the synonym. It differs from *Cytisus patens* in the upper lip of the calyx being acutely bipartite, lower lip of 3 bristles, not with the lips nearly equal and entire.

*Spreading Genista.* Fl. April, July. Clt. ? Shrub 4 to 8 feet.

7 *G. LINIFOLIA* (Lin. spec. 405.) leaves sessile, trifoliate; leaflets linear, silky beneath, at length with the margins revolute; racemes terminal, crowded; legumes hairy; branches terete, furrowed. *h. H.* Native of the south of France, and of Spain, Canary Islands, north of Africa, and the Levant. Sims, bot. mag. 442. *Spártium linifolium*, Desf. atl. 2. p. 134. t. 181. *Cytisus linifolius*, Lant. Genistoides linifolia, Mœnch.

*Flax-leaved Genista.* Fl. Jan. Ju. Clt. 1739. Sh. 3 to 6 ft.

8 *G. BIFLORA* (D. C. prod. 2. p. 146.) leaves trifoliate, on

short petioles; leaflets glabrous, linear, rather cuneiform; flowers terminal, usually twin; legume glabrous; branches angular. *h. F.* Native of the north of Africa, near Tlemsen. *Spártium biflorum*, Desf. fl. atl. 2. p. 133. t. 179.

*Two-flowered Genista.* Shrub 1 to 3 feet.

9 *G. TRIQUETRA* (Ait. hort. kew. 3. p. 14. Lher. stirp. 183.) leaves trifoliate, the upper ones simple; leaflets ovate-lanceolate, villous; racemes terminal, short; branches triquetrous, decumbent, young ones villous. *h. H.* Native of Corsica. Curt. bot. mag. 314. *G. triquetra*, Lam. ?

*Triquetrous-stemmed Genista.* Fl. May, June. Clt. 1770. Shrub 2 to 4 feet.

10 *G. BRACTEOLATA* (Link. enum 2. p. 224.) leaves trifoliate; leaflets obovate; racemes short; branches striated, and are as well as the leaves pubescent. *h. H.* The native country of this plant as well as the legume are unknown. Calyx hairy.

*Bracteolate Genista.* Fl. Mar. May. Clt. 1823. Sh. 2 to 4 ft.

11 *G. MICROPHYLLA* (D. C. prod. 2. p. 146.) leaves trifoliate, on short stalks; leaflets oblong-linear, and are as well as the terete branches covered with hoary-silky pubescence; flowers few, almost terminal. *h. F.* Native of the Grand Canary Island, on mountains about Ayacata. *Spártium microphyllum*, Cav. ann. 1801. p. 63. Legume unknown.

*Small-leaved Genista.* Shrub 1 to 3 feet.

12 *G. SESSILIFOLIA* (D. C. leg. mem. VI.) leaflets 3, rising from the same dot on the branches, linear-subulate, silky, sometimes solitary; spike terminal, elongated, loose-flowered; corolla silky; legume ovate, acuminate, pubescent, 1-2-seeded. *h. H.* Native of Galatia, on hills. Flowers nearly like those of *G. pilosa*, but the vexillum is shorter than the carina. Habit of *G. virgata*, but the leaves are trifoliate.

*Sessile-leaved Genista.* Shrub 1 to 2 feet.

13 *G. UMBELLATA* (Poir. suppl. 2. p. 715.) leaves trifoliate, on short stalks; leaflets linear-lanceolate, rather silky; flowers in terminal, aggregate heads; calyx clothed with silky hairs; corolla and legume silky. *h. H.* Native of Barbary, on arid hills near Arzeau. *Spártium umbellatum*, Desf. atl. 2. p. 133. t. 180. Lher. stirp. 183. Branches glabrous. *Spártium umbellatum*, Lois. fl. gall. which is said to be from Corsica. The plant which is a native of Barbary is perhaps distinct from that from Corsica.

*Var. β, capitatum* (D. C. prod. 2. p. 146.) branches and leaves clothed with silky villi. *h. H.* Native of Mogodor. *Spártium capitatum*, Cav. ann. 1801. p. 63.

*Umbellate-flowered Genista.* Fl. April, June. Clt. 1799. Shrub 1 to 2 feet.

14 *G. RADIIATA* (Scop. carn. no. 871.) leaves trifoliate, nearly sessile, opposite; leaflets linear, rather silky; branches angular, crowded, glabrous; heads 2-4-flowered, terminal; corolla and legumes silky. *h. H.* Native of Italy, Carniola, and Vallais. *Spártium radiatum*, Lin. spec. 996. Mill. icon. t. 249. f. 1. Sims, bot. mag. 2260. *G. Ilvensis*, Dalech. Legume oval, short, compressed, 2-seeded, mucronate by the style. Old branches rather spinescent.

*Rayed Genista.* Fl. June, July. Clt. 1758. Sh. 1 to 3 ft.

15 *G. CASPARIANA* (Guss. ex Schlecht. Linnaea 4. p. 38. under *Spártium*) a beautiful shrub with slender branches, the lower leaves ternate and the upper ones simple. *h. H.* Like *G. radiatum*.

*Casparrine Genista.* Shrub.

\* \* \* *Spinose.* Leaves all or some of them trifoliate.

16 *G. HORRIDA* (D. C. fl. fr. 4. p. 500.) leaves trifoliate, stalked, opposite; leaflets linear, complicated, rather silky; branches angular, spiny, crowded, opposite; flowers almost terminal, few; calyx pubescent. *h. H.* Native of the Pyrenees

and Arragon. *Spártium hórridum*, Vahl. symb. 1. p. 51. exclusive of the synonym. *G. erinacea*, Gilib. bot. prat. 2. p. 239. with a figure.

*Horrid Genista*. Fl. May, July. Clt. 1821. Sh. 2 to 4 ft.

17 *G. LUSITÁNICA* (Lin. spec. 999. exclusive of the synonyms of Clus. and J. Bauh.) leaves trifoliate, on short stalks, opposite; leaflets linear, complicated, rather silky; branches spiny, terete, at length striated; flowers terminal, few; calyx very hairy. *h. H.* Native of Portugal. Lam. dict. 2. p. 622. exclusive of the synonymes. Andr. bot. rep. 419.

*Portugal Genista*. Fl. March, May. Clt. 1771. Sh. 2 to 4 ft.

18 *G. ACANTHÓCLADA* (D. C. leg. mem. vi.) leaves trifoliate, nearly sessile; leaflets linear, complicated, rather silky; branches spinose, stiff, terete, at length striated; flowers almost opposite, disposed along the branches in a kind of interrupted spike; calyx pubescent. *h. H.* Native of the Levant, in exposed places in the island of Melos. D'Urv. enum. p. 85. Branches usually opposite, floriferous ones also spiny. Flowers silky. Ovary silky. Vexillum replicate laterally.

*Spiny-branched Genista*. Shrub 2 to 3 feet.

19 *G. EPHEDROIDES* (D. C. leg. mem. vi. t. 36.) leaves few, sessile, trifoliate, and simple; leaflets linear, smoothish; branches spinescent, stiff, terete, at length striated; flowers alternate, spicate; calyx rather pubescent. *h. H.* Native of Sardinia, on the sea shore. A smooth shrub, like *Ephedra distachya*. Corolla rather silky. Vexillum shorter than the keel. Legume compressed, ovate, acute, 1-seeded, clothed with silky-pubescent.

*Ephedra-like Genista*. Shrub 2 to 3 feet.

20 *G. LOBELII* (D. C. fl. fr. 4. p. 499.) leaves few, lower ones sessile, trifoliate, the rest nearly all sessile, scattered, linear-oblong, rather silky; branches crowded, spiny, striated, and rather tuberculated; flowers few, solitary, pedicellate, disposed along the branches in a kind of raceme; calyx pubescent. *h. H.* Native of Corsica and Provence, in arid places. A dwarf subshrub. Legumes 2-3-seeded, hardly pubescent.—Lob. adv. p. 409.—Chabr. sciag. p. 86. f. 1. *Spártium erinaceoides*, Lois. fl. gall. p. 441.

*Lobel's Genista*. Shrub 1 to 2 feet.

21 *G. PARVIFOLIA*; hairy; leaves alternate, trifoliate, upper ones simple; leaflets oblong-linear, acute, complicated, smooth above, lower ones obovate; branches crowded, spiny, alternate, younger ones furrowed; flowers racemose. *h. H.* Native of Sardinia. *G. microphylla*, Moris, elench. p. 13. Legume 4-5-seeded, linear, villous.

*Small-leaved Genista*. Fl. June, July. Shrub 1 to 2 feet.

22 *G. SALZMANNI* (D. C. leg. mem. vi.) leaves sessile, trifoliate or simple, oblong, obtuse, clothed with adpressed pubescence; branches at length striated, loose, spiny; flowers somewhat racemose along the branches, twin, pedicellate, clothed with adpressed silky-pubescent; the 3 lower lobes of the calyx about equal in length to the upper ones, and narrower. *h. H.* Native of Corsica, on rocks near Corfe. *G. umbellata*, Salzm.

*Salzmann's Genista*. Shrub 2 to 3 feet.

23 *G. ASPALATHOIDES* (Lam. dict. 2. p. 620.) leaves few, lower ones sessile, trifoliate, the rest nearly all simple, scattered, linear-oblong, rather silky; branches loose, somewhat recurved, spiny, terete, at length striated; flowers twin, subracemose along the branches, pedicellate, clothed with adpressed silky pubescence; calyx trifid, the 3 lower lobes concrete into a tridentate lip. *h. H.* Native of Barbary, on rocks near Bonne. *Spártium aspalathoides*, Desf. atl. 2. p. 136.

*Aspalathus-like Genista*. Shrub 2 to 3 feet.

24 *G. FEROX* (Poir. suppl. 2. p. 708.) leaves trifoliate, or for the most part simple, oblong, smoothish; branches striated, spinescent at the apex; flowers racemose; calyx rather pubes-

cent; corolla smooth. *h. H.* Native of Barbary, on mountains near Lacalle. *Spártium heterophyllum*, Lher. stirp. 183. *Spártium ferox*, Desf. atl. 2. p. 136. t. 182. Legume linear, 8-10-seeded. Seeds rather torulose, clothed with adpressed pubescence.

*Fierce Genista*. Fl. Ju. July. Clt. 1800. Sh. 3 to 4 feet.

25 *G. CUPANI* (Guss. cat. 1821. p. 77.) leaves sessile, trifoliate, hairy; leaflets linear-lanceolate; branches spiny; racemes terminal, few-flowered; calyx rather hairy; corolla smooth; legume 1-seeded, rather pilose. *h. H.* Native of the Nebrodes, on arid mountains. *Acacia triphylla*, &c. Cup. panph. sic. ed. 1. vol. 2. t. 233.

*Cupani's Genista*. Shrub 2 to 3 feet.

26 *G. TRIACANTHOS* (Brot. phyt. 130. t. 54. fl. lus. 2. p. 89.) leaves sessile, trifoliate, and simple, glabrous; leaflets linear-lanceolate; branches spiny; spines branched; racemes terminal, few-flowered; calyx, corolla, and 1-seeded legume glabrous. *h. H.* Native of Portugal, on mountains and in woods about Coimbra, and elsewhere in Beira. *G. rostrata*, Poir. suppl. 2. p. 719. Spines simple, trifid or branched.

*Var. β, interrupta* (D. C. prod. 2. p. 147.) leaflets linear; branches usually simple and shorter. *h. H.* Native about Tangiers. *Spártium interruptum*, Cav. anal. 1801. vol. 4. p. 58.

*Three-spined Genista*. Fl. May, July. Shrub 2 to 3 feet.

27 *G. INFESTA*; branches striated, spiny; leaves ternate; leaflets obovate, silky beneath; legumes compressed, and arc, as well as the bracteas, covered with adpressed silky pili. *h. H.* Native of Calabria, in bushy places by the sea side. *Spártium infestum*, Gussone, pl. rar. p. 290.

*Troublesome Genista*. Fl. May. Shrub 2 to 3 feet.

28 *G. CUSPIDATA* (D. C. prod. 2. p. 147.) leaves trifoliate and simple; leaflets ovate, oval or lanceolate; branches spiny, terete, divaricate, young ones rather leafy; flowers alternate. *h. G.* Native of the Cape of Good Hope. *Spártium cuspidatum*, Burch. cat. no. 1696. voy. 1. p. 348. A much-branched stiff shrub. Legume oblong, membranous, few-seeded.

*Cuspidate Genista*. Shrub 2 to 3 feet.

\* \* \* *Spinose. Leaves all simple.*

29 *G. HIRSUATA* (Vahl. symb. 1. p. 51.) leaves lanceolate, and are, as well as the branches, hairy; spines trifid, striated; spikes terminal, hairy; corolla pilose, having the carina twice the length of the keel; legume pubescent, 1-seeded. *h. H.* Native of Spain and Portugal.

*Var. β, cuspidata* (D. C. prod. 2. p. 148.) spines much elongated. *h. H.* Native of the north of Africa. *Spártium cuspidatum*, Cav. anal. 1801. p. 56.

*Var. γ, orientalis* (D. C. prod. 2. p. 148.) spines hardly longer than the leaves, trifid or simple. *h. H.* Native of the Levant, near Tschesme.

*Hairy Genista*. Shrub.

30 *G. ALGARVIENSIS* (Brot. fl. lus. 2. p. 89.) leaves lanceolate; spines simple, solitary; flowers terminal, subcapitate; bracteas hairy. *h. H.* Native of Algarves. *G. hirsuta* var. *Algarviensis*, D. C. prod. 2. p. 148. Calyx and corolla yellow.

*Algarves Genista*. Shrub 2 to 4 feet.

31 *G. TRICUSPIDATA* (Desf. atl. 2. p. 135. t. 183.) leaves lanceolate, and are, as well as the branches, hairy or glabrous; spines somewhat tetragonal, stiff, for the most part trifid; racemes spike-formed, terminal; calyx rather hairy; corolla glabrous; keel twice the length of the vexillum and wings. *h. H.* Native of Algiers, on hills. *Spártium tricuspidatum*, Cav. l. c.

*Tricuspidate-leaved Genista*. Shrub 1 to 3 feet.

32 *G. GIBRALTARICA* (D. C. prod. 2. p. 148.) leaves linear-lanceolate, glabrous, as well as the branches, calyxes, and corollas; branches decumbent, flexible; spines trifid and simple,

usually leafy; racemes terminal, somewhat spicate; carina longer than the vexillum and wings. *h. H.* Native on the rocks of Gibraltar, about St. Roque. This plant differs from *G. tricuspidata* in the habit being looser, and in the calycine lobes being very acute and spiny.

*Gibraltar Genista.* Shrub decumbent.

33 *G. TRIDENS* (Cav. anal. scienc. nat. 1801. 4. p. 59.) leaves lanceolate-oblong, glabrous; spines trifid, stiff; racemes terminal; calyxes and corollas glabrous; keel a little longer than the wings. *h. F.* Native of the north of Africa, about Tangiers. Leaves become concave when drying.

*Trident-spined Genista.* Shrub 2 feet.

34 *G. SYLVESTRIS* (Scop. carn. no. 875.) leaves linear-lanceolate, glabrous above, but clothed with adpressed villi beneath; spines axillary, branched, slender; raceme spicate, terminal; flowers glabrous; calycine teeth rather spiny; carina longer than the vexillum and wings. *h. H.* Native of Carniola and of Croatia on hills. *G. Hispanica*, Jacq. icon. rar. t. 557.

*Wood Genista.* Fl. Ju. July. Clt. 1818. Sh. 1 to 2 feet.

35 *G. ÆGYPTIACA* (Spreng. nov. prov. 20.) leaves linear-lanceolate, ending in a spiny mucrone; spines branched; stem furrowed, beset with spreading hairs; racemes secund; corollas smooth. *h. F.* Native of Egypt. This species comes very near *G. sylvestris*, but differs in having spreading hairs, not adpressed ones, and therefore referable to *G. Hispanica*.

*Egyptian Genista.* Shrub 1 to 2 feet.

36 *G. FALCATA* (Brot. phyt. 133. t. 55. fl. lus. 2. p. 89.) leaves ovate-lanceolate, upper and cauline ones roundish, having the margins, middle nerve, and branchlets rather villous; spines stiff, and for the most part trifid; racemes few-flowered; carina longer than the vexillum and wings; flowers glabrous; legumes falcate, many-seeded. *h. H.* Native of Portugal, in Biera and Estramadura.

*Falcate-legged Genista.* Shrub 2 to 3 feet.

37 *G. CORSICA* (D. C. fl. fr. suppl. p. 548.) plant quite smooth; leaves linear-lanceolate; stipulas rather pubescent; spines simple, rigid; flowers axillary, solitary, pedicellate; carina length of the glabrous vexillum; legume 4-8-seeded, quite smooth. *h. H.* Native of Corsica, about Bastia, Bonifacio, &c. *Spärtium Corsicum*, Lois. fl. gall. p. 410.

*Var. β, pubescens* (D. C. prod. 2. p. 148.) branches and young leaves clothed with adpressed pubescence. *h. H.* Native of Corsica, near Calvi.

*Corsican Genista.* Shrub 2 to 3 feet.

38 *G. SCORPIUS* (D. C. fl. fr. 4. p. 498.) leaves very few, oblong, rather silky; spines branched, spreading, striated, smooth; flowers in fascicles, somewhat racemose, on short pedicels, glabrous; carina length of vexillum; legume 2-4-seeded. *h. H.* Native of Spain, in arid places, and south of France, as well as Barbary. Wats. dent. brit. 78. Shrub very thorny, and when in an adult state almost leafless. *Spärtium scörpius*, Lin. spec. 995. *G. spiniflora*, Lam. dict. 2. p. 621.—Clus. hist. 1. p. 106. f. 1.

*Scorpion Genista.* Fl. March, Ap. Clt. 1570. Sh. 2 to 3 ft.

39 *G. HISPANICA* (Lin. spec. 999.) leaves lanceolate, villous; spines branched, stiff; floriferous branches unarmed; racemes terminal, somewhat capitate; carina villous, length of the vexillum, which is smooth; legume oval, 2-4-seeded, rather hispid, when mature rather smoothish. *h. H.* Native of Spain and south of France. Cav. icon. 3. t. 211. Lam. ill. t. 619. f. 3. Spines in the old branches beneath the leafy branchlets.

*Spanish Genista.* Fl. June, July. Clt. 1759. Sh.  $\frac{1}{2}$  to 1 ft.

40 *G. ANGELICA* (Lin. spec. 999.) smooth; leaves ovate-lanceolate; spines simple; floriferous branches unarmed; racemes few-flowered, terminal; carina longer than the wings and vexillum; legume ovate-cylindrical, many-seeded. *h. H.* Native

of Europe, in France, Denmark, &c. In Britain on moist, boggy, heathy commons. Smith, engl. bot. 132. *G. minor*, Lam. fl. fr. 2. p. 615.—Lob. icon. 2. p. 93. f. 2. Root woody, long, and creeping.

*English Genista* or Petty Whin. Fl. May, June. Britain. Shrub 1 to 2 feet.

41 *G. GERMANICA* (Lin. spec. 995.) leaves lanceolate, rather hairy; spines simple or branched; floriferous branches unarmed; racemes terminal; flowers rather villous; carina longer than the vexillum and wings; legume ovate, hairy, 2-4-seeded. *h. H.* Native of Europe, in woods, and on heaths. *Scörpius spinösus*, Moench. meth. 134. *Voglèra spinösa*, fl. Wett. 2. p. 500.—Fuchs. hist. 220. icon.

*Var. β, inermis* (D. C. prod. 2. p. 149.) spines almost wanting.

*German Genista.* Fl. July, Aug. Clt. 1773. Sh. 2 to 3 feet.

\*\*\*\* *Unarmed. Leaves all simple.*

42 *G. PURGANS* (Lin. spec. 999.) erect, much branched; branches terete, striated; leaves very few, lanceolate, almost sessile, rather silky; flowers axillary, solitary, on short pedicels; petals about equal in length, glabrous; young legumes clothed with adpressed pubescence. *h. H.* Native of France, on hills, especially in the Cevennes. Bull. herb. 115. *Spärtium purgans*, Lin. syst. 474. Perhaps nearly allied to *Cytisus nubi-genus*. The seeds are cathartic.

*Purging Genista.* Fl. Ju. July. Clt. 1768. Sh. 3 to 6 feet.

43 *G. RAMOSISSIMA* (Poir. suppl. 2. p. 715.) much branched, erect; branches striated, tuberculated; leaves few, lanceolate, villous; flowers nearly sessile along the branches, crowded; petals silky, about equal in length. *h. H.* Native of Mount Atlas, near Tlemsen. *Spärtium ramosissimum*, Desf. fl. atl. 2. p. 132. t. 178. Fruit unknown.

*Much-branched Genista.* Shrub 2 to 4 feet.

44 *G. CINEREA* (D. C. fl. fr. 4. p. 494.) erect, much branched; branches striated; leaves lanceolate, clothed with adpressed pubescence; flowers almost sessile along the branches, solitary; petals silky, about equal in length; legume clothed with adpressed villi, 4-6-seeded. *h. H.* Native on arid hills and mountains, from Arragon to Nice, in the limits of olives. *Spärtium cinereum*, Vill. prosp. 40. *G. scoparia*, Vill. dauph. 3. p. 420. exclusive of synonyms. *G. florida*, Asso, ar. 91.

*Cinereous Genista.* Fl. Ju. July. Shrub 2 to 6 feet.

45 *G. VIRGATA* (D. C. prod. 2. p. 149.) branches twiggy, terete, striated; leaves oblong-lanceolate, rather silky; flowers disposed in something like racemes; petals silky, about equal in length; legume villous, 1-3-seeded, compressed, rather torose between the seeds. *h. F.* Native of Madeira. *Spärtium virgatum*, Ait. hort. kew. 3. p. 11. *Cytisus tener*, Jacq. icon. rar. t. 147. *G. gracilis*, Poir. suppl. 2. p. 715.

*Twiggy Genista.* Fl. March, Jul. Clt. 1777. Shrub 3 to 4 ft.

46 *G. CONGESTA* (D. C. prod. 2. p. 149.) branches terete, striated, much crowded; leaves lanceolate, silky; flowers terminal, racemose, on very short pedicels; vexillum glabrous; carina pubescent. *h. G.* Native of Teneriffe. *Spärtium congestum*, Willd. enum. 2. p. 744. Allied to *G. virgata*.

*Crowded-branched Genista.* Fl. Ap. July. Sh. 2 to 4 feet.

47 *G. STYLOSA* (Spreng. syst. 3. p. 176.) branches slender, angular, flexuous, and are, as well as the leaves, linear and smooth; flowers in terminal racemes; calyx bracteolate; style elongated, permanent. *h. H.* Native of Portugal. *Genista bracteolata*, Willd. herb. Flowers yellow.

*Long-styled Genista.* Shrub 2 to 4 feet.

48 *G. SERICEA* (Wulf. in Jacq. coll. 2. p. 167.) decumbent; branches erect, terete; leaves linear-lanceolate, silky beneath; flowers 3-4, terminal, sub-racemose; petals silky, about equal in length; calycine lobes oblong, acuminate. *h. H.* Native

of Austria and Croatia, in subalpine places near the shore.—Jacq. icon. rar. 3. t. 556. Floral leaves about equal in length to the calyx.

*Silky Genista.* Fl. May, June. Clt. 1812. Sh.  $\frac{1}{2}$  foot.

49 *G. HUMIFUSA* (Lin. spec. 908. Vill. dauph. 3. p. 421. t. 44.) procumbent; branches twisted, tubercled, as stiff as spines at the apex, hairy, as well as the leaves, which are linear-lanceolate; flowers axillary, solitary, nearly sessile; petals silky, about equal in length; calycine lobes ovate, acutish.  $\frac{1}{2}$ . II. Native of the Levant and of Dauphiny, near Gap.

*Trailing Genista.* Fl. May, June. Clt. 1819. Sh. trailing.

50 *G. APHYLLA* (D. C. prod. 2. p. 149.) branched, erect; leaves very few, linear, very short; racemes terminal, elongated, dense-flowered; legumes compressed, 2-seeded, young ones tomentose, adult ones glabrous.  $\frac{1}{2}$ . II. Native of Siberia, in deserts about the Volga. Flowers violaceous. *Spártium aphyllum*, Lin. fil. suppl. 320. Pall. itin. ed. gall. append. no. 357. t. 99. f. 2. *G. virgata*, Lam. dict. 2. p. 616.

*Leafless Genista.* Fl. June, July. Clt. 1800. Sh. 3 to 4 feet.

51 *G. MONOSPERMA* (Lam. dict. 2. p. 616.) branches erect; leaves very few, linear-oblong, clothed with adpressed pubescence; racemes lateral, few-flowered; petals silky, about equal in length; legume ovate, inflated, membranous, glabrous, 1-2-seeded.  $\frac{1}{2}$ . II. Native of Portugal, Spain, Barbary, and Egypt. *Spártium monospermum*, Lin. spec. 995. Curt. bot. mag. 683. Clus. hist. 1. p. 103. *G. Ractam*, Forsk. Flowers white. Branches slender, twiggy, flexile. The use of this shrub along the shores of Spain is very great in stopping the sand. It converts the most barren spot into a fine odoriferous garden by its flowers, which continue a long time. The leaves and young branches are delicious food for goats. The twigs are used for tying bundles. Forskœl found the plant in Arabia, and Desfontains in Barbary. The Spaniards call it *Ractamas* from its Arabian name *Ractam*.

*One-seeded Genista.* Fl. Ju. July. Clt. 1670. Sh. 2 to 4 ft.

52 *G. SPHÆROCARPA* (Lam. dict. 2. p. 616.) twiggy branched; leaves few, linear, smoothish; racemes lateral, many-flowered; petals glabrous, equal in length; legume ovate, rather fleshy, 1-2-seeded.  $\frac{1}{2}$ . II. Native of the south of Europe and Barbary. *Spártium sphaerocarpon*, Lin. mant. 571.—Clus. hist. 1. p. 102. f. 2. Flowers small, yellow.

*Round-fruited Genista.* Fl. June, July. Clt. 1731. Shrub 3 to 4 feet.

53 *G. ÆTHNENSIS* (D. C. prod. 2. p. 150.) erect, much branched; leaves few, linear, silky; racemes terminal; petals rather glabrous, about equal in length; legume obliquely ovate, compressed, 2-3-seeded, young ones pubescent.  $\frac{1}{2}$ . II. Native of Mount Etna, in the wooded region. *Spártium Æthnense*, Biv. st. sic. mant. 2. Rafin. speech. 1. p. 17. Sims, bot. mag. 2674. *Spártium trisperrnum*, Smith in Rees' cycl. vol. 32. no. 5. Flowers yellow, twice the size of those of *G. sphaerocarpa*, but one-half smaller than those of *G. juncea*.

*Mount Etna Genista.* Fl. Ju. July. Clt. 1816. Sh. 2 to 4 ft.

54 *G. MULTICAULIS* (Lam. dict. 2. p. 617.) humble; branches erect, twiggy; leaves linear-oblong, rather glabrous, tapering into the petiole at the base; flowers solitary, on short pedicels; calyx clothed with adpressed silky pubescence; corolla glabrous.  $\frac{1}{2}$ . H. Native of the Balearic Islands.

*Many-stemmed Genista.* Shrub 1 to 2 feet.

55 *G. TETRAGONA* (Besser. num. coff. 2. p. 73. no. 887.) stem tetragonal, furrowed, decumbent; branches ascending; leaves nearly opposite, lanceolate, young ones and calyxes rather silky; flowers somewhat racemose; corolla glabrous.  $\frac{1}{2}$ . II. Native of the south of Podolia, in high fields at Tyra.

*Tetragonal-branched Genista.* Fl. June, July. Clt. 1822. Shrub decumbent.

56 *G. TENUIFOLIA* (Lois. not. 169.) stems weak; branches terete, striated, erectish; leaves linear, 1-nerved, glabrous; flowers disposed in terminal racemes, and are as well as the legumes glabrous.  $\frac{1}{2}$ . H. Native of Piedmont. This species is nearly allied to *G. tinctoria* and *G. depressa*, from which it is hardly distinct, unless in the flowers being smaller.

*Fine-leaved Genista.* Shrub 1 to 2 feet.

57 *G. DEPRESSA* (Bieb. fl. taur. suppl. p. 460.) stems decumbent; floriferous branches triquetrous, ascending; leaves lanceolate, acute, clothed with adpressed pili; flowers in the upper axils of the leaves on short pedicels, disposed in such a manner as to appear a leafy raceme; corolla glabrous.  $\frac{1}{2}$ . H. Native of Tauria, on mountains, and about Constantinople. Very like *G. mánticum*.

*Depressed Genista.* Shrub decumbent.

58 *G. SCARIO'SA* (Viv. ann. bot. 1. p. 2. p. 175. fragm. fl. ital. 1. p. 5. t. 8.) quite smooth; stem ascending; young branches triquetrous; leaves, lanceolate or the lower ones are obovate, with scarious margins; flowers racemose; corolla twice the length of the calyx.  $\frac{1}{2}$ . II. Native of Liguria, on hills from Genoa to Sarzana, and in the kingdom of Naples, ex. Tenore, fl. nap. 2. p. 127. *G. Januensis*, Viv. cat. p. 10. Bert. pl. *G. Genuensis*, Pers. ench. no. 5. Legume linear, 4-7-seeded, somewhat coarctate.

*Scarious-margined-leaved Genista.* Fl. June, Jul. Clt. 1821. Shrub ascendent.

59 *G. ANXA'NTICA* (Ten. fl. nap. prod. p. 41. fl. nap. 2. p. 127. t. 66.) quite smooth; stems diffuse; branches angular; leaves ovate-elliptic, rather coriaceous, veiny; flowers racemose; corolla 3-times longer than the calyx.  $\frac{1}{2}$ . II. Native of valleys of Naples, called *Amsantica*. Corolla 8 lines long. Legume 8-10-seeded. The name is called by the author *Anxantica* in his prod. fl. nap. p. 41. and *Amsantica* in his fl. nap. text.

*Anxantic Genista.* Fl. June, July. Clt. 1818. Sh. diffuse.

60 *G. TINCTORIA* (Lin. spec. 998.) root creeping; stems erect; branches terete, striated, erect; leaves lanceolate, smoothish; flowers disposed in spicate racemes, and are as well as the legumes smooth.  $\frac{1}{2}$ . H. Native of Europe, frequent in fields and woods; in England in pastures, thickets, and dry borders of fields. Smith, engl. bot. 44. Fuchs. hist. 809. *Genistoides tinctoria*, Mœnch. 132. The *G. tinctoria* is called *Base-broom*, *Green-weed*, *Green-wood*, *Dyers'-weed*, and *Wood-waxen*. When cows feed on it their milk and the butter or cheese made from it are said to be very bitter. A bright yellow colour may be prepared from the flowers, and for wool that is to be dyed green with woad the dyers prefer it to all others. A drachm and a half of the powdered seeds operates as a mild purgative. A decoction of the plant is sometimes diuretic, and therefore has proved serviceable in dropsical cases, and a salt prepared from the ashes is recommended to be used in that disorder.

*Var.  $\beta$ , latifolia* (D. C. fl. fr. suppl. 547.) leaves broad-lanceolate.  $\frac{1}{2}$ . H. Native of Auvergne on the Golden Mount.

*Var.  $\gamma$ , hirsuta* (D. C. prod. 2. p. 151.) leaves rather villous; branches erect.

*Var.  $\delta$ , pratensis* (Poll. pl. ver. 19.) leaves oblong-lanceolate, rather hairy; branches ascending.  $\frac{1}{2}$ . H. Native of Italy, on the upper mountains.

*Dyers' Broom or Green-weed.* Fl. June, Aug. Brit. Sh. 1 to 2 feet.

61 *G. SIBIRICA* (Lin. mant. 571.) stems erect; branches terete, striated, erect; leaves lanceolate, glabrous; flowers disposed in spicate racemes; spikes disposed in panicles, and are as well as the legumes smooth.  $\frac{1}{2}$ . H. Native of Siberia. Jacq. hort. vind. t. 190. *Genistoides elæta*, Mœnch. meth. 132. The plant is very like *G. tinctoria*, but altogether smooth, erect, more slender, and usually taller.

*Siberian Genista.* Fl. June, Aug. Clt. 1785. Sh. 2 to 6 ft.

62 *G. POLYGALÆFO'LIA* (D. C. prod. 2. p. 151.) stem erect, branches terete, striated, erect; leaves lanceolate, rather silky beneath, as well as the calyxes; racemes somewhat secund, disposed in panicles; corolla smooth. *h. H.* Native of the north of Portugal. *G. polygalæphylla*, Brot. fl. lus. 2. p. 86. *G. exaltata*, Link. *G. tinctoria Lusitánica máxima*, Tourn. inst. 643. Allied to *G. florida*.

*Milk-wort-leaved Genista.* Fl. June, Aug. Clt. 1820. Shrub 2 to 4 feet.

63 *G. PERREYMONDI* (Lois. fl. gall. ex. bull. sci. aug. 1828. p. 425.) stems decumbent; branches terete, striated, rather erect; leaves lanceolate, smoothish; flowers racemose, terminal; legume clothed with canescent villi. *h. H.* Native of France. Like *G. tinctoria*. Flowers yellow.

*Perreymond's Genista.* Fl. July. Shrub 2 to 3 feet.

64 *G. FLORIDA* (Lin. spec. 998.) stem erect; branches striated, terete; leaves lanceolate, and are as well as the legumes clothed with adpressed silky down; branches secund; corolla glabrous. *h. H.* Native of Spain. Legume 2-4-seeded, somewhat irregularly coarctate.

*Florid Genista.* Fl. June, Aug. Clt. 1752. Sh. 2 to 4 ft.

65 *G. PULCH'LLA* (Visiani, pl. dalm. ex. bot. zeit. jan. 1830. p. 51.) silky; stems diffuse, much branched; branches furrowed, young ones striped, tubercled at the buds, and rufescent at the apex; leaves simple, lanceolate, entire, small; flowers in crowded racemes, the pedicels all leaning to one side; wings smooth, shorter than the keel; legumes pendulous, 2-3-seeded. *h. H.* Native of Dalmatia. Like *G. Ethnensis* and *G. florida*, but more silky.

*Ncat Genista.* Shrub diffuse.

66 *G. MA'NTICA* (Poll. fl. ver. 2. p. 458. t. 4. f. 7.) stems numerous, prostrate, angularly striated, hairy-pubescent; leaves linear-lanceolate, pubescently-hairy; peduncles axillary, shorter than the leaves; corolla glabrous; legume clothed with silky villi. *h. H.* Native of Italy, in woods near Mantua. Spreng. pug. 2. p. 73. Horn. hort. hafn. suppl. p. 151. Allied to *G. ovata* and *G. tinctoria*, of which last it is probably a variety.

*Mantua Genista.* Fl. June, Aug. Clt. 1816. Sh. prostrate.

67 *G. OVA'TA* (Waldst. et Kit. pl. hung. 1. t. 84.) stems numerous, hairy, erectish, somewhat herbaceous, striated, terete; leaves ovate, or ovate-oblong, and are as well as the legumes hairy; racemes short; corolla smooth. *h. H.* Native of Slavonia and Hungary, and on the hills of Italy, from Piedmont to Naples. *G. ovata*, Balb. Bert. Sav. Ten. *G. nervata*, Kit. in litt. 1815. is hardly distinct.

*Ovate-leaved Genista.* Fl. June, Aug. Clt. 1816. Shrub 2 to 4 feet.

68 *G. PA'TULA* (Bieb. fl. taur. 2. p. 148.) much branched, quite smooth; branches terete, striated, paniced, spreading; leaves linear-lanceolate, acuminate; flowers and legumes glabrous. *h. H.* Native of Tauria, on hills at the river Cyrus, near Tiflis. This species is nearly allied to *G. tinctoria*, but the flowers are one-half smaller.

*Spreading Genista.* Fl. Ju. Aug. Clt. 1818. Sh. 2 to 4 ft.

69 *G. TRIANGULA'RIS* (Willd. spec. 3. p. 939.) smooth; branches triquetrous, and are as well as the stems ascending; leaves lanceolate, mucronate; flowers axillary; legume compressed, mucronate. *h. H.* Native of Hungary, on calcareous rocks. *G. triquetra*, Waldst. et Kit. hung. 2. p. 165. t. 153. but not of Aiton. Legume glabrous.

*Triangular-stemmed Genista.* Fl. May, June. Clt. 1815. Shrub ascending, 1 foot.

70 *G. SAGITTA'LIS* (Lin. spec. 998.) stems prostrate; branches herbaceous, ascending, 2-edged, membranous, somewhat articulated; leaves ovate-lanceolate; flowers disposed in an ovate-

terminal, leafless spike; corolla smooth, but the keel is furnished with a villous line on the back. *h. H.* Native of Europe, in mountain pastures. Mill. icon. t. 259. f. 2. Jacq. fl. au-tr. t. 209. *G. herbacea*, Lam. fl. fr. *Genistella racemosa*, Moench. meth. *Saltzwedelia sagittalis*, fl. wett. 2. p. 498.

*Var. β, minor* (D. C. prod. 2. p. 151.) a small shrub, having the branches clothed with adpressed pubescence at the apex as well as the leaves.

*Arrow-jointed Broom.* Fl. May, June. Clt. 1750. Shrub prostrate,  $\frac{1}{2}$  foot.

71 *G. TRIDENTA'TA* (Lin. spec. 998.) branches shrubby, triquetrous, membranous, somewhat articulated; leaves ovate, tridentate at the apex, glabrous; flowers disposed into crowded, terminal and lateral heads; carina and legumes clothed with silky wool. *h. H.* Native of Portugal, on uncultivated hills and among bushes. Brot. fl. lus. 2. p. 86. Wings of stem rather undulated, with the margins roughly denticulated.

*Tridentate-leaved Genista.* Shrub 1 foot.

72 *G. DIFFUSA* (Willd. spec. 3. p. 942.) branches procumbent from the neck, triquetrous; leaves lanceolate, glabrous, a little ciliated; peduncles axillary, erect, disposed in interrupted fascicles; corollas and legumes glabrous. *h. H.* Native of Italy and Styria in exposed places. *G. humifusa*, Wulf. in Jacq. coll. 2. p. 169. *Spartium decumbens*, Jacq. icon. rar. 3. t. 555. but not of Aiton.

*Diffuse Genista.* Fl. May, June. Clt. 1815. Sh. procumb.

73 *G. PROSTRA'TA* (Lam. dict. 2. p. 618.) stems diffuse, prostrate; branches angular, striated, rather villous; leaves ovate-oblong, rather villous beneath; flowers axillary, on long pedicels, erect; corolla glabrous; legumes villous, 3-4-seeded. *h. H.* Native of Burgundy and the Alps of Jura. *G. pedunculata*, Lher. stirp. 184. *G. decumbens*, Dur. bourg. 1. p. 299. Lodd. bot. cab. 718. *G. Halleri*, Reyn. mem. 1. p. 211. icon.

*Prostrate Genista.* Fl. May, June. Clt. 1775. Sh. prostr.

74 *G. PROCUMBENS* (Waldst. et Kit. in Willd. spec. 3. p. 940.) branches procumbent, terete, striated, rather pubescent; leaves lanceolate, acute, pubescent beneath as well as the calyxes; flowers pedicellate, axillary, tern; corolla glabrous. *h. H.* Native of Hungary in woods, and of Moravia. Vexillum a little shorter than the keel. Legume unknown.

*Procumbent Genista.* Fl. June, Aug. Clt. 1816. Sh. proc.

75 *G. ALBIDA* (Willd. spec. 3. p. 942.) stems procumbent, striated, branched; leaves lanceolate or linear, clothed with white villi; flowers axillary, sessile; calyx and corolla clothed with silky villi; legume tomentose. *h. H.* Native of Tauria and Bessarabia, on stony mountains. Bieb. fl. taur. 2. p. 149. 3. p. 459. Allied to *G. pilosa*.

*Whitened Genista.* Shrub procumbent.

76 *G. PILOSA* (Lin. spec. 999.) stems procumbent, striated, branched, tuberculated; leaves obovate-lanceolate, obtuse, complicated, clothed beneath with adpressed silky down; flowers axillary, on short pedicels; calyx and pedicels silky; legumes pubescent, 3-4-seeded. *h. H.* Native of the south of France, Switzerland, Germany, &c.; in Britain on dry elevated downs or heaths, on high sandy ground about Bury, Suffolk. About Tornham, on the north side of Bury, also on rocks near the Lizard Point, Cornwall. At the foot of Cader Idris, North Wales. Jacq. fl. austr. t. 208. Smith, engl. bot. 208. Fl. dan. 1225. - Clus. hist. 1. p. 163. f. 2. *G. repens*, Lam. fl. fr. *Genistoides tuberculata*, Moench. meth.

*Pilose Genista.* Fl. May, June. England. Sh. procumbent.

77 *G. MICRA'NTHA* (Ort. dec. 6. p. 68. t. 10. f. 1.) stems procumbent, smooth, angular; leaves linear-lanceolate; flowers disposed in terminal spikes, distant; carina rather villous; legume 2-3-seeded. *h. H.* Native of Spain, in humid places in the wood called Corazo, near Silos.

*Small-flowered Genista.* Fl. May, June. Sh. procumbent.

78 *G. BROTERII* (Poir. suppl. 2. p. 720.) stems erect; branches angular, twiggy, glabrous; leaves linear-lanceolate, smoothish on both surfaces; racemes short, terminal; bracteas, calyxes, corollas, and legumes glabrous; carina longer than the vexillum, and the vexillum longer than the wings.  $\frac{1}{2}$ . II. Native of the north of Portugal, in glens of mountains. *G. parviflora*, Brot. fl. lus. 2. p. 87.

*Brotero's Genista.* Shrub 4 to 6 feet.

79 *G. PILOCARPA* (Link. enum. 2. p. 223.) erect; branches angular, pubescent; leaves lanceolate, clothed beneath with silky pubescence; flowers racemose, on short pedicels; legume pilose.  $\frac{1}{2}$ . II. Native of?

*Pilose-fruited Genista.* Fl. Ju. Jul. Clt. 1823. Sh. 2 to 3 ft.

+ *Species not sufficiently known.*

80 *G. ? HETEROPHYLLA* (D. C. prod. 2. p. 152.) stems erect; branches angular, sterile ones villous; leaves simple, obovate, on short petioles, clothed with silky villi; flowers usually tern, axillary, pedunculate; calyxes campanulate, villous; legume silky.  $\frac{1}{2}$ . II. Native of the Pyrenees, at Monney. *Cytisus heterophyllus*, Lapeyr. abr. 422.

*Variable-leaved Genista.* Shrub 2 to 4 feet.

81 *G. ANGULATA* (Rafin. prec. dec. som. p. 37. under *Spartium*.) unarmed; branches pentagonal, glabrous; leaves simple and trifoliate, stalked; leaflets thin, oblong, mucronate, almost smooth; legume solitary, pedunculate, oblong, compressed, pubescent.  $\frac{1}{2}$ . II. Native of Maryland, in woods.

*Angular-branched Genista.* Shrub 2 to 3 feet.

82 *G. ? DESIDERATA* (D. C. prod. 2. p. 152.) branches unarmed, terete; leaves trifoliate, petiolate; leaflets linear-subulate, pungent at the apex, clothed with adpressed silky pubescence; flowers solitary, pedicellate; calyxes and many-seeded legumes pubescent.  $\frac{1}{2}$ . G. Native of Port Desideratum. Calyx, stamens, and legumes nearly like *Genista*, but the corolla is unknown. Probably a distinct genus.

*Port Desideratum Genista.* Shrub.

83 *G. ? SCANDENS* (Lour. coch. p. 428.) stem scandent; spines simple; leaves bipinnate.  $\frac{1}{2}$ . G. Native of Cochinchina, on the banks of rivers. Flowers very numerous, golden yellow. This plant should certainly be removed from *Genista*. It is perhaps a species of *Cesalpinia*.

*Climbing Genista.* Shrub cl.

*Cult.* All the species of this genus are very elegant when in flower. The hardy species are well fitted for the front of shrubberies, as they are generally of low growth; they are usually increased by seeds or layers. The greenhouse and frame kinds thrive well in a mixture of loam, peat, and sand, and young cuttings of them root readily if planted in a pot of sand, with a bell-glass placed over them, but the glasses must be taken off and wiped occasionally, otherwise the cuttings are apt to damp off.

**LX. CYTISUS** (from *Cýthnos*, one of the Cyclades, some one of the species were first found there). D. C. fl. fr. 4. p. 501. Leg. mem. VI.—*Cytisus* and *Calycotome*, Link.—*Cytisus* and *Spartium*, species, Lin. and Lam. &c.

**LIN. SYST.** *Monadelphina*, *Dicandria*. Calyx bilabiate; upper lip usually entire, lower one somewhat tridentate. Vexillum ovate, large. Carina very obtuse, inclosing the genitals. Stamens monadelphous. Legume compressed, many-seeded, glandless. Shrubs, with the habit of the *Genista*, with trifoliate leaves. Flowers of nearly all the species yellow. Leaves of all trifoliate.

**SECT. I. ALBERNOIDES** (*alburnum*, the white inner sap of trees; in reference to the white flowers of the species). D. C. l. c. prod.

2. p. 153. Calyx campanulate. Legume 1-4-seeded, not dilated at the upper suture. Flowers white. Leaves very few. Branches unarmed.

1 *C. NUBIGENUS* (Link. enum. 2. p. 240.) branches terete, striated; leaves very few, petiolate; leaflets lanceolate, pilose; flowers lateral, in fascicles; legumes many-seeded, glabrous.  $\frac{1}{2}$ . G. Native of Teneriffe, on the sides of the Peak. *Spartium nubigenum*, Ait. hort. kew. 3. p. 13. *Spartium supranubium*, Lin. fil. suppl. 319. *Cytisus fragrans*, Lam. dict. Flowers very sweet-scented. Habit of *Genista purgans*.

*Cloud-born Cytisus.* Fl. May, June. Clt. 1779. Sh. 6 ft.

2 *C. ALBUS* (Link. enum. 2. p. 241.) branches terete, twiggy; leaves simple and trifoliate, sessile; leaflets linear-oblong, silky; flowers in fascicles, disposed in long racemes; legume 2-seeded, very villous.  $\frac{1}{2}$ . II. Native of Portugal and the Levant. *Genista alba*, Lam. dict. 2. p. 623. *Spartium album*, Desf. fl. atl. 2. p. 132. *Spartium multiflorum*, Ait. hort. kew. 3. p. 11. *Spartium dispernum*, Mæneh. meth. 130.

*Portugal Broom or White-flowered Cytisus.* Fl. May. Clt. 1752. Shrub 6 to 10 feet.

**SECT. II. LABURNUM** (a name formed from the Alpine name of the tree *L'Aubours*). D. C. l. c. prod. 2. p. 153. Calyx campanulate. Legume many-seeded, not dilated at the upper suture. Flowers yellow. Branches unarmed, leafy.

3 *C. LABURNUM* (Lin. spec. 1041.) branches terete, whitish; leaves petiolate; leaflets ovate-lanceolate, pubescent beneath; racemes pendulous, simple; pedicels and calyxes clothed with adpressed pubescence; legume linear, many-seeded, clothed with adpressed pubescence.  $\frac{1}{2}$ . II. Native of Europe, frequent on the lower mountains. Jacq. aust. t. 306. Curt. bot. mag. 176. Duham. arbr. ed. nov. 5. t. 44. *C. alpinus*, Lam. fl. fr. 2. p. 621. — J. Bauh. hist. 1. p. 2. p. 361. icon. *Laburnum* is usually cultivated for ornament. The wood is hard, of a fine colour, and will polish very well; it approaches near to green ebony, and is called by the French ebony of the Alps, and is there used for many kinds of furniture; but in England there are few of the trees which have been suffered to stand long enough to arrive at any considerable size. Haller observes that *Laburnum* is very bitter, that the seeds are violently purgative and emetic. He also remarks that the Latin name *Laburnum* was evidently formed from the Alpine name *L'Aubours*. In German it is called *Bohnenbaum*, and in French *Cytise des Alpes*, *Aubours*, and *Faux Ebenier*. The seed of *Laburnum* is frequently sown in plantations infested with hares and rabbits, who will touch no other tree as long as a twig of *Laburnum* remains. Though eaten to the ground every season, it rises again in the spring, thus affording a constant supply for these animals, so as to save the other trees till of a size to resist their attacks. The tree grows best in light loam, or sandy soil.

*Var.  $\beta$ , quercifolia* (Hortul.) leaflets sinuated.

*Laburnum.* Fl. May, June. Clt. 1596. Tree 20 feet.

4 *C. ALPINUS* (Mill. dict. no. 2.) glabrous; branches terete; leaves petiolate; leaflets ovate-lanceolate, rounded at the base; racemes pendulous; pedicels and calyxes pyberulous; legumes glabrous, few-seeded, marginate.  $\frac{1}{2}$ . II. Native of Carinthia, in groves (Hoppe), in Pannonia (Willd.). In the Alps of Jura on Mount Dole and near Moret, also in the Apennines and on Mount Cenis. Waldst. et Kit. hung. 3. p. 288. t. 260. *C. laburnum  $\beta$* , Ait. Lam. D. C. fl. fr. *Cytisus angustifolius*, Mæneh. meth. 145. This species is nearly allied to the preceding, but is still truly distinct. The tree or *Scotch Laburnum*, or *Cytisus alpinus*, is a native of Switzerland and Scotland; it is cultivated chiefly for ornament, but affords also a valuable timber; for this purpose the *C. alpinus* is decidedly preferable to the common kind, as being more of a tree. The wood of both

the Scotch and common *Laburnum* is much used by cabinet-makers and turners, for its hardness, beauty of grain, and durability.

*Alpine* or Scotch Laburnum. Fl. June. Clt. 1596. Tree 15 to 20 feet.

5 *C. NIGRICANS* (Lin. spec. 1041.) branches terete, twiggy; leaves stalked, clothed with adpressed pubescence beneath, as well as the branches, calyxes, and legumes; leaflets elliptic; racemes elongated, terminal, erect; calyxes bractless.  $\frac{1}{2}$ . H. Native of Piedmont, Vallais, and Bohemia, on hills and along way sides. Jacq. austr. t. 387. Ker. bot. reg. 802. Lam. ill. t. 618. f. 3. Duh. arb. ed. nov. 5. t. 46. f. 1. This plant turns truly black on drying.

*Blackish* Cytisus. Fl. Ju. July. Clt. 1730. Sh. 3 to 6 feet.

6 *C. SESSILIFOLIUS* (Lin. spec. 1041.) plant quite smooth; branches terete; floral leaves almost sessile; leaflets ovate; racemes terminal, erect, short; calyxes each having a 3-leaved bractea just under it.  $\frac{1}{2}$ . H. Native of the south of France and Piedmont. Lam. ill. t. 618. f. 2. Duham. arb. ed. nov. 5. t. 45. f. 1. Curt. bot. mag. 255.—J. Bauh. hist. 1. p. 2. p. 374. f. 2.

*Sessile-leaved* Cytisus. Fl. May, June. Clt. 1629. Shrub 4 to 6 feet.

7 *C. TRIFLORUS* (Lher. stirp. 184. Desf. fl. atl. 2. p. 139. but not of Lam.) hairy; branches terete; leaves petiolate; leaflets obovate-elliptic; flowers axillary, pedicellate, terete, somewhat racemose at the tops of the branchlets.  $\frac{1}{2}$ . H. Native about Narbonne. In Provence, Liguria, Etruria, Sicily, and Mauritania. *C. villosus*, Pourr. act. toul. 3. p. 317.—Clus. hist. 1. p. 94. f. 3. Branches rather hispid. Leaves villous. Legume hairy. It differs from *C. triflora* of Lam. in the calyx being campanulate and broadly bilabiate, not tubular.

*Three-flowered* Cytisus. Fl. June, July. Clt. 1640. Shrub 3 to 4 feet.

8 *C. MOLLE* (Willd. enum. suppl. 51.) leaflets oblong, clothed with soft pubescence, acute at both ends; peduncles axillary, usually tern; calyxes subglobose, bifid, scarious.  $\frac{1}{2}$ . H. Native of? Perhaps sufficiently distinct from *C. triflorus*.

*Soft* Cytisus. Fl. June, July. Clt. 1818. Shrub 2 to 4 ft.

9 *C. PATENS* (Lin. syst. veg. 555. ex Lher. stirp. 184.) branches striated, somewhat pubescent; leaves petiolate, trifoliate, but the upper ones are simple, and are as well as the leaflets obovate, and clothed with adpressed pubescence; flowers axillary, usually twin, pedicellate, nodding; legumes very hairy.  $\frac{1}{2}$ . H. Native of Portugal. *C. pendulinus*, Lin. fil. suppl. 328. *Genista tomentosa*, Poir. suppl. 2. p. 719. *Spártium patens*, Lin. syst. 535. Brot. fl. lus. 2. p. 83. but not of Cav.

*Spreading* Cytisus. Fl. Ju. July. Clt. 1752. Sh. 4 to 6 ft.

10 *C. ARBOREUS* (D. C. prod. 2. p. 154.) branches striated, glabrous; leaves stalked; leaflets obovate, clothed with fine pubescence beneath; flowers axillary, aggregate, pedicellate, nodding; legumes clothed with adpressed silky villi.  $\frac{1}{2}$ . H. Native of valleys about Algiers. *Spártium arboreum*, Desf. atl. 2. p. 131. t. 177. *Genista pendulum*, Poir. voy. 2. p. 208. A shrub 8 to 10 feet high, with a trunk about the thickness of a man's arm.

*Arboreous* Cytisus. Shrub 8 to 10 feet.

11 *C. WELDENI* (Visàni, pl. dahn. ex bot. zeit. jan. 1830. p. 52.) erect; leaves ternate, petiolate; leaflets elliptic, entire, cuneated at the base, and obtuse at the apex, smooth; racemes terminal, stalked, pyramidal, straight; pedicels hoary and villous; calyxes campanulate, 3-lobed; lobes tomentosely ciliated; corolla glabrous, but the carina is clothed with silky villi; legume glabrous, mucronate by the style.  $\frac{1}{2}$ . H. Native of Dalmatia, in woods on mounts Grab and Krivoscie. Flowers fragrant, yellow.

*Welden's* Cytisus. Shrub 2 to 4 feet.

12 *C. GRANDIFLORUS* (D. C. prod. 2. p. 154.) branches angular, usually glabrous; leaves in fascicles, petiolate, trifoliate, but for the most part simple, and are, as well as the leaflets, ovate-lanceolate, but the primary ones are roundish; flowers lateral, pedicellate, solitary or twin; legume woolly.  $\frac{1}{2}$ . H. Native of Portugal, on hills, in hedges, and in woods. *Spártium grandiflorum*, Brot. fl. lus. 2. p. 80.

*Great-flowered* Cytisus. Fl. June, July. Clt. 1816. Shrub 3 to 4 feet.

13 *C. SCOPARIUS* (Link. enum. 2. p. 241.) branches angular, smooth; leaves trifoliate, petiolate, upper ones simple, and are oblong, as well as the leaflets; flowers axillary, pedicellate, solitary; legume pilose on the margins.  $\frac{1}{2}$ . H. Native of Europe, in woods and on commons; plentiful in Britain. *Spártium scoparium*, Lin. spec. 996. Qued. fl. dan. t. 313. Smith, engl. bot. 1339. *Genista scoparia*, Lam. dict. 2. p. 623. but not of Vill. *Gen. hirsuta*, Menech. meth. 114. Duham. arb. t. 84. The common broom is used in many parts of Britain for besoms, and in some places it serves for thatching cottages, corn, and hay ricks. The flower-buds before expansion are sometimes pickled in the manner of capers. The branches are said to be capable of tanning leather, and of being manufactured into coarse cloth, when tender they are mixed with hops in brewing, and in some places used as fodder. The old wood furnishes the cabinet-makers with the most beautiful material for veneering. The plant when burnt affords a most beautiful alkaline salt, and on this salt the efficacy of broom in dropsies must depend. The seeds of broom have a very bitter taste, and when given in decoction prove considerably diuretic. The branches have similar properties.

*Var.  $\beta$ , albus*; flowers white.

*Common-Broom*. Fl. April, July. Britain. Sh. 3 to 10 ft.

SECT. III. CALYCOTOME (from  $\kappa\alpha\lambda\upsilon\zeta$ , *calyx*, and  $\tau\omicron\mu\eta$ , *to cut*, a cutting; in reference to the calyx at length falling off in part, giving it the appearance of being cut off). Link. in Schrad. neue. journ. 2. p. 2. p. 50. D. C. prod. 2. p. 154.—Calycotomon, Hoffmans. verz. plant. 1824. p. 166. Calyx campanulate, somewhat bilabiate, at length circumscissely truncate. Legume thickened on the upper suture. Shrubs, with spiny branches and yellow flowers.

14 *C. SPINOSUS* (Lam. dict. 2. p. 247.) branches angular, spiny; leaves trifoliate; leaflets obovate-oblong; legumes quite glabrous.  $\frac{1}{2}$ . H. Native about Genoa, on hills in Corsica, and of Algiers. *Spártium spinosum*, Lin. spec. 997.—J. Bauh. hist. 1. p. 2. p. 376. icon.—Lob. icon. 2. t. 95.

*Spiny* Cytisus. Fl. June, July. Clt. 1596. Sh. 5 to 6 feet.

15 *C. LANIGERUS* (D. C. prod. 2. p. 154.) branches striated, spiny; leaves trifoliate; leaflets obovate-elliptic; legumes very hairy, and rather woolly.  $\frac{1}{2}$ . H. Native of Corsica, Crete, Mauritania, Gibraltar, Portugal, &c. on hills. *Spártium lanigerum*, Desf. atl. 2. p. 135. *Sp. villosum*, Poir. voy. 2. p. 207. *Calycotome villosa*, Link, l. c. *Spártium spinosum*, Brot. fl. lus. 2. p. 85.

*Var.  $\beta$ , rigidus* (D. C. prod. 2. p. 154.) spines very strong.  $\frac{1}{2}$ . H. Native of the Great Syrtes. *Spártium rigidum*, Viv. fl. lib. p. 40. t. 17. f. 1.

*Wool-bearing* Cytisus. Fl. Ju. July. Clt. 1821. Sh. 3 to 6 ft.

SECT. IV. TUBOCYTISUS (from *tubus*, a tube, and *cytismus*; in reference to the tubular shape of the calyx). D. C. l. c. prod. 2. p. 155.—*Viborgia*, Menech. meth. 132. but not of Thunb. Calyx tubular, bilabiate at the apex.—Unarmed shrubs.

\* *Flowers white or whitish.*

16 *C. PROLIFERUS* (Lin. fil. suppl. 328.) stems erect; branches terete, velvety; leaflets elliptic, and are, as well as the calyxes silky; flowers lateral, umbellately aggregate; legume villous.

h. G. Native of Teneriffe, on the mountains. Ait. hort. kew. 3. p. 51. Lher. stirp. 134. Vent. cels. t. 13. Lodd. bot. cab. t. 761. Ker. bot. reg. 121. Flowers white.

*Proliferous* Cytisus. Fl. Ap. May. Clt. 1779. Sh. 2 to 4 ft.

17 *C. LEUCANTHUS* (Waldst. et Kit. hung. 2. p. 141. t. 132.) stems erect; branches terete, and are, as well as the leaves, clothed with adpressed pubescence; leaflets elliptic, acute; flowers at the tops of the branches; heads of flowers bracteate, by two leaves. h. H. Native of Croatia, in woods. Willd. spec. 3. p. 1124. Sims, bot. mag. 1138. This species differs from *C. Austriacus* in the flowers being white, not yellow.

*Var. β, pallidus* (Schröd. in litt.) flowers cream-coloured.

h. H. An intermediate plant between *C. leucanthus* and *C. Austriacus*.

*White-flowered* Cytisus. Fl. June, July. Clt. 1806. Shrub 3 to 4 feet.

18 *C. ALBIDUS* (D. C. cat. hort. monsp. 101. no. 85.) stems erect; branches divaricate, terete, rather glabrous; leaflets oblong, pubescent beneath, as well as the calyxes; flowers axillary, usually tern, pedicellate; calyx with both lips entire. h. H. Native of the south of Europe and north of Africa. Flowers white. Ovary pubescent.

*Whitish-flowered* Cytisus. Fl. June, July. Shrub 2 to 4 ft.

\* \* \* *Flowers purple.*

19 *C. PURPUREUS* (Scop. carn. no. 905. t. 43.) stems procumbent, twiggy; leaves, calyxes, and legumes glabrous; leaflets oblong; flowers axillary, solitary, on short pedicels. h. H. Native of Carniola and Croatia, in exposed places. Jacq. austr. append. t. 48. Lodd. bot. cab. 892. Sims, bot. mag. 1176. Flowers purple. This plant is very beautiful when in flower, but has a better effect when grafted on a rather tall laburnum.

*Var. β, albiflorus*; flowers white.

*Purple-flowered* Cytisus. Fl. May, Aug. Clt. 1792. Shrub procumbent.

\* \* \* *Flowers yellow.*

20 *C. BIFLORUS* (Lher. stirp. 184. Ait. hort. kew. 3. p. 52.) stems diffuse; branches terete, and are as well as the leaves rather pubescent; leaflets oblong-lanceolate; flowers on short peduncles, axillary, and usually twin; calyxes and legumes clothed with adpressed pubescence. h. H. Native of Austria, Pannonia, Podolia, Tauria, and Siberia. Waldst. et Kit. hung. 2. p. 166. Duham. arb. ed. nov. 5. p. 45. f. 2. *C. supinus*, Jacq. fl. austr. 1. t. 20. *C. hirsutus*, Gmel. sib. 4. p. 17. t. 6. f. 2. *C. hirsutus* and *C. supinus*, Bieb. fl. taur. ex Stev. in litt. *C. macrospermus*, Bess. in litt.

*Var. β, glaber* (Lin. fil. suppl. 325.) branches and leaves glabrous; leaflets obovate.

*Var. γ, subspinescens* (D. C. prod. 2. p. 155.) branches rather hoary, more diffuse, somewhat spinose at the apex. h. H. Native of Naples and Hungary.

*Two-flowered* Cytisus. Fl. May, June. Shrub procumbent.

21 *C. ELONGATUS* (Waldst. et Kit. hung. 2. p. 200. t. 183.) stems erect; branches elongated, terete, young ones villous; leaflets obovate, clothed beneath with adpressed villi; flowers lateral, usually in fours on short pedicels; calyxes villous. h. H. Native of Hungary, in woods. Petioles of the upper leaves longer than the calyxes. Flowers few.

*Elongated* Cytisus. Fl. May, June. Clt. 1804. Sh. 3 to 4 ft.

22 *C. MULTIFLORUS* (Lindl. bot. reg. t. 1191.) stems erect; branches elongated, terete, younger ones villous; leaflets oblong, tapering to the base, villous beneath, the same colour on both surfaces; flowers usually tern; pedicels about equal in length to the petioles; vexillum emarginate, undulated. h. H. Native of Europe. *C. elongatus*, Hortul. but not of Kit. *C. elongatus β, multiflorus*, D. C. prod.

*Many-flowered* Cytisus. Fl. May, June. Clt. 1800. Shrub 2 to 3 feet.

23 *C. FALCATUS* (Waldst. et Kit. hung. 3. p. 264. t. 238.) stems declinate; branches terete, twiggy, young ones, as well as the leaves clothed with adpressed villous pubescence; petioles hairy; flowers usually tern, lateral, on short peduncles; calyxes clothed with adpressed villi. h. H. Native of Croatia, Volhynia, Podolia, and Galicia. Lodd. bot. cab. 520. The plant cultivated in the garden of Geneva differs from the wild plant in the flowers being almost sessile, and in the leaves being pubescent, not silky-villous.

*Falcate* Cytisus. Fl. Ju. Aug. Clt. 1816. Shrub 2 to 4 feet.

24 *C. AUSTRIACUS* (Lin. spec. 1042.) stems erect; branches twiggy, terete, and are, as well as the leaves, clothed with adpressed strigose pubescence; leaflets lanceolate, attenuated at both ends; flowers terminal, somewhat umbellate; calyxes and legumes sparingly villous. h. H. Native of Austria, upper Italy, the Ukraine, and Siberia, in woods and rough places. Mill. icon. 117. f. 2. Pall. itin. ed. gall. t. 100. f. 3. Jacq. austr. 1. t. 21.

*Austrian* Cytisus. Fl. Ju. Sept. Clt. 1741. Sh. 2 to 4 feet.

25 *C. SUPINUS* (Jacq. fl. austr. 1. t. 20.) stems decumbent, branched; branches terete, young ones rather hairy, adult ones smooth; leaflets obovate, obtuse, rather hairy beneath; flowers 2-4, usually terminal, pedunculate; calyxes and legumes sparingly villous. h. H. Native of Belgium, Austria, Pannonia, Siberia, Turkey, and Dauphiny, on exposed hills and in bushy places.—Clus. hist. p. 96. no. vii. icon. *C. lotoides*, Pourr. act. toul. 3. p. 318. Flowers pale-yellow, with the vexillum reddish.

*Supine* Cytisus. Fl. May, Aug. Clt. 1755. Sh. decumbent.

26 *C. HIRSUTUS* (Lin. spec. 1042. Jacq. obs. 4. t. 96.) stems decumbent; branches twiggy, terete, young ones hispid, adult ones smooth; leaflets obovate, villous beneath; flowers lateral, on very short pedicels, aggregate; calyxes and legumes hairy. h. H. Native from Genoa to Hungary, in rugged places. *C. supinus*, Bertol. pl. gen. but not of Linnaeus. *C. triflorus*, Lam. dict. 2. p. 250.—Clus. hist. 95. no. 4.

*Hairy* Cytisus. Fl. June, Aug. Clt. 1739. Sh. decumbent.

27 *C. SEROTINUS* (Kit. in litt.) stems ascending; branches terete, hairy; leaflets obovate, glabrous above, rather villous beneath; flowers axillary, 2-3, pedicellate; calyxes hairy. h. H. Native of Hungary. This plant is sufficiently distinct from the two preceding.

*Late-flowering* Cytisus. Shrub 2 to 3 feet.

28 *C. CAPITATUS* (Jacq. fl. austr. t. 33.) stems erect; branches straight, hispid; leaflets ovate-elliptic, villous; flowers numerous, capitate at the tops of the branches; calyxes and legumes covered with hispid villi. h. H. Native of Burgundy, Italy, and Austria, on the edges of woods. Lodd. bot. cab. 497. *C. supinus*, Lin. spec. 1040. *C. hirsutus*, Lam. dict. 2. p. 250. Flowers sometimes lateral in the autumn.

*Capitate-flowered* Cytisus. Fl. June, July. Clt. 1774. Sh. 2 to 4 feet.

29 *C. CILIATUS* (Wahlenb. fl. carp. 219.) stems erect; young branches hispid, adult ones glabrous; leaflets obovate, clothed beneath with adpressed villi; flowers approximate, tern, at length lateral; legumes glabrous, ciliated. h. H. Native of the Carpathian mountains, on the plains of Litova.

*Ciliated-podded* Cytisus. Fl. June, July. Clt. 1817. Shrub 2 to 4 feet.

30 *C. POLYTRICHUS* (Bieb. fl. taur. suppl. 477.) stems declinate; branches hispid; leaflets obovate-elliptic, and are, as well as the calyxes, villous; flowers lateral, usually twin, pedicellate; legumes hairy. h. H. Native of southern Tauria, on the higher mountains in pine forests. This species is more hairy

than *C. capitatus*, and the disposition of the flowers is that of *C. hirsutus*, and the habit that of *C. supinus*.

*Many-haired Cytisus*. Fl. Ju. July. Clt. 1818. Sh. 2 to 3 ft.

SECT. V. *LOTOIDES* (from *λωτος*, *lotos*, *lotus*, and *ἰῆα*, form; resemblance to the genus *Lotus*). D. C. l. c. prod. 2. p. 156. Tube of calyx short, obconical, the upper lip bipartite, the lower one tridentate. Corolla hardly longer than the calyx. Many-stemmed decumbent subshrubs. Flowers few, somewhat capitate, of all yellow.

31 *C. ARGENTRUS* (Lin. spec. 1043.) stems decumbent; leaves, calyxes, corollas, and legumes clothed with adpressed silky down; leaves petiolate, trifoliate; leaflets oblong-lanceolate; flowers 3-4, terminal. *h. H.* Native of Portugal, Spain, south of France, Italy, Carniola, and Mauritania, in rugged places. Desf. atl. 2. p. 139. *Lotus argenteus*, Brot. fl. lus. 2. p. 119.—Lob. icon. 2. p. 41. f. 2.

*Silvery Cytisus*. Fl. Aug. Clt. 1739. Shrub decumbent.

32 *C. PYGMÆUS* (Willd. spec. 3. p. 1127.) stems decumbent, suffruticose; leaves petiolate, trifoliate; leaflets oblong-lanceolate, silky; flowers usually terminal; legumes oblong, villous. *h. H.* Native of Galatia.

*Pygmy Cytisus*. Fl. June, July. Shrub decumbent.

33 *C. CALYCINUS* (Bieb. fl. taur. 2. p. 166.) stems ascending; leaves, calyxes, and legumes rather hairy from spreading down; leaves petiolate, trifoliate; leaflets roundish-obovate; flowers 2-8, terminal. *h. H.* Native of Caucasus, in stony places. *C. pauciflorus*, Willd. spec. 3. p. 1126.

*Large-calyxed Cytisus*. Fl. Aug. Clt. 1820. Sh. prostrate.

34 *C. LOTOIDES* (Willd. spec. 3. p. 1127.) stems decumbent, herbaceous, simple, and are, as well as the leaves, pubescent; leaves petiolate, trifoliate; leaflets roundish-elliptic, mucronate; flowers 7-8, capitate. *h. H.* Native of Galatia.

*Lotus-like Cytisus*. Shrub decumbent.

35 *C. NANUS* (Willd. enum. 769.) stems erect; leaves trifoliate, obovate, clothed with strigose pubescence beneath and smooth above; raceme terminal, secund, usually 4-flowered; calyx deeply 3-parted; hairs on the stems and peduncles adpressed. Wats. dend. brit. 81. *h. H.* Native of the Levant.

*Dwarf Cytisus*. Fl. May, June. Clt. 1816. Sh. decumbent.

SECT. VI. *CHRONANTHUS* (*χρονος*, *chronos*, a year, and *ανθος*, *anthos*, a flower; in reference to the permanent petals, which remain all the year). D. C. l. c. prod. 2. p. 157. Upper lip of calyx bifid, lower one trifid; lobes acute, length of the tube. Petals permanent. Legume oval, much compressed, 2-seeded. Perhaps a proper genus.

36 *C. ORIENTALIS* (Lois. in Duham. arbr. ed. nov. p. 136.) stems erect, hairy; leaves almost sessile, trifoliate, villous; leaflets linear, acute; flowers sub-terminal, few, and are, as well as the legumes, glabrous. *h. H.* Native of the Levant. *C. orientalis*, &c. Sherard and Vaill. herb. Flowers large, on short pedicels, yellow. Calyx villous, more 5-cleft than bilabiate.

*Oriental Cytisus*. Fl. Ju. July. Clt. 1818. Sh. 2 to 3 feet.

†Species not sufficiently known.

37 *C. PONTICUS* (Willd. spec. 3. p. 1120. exclusive of the synonyme of Tourn.) branches furrowed, ascending, and are, as well as the leaves, pubescent; leaves trifoliate; leaflets elliptic, obtuse; branches erect, terminal; calyxes villous. *h. H.* Native of Pontus. According to Willd. this plant is allied to *Adenocarpus Hispanicus*. *C. Ponticus humifusus magno flore*, Tourn. cor. 44. According to Willd. the branches are terete, not sulcated, and the leaflets obovate, not elliptic.

*Pontic Cytisus*. Shrub ascending.

38 *C. CANESCENS* (Lois. in Duham. arbr. ed. nov. 5. p. 151.)

the whole plant is clothed with silky hoary pubescence; leaves trifoliate; leaflets linear-oblong; racemes few-flowered, terminal; calyxes short, campanulate, canescent, 5-toothed. *h. H.* Native of? Legumes unknown.

*Canescent Cytisus*. Shrub.

39 *C. AFRICANUS* (Lois. in Duham. arbr. ed. nov. 5. p. 154.) branches erect, hairy; leaves trifoliate, petiolate; leaflets linear, pilose; umbels terminal, pedunculate; calyx hairy, hardly shorter than the corolla. *h. H.* Native of the north of Africa. *C. Africanus hirsutus angustifolius*, Tourn. inst. 618. This plant is said to be allied to *Adenocarpus*.

*African Cytisus*. Shrub.

40 *C. PALLIDUS* (Poir. suppl. 2. p. 442. but not of Schrad.) branches furrowed, glabrous; leaves sessile, trifoliate; leaflets oblong-lanceolate; flowers axillary and terminal, somewhat capitate. *h. G.* Native of the Canary Islands. Corolla pale-white. Perhaps a variety of *Genista linifolia*.

*Pale-flowered Cytisus*. Shrub 2 to 3 feet.

41 *C. PROCERUS* (Link. enum. 2. p. 241.) branches terete, striated; leaves lanceolate, pilose; flowers solitary, axillary; legumes villous. *h. H.* Native of Portugal. *Spártium procérum*, Willd. enum. 742.

*Tall Cytisus*. Shrub 6 to 8 feet.

42 *C. ? PERSICUS* (Burm. fl. ind. p. 163. t. 51. f. 1.) branches straight, divaricate, and are as well as the leaves finely pubescent; leaves petiolate, trifoliate; leaflets linear, the middle one twice the length of the others; racemes elongated, loose-flowered, opposite the leaves; ovary villous. *h. H.* Native of Persia. *Spártium Persicum*, Willd. spec. 3. p. 931. Habit almost of *Indigifera psoraleoides*, and if the stamens, as is suspected, are diadelphous, it is certainly referable to *Indigifera*.

*Persian Cytisus*. Shrub 3 to 4 feet.

43 *C. ANTILLANUS* (D. C. prod. 2. p. 157.) spines under the origin of the leaves, shorter than the petioles; leaves trifoliate; leaflets rhomboidal-oblong, silvery beneath; flowers axillary, solitary, on short pedicels. *h. S.* Native of the Caribbee Islands. *C. spinosus*, Descourt, fl. med. ant. 1. t. 8. but not of Linnaeus. *C. spinosus*, with yellow flowers rising from the wings. Plum. gen. p. 19. ex Desc. Calyx campanulate, bilabiate. Legume an inch long, somewhat inflated, 5-6-seeded. Stamens, according to the description, diadelphous, but from the figure monadelphous.

*Antilles Cytisus*. Shrub.

*Cult.* The species of this genus are very elegant when in flower, the hardy kinds are well adapted for ornamenting shrubberies, the trailing kinds of them are well fitted for rock-work, or to be planted on dry banks; the *C. purpureus* is one of the handsomest of this description, and has a very beautiful appearance when grafted on a tall *Laburnum*. The larger kinds, such as the *Laburnum*, should be planted in conspicuous places. All are readily increased by seeds or layers, or by grafting the rarer on the commoner kinds. The greenhouse and frame kinds thrive best in a mixture of loam, peat, and sand, and young cuttings of them root freely if planted in a pot of sand, with a bell-glass placed over them, the glasses to be taken off and wiped occasionally.

LXI. *ADENOCARPUS* (from *ἀδην*, *aden*, a gland, and *καρπος*, *karpos*, a fruit; in reference to the legumes being beset with pedicellate glands). D. C. fl. fr. suppl. 549. Leg. mem. VI. prod. 2. p. 158.

LIN. SYST. *Monadelphia, Decandria*. Calyx obconical, usually beset with glands, bilabiate, upper lip bipartite, lower one longer and trifid. Carina obtuse, inclosing the genitals. Stamens monadelphous. Legume oblong, compressed, bearing on all sides pedicellate glands.—Shrubs with divaricate branches, trifoliate,

usually aggregate leaves, having petiolar stipulas, complicated leaflets and terminal racemes of yellow flowers, with the pedicels bracteate.

1 *A. HISPA'NICUS* (D. C. l. c.) calyx beset with glands and villi; lower lip of calyx with 3 equal segments, hardly longer than the upper lip; branchlets hairy; flowers crowded; vexillum smoothish. *h. H.* Native of Spain and Portugal, in shady humid places. *Cytisus Hispanicus*, Lam. dict. 2. p. 248. *Cytisus anagyrius*, Lher. stirp. 184.

*Spanish Adenocarpus.* Fl. June, Jul. Clt. 1816. Sh. 2 to 4 ft.

2 *A. INTERMÉDIUS* (D. C. l. c.) calyx beset with glandular pubescence, with the lower lip trifid, the lateral segments shorter than the middle one, and much exceeding the upper lip; branches rather villous; flowers remotish; vexillum smoothish. *h. II.* Native of Sicily and Naples, on mountains. Clus. hist. 1. p. 94. f. 1. *Cytisus complicatus*, Brot. fl. lus. 2. p. 92.

*Intermediate Cytisus.* Fl. May, July. Clt.? Sh. 3 to 4 feet.

3 *A. PARVIFOLIUS* (D. C. l. c.) calyx clothed with glandular pubescence, with the middle segment of the lower lip longer than the lateral ones, much exceeding the upper lip; branches glabrous; flowers remote; vexillum pubescent. *h. II.* Native of the west of France, on exposed heaths. *Cytisus parvifolius*, Lam. dict. 2. p. 248. exclusive of the synonymes. *Cytisus divaricatus*, Lher. stirp. 184. *Cyt. complicatus*, D. C. fl. fr. no. 3821. *Spartium complicatum*, Lois. fl. gall. 441. Branches white.

*Small-leaved Adenocarpus.* Fl. May, July. Clt. 1800. Sh. 3 to 4 feet.

4 *A. TELONÉNSIS* (D. C. l. c.) calyx clothed with glandless pubescence, the segments of the lower lip about equal in length, a little longer than the superior lip; branchlets smoothish; flowers remote; vexillum pubescent. *h. II.* Native of the Pyrenees, Cevennes, mountains of Provence and Rome. *Cytisus Telonensis*, Lois. fl. gall. 446. and in Duh. arb. ed. nov. 5. p. 155. t. 47. f. 2. *Spartium complicatum*, Gouan. hort. monsp. 356. exclusive of the synonyme.

*Telone Adenocarpus.* Fl. Ju. Jul. Clt. 1800. Sh. 2 to 4 ft.

5 *A. FRANKENIODES* (Choisy. mss. in herb. D. C. prod. 2. p. 158.) calyx beset with glandular pubescence, with the lower lip having the middle segment longer than the lateral ones, and exceeding the lower lip; branches velvety; leaves much crowded, hairy; flowers crowded; vexillum pubescent at the apex. *h. F.* Native of Teneriffe, on the declivities of the Peak, at the height of 5000 feet, where it is called *Codeso*. *Genista viscosa*, Willd. spec. 3. p. 837. It is usually confused with the following species, but differs in the calyx being glandular, as *A. parvifolius* differs from *A. Telonensis*.

*Frankenia-like Adenocarpus.* Fl. April, July. Clt. 1815. Shrub 1 to 3 feet.

6 *A. FOLIOLOSUS* (D. C. l. c.) calyx covered with glandless villi, with the lower lip elongated and trifid at the apex, the segments equal; leaves and branches much crowded, hairy; vexillum pubescent. *h. F.* Native of the Grand Canary Island, among bushes, and in the woods of Laguna. *Cytisus foliolosus*, Ait. hort. kew. 3. p. 49. Pluk. alm. t. 277. f. 6. bad. Young legume furnished with a few glandular hairs, adult ones almost smooth.

*Leafy Adenocarpus.* Fl. May, Ju. Clt. 1629. Sh. 4 to 6 ft.

*Cult.* Elegant plants when in flower, and well fitted for ornamenting the front of shrubberies. Their culture and propagation is the same as that for the hardy species of *Cytisus*. The two last species require protection in winter.

LXII. ONONIS (said to be from *onos*, *onos*, an ass, and *onemi*, *onemi*, to delight; some of the species are said to be grateful to asses). Lin. gen. no. 863. Lam. ill. t. 616. D. C.

prod. 2. p. 158.—*Anònis* and *Nàtrix*, Mœnch. meth. 157. and 158.

LIN. SYST. *Monadelphica*, *Decándria*. Calyx campanulate, 5-cleft, with linear segments. Vexillum large, striated. Stamens monadelphous, the tenth one sometimes almost free. Legume usually turgid, sessile, few-seeded.—Herbs or subshrubs, with trifoliate leaves, seldom simple, but more rarely imparipinnate. Flowers rising from the axils of the leaves, sometimes pedunculate, sometimes sessile, yellow or purple, rarely white. Pedicels usually furnished with an awn, a floral leaf, or abortive petiole.

SECT. I. *EUONONIS* (*eu*, *eu*, good, and *ononis*; genuine species. D. C. prod. 2. p. 158.). Stipulas adnate to the petiole.

§ 1. *Nàtrix* (the name of a plant which smells like a goat). *Leaves simple or trifoliate. Flowers axillary, pedunculate, yellow.*

1 *O. CRISPA* (Lin. spec. 1010. exclusive of the synonyme of Magn.) shrubby; leaves trifoliate; leaflets roundish, undulated, toothed, clothed with clammy pubescence; pedicels 1-flowered, awnless. *h. F.* Native of Spain. Wendl. in Rœm. arch. 1. p. 3. p. 106. Stipulas spreadingly-deflexed. Vexillum striped with blood-colour on the outside.

*Curled-leaved Rest-harrow.* Fl. June, Aug. Clt. 1739. Sh. 1 to 2 feet.

2 *O. HISPA'NICA* (Lin. fil. suppl. 324.) shrubby; leaves trifoliate; leaflets channelled, recurved, with the margin serrated; pedicels 1-2-flowered, furnished each with an awn. *h. F.* Native of Spain, along the Mediterranean Sea, in the sand. Sims, bot. mag. 2450. exclusive of the synonyme of Tenore.—Barr. icon. t. 775. Perhaps a variety of *O. crispa*.

*Spanish Rest-harrow.* Fl. May, Sept. Clt. 1799. Sh. 1 to 2 ft.

3 *O. VAGINALIS* (Vahl. symb. 1. p. 53.) shrubby; leaves crowded, sessile, trifoliate, but the upper ones are simple; stipulas sheathing; leaflets obovate, serrated; pedicels elongated, 1-flowered, permanent, each furnished with an awn. *h. F.* Native of Egypt. Vent. hort. cels. t. 32. Viv. fl. lyb. 41. t. 4. f. 4. *O. Cherlèri*, Forsk. descr. 130. Leaves, branches, peduncles, and calyxes clothed with clammy pubescence.

*Sheathed Rest-harrow.* Fl. Ju. Aug. Clt. 1815. Sh. 1 to 2 ft.

4 *O. NÀTRIX* (D. C. fl. fr. 4. p. 514.) shrubby; clothed with clammy pubescence; leaves trifoliate; leaflets oblong, serrated at the apex, upper ones sometimes simple; stipulas oval-lanceolate; pedicels 1-flowered, each furnished with an awn. *h. II.* Native of Europe, in places exposed to the sun.

*Var. α*; vexillum yellow. *O. natrix*, Lin. spec. 1008. Cam. epit. 444. with a figure. Mill. icon. t. 37. Sims, bot. mag. 329. *Natrix pinguis*, Mœnch. meth. 158.

*Var. β*; vexillum striated with red. *O. pinguis*, Lin. spec. 1009.

*Goat-root Rest-harrow.* Fl. June, Aug. Clt. 1683. Shrub 1 to 2 feet.

5 *O. ARACHNOÏDEA* (Lapeyr. abr. 409.) shrubby, villous, but not clammy; leaves pinnately trifoliate; leaflets oval-oblong, serrated at the apex, upper ones sometimes simple; pedicels 1-flowered, each furnished with an awn. *h. F.* Native of the Pyrenees, on the eastern side along the torrents. D. C. fl. fr. suppl. 552. Vexillum striated with red. Branches beset with soft hairs.

*Cobwebbed Rest-harrow.* Shrub 1 to 2 feet.

6 *O. CUSPIDATA* (Desf. atl. 2. p. 144.) herbaceous, villous, but not clammy; leaves trifoliate, but the upper ones are simple; leaflets elliptic, serrated; pedicels 1-flowered, each furnished with an awn, the awns broadest above. *h. F.* Native of Algiers. Like *O. natrix*, but the villi is longer and not clammy, and the corolla is not half the size.

*Cuspidate Rest-harrow.* Fl. May, Sept. Clt. 1818. Sh. 1 to 2 feet.

7 *O. PICTA* (Desf. fl. atl. 2. p. 144.) herbaceous, clothed with clammy villi; leaves trifoliate; leaflets elliptic, serrated; pedicels 1-flowered, each furnished with an awn, shorter than the leaves; corolla hardly higher than the calyx. 2. F. Native of Barbary, near Mascar. Vexillum painted with purple lines.

*Painted Rest-harrow.* Fl. May, June. Clt. 1820. Pl. 1 ft.

8 *O. LONGIFOLIA* (Willd. enum. 750.) shrubby, clothed with clammy pubescence; leaves trifoliate; leaflets linear-lanceolate, serrated at the apex; stipulas setaceous, linear; pedicels 1-flowered, each furnished with an awn. 2. F. Native of Tenerife and on the mountains in the Grand Canary Island.

*Long-leaved Rest-harrow.* Fl. June, Aug. Clt. 1816. Sh. 1 to 2 feet.

9 *O. FALCATA* (Viv. fl. lyb. 41. t. 18. f. 3.) erect, hairy; stipulas falcate, sheathing at the base; leaves all trifoliate; leaflets almost linear, toothed at the apex; pedicels 1-flowered, each furnished with a very short awn, longer than the leaves. 2. F. Native of Cyrenaica.

*Falcate-stipuled Rest-harrow.* Fl. Ju. Aug. Sh. 1 to 2 ft.

10 *O. RAMOSISSIMA* (Desf. fl. atl. 2. p. 142. t. 186.) plant suffruticose, much branched, clothed with clammy pubescence; leaves trifoliate; leaflets linear-obovate, serrated; pedicels 1-flowered, longer than the leaves, each furnished with a long awn.

2. F. Native of Barbary, Sicily, and Nice, in the sand by the sea side. D. C. fl. fr. 4. p. 515. Vexillum striated with purple veins.

*Much-branched Rest-harrow.* Fl. June, Aug. Clt. 1819. Shrub  $\frac{1}{2}$  to 1 foot.

11 *O. ARENARIA* (D. C. cat. hort. monsp. 128. fl. fr. suppl. p. 551.) plant suffruticose at the base, much branched, clothed with clammy pubescence; leaves trifoliate; leaflets linear-obovate, serrated; pedicels 1-flowered, shorter than the leaves, hardly awned. 2. H. Native of Montpellier, in the sand by the sea side. *Anonis spinis carens lutea minor*, Magn. bot. 21. Vexillum yellow, but not striated. Perhaps sufficiently distinct from the preceding.

*Sand Rest-harrow.* Fl. Ju. July. Clt. 1819. Sh.  $\frac{1}{2}$  to 1 foot.

12 *O. BIFLORA* (Desf. atl. 2. p. 143.) herbaceous? downy; leaves trifoliate; leaflets oblong, serrated; peduncles 2-flowered, nodding, each furnished with an awn, longer than the petioles. 2. H. Native of Barbary. Corolla yellow, painted with longitudinal lines.

*Two-flowered Rest-harrow.* Fl. Ju. July. Clt. 1818. Pl. 1 ft.

13 *O. VESTITA* (Viv. fl. lyb. p. 40. t. 18. f. 1.) herbaceous, flexuous, erectish, beset with glandular hairs; stipulas lanceolate, sheathing, striated with nerves; leaves trifoliate, upper ones simple; leaflets ovate, serrated; pedicels 1-flowered, awnless. 2. H. Native of Lybia, in the great Syrtis.

*Clothed Rest-harrow.* Pl.  $\frac{1}{2}$  foot.

14 *O. viscosa* (Lin. spec. 1009. var. a.) herbaceous, pubescent, clammy; superior leaves simple, lower leaves trifoliate, middle leaflet largest; stipulas about equal in length to the petioles; peduncles 1-flowered, each furnished with an awn, longer than the leaves; corolla longer than the calycine lobes. 2. H. Native of the south of France, Spain, and Portugal.—Barr. icon. t. 1239. Awn of pedicel shorter than the calyx.

*Clammy Rest-harrow.* Fl. Ju. July. Clt. 1759. Pl.  $\frac{1}{2}$  to 1 ft.

15 *O. BRACHYCARPA* (D. C. prod. 2. p. 160.) herbaceous, pilose, rather clammy; superior leaves simple, inferior ones trifoliate; middle leaflet largest; stipulas about equal in length to the petioles; peduncles 1-flowered, each furnished with an awn, longer than the leaves, permanent; corolla and legume length of calyx. 2. H. Native of Spain, near Aranjuez, as well as about Madrid.

*Short-podded Rest-harrow.* Fl. June, July. Clt. 1823. Pl.  $\frac{1}{2}$  foot.

16 *O. BREVIFLORA* (D. C. prod. 2. p. 160.) herbaceous, pilose, rather clammy, upper leaves simple, lower ones trifoliate; leaflets elliptic, obtuse, serrated, middle one largest; stipulas serrated, about equal in length to the petiole; peduncles 1-flowered, each furnished with an awn, length of leaves; corolla shorter than the calycine lobes. 2. H. Native of Italy, Sicily, and Spain, and perhaps of the south of France. *O. viscosa* 2, Lin. D. C. fl. fr. 5. p. 515. Awn of pedicel about equal in length to the calyx. Legume twice the length of the calyx. Perhaps only a variety of the preceding.

*Short-flowered Rest-harrow.* Fl. Ju. July. Clt. 1800. Pl.  $\frac{1}{2}$  ft.

17 *O. SICULA* (Guss. cat. 1821. p. 78.) herbaceous, diffuse, clammy, pubescent; upper leaves simple, the rest trifoliate; leaflets linear-oblong, acute, serrated at the apex; stipulas nearly entire, about equal in length to the petiole; peduncles 1-flowered, each furnished with an awn; corolla shorter than the calyx; legumes shorter than the calyx, pendulous. 2. H. Native of Sicily, on the Volcanic rocks near Palagonia. Stipulas lanceolate, acuminate. Flowers yellow, reclinate. Stamens 7-18.

*Sicilian Rest-harrow.* Fl. Ju. July. Clt. 1817. Pl. 1 foot.

18 *O. CINTRA'NA* (Brot. phyt. 138. t. 57.) herbaceous, pubescent; upper leaves simple, lower ones trifoliate; leaflets oval-oblong or lanceolate, serrated; stipulas serrated, equal in length to the petioles; peduncles 1-flowered, awnless. 2. H. Native of Portugal, on the lower region of the Cintra mountains.

*Cintra Rest-harrow.* Pl. 1 foot.

19 *O. PUBESCENS* (Lin. mant. 267.) herbaceous, erect, clammy, pubescent; upper leaves simple, the rest trifoliate; leaflets oval-oblong, serrated; stipulas large, acuminate, entire; calyxes broad, striated; peduncles 1-flowered, awnless, shorter than the leaves. 2. H. Native of Portugal, Spain, Mauritania, and the islands of the Archipelago. D. C. fl. fr. suppl. p. 551. *O. arthropodia*, Brot. phyt. 110. t. 58. *O. Morisoni*, Gouan. herb. 47. *O. calycina*, Lam. dict. 1. p. 506. Vexillum somewhat pubescent. Legume 2-seeded; shorter than the calyx, according to Brotero, but a little longer than the calyx, and containing 4 or 6 seeds in the specimen collected in Sicily contained in the herbarium of Moricand.

*Pubescent Rest-harrow.* Fl. Ju. Aug. Clt. 1680. Pl. 1 to 1 $\frac{1}{2}$  ft.

20 *O. POLYMOERPA* (Guss. pl. rar. p. 291.) plant clothed with clammy pubescence; lower leaves ternate, superior ones simple; leaflets elliptic-oblong, serrulated from the middle to the apex; peduncles 1-flowered, mutic or awned, at length exceeding the leaves; calyx nerved, equal in length to the corolla; legume pendulous, 4-6-seeded, mucronate by the reflexed style, rather longer than the calyx. 2. H. Native of Calabria. Flowers yellow.

*Polymorphous Rest-harrow.* Fl. April, May. Pl.  $\frac{1}{2}$  foot.

21 *O. CALYCINA* (Viv. fl. lyb. 41. t. 18. f. 3. but not of Lam.) herbaceous, erect, clothed with glandular hairs; lower leaves trifoliate, upper ones simple; leaflets obovate-emucated, and are, as well as the stipulas, serrate-toothed; pedicels 1-flowered, awnless, shorter than the leaves; calyx equal in length to the corolla. 2. H. Native of the north of Africa, on the sea shore.

*Large-calyced Rest-harrow.* Fl. July, Aug. Pl.  $\frac{1}{2}$  foot.

22 *O. ORNITHOPODIODES* (Lin. spec. 1009.) herbaceous, clothed with clammy pubescence; leaves trifoliate; leaflets oblong, serrated; peduncles 1-2-flowered, each furnished with an awn; legume linear, drooping, contracted between the seeds. 2. H. Native of Spain, Italy, Sicily, and Mauritania. Cav. icon. 2. t. 192. Cup. pamph. sic. ed. bon. t. 20. the outmost figure.

*Bird's-foot-like Rest-harrow.* Fl. Ju. July, Aug. Clt. 1713. Pl.  $\frac{1}{2}$  foot.

§ 2. *Natridium* (from *Natrix* and *idea*, formed; the plants have the habit of the last division). *D. C. prod.* 2. p. 161. *Leaves simple and trifoliate. Flowers axillary, pedunculate, purplish, rarely white.*

23 *O. ROTUNDIFOLIA* (Lin. spec. ed. 1. p. 719. but not ed. 2.) shrubby; leaves trifoliate; leaflets obovate-roundish, toothed; peduncles 3-flowered, bractless.  $\frac{1}{2}$ . II. Native of the Pyrenees and the Alps of Europe. Jacq. fl. austr. append. t. 49. Lam. ill. t. 616. Curt. bot. mag. 335.—Lob. icon. 2. p. 73. f. 1. *O. latifolia*, Asso, syn. 97. mant. t. 11. f. 1. *Natrix rotundifolia*, Moench.

*Var.  $\beta$ , aristata* (*D. C. prod.* 2. p. 161.) peduncles 3-flowered, each furnished with an awn.

*Round-leaved Rest-harrow.* Fl. May, Sept. Clt. 1570. Sh. 2 to 3 feet.

24 *O. TRIERACTEATA* (*D. C. fl. fr. suppl.* 553.) shrubby; leaves trifoliate; leaflets ovate, toothed; peduncles usually 3-flowered; calyx bracteated with 3 leaves.  $\frac{1}{2}$ . II. Native of Carinthia. *O. rotundifolia* of Lin. spec. ed. 2. p. 1050. exclusive of the synonyms.

*Three-bracteated-calyxed Rest-harrow.* Fl. May, July. Clt. 1800. Shrub 1 to 2 feet.

25 *O. FRUTICOSA* (Lin. spec. 1010.) shrubby; leaves trifoliate; leaflets sessile, lanceolate, serrated; stipulas connate into one, having 4 awns, leafless on the upper part; peduncles 3-flowered, disposed in a raceme.  $\frac{1}{2}$ . F. Native of Provence and Dauphiny, on the Alps. Duh. ed. nov. 1. t. 58. Mill. dict. t. 36. Sims, bot. mag. 317.

*Var.  $\beta$ , microphylla* (*D. C. prod.* 2. p. 161.) leaflets small, obovate, serrated.  $\frac{1}{2}$ . F. Native of Arragon, on the mountains. *O. fruticosa*, Asso, syn. arr. 97.

*Shrubby Rest-harrow.* Fl. May, Jun. Clt. 1680. Sh. 1 to 2 ft.

26 *O. TRIDENTATA* (Lin. spec. 1009.) shrubby; leaves palmately-trifoliate, smoothish, fleshy; leaflets linear-cuneated, tridentate at the apex; upper stipulas tridentate; peduncles 1-2-flowered.  $\frac{1}{2}$ . F. Native of Spain. Cav. icon. 2. t. 152. Magn. bot. t. 16. *O. crassifolia*, Dufour, ined. and *O. arbuscula*, Desv. journ. bot. 1814. 1. p. 76. ex herb. Desf.

*Var.  $\beta$ , canescens* (Lam. dict. 1. p. 505.) branches clothed with hoary tomentum; leaflets pale, wedge-shaped, 5-toothed.  $\frac{1}{2}$ . F. Native of Arragon. Asso, fl. arr. no. 671. var. 2.—Barr. icon. t. 416.

*Tridentate-leaved Rest-harrow.* Fl. June, Aug. Clt. 1752. Shrub 1 to 2 feet.

27 *O. ANGUSTIFOLIA* (Lam. dict. 1. p. 508.) shrubby; leaves palmately-trifoliate; leaflets linear, acute, serrated at the apex; peduncles 1-flowered, each furnished with an awn, longer than the leaves.  $\frac{1}{2}$ . F. Native of Spain, along way sides between Valentia and Denia.—Barr. icon. t. 299 or 300.

*Narrow-leaved Rest-harrow.* Fl. May, Jun. Clt. 1825. Sh. 1 ft.

28 *O. CENESIA* (Lin. mant. 267.) suffruticose at the base, many-stemmed, tufted, prostrate, glabrous; leaves palmately-trifoliate; leaflets cuneated, and are, as well as the stipulas serrated; peduncles 1-flowered, without an awn, longer than the leaves.  $\frac{1}{2}$ . H. Native of Piedmont, Provence, Dauphiny, and Savoy on rocks, in the Alps. All. fl. ped. no. 1173. t. 10. f. 2.—Barr. icon. t. 1104. *O. cristata*, Mill. dict.

*Var.  $\beta$ , subaristata* (*D. C. prod.* 2. p. 161.) peduncles each furnished with a kind of awn.  $\frac{1}{2}$ . F. Native of the Pyrenees, on the eastern side, and of Arragon. *O. Cenèsia*, Asso, syn. no. 674.

*Mount-Cenis Rest-harrow.* Fl. June, July. Clt. 1759. Sh.  $\frac{1}{2}$  to 1 foot.

29 *O. FÆTIDA* (Schousb. ex Balb. *D. C. prod.* 2. p. 161.) herbaceous; branchlets pilose; leaves smoothish, upper ones simple, the rest trifoliate; leaflets elliptic, serrulated, middle

one largest; stipulas about equal in length to the petioles; peduncles 1-flowered, each furnished with an awn.  $\frac{1}{2}$ . ? F. Native of Morocco, in fields. Corolla nearly like that of *O. Cenèsia*.

*Fætid Rest-harrow.* Fl. June, July. Clt. 1818. Pl.  $\frac{1}{2}$  foot.

30 *O. GEMINIFLORA* (Lag. nov. spec. p. 22.) herbaceous, villous; leaves trifoliate; leaflets oblong, truncate, serrate-toothed at the apex; peduncles 2-flowered, each furnished with an awn, longer than the petioles.  $\odot$ . II. Native of Spain, near Madrid, in arid places. Legumes drooping.

*Twin-flowered Rest-harrow.* Fl. Ju. Aug. Clt. 1817. Pl.  $\frac{1}{2}$  ft.

31 *O. LAXIFLORA* (Desf. fl. atl. 2. p. 146. t. 190.) herbaceous; leaflets pubescent, obovate, and are, as well as the stipulas toothed; peduncles 1-flowered, without an awn, lax; calyx about equal in length to the corolla, but 3 times shorter than the legume.  $\odot$ . II. Native of Algiers, on uncultivated hills. Corolla bluish.

*Lax-flowered Rest-harrow.* Pl.  $\frac{1}{2}$  to 1 foot.

32 *O. BROUSSENETII* (*D. C. prod.* 1. p. 161.) herbaceous; leaves trifoliate; leaflets smoothish, oblong, and are, as well as the stipulas, serrated; peduncles 1-flowered, without an awn, disposed in an almost leafless raceme; calyx one-half shorter than the corolla.  $\odot$ . II. Native of Mogodor, in fields. Root simple. Stems numerous. Peduncles 8-10 lines long. Upper stipulas joined into a bractea-like acuminate leaf.

*Brousseuet's Rest-harrow.* Pl.  $\frac{1}{2}$  foot.

33 *O. SCHÖTWH* (*D. C. prod.* 2. p. 162.) herbaceous; leaves trifoliate; leaflets oblong-obovate, smoothish, and are, as well as the stipulas, serrated; peduncles 1-flowered, without an awn, hardly the length of the calyx, aggregated into an ovate raceme; calyx shorter than the corolla and legume.  $\odot$ . II. Native near Palermo, on mountains. Stems pilose. Allied to the following.

*Schouw's Rest-harrow.* Pl.  $\frac{1}{2}$  foot.

34 *O. BROTERIANA* (*D. C. prod.* 2. p. 162.) herbaceous; upper leaves simple, the rest trifoliate; leaflets pubescent, oval, and are, as well as the stipulas, serrated; peduncles 1-flowered, without an awn, shorter than the calyx, disposed in a long peduncled raceme; calyx a little shorter than the corolla; legume glabrous.  $\odot$ . II. Native of Spain, in Estramadura, in sandy places. *O. racemosa*, Brot. fl. lus. 2. p. 97. but not of Thunb.

*Brotero's Rest-harrow.* Pl.  $\frac{1}{2}$  foot.

35 *O. RECLINATA* (Lin. spec. 1011.) herbaceous, diffuse; leaves trifoliate; leaflets obovate, serrated, covered with clammy pubescence; stipulas broad-ovate, acute, serrated; peduncles 1-flowered, length of leaves, somewhat bracteolate under the apex; calyx longer than the corolla.  $\odot$ . H. Native of the south of France, by the sea side. *D. C. fl. fr.* 4. p. 512.—Barr. icon. t. 761. Legume, according to Linnaeus, villous, and one-half longer than the corolla.

*Reclinate Rest-harrow.* Fl. June, Aug. Clt. 1800. Pl. trailing.

36 *O. MOLLIS* (Lag. nov. spec. p. 22.) herbaceous, erectish; leaves trifoliate; leaflets oblong-obovate, serrated at the apex; stipulas nearly entire; peduncles 1-flowered, without an awn, length of leaves; calyx equal in length to the corolla, and at length also to the legume.  $\odot$ . H. Native of Spain and Italy, on hills in exposed places. Stems and calyxes rather hispid. *O. Desfontainii*, Dufour, in litt. *O. mollis*, Sav. mem. soc. ital. 9. p. 351. t. 8.

*Soft Rest-harrow.* Pl.  $\frac{1}{2}$  foot.

37 *O. CHERLERI* (Lin. spec. 1007.) herbaceous, hairy; leaves trifoliate; leaflets oblong-cuneated, serrated at the apex; stipulas almost entire; peduncles 1-flowered, without an awn, shorter than the leaves, aggregate into a raceme; calyx longer than the corolla, but about equal in length to the legume.  $\odot$ . H. Native of Montpellier, on rocks, Nièze, and Barbary.—J. Bauh. hist. 2. n. 394. f. 2.

*Cherler's Rest-harrow.* Fl. June, July. Clt. 1771. Pl.  $\frac{1}{2}$  ft.  
 37 *O. PENDULA* (Desf. atl. 2. p. 197. t. 191.) herbaceous, rather hairy; leaves trifoliate; leaflets obovate, obtuse, and are, as well as the stipulas, serrated; peduncles 1-flowered, without an awn, nearly the length of the leaves; calyx a little shorter than the corolla and legume. ☉. II. Native of Barbary, in corn-fields near Mascar.

*Pendulous Rest-harrow.* Fl. June, Aug. Clt. 1818. Pl. 1 ft.

38 *O. SIENË'RI* (Besser, in litt. D. C. prod. 2. p. 162.) stem herbaceous, hairy; leaves smoothish, and for the most part simple, oval, serrated at the apex, rarely trifoliate with the lateral leaflets, oblong-linear, acute, and small; stipulas acute, entire; pedicels 1-flowered, awnless, longer than the leaves; corolla length of calyx. ☉. II. Native of Crete. *O. pëndula*, Sieb. herb. but not of Desf. Legume 2-4-seeded, a little longer than the calyx. This species comes very near to *O. Gussoniàna*, but the flowers in the dried specimens appear red.

*Sieber's Rest-harrow.* Pl.  $\frac{1}{2}$  foot.

§ 3. *Bugràna* (*Bugrane* is the French name of *Rest-harrow*). D. C. prod. 2. p. 162. Leaves simple or trifoliate. Flowers sessile or on very short pedicels, purple or rose-coloured, rarely white.

39 *O. ARBORESCENS* (Desf. fl. atl. 2. p. 149. t. 193.) erect; branchlets unarmed, sparingly villous; leaves trifoliate; leaflets obovate, serrated; calycine lobes villous, 3-nerved, rather longer than the legume. ♀. G. Native of Barbary, about Arzeau on mountains. Flowers rose-coloured.

*Arborescent Rest-harrow.* Fl. May, July. Clt. 1826. Shrub 10 feet.

40 *O. ALTÍSSIMA* (Lam. dict. 1. p. 506.) erect; branches unarmed, villous, rather viscid; leaves trifoliate; leaflets oblong-lanceolate, acute, serrated; flowers usually twin; calycine lobes villous, length of legume. ♀. II. Native of Europe, in cultivated fields and sandy places. *O. hircina*, Jacq. hort. vind. t. 93. *O. fœtens*, All. ped. no. 1164. t. 41. f. 1. *O. arvënsis*, Retz, obs. 2. p. 21. *O. spinosa* α, Lin. spec. 1006. Flowers red.

*Tallest Rest-harrow.* Fl. May, Aug. Clt. 1596. Pl. 3 to 6 ft.

41 *O. PROCURRENS* (Wallr. sched. crit. p. 381.) stems rooting at the base, creeping, diffuse; floriferous branches ascending, pubescent; leaves trifoliate; leaflets ovate-roundish, glandular on both surfaces, somewhat serrated; calycine lobes exceeding the legume. ♀. II. Native of Europe, in sandy fields frequent. *O. arvënsis*, Lam. dict. 1. p. 505. D. C. fl. fr. 4. p. 509. Flowers purple or white.

*Running Rest-harrow.* Fl. June, July. Clt. 1820. Pl. prostrate.

42 *O. REPENS* (Lin. spec. 1006.) stems prostrate, unarmed, hairy; lower leaves trifoliate, the upper ones simple, cuneate-elliptic, serrulated at the apex; flowers usually solitary. ♀. II. Native of Europe, in sandy places on the sea coast; plentiful in Britain.—Dill. hort. elth. t. 25. f. 28. *O. inermis* β, Huds. 313. *O. spinosa* γ, repens, Smith, engl. fl. 3. p. 267. Flowers white or rose-coloured.

*Var. β, cadūca* (Vill. dauph. 3. p. 428.) branches clothed with clammy villi; leaflets oblong, pubescent. ♀. II. Native of Dauphiny, on mountains.

*Creeping Rest-harrow.* Fl. June, Aug. Brit. Pl. prostrate.

43 *O. SPINOSA* (Wallr. sched. crit. p. 379. Lin. syst. veg. ed. 14. p. 651.) stems erect, and are, as well as the branches, spiny and hairy; lower leaves trifoliate, the rest simple; leaflets and leaves oblong, cuneated at the base, almost entire; flowers usually solitary; calycine lobes shorter than the legume. ♀. II. Native of Europe, by way sides and in fields; plentiful in Britain on the borders of fields, and in barren pastures. *O. spinosa* β, Lin. spec. 1006. Mart. rust. 129. Fl. dan. 783.—Tab. hist. vop. II.

913. icon. *O. arvënsis*, Smith, engl. bot. 682. and perhaps *O. senescens*, Lapeyr. abr. p. 405. Flowers either white or red.

*Var. β, angustifolia* (Wallr. l. c.) leaflets oblong; branches pubescent on one side. ♀. H. Native of Thuringia.

*Var. γ, glabra* (D. C. prod. 2. p. 163.) leaflets oblong; branches smooth. ♀. II. Native of the south of France, in dry places.

*Spiny Rest-harrow.* Fl. June, Aug. Britain. Pl. 1 to 2 feet.

44 *O. HISPIDA* (Desf. fl. atl. 2. p. 146. t. 189.) stems erect, clothed with spreading hairs, unarmed; leaves trifoliate; leaflets obovate, serrated; flowers solitary; calyx hispid, about equal in length to the corolla, but twice the length of the legume. ♀. F. Native of Barbary, in corn fields.

*Var. β, spinescens* (D. C. prod. 2. p. 163.) branches spinescent; leaflets oval-oblong. ♀. II. Native of Tauria. *O. spinosa* hirsutissima, Steven in litt.

*Hispid Rest-harrow.* Pl. 1 to 2 feet.

45 *O. MITISSIMA* (Lin. spec. 1007.) stems erect, rather pilose, white; leaves trifoliate; leaflets ovate, serrated; flowers disposed in an elongated spike, furnished with stipular, scarious, variegated bracteas. ☉. H. Native of Portugal, Corsica, and the islands of the Archipelago.—Dill. hort. elth. t. 24. f. 27. *Anonis scariosa*, Mœnch.

*Very-mild Rest-harrow.* Fl. June, July. Clt. 1732. Pl. 1 ft.

46 *O. DIFFUSA* (Ten. prod. p. 41. append. 1815. p. 62. cat. 1819. p. 59.) stems diffuse, pubescent, white; leaves trifoliate; leaflets oblong-cuneated, glabrous, serrated; stipulas lanceolate, serrated; flowers disposed in a spike; calyx scarious, shorter than the corolla, and about equal in length to the legume. ☉. II. Native of Naples and Barbary, in uncultivated places.

*Diffuse Rest-harrow.* Fl. Ju. July. Clt. 1820. Pl.  $\frac{1}{2}$  to 1 ft.

47 *O. VILLOSISSIMA* (Desf. fl. atl. 2. p. 147. t. 192.) stems diffuse, very villous, and clammy; leaves trifoliate; leaflets obovate, and are, as well as the stipulas, serrated; flowers disposed in spicate racemes; corolla and legume shorter than the calyx. ☉. ? II. Native of Algiers, in corn fields. Flowers small, rose-coloured.

*Very-villous Rest-harrow.* Pl.  $1\frac{1}{2}$  foot.

48 *O. SERRATA* (Forsk. deser. 130. Vahl. symb. 1. p. 52.) clothed with clammy pubescence, many-stemmed, decumbent; leaves trifoliate; leaflets obovate or oblong, serrated; stipulas a little toothed; flowers disposed in spicate racemes; calyx length of corolla and legume; calycine segments somewhat 3-nerved. ☉. II. Native of Egypt, Islands of the Archipelago, Corsica, and Mogodor, in sandy places. Flowers white, but with the vexillum red.

*Serrated-leaved Rest-harrow.* Pl.  $\frac{3}{4}$  to 1 foot.

49 *O. HIRTA* (Desf. hort. par. ex Poir. suppl. 1. p. 741.) plant hairy, much branched; leaves trifoliate; leaflets obovate, sharply denticulated; stipulas crenated; flowers disposed in spicate-racemes; calyx rather shorter than the corolla, but rather longer than the legume. ♀. II. Native of the Levant. Flowers blue. Floral leaves simple. Hairs on the stem soft, and spreading.

*Hairy Rest-harrow.* Fl. Ju. July. Clt. 1816. Pl. 1 foot.

50 *O. ALOPECUROIDES* (Lin. spec. 1008.) stem solitary, erect, rather pilose, branched at the base; leaves simple, elliptic, obtuse, and are as well as the large stipulas a little serrated; flowers in dense spikes; calyx hispid, nearly twice the length of the corolla and legume. ☉. II. Native of Sicily, Spain, and Barbary. Desf. fl. atl. 2. p. 146. Schkhr, handb. t. 194. Corolla rose-coloured.

*Fox-tail-like Rest-harrow.* Fl. Jul. Aug. Clt. 1696. Pl. 1 ft.

51 *O. MONOPHYLLA* (Desf. fl. atl. 2. p. 145. t. 188.) stem branched, erect, rather villous; leaves simple, elliptic, and are, as well as the large stipulas, sharply serrated; flowers in dense spikes;

calycine lobes villous, about equal in length to the corolla. ☉. H. Native of Barbary and Mogodor. Very like the preceding species.

*One-leaved Rest-harrow.* Fl. July, Aug. Clt. 1800. Pl. 1 ft.

52 *O. A'LBIA* (Poir. voy. barb. 2. p. 210.) stem erect, villous; leaves simple, oblong, and are, as well as the stipulas, serrulated; flowers distant, almost sessile, disposed in spicate racemes; calyx covered with soft villi, rather longer than the corolla. ☉. H. Native of Barbary and Naples. Vahl. symb. 2. p. 80. Desf. fl. atl. 2. p. 145. Flowers white.

*White-flowered Rest-harrow.* Fl. May, Sept. Clt. 1823. Pl. 1 to 2 feet.

53 *O. OLIGOPHY'LLA* (Ten. prod. 69. cat. 1815. app. p. 62. fl. nap. 2. t. 67.) stem ascending; leaves glabrous, simple, orbicular, and are, as well as the stipulas, serrated; flowers pedicellate, racemose; calyx villous, shorter than the corolla. ☉. H. Native of Naples and of Sicily, near Palermo, &c. There are varieties of this plant with the stems and leaves glabrous on the upper part, and pilose. Allied to *O. alba*, and hardly to be distinguished from it unless in the flowers being on longer pedicels.

*Few-leaved Rest-harrow.* Fl. May, Sept. Clt. 1823. Pl. 1 ft.

§ 4. *Bugranoides* (so called from the similarity of the species of this section to the last). *D. C. prod.* 2. p. 164. *Leaves simple or trifoliate. Flowers sessile or sub-sessile, yellow.*

54 *O. ARRAGONE'NSIS* (Asso, syn. arr. 96. t. 6. f. 2.) shrubby; leaves trifoliate, glabrous; leaflets roundish, serrated; flowers almost sessile, twin, disposed in a leafless raceme; calyx villous, one-half shorter than the corolla. ♀. H. Native of Spain, in the kingdom of Valentia, on mountains; also of Arragon, and in the Pyrenees on the confines of France, and about Vena. *D. C. fl. fr. suppl.* p. 552. *O. dumosa*, Lapeyr. arb. 410.—*Magn. hort. monsp.* 17. t. 21.

*Arragon Rest-harrow.* Fl. May, July. Clt. 1816. Shrub 1 to 2 feet.

55 *O. SPECIO'SA* (Lag. nov. spec. 22. p. 294.) shrubby, pubescent; leaves trifoliate; leaflets ovate, doubly serrated; raceme sub-spicate, terminal, elongated, hairy; lower pedicels solitary, upper ones twin, shorter than the bracteas. ♀. H. Native of Spain, in Granada.

*Shewy Rest-harrow.* Shrub 1 to 2 feet.

56 *O. JU'NCEA* (Asso, syn. arr. 96. t. 5. f. 2.) shrubby, glabrous; leaves trifoliate; leaflets obovate, and are, as well as the stipulas, serrated; flowers almost sessile, disposed in a long spike; bracteas stipular, and are, as well as the calyces, scarious; corolla length of calyx. ♀. H. Native of Spain, in Arragon. Very like *O. minutissima*, but the flowers are pale-yellow, and the stems are shrubby at the base.

*Rushy Rest-harrow.* Shrub  $\frac{1}{2}$  to 1 foot.

57 *O. CAPITA'TA* (Cav. icon. 2. p. 43. t. 154. f. 2.) glabrous; stems prostrate, branched, filiform; leaves trifoliate; leaflets ovate-oblong, toothed; flowers capitate; corolla a little longer than the calyx. ♀. H. Native of Spain, in the kingdom of Valentia.

*Capitate-flowered Rest-harrow.* Fl. June, Aug. Clt. 1820. Pl.  $\frac{1}{2}$  foot.

58 *O. STRIA'TA* (Gouan. ill. 47. *D. C. fl. fr.* 4. p. 511.) stems diffusely prostrate, branched; leaves trifoliate, rather scabrous; leaflets obovate-cuneated, striated, and are, as well as the stipulas, serrated; flowers capitate; corolla longer than the hairy clammy calyx. ♀. H. Native of mountain pastures from Arragon to Provence, near the limits of olives. *O. aggregata*, Asso, syn. arr. 56. *O. reclinata*, Lam. fl. fr. exclusive of the synonymes. There are varieties of this plant almost smooth, and beset with rough glandular hairs.

*Striated Rest-harrow.* Pl.  $\frac{1}{2}$  to 1 foot.

59 *O. COLU'MNÆ* (All. ped. 1. no. 1166. t. 20. f. 3.) pubescent; stems tufted; leaves trifoliate; leaflets obovate-oblong, and are, as well as the stipulas, serrated, but the upper leaves are simple; flowers aggregate into a leafy spike; corolla shorter than the calyx. ♀. H. Native of Spain, France, Piedmont, Switzerland, Hungary, and Tauria, on hills. *O. parviflora*, Lam. dict. 1. p. 510. but not of Thunb. *O. subocculta*, Vill. dauph. 3. p. 429. *O. minutissima*, Jacq. austr. 240.

*Column's Rest-harrow.* Fl. Ju. July. Clt. 1732. Pl.  $\frac{1}{2}$  foot.

60 *O. MINUTISSIMA* (Lin. spec. 1007.) glabrous; stems rather tufted; leaves trifoliate; leaflets oblong-obovate, serrated; stipulas subulate, entire; flowers collected into a leafy spike; corolla shorter than the calyx. ♀. H. Native of Spain, in rugged places, and the south of France. *O. saxatilis*, Lam. dict. 1. p. 509. *O. barbata*, Cav. icon. t. 153. Root sometimes shrubby. Lobes of calyx subulate, elongated.

*Very-minute Rest-harrow.* Fl. June, July. Clt. 1818. Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

61 *O. VARIEGA'TA* (Lin. spec. 1008.) glabrous, diffuse; leaves simple, sessile, obovate, striated, serrated; stipulas large, rather sheathing, serrated; flowers almost sessile, axillary; corolla longer than the pubescent calyx. ☉. H. Native of Spain, in the sand by the sea side. Desf. atl. t. 185.

*Var. β, crioclada* (*D. C. prod.* 2. p. 165.) branches and calyces hairy. ☉. H. Native about Gibraltar.

*Variegated Rest-harrow.* Fl. July, Aug. Clt. 1784. Pl. proc.

62 *O. EUPHRASIEFOLIA* (Desf. fl. atl. 2. p. 141. t. 184.) erect, glabrous, simple; leaves simple, petiolate, lanceolate, and are, as well as the stipulas, serrated; flowers disposed in a somewhat leafy spike; corolla longer than the rather hairy calyx. ☉. H. Native of Barbary, near Mascar, in sand.

*Eye-bright-leaved Rest-harrow.* Pl.  $\frac{1}{2}$  foot.

§ 5. *Pterononis* (from πτερον, pteron, a wing, and ononis, so called in allusion to the pinnate leaves of the species). *D. C. prod.* 2. p. 165. *Lower leaves impari-pinnate, having many pairs of leaflets. The species contained in this section are not sufficiently known.*

63 *O. ROSÆFOLIA* (*D. C. leg. mem. vi. prod.* 2. p. 165.) suffruticose, erect, hispid; leaflets 4 pairs, ovate, serrated, rather villous, the odd leaflet very remote from the upper pair; flowers in dense spikes. ♀. F. Native of Spain. *Anonis Hispanica frutescens folio rosæ sylvestris*, Tourn. inst. 409. ex herb. Vaill. *O. Arragonensis β*, Lam. dict. 1. p. 510. exclusive of the synonymes. Stipulas large, leafy, semi-ovate, serrated. Lower leaves with 4 pairs of leaflets, upper ones with one pair, some of them reduced to the odd leaflet. Flowers large, yellow. Calyx very villous.

*Rose-leaved Rest-harrow.* Shrub  $1\frac{1}{2}$  foot.

64 *O. CICERIFOLIA* (*D. C. leg. mem. vi.*) suffruticose, erect, hispid; leaves having 3 pairs of oblong-cuneated leaflets, which are acutely-serrated at the apex, and very villous; flowers spicate. ♀. F. Native perhaps of the Levant. Stipulas leafy, semi-ovate, acute, serrated at the apex. Lower leaves with 3 pairs of leaflets, upper ones with one pair. Calyx very villous, with linear awl-shaped lobes. Flowers yellow.

*Cicer-leaved Rest-harrow.* Shrub 1 foot.

65 *O. INÆQUIFOLIA* (*D. C. prod.* 2. p. 165.) somewhat herbaceous, erect, beset with clammy villi; leaves with 3 pairs of oval-oblong, serrated, villous leaflets, the odd one approximate to the superior pair; racemes terminal; flower pedicellate. ♀. H. Native of the Levant. *Anonis orientalis pentaphylla et heptaphylla viscosa*, Vaill. herb. Stipulas lanceolate, elongated. Lower leaves with 3 pairs of leaflets, upper ones with one pair; floral leaves simple, shorter than the pedicels. Vexillum striated.

*Unequal-leaved Rest-harrow.* Pl. 1 foot.

66 *O. PINNA'TA* (Brot. fl. lus. 2. p. 99.) herbaceous, and clothed with clammy villi; leaves with 3-4 pairs of cuneated, ciliated, somewhat serrated leaflets; spikes terminal. ☉. H. Native of Portugal, in sand. Corolla large, white, but with the vexillum rose-coloured.

*Pinnate-leaved Rest-harrow.* Pl. 1 foot.

† *Species belonging to section Euononis, but are not sufficiently known.*

67 *O. MACRACA'NTIA* (Clark. in Spreng. neue entd. 3. p. 16.) suffruticose, spiny; peduncles awnless, 1-flowered; upper leaves simple, obovate, glandular, toothed at the apex; calyx glandular, shorter than the corolla. ♀. F. Native of the Levant.

*Long-spined Rest-harrow.* Shrub.

68 *O. PANICULA'TA* (Cav. anal. scienc. nat. 1801. 4. p. 69.) villous; stem panicled; lower leaves trifoliate, middle leaflet larger; superior leaves simple; stipulas large, lanceolate, very acute. ♀. ? F. Native of the north of Africa.

*Panicled-flowered Rest-harrow.* Shrub.

69 *O. PYRAMIDA'LIS* (Cav. l. c. p. 71.) stem pilose, terete; branches alternate, pyramidal; leaves trifoliate; leaflets linear-lanceolate, serrated; flowers sessile, capitate; legume 2-seeded. ♀. ? F. Native of the north of Africa, near Sale.

*Pyramidal-branched Rest-harrow.* Shrub.

70 *O. SUBCORDA'TA* (Cav. l. c. p. 70.) erect, herbaceous; leaves all simple, and somewhat cordate, ovate-oblong, and are, as well as the stipulas, serrated; peduncles awned, 1-flowered, shorter than the leaves. ☉. H. Native of the north of Africa, near Mogodor.

*Subcordate-leaved Rest-harrow.* Pl. 1 foot.

71 *O. COMPRESSA* (Lag. anal. scienc. nat. 1801. p. 261.) stem herbaceous, compressed; peduncles 1-flowered, each furnished with an awn; leaves simple, lower ones trifoliate; stipulas entire. ☉. ? H. Native of Spain.

*Compressed-stemmed Rest-harrow.* Pl.  $\frac{1}{2}$  to 1 foot.

72 *O. PERSICA* (Burm. ind. 157. t. 49. f. 1.) plant rather diffuse, small; peduncles without an awn, 2-flowered, racemose; leaves trifoliate, with linear, truncate, serrated leaflets; stipulas quite entire. ☉. H. Native of Persia. Flowers yellow, with the habit almost of *Melilotus*.

*Persian Rest-harrow.* Pl. diffuse.

73 *O. RHINANTHOIDES* (Lapeyr. abr. 407.) erect, small, clothed with clammy villi; leaves trifoliate, with cuneated emarginate leaflets, which are awnedly-toothed; stipulas acutely-toothed; flowers almost sessile, solitary, terminal; legume ovate, villous, awned, shorter than the calyx. ☉. H. Native of the Pyrenees. Flowers having a purplish vexillum.

*Rhinanthus-like Rest-harrow.* Pl. 1 foot.

74 *O. SCABRA* (Lapeyr. abr. 407.) erect; leaves distant, trifoliate, dotted from points; leaflets cuneated, truncate, dentate at the apex; stipulas ovate, acute, entire; calyx equalling the corolla in length. ☉. H. Native of the Eastern Pyrenees. Corolla white, with a rose-coloured vexillum.

*Scabrous Rest-harrow.* Pl. 1 foot.

75 *O. PALIDA* (Horn. hort. hafn. 2. p. 676.) peduncles 1-flowered; leaves trifoliate; leaflets roundish, cuneated at the base, toothed from the middle to the apex; calyxes and legumes villous, drooping. ☉. H. Native of ?

*Pale-flowered Rest-harrow.* Pl. 1 foot.

SECT. II. LOTONONIS (from *Lotus* and *Ononis*; the plants appear intermediate between the two genera). D. C. Leg. mem. VI. prod. 2. p. 166. Stipulas hardly or not adnate to the petiole, leafy as in *Lotus*, but with the stamens monadelphous, as in the rest of *Ononis*. The species of this section are all from the Cape of Good Hope, but none of them are sufficiently known.

76 *O. SPICA'TA* (Thunb. prod. 129. fl. cap. 584.) leaves simple, stipulate, ovate, silky; stem shrubby, erect; flowers spicate. ♀. G. Leaves acute, sessile. Spikes a finger long.

*Spicate-flowered Rest-harrow.* Shrub.

77 *O. HIRSU'TA* (Thunb. l. c.) leaves simple, lanceolate, hairy; stem herbaceous, decumbent; racemes ovate, drooping. ♀. G. Plant very hairy. Leaves imbricately spreading.

*Hairy Rest-harrow.* Pl. decumbent.

78 *O. STIPULA'TA* (Thunb. l. c.) leaves trifoliate, villous; leaflets oblong, obtuse, convolute; stipulas ovate; flowers spicate; stem frutescent. ♀. G. Flowers yellow. Superior stipulas large, bract-formed.

*Stipulate-leaved Rest-harrow.* Shrub.

79 *O. PARVIFLORA* (Berg. cap. 214. Thunb. l. c. but not of Lam.) leaves trifoliate, villous; leaflets lanceolate, intermediate one largest; umbels lateral; stem herbaceous, villous. ☉. G. Branches twiggy.

*Small-flowered Rest-harrow.* Fl. June, July. Clt. 1818. Pl.  $\frac{1}{2}$  to 1 foot.

80 *O. MICROPHYLLA* (Lin. fil. suppl. 324. Thunb. l. c.) leaves trifoliate, scabrous; leaflets ovate, convolute; stipulas and bract-eas ovate; flowers axillary; branches and branchlets spinescent. ♀. G. Petiole trigonal. Legume lanceolate, reflexed, scabrous.

*Small-leaved Rest-harrow.* Shrub.

81 *O. CAPILLA'RI* (Thunb. l. c.) leaves trifoliate, glabrous; leaflets linear-lanceolate, mucronate; peduncles axillary, 1-flowered; stem erectish, suffrutescent. ♀. G. Leaves appearing in fascicles at first sight.

*Hair-leaved Rest-harrow.* Shrub.

82 *O. VILLOSA* (Thunb. l. c.) leaves trifoliate, villous; leaflets lanceolate; stipulas length of petioles; peduncles lateral, 1-flowered, each furnished beneath the leaves with an acute, linear leaflet; stems hairy, decumbent. ♀. G. Legume villous, turgid. Perhaps a species of *Cytisus* or a proper genus.

*Villous Rest-harrow.* Fl. June, July. Clt. 1820. Sh. dec.

83 *O. HETEROPHYLLA* (Thunb. l. c.) leaves trifoliate, pilose beneath; lower leaflets ovate, superior ones lanceolate; flowers solitary, pedunculate, terminal; stem herbaceous. ♀. G.

*Variable-leaved Rest-harrow.* Shrub.

84 *O. PROSTRATA* (Lin. mant. 266. Thunb. l. c.) leaves trifoliate, pubescent; leaflets ovate, obtuse; stipulas much shorter than the petiole; peduncles 1-flowered, lateral; stem decumbent. ♀. G. *Lotus prostratus*, Lin. spec. 1090.

*Prostrate Rest-harrow.* Pl. prostrate.

85 *O. DECUMBENS* (Thunb. l. c. but not of Miller) leaves trifoliate, pubescent beneath; leaflets obovate, acute; stipulas oblong; flowers solitary, lateral, on short pedicels; stem decumbent. ♀. G. Flowers yellow. Legume oblong, rather turgid.

*Decumbent Rest-harrow.* Pl. decumbent.

86 *O. SERICEA* (Thunb. l. c.) leaves trifoliate, clothed beneath with silky-villi; leaflets oblong, acute; stipulas ovate, pilose; flowers disposed in a second, 3-flowered, terminal spike. ♀. G. Stems ascending.

*Silky Rest-harrow.* Pl. prostrate.

87 *O. EXCISA* (Thunb. l. c.) leaves trifoliate, pubescent beneath; leaflets obovate, emarginate; flowers twin, terminal; stem decumbent. ♀. G. Stem glabrous. Petiole longer than leaflets. Stipulas subulate (Willd.).

*Cut-leaved Rest-harrow.* Pl. decumbent.

88 *O. GEMINATA* (Ait. hort. kew. 3. p. 23.) leaves trifoliate; leaflets obovate; peduncles lateral, 2-flowered. ♀. G. Allied to *O. excisa* according to Willd.

*Twin-flowered Rest-harrow.* Fl. July, Sept. Clt. 1788. Pl. decumbent.

89 *O. RACEMOSA* (Thunb. l. c. but not of Brot.) leaves trifoliate, pubescent beneath; leaflets oblong, acute; flowers rac-

mose; stem decumbent. ♀. G. Flowers 4, yellow, remote, drooping.

*Racemose Rest-harrow.* Pl. decumbent.

90 *O. ELONGATA* (Thunb. l. c.) leaves trifoliate, hairy; leaflets ovate, acute; peduncles lateral, 1-flowered; stem decumbent, hairy. ♀. G. Peduncles 2 inches long.

*Elongated Rest-harrow.* Pl. decumbent.

91 *O. MICRANTHA* (Thunb. l. c.) leaves trifoliate, finely pubescent beneath; leaflets oblong, obtuse; umbel of flowers terminal; stem glabrous, decumbent. ♀. G. Corolla yellow, very minute.

*Small-flowered Rest-harrow.* Pl. decumbent.

92 *O. INVOLUCRATA* (Lin. fil. suppl. 324.) leaves trifoliate, villous; leaflets oblong, obtuse; flowers umbellate, involucred; stem hairy, decumbent. ♀. G. Anthyllis involucreta, Lin. mant. 265. *Lötus ononoides*, Lam. dict. 3. p. 608. Flowers yellow.

*Involucred-flowered Rest-harrow.* Pl. decumbent.

93 *O. UMBELLATA* (Lin. mant. 266. Thunb. l. c.) leaves trifoliate, villous; leaflets oblong, obtuse; flowers umbellate; stem decumbent, hairy. ♀. G. An allied genus according to Agardh.

*Umbellate-flowered Rest-harrow.* Pl. decumbent.

94 *O. SECUNDA* (Thunb. l. c.) leaves trifoliate, glabrous; leaflets oblong, acute; umbels terminal; stem decumbent, pilose. ♀. G. Umbels involucred, 6-flowered.

*Secund-flowered Rest-harrow.* Pl. decumbent.

95 *O. STRIGOSA* (Thunb. l. c. but not of Burm.) leaves trifoliate, villous beneath; leaflets ovate, obtuse; umbels terminal; stem decumbent, frutescent. ♀. G. Leaflets longer than the petiole.

*Strigose Rest-harrow.* Shrub decumbent.

96 *O. GLABRA* (Thunb. l. c.) leaves trifoliate, glabrous; leaflets ovate, obtuse; flowers umbellate; stem decumbent, suffrutescent. ♀. G. Petiole twice the length of the leaflets. Umbels many-flowered. Corolla yellow.

*Glabrous Rest-harrow.* Pl. decumbent.

97 *O. LA'GORUS* (Thunb. l. c.) leaves trifoliate, villous; leaflets lanceolate, setaceous mucronate; spike leafy, hairy; stem erect, frutescent. ♀. G. Leaves in fascicles.

*Hare's-foot Rest-harrow.* Shrub.

98 *O. FASCICULATA* (Thunb. l. c.) leaves in fascicles, lanceolate, crenated, glabrous; flowers spicate; stem erect, pubescent, shrubby. ♀. G. Bracteas cucullately-convolute. Vexillum flesh-coloured, pubescent on the back.

*Fascicled-leaved Rest-harrow.* Shrub.

99 *O. QUINATA* (Thunb. l. c.) leaves with 5 leaflets, somewhat pubescent; leaflets lanceolate, convolute; flowers lateral, usually twin; stem decumbent, glabrous, suffrutescent. ♀. G. Legume oblong, glabrous.

*Quinate-leaved Rest-harrow.* Shrub decumbent.

100 *O. CAPE'NSIS* (Lin. amœn. 6. afr. 41. Burm. cap. 21.) leaves trifoliate, with the leaflets orbicular, rather pilose and mucronate; racemes pedunculate, long. ♂. H. Branches, peduncles, and petioles hairy. Teeth of calyx linear-subulate, rather villous. Flowers purplish.

*Cape Rest-harrow.* Fl. June, July. Clt. 1800. Pl.  $\frac{1}{2}$  foot.

101 *O. CERNUA* (Lin. spec. 1011.) leaves trifoliate, cuneiform, hardly emarginate; raceme erect, pilose; branches beset with white hairs. ♀. G. Comm. hort. amst. 2. t. 82. *Lötus cernuus*, Lam. dict. 3. p. 612. *Ononis Æthiopica*, Burm. cap. 21. *Cytisus Æthiopicus*, Lin. spec. 1042. Stamens monadelphous. Calyx trifid. Lower segment tridentate. Legume linear, compressed, drooping, torulose. Flowers yellow.

*Drooping Rest-harrow.* Shrub 2 feet.

102 *O. ASPALATHOIDES* (D. C. prod. 2. p. 167.) hairy; leaves

trifoliate; leaflets linear-oblong, attenuated at the base; stipulas oblong-linear, acute, filiform, about equal in length to the petiole; heads subterminal, 4-5-flowered, pedunculate, furnished with a trifoliate bractea under the flowers. ♂. G. Anthyllus aspalathoides, Burm. cap. 21. *Lötus ononoides*, Desv. in Lam. dict. 3. p. 609. Habit of *Lötus*. Calyx almost that of *Anthyllis*. Stem herbaceous. Stamens monadelphous. Ovary very villous.

*Var. β, linearis* (D. C. prod. 2. p. 168.) leaflets linear. *Lötus Persicus*, Desv. in Lam. dict. 3. p. 608. Burm. fl. ind. t. 49. f. 3. but both description and country remain doubtful.

*Var. γ, angustissima* (D. C. prod. 2. p. 168.) leaflets linear-subulate. *Cytisus hirtus*, Burm. cap. 22. and is to be found in his herbarium, under the name of *Anthyllis aspalathoides angustifolia*. Flowers yellow.

*Aspalathus-like Rest-harrow.* Pl.  $\frac{1}{2}$  foot.

103 *O. ANTHYLLOIDES* (D. C. prod. 2. p. 168.) leaves trifoliate; leaflets obovate, cuneated, retuse, glabrous; racemes opposite the leaves, subterminal, pedunculate; flowers pedicellate, at length drooping. ♀. G. Anthyllis ononoides, Burm. fl. cap. 21. *Psoralea herbacea*, Sieb. pl. exs. cap. no. 52. Stamens monadelphous. Flowers yellow.

*Anthyllis-like Rest-harrow.* Shrub.

104 *O. VISCIFLORA* (D. C. prod. 2. p. 168.) shrubby, prostrate; leaves digitately pinnate; leaflets linear; heads 5-6-flowered; calyxes hairy. ♀. G. Anthyllis visciflora, Lin. fil. suppl. 335. Peduncles leafless. Corolla yellow.

*Viscid-flowered Rest-harrow.* Shrub prostrate.

+ *Species not sufficiently known.*

105 *O. ANIL* (Mill. dict. no. 14.) leaves trifoliate; leaflets ovate; petioles very long, pilose; spikes terminal; legumes very hairy. ♂. H. Native of the American islands, where it is called *Indigo-darc*. Perhaps a species of *Indigofera*.

*Anil Rest-harrow.* Pl. 2 feet.

106 *O. MILLE'RI* (D. C. prod. 2. p. 168.) stem decumbent; leaves rather pilose, trifoliate; leaflets linear-lanceolate; flowers in lateral spikes, yellow. ♀. S. Native of Vera-Cruz. *O. decumbens*, Mill. dict. no. 15. but not of Thunberg. Perhaps a species of *Indigofera*.

*Miller's Rest-harrow.* Pl. decumbent.

107 *O. GLUTINOSA* (Mart. acad. mun. 6. p. 154.) shrubby, clothed with clammy pili; leaves simple, oblong, entire; stipulas subulate; flowers racemose. ♀. S. Native of the East Indies. The colour of the flowers is unknown.

*Clammy Rest-harrow.* Shrub.

*Cult.* The greater part of the species of *Ononis* are rather handsome when in flower. The hardy shrubby kinds are increased by seeds and layers; the hardy perennial kinds by dividing the plants of the roots in spring, or by seeds; these are well fitted for flower-borders. The seeds of the hardy annual kinds only require to be sown in open borders in April. The greenhouse and frame species thrive well in a mixture of loam, peat, and sand; these are usually increased by seeds, which ripen in abundance; they may also be propagated by young cuttings, planted in sand under a bell-glass.

LXIII. REQUIENIA (in honour of M. Requien of Avignon, a French botanist). D. C. leg. mem. VI. prod. 2. p. 168.

LIN. SYST. *Monadelphus*, *Decandria*. Calyx acutely and almost equally 5-cleft, permanent, but not inflated after flowering. Carina obtuse; petals free. Stamens monadelphous, with the tube cleft in front. Anthers 5. Style filiform, hardly incurved. Legume compressed, oval, 1-seeded, hooked by the base of the style.—African subshrubs, with bistipulate, simple, obcordate, mucronate, feather-nerved leaves, and with small

flowers crowded in the axils of the leaves, almost sessile. This genus is very distinct from *Podalyria*, and is more nearly allied to *Hállia*, *Anthyllis*, and *Heylandia*.

1 *R. OBCORDATA* (D. C. l. c. t. 37.) stipulas about equal in length to the calyx; legume villous; seeds ovate-oblong. *h. S.* Native of Senegal. *Podalyria obcordata*, Lam. ill. t. 327. f. 5. Poir. dict. 5. p. 445. *Sophora Senegalensis*, herb. Deless. *Crotalaria ramiflora*, Perr. in litt. 1825. Flowers sessile. Legume not attenuated at the base.

*Obcordate-leaved Requiènia*. Fl. July. Clt. 1825. Sh. 1 ft.

2 *R. SPHEROSPERMA* (D. C. l. c. t. 38.) stipulas shorter than the calyx; legumes pubescent, attenuated at the base; seeds spherical. *h. G.* Native of the Cape of Good Hope. Flowers on short pedicels.

*Spherical-seeded Requiènia*. Shrub 1 foot.

*Cult.* A mixture of loam, peat, and sand answers these shrubs, and young cuttings will strike root readily if planted in a pot of sand, with a bell-glass placed over them, the glass to be taken off and wiped occasionally.

LXIV. ANTHYLLIS (from *ανθος*, *anthos*, a flower, and *ιουλος*, *ioulos*, down, in reference to the flowers being usually downy). Lin. gen. no. 864. Lam. ill. t. 615. D. C. prod. 2. p. 168.

LIN. SYST. *Monadelphica*, *Decandria*. Calyx tubular, 5-toothed, permanent after flowering, more or less inflated. Wings about equal with the carina and vexillum. Stamens all connected. Legume ovate, 1-2-seeded, rarely oblong-linear, many-seeded, always hidden by the calyx. Herbs or subshrubs, variable in habit. Perhaps the genus ought to be divided into several genera.

SECT. I. DORYCNIODES (from *Dorycnium*, and *idea*, like; plant resembling species of *Dorycnium*). D. C. leg. mem. VI. prod. 2. p. 168. Calyx hardly inflated. Legume 1-celled, 1-seeded. Perennial herbs, with suffrutescent roots and pedunculate leafless heads of flowers. Leaves impari-pinnate, with the leaflets about equal in size and form, the odd one sessile.

1 *A. GERARDI* (Lin. mant. 100.) herbaceous, diffuse; leaves pinnate, glabrous; leaflets 5-9, oblong-linear, mucronate; heads 15-20-flowered. *U. H.* Native of Provence and Corsica, on exposed rocks and in grassy woods. Ger. galloprov. 490. t. 18. Flowers rose-coloured.

*Gerard's Kidney-vetch*. Fl. June, Aug. Clt. 1806. Pl. 1 ft. prostrate.

2 *A. ONOBRYCHIOIDES* (Cav. icon. 2. p. 40. t. 150.) herbaceous, erectish; leaves pinnate, smoothish; leaflets 7-11, linear; heads 10-12-flowered. *U. H.* Native of Spain at Valldigna. Very like the preceding species, but the flowers are said to be yellow.

*Saintfoin-like Kidney-vetch*. Fl. Ju. Jul. Clt. 1817. Pl. 1½ ft.

SECT. II. ASPALATHOIDES (from *Aspalathus* and *idea*, form; plants like *Aspalathus*). D. C. leg. mem. VI. prod. 2. p. 169. Calyx hardly inflated. Legume 1-celled, 1-2-seeded. Flowers in interrupted spikes, or nearly sessile in the axils of the superior leaves, few or solitary.—Humble, much-branched shrubs, usually spinescent. Leaves trifoliate or simple.

3 *A. CYTISOIDES* (Lin. spec. 1013.) shrubby, unarmed, much branched, twiggy; leaves simple or trifoliate; odd leaflet much larger than the lateral ones; branches hoary from adpressed velvety pubescence; flowers few, sessile in the axils of the upper leaves, forming an interrupted spike; calyxes hairy. *h. F.* Native of Spain and the south of France, on hills and among rocks.—Barr. icon. 1182. Calyx woolly. Flowers yellow. The upper leaves are simple. Perhaps the leaves are all simple, furnished with 2 leafy stipulas.

*Cytisus-like Kidney-vetch*. Fl. Apr. Ju. Clt. 1731. Sh. 2 ft. 4 *A. GENISTÆ* (Dufour, in litt. D. C. prod. 2. p. 169.) shrubby, unarmed, much branched, twiggy; branches hoary; leaves simple, lanceolate, nearly sessile, glabrous; flowers few, almost sessile in the axils of the upper leaves, forming an interrupted spike; calyx pubescent. *h. F.* Native of Spain, in Valentia on arid mountains, and in Murcia. *Genista tenuiflora*, Lag. nov. spec. 22. no. 290. Flowers yellow.

*Genista-like Kidney-vetch*. Shrub 1 to 2 feet.

5 *A. HERMANNIÆ* (Lin. spec. 1014.) shrubby, much branched; branches spinescent, smoothish; leaves almost sessile, simple, or trifoliate; leaflets oblong-cuneate, glabrous or clothed with adpressed pubescence; heads few-flowered, nearly sessile in the axils of the upper leaves. *h. F.* Native of Corsica, Crete, Palestine, and in the islands of the Archipelago. Sims, bot. mag. 2576. *Spartium spinosum*, Alp. exot. t. 26. *Aspalathus Crética*, Lin. spec. 1002. *Cytisus Græcus*, Lin. spec. 1013. ex Smith, prod. fl. græc. 2. p. 60. *Aspalathus erinacea*, Lam. dict. 1. p. 291. Flowers small, yellow. Calyx shorter and less villous.

*Hermann's Kidney-vetch*. Fl. April, July. Clt. 1739. Sh. 2 to 4 feet.

6 *A. ASPALATHI* (D. C. prod. 2. p. 169.) shrubby, much branched; branches spinescent, glabrous; leaves almost sessile, oblong-cuneate, simple, smooth; flowers nearly sessile, solitary along the tops of the branches. *h. F.* Native of the Levant and Crete. *Aspalathus Créticus*, Lin. spec. 1002. *Spartium Créticum*, Desf. cat. 213. *Aspalathus spiniflora*, Lher. herb. Very like the preceding species, but differs in the flowers being smaller and solitary, the branches more spinescent. The stamens are also monadelphous, as in the rest of *Anthyllis*, not having the vagina cleft in front, as in *Aspalathus*. Flowers yellow. Lodd. bot. cab. 1169.

*Aspalathus-like Kidney-vetch*. Fl. April, July. Clt. 1824. Shrub 2 to 4 feet.

SECT. III. ERINACEA (from *erinaceus*, a hedge-hog; in reference to the shrubs being prickly). Clus. hist. 1. p. 107. with a figure. D. C. prod. 2. p. 169. Calyx evidently inflated and bladdery after flowering. Legume 1-celled, 1-2-ovulate, compressed, lanceolate, longer than the calyx. A much-branched, spiny, almost leafless shrub. Heads few-flowered, on short peduncles, bracteate.

7 *A. ERINACEA* (Lin. spec. 1014.) shrubby; branches spinescent; leaves very few, oval, or oblong; flowers somewhat capitate. *h. F.* Native of Spain and Barbary. Andr. bot. rep. 1. t. 15. Sims, bot. mag. 676. Flowers bluish-purple.

*Hedge-hog Kidney-vetch*. Fl. April, July. Clt. 1759. Sh. ½ to 1 foot.

SECT. IV. VULNERARIA (from *vulnerarius*, for wounds; in reference to reputed vulnerary properties in *A. vulneraria*). D. C. leg. mem. VI. prod. 2. p. 169. Calyx evidently inflated and bladdery after flowering. Legume 1-celled, 1-2-seeded, shorter than the calyx, or equal to it, ovate. Heads of flowers bracteate. Shrubs or perennial herbs with impari-pinnate leaves.

8 *A. EABRAJÖVIS* (Lin. spec. 1013.) shrubby; leaves pinnate, and are as well as the branches clothed with silky tomentum; leaflets 9-13, oblong-linear, equal in size and shape; bractæes about equal in length to the globose, many-flowered head. *h. F.* Native of Spain, Barbary, the Levant, and Italy, on rocks. Sims, bot. mag. 1927. Barr. icon. t. 378. Duh. arb. ed. nov. 2. t. 67. *Vulneraria argentea*, Lam. fl. fr. *Barbajövis argyrophylla*, Moench. Flowers pale-yellow.

*Jupiter's beard* or *Silver-bush*. Fl. Mar. May. Clt. 1640. Shrub 4 to 8 feet.

9 *A. SPLENDENS* (Willd. spec. 3. p. 1018.) shrubby; leaves pinnate, and arc, as well as the branches, clothed with silky tomentum; bractea longer than the few-flowered head.  $\frac{1}{2}$ . F. Native of Crete. Perhaps only a variety of the preceding. Flowers yellow.

*Splendid Kidney-vetch.* Shrub 2 to 4 feet.

10 *A. INDICA* (Lour. coch. p. 429.) shrubby; leaves pinnate, smooth; leaflets ovate, nearly equal; racemes oblong.  $\frac{1}{2}$ . G. Native of Cochinchina, on mountains. Calyx red. Corolla white. Perhaps the head of flowers is bracteate. A large scandent shrub.

*Indian Kidney-vetch.* Shrub cl.

11 *A. HETEROPHYLLA* (Lin. spec. 1013.) shrubby, procumbent; leaves pinnate, silky; leaflets 17, lanceolate, acute; floral ones palmately-trifoliate; heads pedunculate, few-flowered.  $\frac{1}{2}$ . F. Native of Portugal and Spain. Flowers small, variegated, according to Tournefort.

*Variable-leaved Kidney-vetch.* Fl. June, July. Clt. 1768. Shrub procumbent.

12 *A. SERICEA* (Lag. nov. gen. et spec. p. 22. no. 291. but not of Willd.) shrubby, erect; leaves pinnate, clothed with silky pubescence; leaflets linear-oblong, unequal; floral ones palmately 3-5-foliate; heads pedunculate, few-flowered.  $\frac{1}{2}$ . F. Native of Spain, in the kingdom of Murcia.

*Silky Kidney-vetch.* Shrub 1 foot.

13 *A. POLYCEPHALA* (Desf. fl. atl. 2. p. 150. t. 195.) herbaceous, procumbent; leaves pinnate, and arc, as well as the branches, villous; leaflets 23-35, oval-oblong, equal, heads numerous, sessile, distant, alternate.  $\frac{1}{4}$ . F. Native of Algiers, in the fissures of rocks near Tlemcen. Flowers yellow.

*Many-headed Kidney-vetch.* Pl. 1 foot.

14 *A. MONTANA* (Lin. spec. 1012.) herbaceous, tufted; leaves pinnate, and arc, as well as the branches, white from villi; leaflets 15-19, oval-oblong; heads solitary, on long peduncles.  $\frac{1}{4}$ . H. Native of the Alps of Europe. Jacq. fl. austr. t. 334. Lam. ill. t. 615. f. 5. Lodd. bot. cab. 578. — Barr. icon. 722. Flowers pink or purplish.

*Var.  $\beta$ , albiflora*; flowers white.

*Mountain Kidney-vetch.* Fl. Ju. July. Clt. 1759. Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  ft.

15 *A. VULNERARIA* (Lin. spec. 1012.) herbaceous, erectish; leaflets pinnate, with 5 or more unequal leaflets, the lower ones smallest, and the terminal one much the largest; heads of flowers twin.  $\frac{1}{4}$ . H. Native of Europe, in fields and pastures frequent, where the soil is dry and rather barren; plentiful in Britain. D. C. fl. fr. no. 3850. Smith, engl. bot. 104. *Vulneraria rustica*, Lam. fl. fr. 2. p. 649. *Vuln. heterophylla*, Mæsch. meth. 146. *Anthyllis vulneraria* is recommended as an excellent pasturage for sheep. A Mr. Young informs us that it abounds greatly in the best meadows of the Pyrenees, at the same time he says that its produce is not large. With us the whole plant is dry, and looked upon as astringent; this is owing most probably to its affecting dry calcareous soils; cultivated in a rich soil it would doubtless become more succulent. Gesner, it seems, first raised the report of the vulnerary properties of this plant, which perhaps, like other soft and downy applications, may on an emergency staunch the blood of rustic wounds, and give nature and a good constitution time to perfect a cure.

*Var.  $\alpha$ , lutea*; flowers yellow; leaves and stems villous or smooth. Lam. ill. t. 615. f. 1.

*Var.  $\beta$ , albiflora*; flowers white.—Tourn. inst. 291. *A. rustica*, Mill. dict. no. 3.

*Var.  $\gamma$ , rubiflora*; flowers red; leaves and stems sparingly villous or smooth.—Dill. hort. elth. 320. f. 413. *A. Dillénii*, Schultes in herb. Balb. This plant is said to grow wild in Pembroke-shire.

*Var.  $\delta$ , hirsutissima*; flowers scarlet or red; plant very hairy.

*Var.  $\epsilon$ , Allionii*; flowers yellow; leaves, stems, and heads very hairy. *Astragalus vulnerarioides*, All. ped. no. 1278. t. 19. f. 2. exclusive of the description of the fruit.

Common *Wound-wort.* Fl. May, Aug. Britain. Pl. 1 foot.

16 *A. POLYPHYLLA* (Kit. ex Bess. in litt.) herbaceous; leaves pinnate, villous; leaflets 11-15, lower ones oblong, upper ones linear, terminal one largest; stem erect; heads aggregate.  $\frac{1}{4}$ . H. Native of Hungary, Volhynia, and Lithuania. Flowers yellow. *A. vulneraria* var.  $\zeta$  polyphylla, D. C. prod. 2. p. 170.

*Var.  $\beta$ , Schinerékia*; flowers yellow; leaflets 9-13, all oval. *A. vulneraria*, Schiw. ex herb. Besser. Very like *A. polycephala* of Desf.

*Many-leafletted Wound-wort.* Fl. May, Aug. Clt. 1816. Pl. 1 foot.

17 *A. INCISA* (Willd. spec. 3. p. 1017.) herbaceous, erectish; leaves pinnate, with 1-2-pairs of wedge-shaped, deeply toothed, leaflets, terminal one largest.  $\frac{1}{4}$ . H. Native of the islands of the Archipelago. Flowers purplish-violet. Stipulas ovate. Head of flowers small.

*Cut-leafletted Kidney-vetch.* Pl.  $\frac{1}{2}$  to 1 foot.

SECT. V. CORNICINA (from *cornu*, a horn; in reference to the shape of the pods). D. C. leg. mem. vi. prod. 2. p. 170. Calyxes inflated. Legume glabrous, 2 or many-celled, the seeds separated by small dissepiments.—Annual herbs, with pinnate leaves, and yellow, capitate, bracteate flowers. Perhaps a proper genus.

18 *A. TETRAPHYLLA* (Lin. spec. 1012.) herbaceous, procumbent; leaves pinnate, the terminal leaflets ovate and large, the other 3 small and acute; heads axillary, sessile, few-flowered; legume straight, 2-celled, 2-seeded, inclosed within the calyx.  $\odot$ . H. Native of the south of Europe, in exposed places. *Vulneraria vesicaria*, Lam. fl. fr. 2. p. 650. Curt. bot. mag. 108.—Cam. hort. t. 47. Barr. icon. t. 554. Perhaps the leaves are trifoliate, furnished with a small acute stipule. Flowers white.

*Four-leaved Kidney-vetch.* Fl. July, Aug. Clt. 1640. Pl. decumbent.

19 *A. CORNICINA* (Lin. spec. 1012.) herbaceous, erectish; leaves pinnate; leaflets 6-8, alternate, terminal one oblong, large, the rest oblong-linear; heads axillary, pedunculate; legume arched, 2-3-seeded, 2-3-celled, inclosed within the calyx.  $\odot$ . H. Native of Spain.—Cav. icon. 1. t. 39. f. 2. Flowers pale-yellow. Stems erect, but usually procumbent.

*Horned Kidney-vetch.* Fl. July, Aug. Clt. 1759. Pl.  $\frac{3}{4}$  foot.

20 *A. HAMOSA* (Desf. fl. atl. 2. p. 151.) herbaceous, procumbent; leaves pinnate; leaflets 7-11, lanceolate, superior one largest; heads pedunculate; legume hooked, 1-6-seeded, longer than the calyx.  $\odot$ . H. Native of Barbary, in corn-fields near Calle. *A. cornicina*, Poir. itin.

*Hooked Kidney-vetch.* Fl. July, Aug. Clt. 1821. Pl. proc.

21 *A. LOTORDES* (Lin. spec. 1012.) herbaceous, erectish; leaves pinnate; leaflets 5, oblong-linear, nearly equal; heads of flowers pedunculate; legume straight, 6-8-seeded, 6-8-celled, longer than the calyx.  $\odot$ . H. Native of Spain, in fields.—Cav. icon. 1. t. 40. Lower leaves hairy, the terminal leaflet largest.

*Lotus-like Kidney-vetch.* Fl. June, July. Clt. 1739. Pl.  $\frac{1}{2}$  foot.

22 *A. CHILENSIS* (D. C. prod. 2. p. 171.) herbaceous, decumbent, hairy; leaves pinnate, with 4 elliptic-lanceolate or oblong, nearly equal leaflets; flowers axillary, solitary; legume straight, hairy.  $\odot$ .? H. Native of Chili, at Talcahuana. *Lotus utriculatus*, Domb. et Lag. herb. *Lotus subpinnatus*, Lag. nov. gen. 23. Stamens monadelphous. Legume longer than the calyx. Root fibrous, furnished with globose scattered tubercles. Stems numerous from the root.

*Chili Kidney-vetch.* Pl. decumbent.

*Cult.* All the species of *Anthyllis* are very beautiful when in flower. The hardy, herbaceous, perennial kinds thrive best in dry light soil, and are very readily increased by seeds; they are well adapted for ornamenting rock-work. The seeds of the hardy annual kinds should be sown in a rather dry warm situation in the open ground. The green-house and frame kinds thrive best in a mixture of loam, sand, and peat, most of them produce perfect seed, by which they are readily increased. Young cuttings of them will also root if planted in a pot of sand with a bell-glass placed over them; the glasses to be taken off and wiped occasionally to prevent damp.

**SUBTRIBE II. TRIFOLIÆ** (plants agreeing with *Trifolium* in some important characters). Bronn. diss. l. c. D. C. prod. 2. p. 171. Legume 1-celled. Stamens diadelphous. Stems herbaceous, rarely frutescent. Leaves usually palmate, with 3-5 leaflets, rarely impari-pinnate. Primordial ones alternate.

**LXV. MEDICAGO** (from *Medike*, a name given by Dioscorides to a Median grass). Lin. gen. no. 1214. Gart. fruct. 2. p. 348. t. 155. f. 7. D. C. prod. 2. p. 171.

**LIN. SYST.** *Diadélphia*, *Decándria*. Calyx somewhat cylindrical, 5-cleft. Carina rather remote from the vexillum (f. 30. b.). Stamens diadelphous. Legume many-seeded, of various forms, reniform, falcate, cochleate, but usually twisted in a spiral manner (f. 30. c.).—Herbs or shrubs. Stipulas usually cut. Leaves stalked, trifoliate in all; leaflets usually toothed. Peduncles axillary, 1-2 or many-flowered. Flowers yellow.

**SECT. I. LUPULARIA** (from *lupulus*, hops. The *M. lupulina* is called *Hop-Trefoil*, from the heads of flowers resembling hops). Ser. mss. in D. C. prod. 2. p. 172. Legume reniform, falcate, or somewhat cochleate, glabrous or pubescent, with entire margins.—Leaves trifoliate.

1 *M. RUPESTRIS* (Bieb. fl. taur. 2. p. 225. suppl. p. 517.) stems prostrate; leaves trifoliate; leaflets oblong, cuneiform, toothed at the apex, pubescent; peduncles usually 2-flowered; legume reniformly twisted, reticulated, hoary; seeds rather ovate, brown; radicle hardly prominent. ♀. H. Native of Tauria, among calcareous rocks. Allied to *M. prostrata*, but differs in the peduncles being few-flowered, in the flowers being smaller, and in the legumes being less twisted.

*Rock Lucern.* Fl. June, July. Clt. 1820. Pl. ascending.

2 *M. BRACHYCARPA* (Fisch. in Bieb. fl. taur. suppl. p. 517.) pilose; stem ascending; leaves trifoliate; leaflets obovate, denticulated, with numerous nerves; stipulas lanceolate-linear; heads spherical; calycine segments 3 times longer than the tube, linear; legumes 1-seeded, with numerous transverse and parallel nerves; the seminiferous margin thick and straight; seeds ovate, cordate, compressed. ♂. H. Native of Tauria, near Tiflis.

*Short-fruited Medick.* Fl. May, Jul. Clt. 1823. Pl. prostrate.

3 *M. LUPULINA* (Lin. spec. 1097.) stem procumbent; leaves trifoliate; leaflets obovate-cuneated, denticulated at the apex; stipulas lanceolate, acute, toothed; peduncles bearing ovate spikes of flowers; flowers sessile; legumes reniform, 1-seeded, arched, reticulated; seeds ovate, somewhat kidney-shaped. ♂. H. Native of Europe, in meadows, pastures, and cultivated fields; plentiful in Britain. Smith, engl. bot. 971. Fl. dan. 992. Curt. fl. lond. fasc. 2. t. 57. Mart. fl. rust. t. 19.—Fuchs. hist. 819. icon. M. Willdenovii, Mer. fl. par. 296. is a variety having the stem and leaves more or less pilose. This is one of the most valuable of artificial grasses, affording excellent fodder for sheep. For its culture and uses see *Trifolium procumbens*.

*Var. β, polistachya* (Ser. mss. D. C. prod. 2. p. 272.) heads aggregate into a terminal raceme; leaflets large. ♂. H. Native of Switzerland, about Bern.

*Var. γ, corymbosa* (Ser. mss. D. C. prod. 2. p. 172.) flowers almost abortive and corymbose; pedicels filiform, elongated. ♂. H. Native about Geneva.

*Hop-Trefoil* or *Black Nonsuch.* Fl. May, Aug. Brit. Pl. tr.

4 *M. MNIOCARPA* (Wallr. in litt.) stems procumbent; leaflets obovate-cuneated, denticulated at the apex; stipulas lanceolate, acute, almost entire; flowers apetalous, disposed in racemose spikes; legumes falcate, hardly nerved, stipulate, unguiculate. ♂. H. Native of Switzerland about Longirod, and of Belgium.

*Moss-fruited Medick.* Fl. May, Aug. Clt. 1816. Pl. prostrate.

5 *M. CRETACEA* (Bieb. fl. taur. 2. p. 223. suppl. 517.) glabrous; stems ascending, suffruticose; leaves trifoliate; leaflets nearly orbicular, coriaceous, almost entire, having numerous nerves; stipulas lanceolate, acute, nerved; peduncles many-flowered; legume falcately-reniform, quite entire, rayed with numerous nerves. ♀. H. Native of Tauria, in sterile cretaceous places. *M. nummularia*, Stev. in Bess. cat. hort. crem. 1816. p. 85. but not of D. C. Flowers the colour and form of those of *M. falcata*, but a little smaller. A very distinct species.

*Cretaceous Lucern.* Fl. July. Clt. 1805. Pl. 2 to 3 feet long.

6 *M. CORYMBIFERA* (Schmidt in Schlecht. Linnaea. 4. p. 74.) stems ascending; leaflets obovate-cuneated, denticulated at the apex; stipulas toothed; corymbs compound, dense; peduncles and pedicels beset with glandular pili; legume reniform, rugose, pilose, 1-seeded. ♂. H. Native on the shores of the Baltic sea.

*Corymb-bearing Medick.* Pl. ascending.

7 *M. FALCATA* (Lin. spec. 1096.) stems prostrate; leaflets oblong, toothed at the apex; stipulas quite entire; peduncles racemose; legumes falcate, smoothish or pubescent; seeds oblong; radicle hardly prominent. ♂. H. Native of Europe, in dry, mountainous pastures. In Britain on dry gravelly banks and old walls; between Watford and Bushy-hill by the foot-way; in Cambridgeshire; common about Norwich in gravelly fields, and on many parts of the city walls, also about Bury St. Edmund. Smith, engl. bot. 1016. Flowers usually pale-yellow, but occasionally violet and green. This is said to be the kind of *lucerna* cultivated in Switzerland. For its culture see *M. sativa*.

*Var. β, annularis* (Ser. mss. D. C. prod. 2. p. 172.) leaflets narrower and smaller; legumes more arched. ♂. H. *M. annularis*, Besser. in litt.

*Var. γ, tumida* (Ser. mss. D. C. prod. 2. p. 173.) flowers tumid; carpels tumid. ♂. H. About Geneva.

*Falcate-podded Lucern.* Fl. July. Britain. Pl. prostrate.

8 *M. PROCUMBENS* (Besser. prim. fl. galiz. 2. p. 127.) stems procumbent; leaflets oblong-linear, toothed at the apex; stipulas toothed at the base; peduncles racemose; legume falcate, almost naked, reticulated, 2-seeded; seeds irregularly cordate. ♀. H. Native of Cracovia, in dry fields and on hills. Perhaps only a variety of *M. falcata*, but differs in the legumes being a little broader, short and long in the same specimen.

*Procumbent Lucern.* Fl. Ju. July. Clt. 1818. Pl. prostrate.

9 *M. CANCELLATA* (Bieb. fl. taur. 226. but not of Ten.) stems prostrate; leaflets oblong-cuneiform, toothed at the apex, quite smooth; stipulas subulate, lower ones denticulated; peduncles many-flowered; legume cochleate, reticulately-veined, glabrous, with the veins radiating towards the margins. ♀. H. Native of Caucasus. Flowers fewer and smaller than in *M. falcata*, always yellow.

*Latticeed-veined Lucern.* Fl. June, July. Clt. 1818. Pl. prostrate.

10 *M. SUFFRUTICOSA* (Ram. in D. C. fl. fr. 4. p. 341.) stems prostrate, suffruticose; leaflets obovate-roundish, almost entire or orbiculate; stipulas lanceolate, broad, toothed; peduncles racemose, twice the length of the petioles; legume pubescent, almost spiral, reticulated with arched veins; seeds irregularly

cordate, with a prominent radicle. *Æ. H.* Native of the Pyrenees. Flowers at first rather violaceous, but at length becoming yellow.

*Suffrutescent Lucern.* Fl. June, July. Clt. 1820. Pl. prostrate.

11 *M. ARBOREA* (Lin. spec. 1096.) villous, shrubby; leaflets obovate-cordate, nearly entire; stipulas linear, acute, entire; peduncles racemose; legumes stipitate, twisted, reticulated from transverse veins, 2-3-seeded; seeds somewhat kidney-shaped. *Æ. F.* Native of Italy.—Lob. icon. 2. p. 46.

*Tree Medick.* Fl. May, Nov. Clt. 1596. Shrub 6 to 8 feet.

12 *M. SIBIRICA* (D. C. prod. 2. p. 173.) stems herbaceous, villous at the apex; leaflets obovate-roundish, ciliated, a little toothed; stipulas broad, semi-ovate, acuminate, toothed on the outside; spikes oblong, crowded; calycine segments setaceous, unequal; legume lenticular, rather villous. *Æ. H.* Native of Siberia. *Melilotus Sibirica*, Poir. suppl. 3. p. 647. Flowers small, yellow. Calyx at length cleft on the upper side.

*Siberian Lucern.* Fl. June, July. Clt. 1817. Pl. prostrate.

13 *M. MEDIA* (Pers. ench. 2. p. 356.) stems ascending; leaflets linear-cuneate, retuse, toothed at the apex, pilose beneath; peduncles corymbose; flowers pale-blue, at length yellow. *Æ. H.* Native of Europe, in meadows, on hills, and in divisions of fields. *M. falcata*, Lam. dict. 3. p. 639. Perhaps only a variety of *M. sativa*.

*Intermediate Lucern.* Fl. Ju. July. Clt. 1817. Pl. 1 to 2 ft.

14 *M. SATIVA* (Lin. spec. 1096.) stems erect, glabrous; leaflets obovate-oblong, toothed, mucronate; stipulas lanceolate, somewhat toothed; peduncles racemose; legumes smooth, cochleately-twisted, finely reticulated; seeds flat, irregularly-ovate or irregularly cordate, brownish. *Æ. H.* Native of Spain, but now cultivated throughout Europe in fields. In Britain, but hardly a native. Smith, engl. bot. 1749. Mart. rust. 48.—Clus. hist. 2. p. 242. Flowers large, violet.

*Lucern* or *medick* is highly extolled by Ronian writers; it is much grown in Persia and Lima, and mown in both countries all the year round; it is also of unknown antiquity in old Spain, Italy, and the south of France. It was introduced, according to Miller, from the latter country in 1657. It is now only cultivated in a few places, and chiefly in Kent. Columella estimated *lucern* as the choicest of all fodders, because it lasted many years, and bore being cut down 4 or 5 times every year. About three quarters of an acre of it is, he thinks, sufficient to feed three horses during the whole year. But though it was so much esteemed by the ancients, and has been long cultivated to advantage in France and Switzerland, it has yet found no great reception in this country. Where the climate and soil suit, a field of it perhaps may be advantageously sown to afford early cutting or food for young or sick animals, for which it is said to be well adapted; but though it will produce good crops for 8 or 10 successive years, yet from the time the farmer must wait till this crop attains its perfection, and from the care requisite to keep it from grass and weeds, it is not likely that the plant will ever come into general culture in this country. *Lucern* has been observed to thrive best in dry, sandy, chalky, marly or gravelly soils; in short, all soils that are good enough for wheat, and dry enough for turnips, to be fed on the land, do well for *lucern*. The latter end of March is the best time for sowing *lucern* seed, which will allow the plants to be fully established before the hot months. If the plants be intended to be transplanted out in the garden method, it will also be the best practice to sow the seed-bed as early in the spring as the frosts will admit, in order that they may be strong enough and fit to set out early in August. *Lucern* may be either sown broad-cast or in drills, and either with or without an accompanying crop of corn the first year. Broad-cast and a very thin crop of barley or other spring crop is generally preferred. Drilling,

however, at nine inches apart, perhaps has many advantages over the broad-cast method, especially as far as regards keeping the crop clean and free from weeds. The quantity of seed required in the broad-cast method is said to be 15 to 20 pounds per acre, and from 8 to 12 if drilled. The same depth of covering as for clover will answer. Transplanting is sometimes resorted to, but it does not seem to us advisable, unless for filling up blanks. The after culture of *lucern*, sown broad-cast, consists in harrowing to destroy weeds, rolling after the harrowing to smooth the soil for the scythe, and such occasional top-dressings of manure as the state of the plants may seem to require. Where *lucern* is drilled horse-hoeing may be substituted for harrowing, which is, as already observed, the only advantage of this mode of sowing. *Lucern* frequently attains a sufficient height for the scythe towards the end of April, and in soils that are favourable for its culture will be in a state of readiness for a second cutting in the course of six weeks longer, being capable of undergoing the same operation at nearly similar distances of time during the whole of the summer season. The application of *lucern* is nearly the same as clover, the principal practice in its application is that of soiling horses, neat cattle, and hogs; but as a dry fodder it is also capable of affording much assistance, and as an early food for ewes and lambs may be of great value in particular cases. All agree in extolling it as a food for cows, whether in a green or dried state. It is said to be much superior to clover, both in increasing milk and butter, and improving their flavour. Care must be taken not to give the animals too much of it in a green state, as they may be hoven or blown with it as with clover. The produce of *lucern* may be estimated as equal in bulk and value to a crop of red clover. The nutritive product of *lucern*, according to Sir H. Davy, is 27 $\frac{3}{10}$  per cent.; as to that of clover and saintfoin, as 23 to 39. The diseases of *lucern* are the same as those of clover, and the manner of saving seed the same.

*Var. β, versicolor* (Ser. mss. D. C. prod. 2. p. 173.) flowers yellow and blue on the same plant. *M. falcata versicolor*, Wallr. sched. crit. p. 398. *M. luteo-cerulea*, Hortul.

*Cultivated Lucern.* Fl. June, Aug. Britain. Pl. 2 feet.

15 *M. PROSTRATA* (Jacq. hort. vind. 1. p. 39. t. 89.) stems prostrate; leaflets linear, toothed at the apex; stipulas linear-subulate, toothed at the base, and having numerous parallel nerves; peduncles racemose; legumes smooth, cochleately-twisted, finely reticulated, 2-seeded; seeds exactly reniform, black. *Æ. H.* Native of Hungary, Willd. spec. 3. p. 1405. *M. declinata*, Kit. in litt. Allied to *M. falcata*, but the legume is more twisted and much smaller. Flowers yellow.

*Prostrate Lucern.* Fl. June, Jul. Clt. 1793. Pl. prostrate.

16 *M. INTERMEDIA* (Schult. obs. p. 160.) stem procumbent; leaflets linear, obcordate, rather serrulated at the apex; stipulas sagittate; peduncles bearing corymbose racemes; legumes falcate, rather pubescent. *Æ. H.* Native of Galicia.

*Intermediate Lucern.* Pl. procumbent.

17 *M. GLOMERATA* (Balb. elench. 93. D. C. fl. fr. 4. p. 540.) stems erectish; leaflets obovate-oblong, cuneiform, emarginate, and mucronate, hardly toothed; stipulas lanceolate, acute, hardly toothed at the base; peduncles racemose; legumes twisted, obscurely and reticulately veined, pubescent; seed oblong-reniform, brownish. *Æ. H.* Native of the mountains of Tenda, near Barra, and on hills about Turin.

*Glomerate-flowered Lucern.* Fl. Ju. Jul. Clt. 1817. Pl. 1 to 2 ft.

18 *M. GLUTINOSA* (Bieb. casp. p. 191. append. no. 60. fl. taur. 2. p. 224. et suppl. 516.) clothed with clammy hairs; stems ascending; leaflets obovate-cuneiform, somewhat retuse, pilose, obsolete toothed; stipulas lanceolate, toothed a little at the base; peduncles racemose; calycine segments broad at the base, length of tube; legume twisted, cochleate, reticulately

veined, pubescent. *U. H.* Native of Caucasus, in mountain meadows. Flowers violet and yellow. Calyx clammy.

*Var. β, Panacriana* (Ser. mss. D. C. prod. 2. p. 174.) stem pilose, but the rest of the plant is quite smooth; leaflets obcordate, cuneiform. *M. glutinosa*, Panzer, in litt.

*Clammy Lucern.* Fl. June, July. Clt. 1817. Pl. 1 to 2 ft.

**SECT. II. SPIROCARPUS** (from *σπειρα*, *speira*, a spire, and *καρπος*, *karpos*, a fruit; in reference to the fruit of all the species being spirally twisted (f. 30. c.). Ser. mss. in D. C. prod. 2. p. 174. Legume twisted into an orbicular form (f. 30. c.), pilose, or glabrous, with the margins either entire, wrinkled, or spiny. Leaves trifoliate.

§ 1. *Legumes with thin, unarmed margins.*

19 *M. obscura* (Retz, obs. fasc. 1. p. 24. t. 1.) stems decumbent; leaflets obovate-rhomboid, denticulated, having numerous prominent nerves; stipulas lanceolate, profoundly toothed; peduncles racemose, many-flowered; legume reniform, or twisted into an orb, quite entire, glabrous, radiately veined, 2-seeded. *U. H.* Native of the south of France. *M. lenticularis*, Desr. in Lam. dict. 3. p. 630. Seeds exactly reniform, brown.

*Var. β, triflora* (Ser. in D. C. prod. 2. p. 174.) peduncles 3-flowered; leaflets very acutely toothed; legume somewhat coriaceous, twisted into a round form, having prominent nerves.

*Obscure Medick.* Fl. June, Aug. Clt. 1734. Pl. procumb.

20 *M. intermedia* (D. C. herb.) the same as the last species, but differs in the legumes being furnished with warted nerves, and in the seeds being yellow. *U. H.* Native about Naples. *M. obscura*, var. *γ*, *rugulosa*, Ser. mss. in D. C. prod. 2. p. 174.

*Intermediate Medick.* Fl. June, Aug. Clt. 1817. Pl. pr.

21 *M. levis* (Desf. fl. atl. 2. p. 213.) procumbent; leaflets obovate, toothed; stipulas dentately-pinnatifid, the segments bristle-formed; peduncles many-flowered; legume unarmed, cochleate, orbicular, flat. *U. H.* Native of the north of Africa, in fields. *M. helix*, Willd. spec. 3. p. 1409. Legume nearly like that of *M. obscura*.

*Smooth Medick.* Fl. July, Aug. Clt. 1816. Pl. tr.

22 *M. orbicularis* (All. ped. no. 1150.) stems diffuse; leaflets obcordate, toothed at the apex; stipulas jagged, the segments very narrow and diverging; peduncles 1-2-flowered; legumes cochleate, compressed, glabrous, irregularly and reticulately veined, many-seeded; seeds subtriangular, rugged from dots. *U. H.* Native of the south of Europe. *M. orbiculata*, J. Bauh. hist. 2. p. 384. Gaertn. fruct. 2. p. 155.—Mor. hist. 2. t. 15. f. 2. *M. polymorpha α*, Lin. spec. 1097.

*Var. β, microcarpa* (Moricand, herb.) fruit smaller.

*Orbicular-fruited Medick.* Fl. Jul. Aug. Clt. 1688. Pl. diff.

23 *M. marginata* (Willd. enum. p. 802.) procumbent; leaflets obovate, dentate; stipulas divided into many setaceous segments; peduncles usually 2-flowered; legume unarmed, twisted into an orbicular, flat form, the circles loose. *U. H.* Native of the south of Europe.—Moris. hist. sect. 2. t. 15. f. 2. This species is very like the preceding, but differs in the legumes being flat on both sides. It is perhaps only a variety of *M. orbicularis*.

*Margined Medick.* Fl. June, Aug. Clt. 1816. Pl. trail.

24 *M. applanata* (Willd. suppl. p. 52. ex Horn. hort. hafn. suppl. p. 85.) procumbent; leaflets obovate, toothed; stipulas divided into many setaceous segments; peduncles usually 1-flowered; legumes unarmed, orbicular, flattish on both sides, and ciliated on the margins, the circles distant and large. *U. H.* Native of? Perhaps only a variety of *M. orbicularis*.

*Flat-podded Medick.* Fl. June, Aug. Clt. 1810. Pl. trail.

25 *M. scutellata* (All. ped. no. 1155.) pilose; stems dif-

fuse; leaflets obovate, toothed around; stipulas lanceolate, toothed; peduncles 1-2-flowered; legume cochleate, many-seeded, hemispherically convex above, but flat below, beset with dense, oblique, reticulated veins; the veins thin at the margins, and anastomosing; seeds large, kidney-shaped, smooth, brown. *U. H.* Native of the south of Europe. Gaertn. fruct. 2. t. 155. f. 7.—J. Bauh. hist. 2. p. 384. with a figure. Moris. hist. sect. 2. t. 15. f. 3. *M. polymorpha β*, Lin. spec. 1097.

*Dish-like-podded Medick.* Fl. Ju. Aug. Clt. 1562. Pl. diff.

26 *M. rugosa* (Lam. dict. 3. p. 632.) procumbent; leaflets obovate-rhomboid, denticulated towards the apex; stipulas lanceolate, toothed; peduncles 2-4-flowered; legume having 2-3 circles, obliquely and reticulately veined, the veins becoming thicker towards the margins, but the margin is smooth and thinner; seeds reniform, compressed, dark, truncate at the apex. *U. H.* Native of the south of Europe. *M. elegans*, Willd. spec. 3. p. 1408.—Moris. hist. 2. sect. 2. t. 15. f. 4.

*Wrinkled-fruited Medick.* Fl. June, Aug. Clt. 1680. Pl. pr.

27 *M. saxatilis* (Bieb. fl. taur. 2. p. 225.) procumbent; leaflets oblong-cuneiform, toothed at the apex, rather pubescent; stipulas subulate, a little toothed; peduncles few-flowered; legume cochleate, veiny, with the margins beset with spiny denticulations, glabrous. *U. H.* Native of Tauria, on rocks. Legume about the size of that of *M. rupëstris*, but the form is different, the windings being only 3 or 4.

*Rock Medick.* Fl. June, Aug. Pl. procumbent.

§ 2. *Legumes with thickened, unarmed margins.*

28 *M. tornata* (Willd. spec. 3. p. 1409.) stems diffuse; leaflets obovate, denticulated; stipulas ciliate-toothed; peduncles many-flowered; legume twisted into a cylindrical form, truncate at both ends, glabrous, with thick, smooth, nerveless margins, having the circles almost concrete; seeds kidney-shaped, truncate at the apex, smooth, orange-coloured. *U. H.* Native of the south of Europe. *M. polymorpha γ*, *tornata*, Lin. spec. 1098.

*Turned-podded Medick.* Fl. June, Aug. Clt. 1658. Pl. diff.

29 *M. turbinata* (Willd. spec. 3. p. 1409.) stems diffuse; leaflets obovate-rhomboid, toothed; stipulas lanceolate, toothed; peduncles usually 2-flowered; legumes twisted into an ovate form, convex at both ends, with thick, lined, somewhat concrete margins; seeds kidney-shaped, truncate at the apex, pale-yellow. *U. H.* Native of the south of Europe. *M. polymorpha δ*, *turbinata*, Lin. spec. 1098.—Moris. hist. 2. p. 153. sect. 2. t. 15. f. 5.

*Turbinate-podded Medick.* Fl. Ju. Jul. Clt. 1680. Pl. diff.

30 *M. tuberculata* (Willd. spec. 3. p. 1410.) stems procumbent; leaflets obovate-rhomboid, toothed; stipulas lanceolate, toothed; peduncles 1-2-flowered; legume twisted into an ovate form, with thick, subconcrete margins, bearing a double row of tubercles, leprous in the summer; seeds reniform, truncate at the apex, yellow. *U. H.* Native of the south of Europe. *M. magna turbinata*, J. Bauh. hist. 2. p. 385. f. 1.—Moris. hist. sect. 2. t. 15. f. 6. ?

*Tubercled Medick.* Fl. June, Aug. Clt. 1658. Pl. pr.

31 *M. olivæformis* (Moris. clench. sard. 1827. fasc. 1.) pubescent; leaflets somewhat rhomboidal-obovate, denticulated; stipulas lanceolate, toothed; peduncles few-flowered; legumes cochleate, ovate, pubescent, having 6-7 turnings, with very thick, reticulated, warted, or tubercled margins. *U. H.* Native of Sardinia.

*Olive-formed-podded Medick.* Pl. prostrate.

32 *M. syriaca* (Bast. journ. bot. 1814. 3. p. 19.) stems procumbent; leaflets obovate, denticulated; stipulas lanceolate, toothed; peduncles 5-6-flowered; legumes with 3-5 circles, twisted into a cylindrical form, having thickened margins, beset

with mamillary dots above, and marked with lines beneath; seeds reniform, truncate at the apex, small, brownish. ☉. H. Native of Scandinavia, in sand on the sea-shore. *M. trieyela*, D. C. cat. monsp. 125.

*Striated-podded* Medick. Fl. June, Aug. Clt. 1820. Pl. pr.

§ 3. *Legumes spiny.*

33 *M. APICULATA* (Willd. spec. 3. p. 1414.) stems prostrate; leaflets obovate, hardly denticulated at the apex; stipulas ciliate-toothed; peduncles 3-7-flowered; legumes cochleate, flat at both ends, of 3 circles, reticulate and somewhat lacunose, having muricated, smooth margins; spines straight, diverging; seeds oblong-kidney-shaped, yellow. ☉. H. Native about Nice, in corn-fields. *M. coronata*, Gärtn. fruct. 2. p. 155. f. 7. but not of Lam. *M. myricata* γ, Lam. dict. 3. p. 635. *M. polycarpa*, Willd. enum. suppl. 52. *M. polycéphala*, Hortul.

*Apiculated* Medick. Fl. June, Aug. Clt. 1800. Pl. prost.

34 *M. CATALONICA* (Schrank, hort. mon. t. 28.) pubescent; stems elongated, diffuse; leaflets rhomboidal-ovate, denticulated; stipulas toothed; peduncles many-flowered; legume cochleate, compressed, having 4 muricated circles. ☉. H. Native of Catalonia. Allied to *M. spinulosa*.

*Catalonian* Medick. Fl. June, Aug. Clt. 1820. Pl. diff.

35 *M. DENTICULATA* (Willd. spec. 3. p. 1414.) stems prostrate; leaflets obovate or obcordate, denticulated; stipulas ciliate-toothed; legumes flat at both ends, having 2 circles, obliquely reticulated, with prickly smooth margins, the prickles diverging and hooked; seeds oblong-kidney-shaped, rather truncate at the apex. ☉. H. Native of the south of France, and about Conception, in Chili. This species comes very near to *M. apiculata*, but differs in the legumes being larger, and in the spines being longer and hooked.

*Var. β, ciliaris* (Ser. mss. in D. C. prod. 2. p. 176.) prickles elongated. *M. ciliaris*, Savi, cent. p. 148. but not of Willd.

*Denticulated* Medick. Fl. June, Aug. Clt. 1800. Pl. prost.

36 *M. GLOBULOSA* (Desv. journ. bot. 1814. 1. p. 77.) stems procumbent, hairy; leaflets somewhat rhomboidal, crenated, rather pilose; peduncles usually 2-flowered; legume twisted into a globose form, glabrous, having 7 approximate circles, bearing remote incurved prickles on the back. ☉. H. Native of Numidia.

*Globulose-fruited* Medick. Fl. June, Aug. Pl. procumbent.

37 *M. FLEXUOSA* (Ten. cat. 1819. p. 54.) glabrous, procumbent; leaflets obovate, retuse, toothed; stipulas ciliate-toothed; peduncles many-flowered; legume cochleate, flexuous, glabrous, having only 2 circles, which are reticulated and prickly, the prickles arched and short. ☉. H. Native of Naples, in fields.

*Flexuous-podded* Medick. Fl. June, Aug. Clt. 1819. Pl. tr.

38 *M. GLOBULIFERA* (Poir. dict. suppl. 3. p. 526.) smoothish; stems erect; leaflets ovate, denticulated; stipulas pinnatifidly-jagged; peduncles 3-4-flowered; legume twisted into a globose form, usually with 3 circles, having short, hispid, straight prickles. ☉. H. Native of?

*Globe-bearing* Medick. Pl. 1 foot.

39 *M. SPINULOSA* (D. C. fl. fr. 5. p. 569.) pilose; stems prostrate; leaflets obovate or obcordate, sharply denticulated; stipulas lanceolate, toothed; peduncles 2-flowered; legume cochleate, egg-shaped, having 3-4 circles, prickly beneath the margins, the prickles straight, converging, and adpressed, concrete, hardly longer than the lacunose margins; seeds reniform, brown, rather truncate at the apex. ☉. H. Native of the south of France, and of the islands of the Archipelago. *M. apiculata*, Bast. ess. p. 280. but not of Willd. *M. rugosa*, D'Urv. enum. p. 98. but not of Lam.

*Spinulose* Medick. Fl. June, Aug. Clt. 1820. Pl. prostr.

40 *M. PUBESCENS* (D. C. cat. monsp. p. 124. but not of Horn.) plant prostrate, clothed with soft pubescence or villi; stems elongated; leaflets broad, obovate, denticulated; stipulas lanceolate, acuminate, somewhat denticulated at the base; peduncles 5-8-flowered; legumes cochleate, having 2-3 circles, smooth, hardly arcuately reticulated under the margin; the prickles thick, converging, straight, adpressed, longer than the margin. ☉. H. Native about Montpellier.—J. Bauh. hist. 2. p. 385. with a figure. Very like *M. spinulosa*, but differs in the prickles being much longer than the margins.

*Pubescent* Medick. Fl. Ju. Aug. Clt. 1819. Pl. prostrate.

41 *M. SARDIA* (Moris. elench. sard. p. 15.) smoothish; leaflets rhomboidal-obovate, denticulated, mucronate; stipulas jagged; peduncles many-flowered; legumes cochleate, cylindrical, having 4 turnings, reticulately nerved, prickly on the margins. ☉. H. Native of Sardinia.

*Sardia* Medick. Fl. June, Aug. Pl. prostrate.

42 *M. TEREbellum* (Willd. spec. 3. p. 1416.) stems prostrate; leaflets obovate, retuse, toothed; stipulas ciliate-toothed; peduncles many-flowered; legume twisted into a cylindrical form, flat at both ends, having 5 reticulated, smooth circles; the prickles very short, distinct, subulate, and spreading; seeds reniform and dark. ☉. H. Native of the south of Europe. *M. aculeata*, Gärtn. fruct. 2. p. 349. t. 155. f. 7.

*Ant-spined* Medick. Fl. June, Aug. Clt. 1798. Pl. prostr.

43 *M. MARINA* (Lin. spec. 1097.) plant densely clothed with tomentum, procumbent; leaflets cuneiform, quite entire; stipulas lanceolate, entire; peduncles many-flowered; legumes cochleate, obliquely nerved, rather spiny; seeds exactly kidney-shaped, yellow. ☉. H. Native of Europe, by the sea-side. Gärtn. fruct. 2. p. 155. f. 7. Cav. icon. 2. t. 130.

*Sea-side* Medick. Fl. June, Aug. Clt. 1596. Pl. prostrate.

44 *M. CORONATA* (Lam. dict. 3. p. 634.) villous; stems prostrate; leaflets obovate or obcordate-roundish, small, denticulated; stipulas lanceolate, entire; peduncles 4-7-flowered, much longer than the leaves; legume cochleate, of 1 or 2 circles, villous, reticulated, the form of a crown, having divaricate, marginal, parallel, straight prickles; seeds reniformly-lunulate, small, brown. ☉. H. Native of the south of Europe, Egypt, &c.—Moris. hist. sect. 2. t. 15. f. 16. *M. coronata* Cherléri, J. Bauh. hist. 2. p. 386. with a figure. *M. polymorpha coronata*, Lin. spec. 1098.

*Crown-formed-podded* Medick. Fl. June, Aug. Clt. 1668. Pl. prostrate.

45 *M. TENTACULATA* (Willd. spec. 3. p. 1413.) prostrate; leaflets obovate, toothed; stipulas subulate, toothed; peduncles usually 2-flowered; legume cochleate, cylindrical, flat at both ends; prickles smooth, lanceolate, distich, closely adpressed. ☉. H. Native of the south of Europe. *M. truncatula*, Gärtn. fruct. 2. p. 350. t. 155. f. 7.

*Tentaculated* Medick. Fl. June, Aug. Clt. 1800. Pl. prost.

46 *M. HORNEMANIA'NA* (Ser. mss. D. C. prod. 2. p. 177.) stems hairy; leaflets rhomboid-obovate, toothed, pubescent; stipulas jagged; peduncles 2-3-flowered; legume twisted into a cylindrical form, rather pilose, small, with the circles approximate; prickles strong, subulate, reflexed, hooked. ☉. H. Native of Morocco. *M. pubescens*, Horn. hort. hafn. 2. p. 726. but not of D. C.

*Horneman's* Medick. Fl. June, Aug. Clt. 1818. Pl. trailing.

47 *M. LITTORALIS* (Rhode in Lois. not. 118. but not of Tenore,) villous; stems procumbent; leaflets obcordate or obovate-cuneiform, toothed at the apex; stipulas lanceolate, toothed; peduncles 2-4-flowered; legumes twisted, subcylindrical, glabrous, with 4 circles, obliquely and flexuously reticu-

lated, and with prickly margins; circles thick, coriaceous; prickles stiff, rather hooked; seeds reniform, bay-coloured. ☉. ? 2. ? H. Native of Europe, by the sea side.—J. Bauh. hist. 2. p. 385. with a figure.

*Var. β, breviseta* (D. C. fl. fr. 5. p. 568.) prickles short, straight. *M. polymorpha rigidula*, Bert. pl. gen. 97. exclusive of the synonymes.

*Shore* Medick. Fl. June, Aug. Clt. 1822. Pl. prostrate.

48 *M. LAPPACEA* (Lam. dict. 3. p. 637.) smoothish; stems procumbent; leaflets obovate, toothed; stipulas ciliate-toothed; peduncles 3-5-flowered; legumes twisted, smooth, obliquely and flexuously-nerved, having 3 circles, and with the margins prickly; prickles long, hooked; seeds kidney-shaped, rather truncate, yellow. ☉. II. Native about Montpellier, and also about Naples. *M. hispida*, Gaert. fruct. 2. p. 155. f. 7. ? Allied to *M. littoralis*, but the legume and seeds are larger.

*Burdock* Medick. Fl. June, Aug. Clt. 1810. Pl. trailing.

49 *M. PENTACYCLA* (D. C. cat. monsp. p. 124.) rather pilose; stems prostrate; leaflets obovate, denticulated; stipulas ciliate-toothed; peduncles many-flowered; legume cochleate, glabrous, convex at both ends; circles 5, reticulated with lacunae above; spines long, diverging, hooked at the apex; seeds ovate-reniform, compressed, bay-coloured. ☉. II. Native about Narbonne.—Moris. hist. sect. 2. t. 15. f. 19. ? Like the preceding, and perhaps not distinct.

*Five-circled* Medick. Fl. June, Aug. Clt. 1820. Pl. trailing.

50 *M. HISTRIX* (Ten. prod. p. 45. cat. 1819. p. 58) glabrous, prostrate; leaflets obovate, retuse, denticulated; stipulas pectinately-multifid; peduncles usually 2-flowered, longer than the leaves; legumes cochleate, cylindrical, compressed at both ends; circles 5, rather distant; prickles subulate, diverging, hooked, rather pilose. ☉. II. Native in fields about Naples. This plant differs from *M. ciliaris* in the legumes being glabrous, and from *M. lappacea*, Lam.

*Porcupine* Medick. Fl. June, Aug. Clt. 1820. Pl. prostrate.

51 *M. DIFFUSA* (Poir. suppl. 3. p. 524.) stems diffuse; leaflets obovate, small; stipulas broad, ciliated; peduncles usually 3-flowered; legume cochleate, globose, having 5 circles; prickles straight, hooked at the apex. ☉. II. Native of Teneriffe, on rocks. This plant differs from *M. lappacea* in the leaflets and fruit being smaller.

*Diffuse* Medick. Fl. June, Aug. Pl. diffuse.

52 *M. DISCIFORMIS* (D. C. cat. monsp. p. 124.) plant pilose; stems procumbent; leaflets obovate, dentate; stipulas lanceolate, toothed; peduncles 3-4-flowered; legume cochleate, glabrous, having 5 approximate circles, which are veiny beneath, and flat above, the 4 lower circles have their margins furnished with long setaceous spines, which are hooked at the apex, the fifth circle naked from abortion; the margins of the whole channelled between the spines. ☉. II. Native about Montpellier, in sterile places. The herb is like *M. minima*, but the form of the legume is very distinct from all the other species.

*Disk-formed* Medick. Fl. June, Aug. Clt. 1822. Pl. prostrate.

53 *M. CARSTIENSIS* (Jacq. icon. rar. 1. t. 156.) stem erect, branched; leaflets ovate, toothed; stipulas lanceolate, toothed; peduncles racemose; legume cochleate, compressed at both ends, obliquely-nerved, having about 3 or 4 circles, green, but at length black; the margins thin, nerveless, and spiny; spines long, straight, hardly diverging; seeds rather reniform, bay-coloured. 2. H. Native of the Alps of Carinthia, about Carst. Sims, bot. mag. 909. *M. Nœcea*, Balb. *M. umbellata*, Hortul.

*Carst* Medick. Fl. June, July. Clt. 1789. Pl. 1 to 2 feet.

54 *M. NIGRA* (Willd. spec. 3. p. 1418.) leaflets obovate, toothed; stipulas ciliate-toothed; peduncles usually 2-flowered; legume cochleate, cylindrical, the circles approximate;

prickles subulate, straight, hooked. ☉. II. Native of the south of France.—Moris. hist. 2. p. 151. sect. 2. t. 15. f. 19.

*Black-fruited* Medick. Fl. Ju. Aug. Clt. 1789. Pl. prostrate.

55 *M. TRIBULOIDES* (Lam. dict. 3. p. 635.) pilose; stems prostrate; leaflets obovate, toothed; stipulas profoundly toothed; peduncles 2-flowered; legume cochleate, cylindrical, flat at both ends, having 5 circles, wrinkled from lacunae; spines thick, diverging, rather hooked at the apex, lateral, not marginal, with the margins thick and elevated, not channelled; seeds kidney-shaped, bay-coloured, obliquely-truncate at the apex. ☉. II. Native of Europe, particularly of France.

*Var. β, Narbonensis* (D. C. prod. 2. p. 178.) spines adpressed, short, and are, as well as the circles, more turgid; legume with tumid warts. D. C. fl. fr. 5. p. 568.

*Caltrop-like* Medick. Fl. Ju. Aug. Clt. 1730. Pl. prostrate.

56 *M. CRASSISPINA* (Visiani, in bot. zeit. March, 1829. p. 20.) pubescent; stems prostrate, tetragonal; leaflets obovate, sharply toothed at the apex; stipulas lanceolate, acuminate, cut at the base; peduncles 3-flowered; legumes cochleate, ovate, depressed, and veiny; prickles stiff, conical, incurved, disposed in two rows. ☉. II. Native of Dalmatia. This species is nearly allied to *M. tribuloides*.

*Thick-spined* Medick. Fl. June, Aug. Pl. prostrate.

57 *M. CYLINDRACEA* (D. C. cat. monsp. p. 123.) stems prostrate; leaflets obovate, dentate; stipulas deeply-toothed; peduncles many-flowered; legume cochleate, cylindrical, truncate at both ends; circles very thick, 5-6, nearly concrete, with a denticulated, 1-lined, flattish margin; seeds regularly kidney-shaped, bay-coloured. ☉. II. Native of? *M. tornata β*, Lam. dict. 3. p. 633.

*Cylindrical-fruited* Medick. Fl. June, Aug. Clt. 1822. Pl. prostrate.

58 *M. PRÆCOX* (D. C. cat. monsp. p. 123.) stems prostrate; leaflets obovate, denticulated; stipulas ciliate-toothed; peduncles short, 1-2-flowered; legume cochleate, glabrous, flat at both ends; circles thin, rather wrinkled from lacunae, with the margins thick, nerveless, and flat, bearing the spines laterally; spines rather diverging, hooked at the apex; seeds ovate-reniform, bay-coloured. ☉. II. Native of Provence.

*Early* Medick. Fl. June, Aug. Clt. 1820. Pl. prostrate.

59 *M. MOLLISSIMA* (Roth, cat. bot. 2. p. 74.) very soft; stipulas broadest at the base, toothed at the apex; peduncles 2-flowered; legume cochleate, having 5 circles; spines long, hooked at the apex. ☉. II. Native of Spain and France.

*Very-soft* Medick. Fl. June, Aug. Clt. 1818. Pl. prostrate.

60 *M. GRECA* (Hörn. hort. hafn. p. 24 and 728.) stems prostrate; leaflets obovate, toothed at the apex, villous on both surfaces; stipulas obsolete-serrated; peduncles many-flowered; legume cochleate, rather pilose; prickles long, bent. ☉. II. Native of Greece. Willd. enum. p. 805. Perhaps distinct from *M. minima* var. *longiseta*.

*Greek* Medick. Fl. July, Aug. Clt. 1804. Pl. prostrate.

61 *M. MINIMA* (Lam. dict. 3. p. 636.) plant pilose; stems prostrate; leaflets hairy, obovate or obovate, entire, tridentate at the apex; stipulas half-ovate, nearly entire; peduncles many-flowered, short; legume cochleate, rather globose, having 3-5 very narrow flattish circles; spines compressed, channelled at the base, hooked; seeds reniform, yellow. ☉. II. Native of Europe, in sandy fields. In England at Narburgh, Norfolk, and near Newmarket. *M. polymorpha minima*, Lin. spec. 1099. Fl. dan. 211. *M. hirsuta*, All. pedem. no. 1156. ex herb. Balb. *M. echinata hirsuta* and *M. minima hirsuta*, J. Bauh. hist. 2. p. 386. with a figure. Moris. hist. sect. 2. t. 15. f. 15. *Trifolium echinatum arvense*, flore minore, C. Bauh. pin. p. 330. no. 7.

*Var. β, canescens* (Ser. mss. D. C. prod. 2. p. 178.) plant canescent; spines longish. About Geneva, in arid places.

*Var. γ, longiseta* (D. C. herb.) spines very long; stems elongated; peduncles many-flowered, elongated. *M. mollissima*, Roth, cat. bot. 3. p. 74. ? *Trifolium echinatum* arvense, C. Bauh. pin. p. 329. no. 6.

*Least Medick.* Fl. May, June. Britain. Pl. prostrate.

62 *M. ARENARIA* (Ten. cat. 1819. p. 59.) stems prostrate; leaflets obovate, denticulated; stipulas rather dentate or quite entire; peduncles usually 2-flowered, shorter than the leaves; legumes cochleate, somewhat cylindrical, flat at both ends; circles 4, approximate; prickles few, arched, diverging, hooked, glabrous. ☉. H. Native of Naples, in sandy places. *M. littoralis*, Ten. prod. 45. but not of Rhode.

*Sand Medick.* Fl. June, Aug. Clt. 1820. Pl. prostrate.

63 *M. MURICOLEPTIS* (Tineo, pl. sic. rar. pug. 1. p. 18. Tenore, app. 4. fl. neap. p. 29.) stems branched, diffuse, angular; leaves obovate or orbiculate, small, serrulated at the apex; stipulas ciliate-toothed; peduncles usually 1-flowered, about equal in length to the leaves; legume usually solitary, cochleate, compressed at both ends; circles 3-4, coarsely reticulated, prickly; prickles oblong, setaceous, arched, marginal in two rows, very broad at the base; margins flat and thickish. ☉. H. Native near Palermo, Calabria, &c. The habit of the plant is that of *M. disciformis*, but the legume in that species is much larger, reticulated, and the margins beset with long awns.

*Slender-warted Medick.* Fl. Ju. Aug. Clt. 1820. Pl. prostrate.

64 *M. UNCINATA* (Willd. spec. 3. p. 1417.) stems prostrate; leaflets obovate, toothed; stipulas toothed; peduncles many-flowered; legume cochleate, cylindrical, flat at both ends; circles distant; prickles distich, reflexed, subulate, hooked. ☉. H. Native of the south of Europe. Allied to *M. rigidula* and *M. nigra*. Perhaps not distinct from *M. pentacycla*.

*Hooked-spined Medick.* Fl. June, July. Pl. prostrate.

65 *M. DISTANS* (Poir. dict. suppl. 3. p. 326.) stems prostrate; leaflets somewhat cordate, denticulated at the apex; stipulas dentately-ciliated; peduncles 2-4-flowered; legume cochleate, ovate, having 3 distant circles, which are prickly; prickles straight, diverging, hooked at the apex. ☉. H. Native of the south of Europe.—Moris. hist. sect. 2. t. 15. f. 21. Perhaps *M. uncinata* of Willd.

*Distant-circled Medick.* Fl. June, Aug. Clt. 1810. Pl. prostrate.

66 *M. RECTA* (Desf. fl. atl. 2. p. 212.) stem erect; leaflets cuneiform, toothed, pubescent; stipulas entire; peduncles 1-flowered; legume twisted into a globose form, almost nerveless, prickly, and rather pilose; prickles long, straight, hooked; circles of legume 3-5, flatish; spines compressed, channelled, hooked. ☉. H. Native of Barbary. Perhaps only a variety of *M. minima*.

*Straight-stemmed Medick.* Fl. Ju. Aug. Clt. 1810. Pl. 1 ft.

67 *M. ACULEATA* (Willd. spec. 3. p. 1410.) prostrate; leaflets rhomboid-obovate, toothed; stipulas toothed; peduncles usually 2-flowered; legume cochleate, cylindrical, flattish at both ends, with the margins of the circles muricated. ☉. H. Native of? Very like *M. tuberculata*, but differs in the prickles of the legume being unequal, thick, very short and obtuse.

*Prickly-podded Medick.* Fl. June, Aug. Clt. 1802. Pl. prostrate.

68 *M. MACULATA* (Willd. spec. 3. p. 1412.) stems prostrate; leaflets obcordate or obovate, toothed, spotted; stipulas dilated, toothed; peduncles 2-3-5-flowered; legumes cochleate, compressed at both ends, white, having 3-5 circles, which are circularly and densely nerved, the margins fringed with 2 rows of long, spreading, slender, weak, partly hooked bristles; seeds kidney-shaped, yellow. ☉. H. Native of Europe, in sand. In England, on gravelly soil in the southern parts.—Moris. hist. sect. 2. t. 15. f. 12. *M. cordata*, Desrous. in Lam.

dict. 3. p. 636. *M. polymorpha*, Smith, engl. bot. 1616. Curt. fl. lond. 3. t. 47. Mart. fl. rust. t. 76. (f. 30.)

*Spotted-leaved Medick.* Fl. May, Aug. Britain. Pl. prostrate.

69 *M. GERARDI* (Waldst. et Kit. ex Willd. spec. 3. p. 1415.) stems prostrate; leaflets obovate, denticulated; stipulas with setaceous teeth; peduncles usually 2-flowered; legume cochleate, villously-tomentose, flattish at both ends, having 5 nerveless, prickly, thick circles; spines hooked at the apex, hardly diverging; seeds reniform, bay-coloured. ☉. H. Native of the south of Europe and Egypt. *M. villosa*, D. C. fl. fr. 4. p. 545.—Moris. hist. 2. p. 153. sect. 2. t. 15. f. 18. *M. rigidula*, Thuill. ex herb. Reyn.

*Var. β, minor* (Ser. mss.) legume cylindrical, with short prickles. *M. villosa β*, D. C. l. c.

*Gerard's Medick.* Fl. Ju. Aug. Clt. 1816. Pl. prostrate.

70 *M. AGRESTIS* (Ten. prod. suppl. 2. et cat. 1819. p. 59.) pubescent; stems prostrate; leaflets cuneiform, toothed at the apex; stipulas with setaceous teeth; peduncles usually 2-flowered; legume twisted, muricated, flat at both ends, having 5 circles; prickles about equal in length to the breadth of the legume. ☉. H. Native of Naples near Caserta, in fields.

*Field Medick.* Fl. June, Aug. Clt. 1820. Pl. prostrate.

71 *M. RIGIDULA* (Lam. dict. 3. p. 634.) stems prostrate; leaflets obovate, denticulated at the apex; stipulas toothed at the base; peduncles 2-3-flowered; legume cylindrical, flat at both ends, beset with muricate-like spines on the back, which hardly diverge. ☉. H. Native of the south of France. Allied to *M. tornata* according to Lamarck.

*Stiffish-podded Medick.* Fl. June, Aug. Clt. 1730. Pl. prostrate.

72 *M. MURICATA* (All. pedem. no. 1158.) stems prostrate; leaflets rhomboid-obovate, toothed; stipulas ciliate-toothed; peduncles 1-3-flowered; legume twisted into an ovate form, glabrous, having 5 thick, somewhat nerved circles, the margin thick, marked by an evanescent narrow zone, not furrowed; spines disposed in a single row, stiff, conical, arched, tooth-formed; seeds irregularly kidney-shaped, of a bay colour. ☉. H. Native of Europe, in fields. In England, at Orford, Suffolk, on the sea bank plentifully.—Vaill. bot. par. t. 33. f. 7. *M. polymorpha muricata*, Lin. spec. 1098.

*Muricated-podded Medick.* Fl. May, July. England. Pl. prostrate.

73 *M. SPHEROCARPUS* (Bert. ital. pl. dec. 3. p. 60.) glabrous, prostrate; leaflets rhomboidal-obovate, sharply-serrulated; stipulas jagged; peduncles many-flowered; legume twisted into a globose form, with the circles so closely adpressed as to be almost concrete, the margin thick, and bisulcate lengthwise; prickles short, thickish. ☉. H. Native of Italy, on grassy hills about Sarzena. Seb. pl. rom. p. 15. t. 3.—Moris. hist. sect. 2. t. 11. f. 12? This species is distinguished from *M. terebellum* of Willd. in the legumes being globose, not cylindrical.

*Round-fruited Medick.* Fl. Ju. Aug. Clt. 1818. Pl. prostrate.

74 *M. MUREX* (Willd. spec. 3. p. 1410.) stems prostrate; leaflets obovate, toothed, lower ones obcordate; stipulas ciliate-toothed; peduncles usually 2-flowered; legume cochleate, cylindrical, rather convex at both ends, prickly, and transversely veined; prickles long, straight, and thick. ☉. H. Native of? This species is very nearly allied to *M. muricata*, but the lower

FIG. 30.

peduncles are longer, the circles of the fruit thinner and nerved, and the prickles longer.

*Prickly Medick.* Fl. June, Aug. Clt. 1802. Pl. procumbent.

75 *M. LACINIATA* (All. pedem. no. 1159.) stem erect; leaflets linear, deeply-toothed, truncate; stipulas ciliate-toothed; peduncles 1-2-flowered; legume twisted into a globose form, very spiny; prickles straight, subulate, hooked, compressed, channelled; margin thick, flattish, but neither sulcate nor zonate; seeds oblong-reniform, bay-coloured. ☉. H. Native of the south of Europe, in corn-fields. *M. polymorpha* var. *laciniata*, Lin. spec. 1099.—Breyn. cent. 81. t. 34. good.

*Jagged-leaved Medick.* Fl. July, Aug. Clt. 1683. Pl. 1 ft.

76 *M. TENOREANA* (Ser. mss. in D. C. prod. 2. p. 180.) pubescent; stems procumbent; peduncles usually 2-flowered, shorter than the leaves; legume twisted into the form of a cylinder, having 5, distant, densely and longitudinally veined circles, the margins rather cartilaginous and rather concave, but not zonate nor sulcate; prickles setaceous, arcuately divaricate, adpressed; seeds reniform, pale. ☉. H. Native in fields about Naples. *M. cancellata*, Ten. cat. 1819. p. 58. but not of Bieb.

*Tenore's Medick.* Fl. June, Aug. Clt. 1820. Pl. prostr.

77 *M. GRANATENSIS* (Willd. enum. p. 803.) stems erect; leaflets obovate, toothed; stipulas pinnatifid; peduncles usually 2-flowered; legume twisted into a subglobose form, having 5 rather distant, reticulated circles, the margin rather cartilaginous, narrow, and convex; prickles conical, firm, and subulate, distich, and adpressed; seeds reniform, large, and black. ☉. H. Native of Spain, near Malaga. *M. polymorpha* pinnatifida, Jacq. coll. suppl. 148. t. 15. f. 2. Allied to *M. intertexta* and *M. Tenoreana*, but very distinct from either.

*Granada Medick.* Fl. June, Aug. Clt. 1816. Pl. 1 foot.

78 *M. INTERTEXTA* (Willd. spec. 3. p. 1411.) stem procumbent; leaflets obovate, toothed; stipulas ciliate-toothed; peduncles usually 2-flowered; legume pilose, cochleate, ovate, disk-formed? rather membranous, obliquely reticulated, having a thin margin; prickles straight, thick, rigid, rather channelled at the base, acute, and adpressed. ☉. H. Native of the south of Europe. Gaertn. fruct. 2. p. 350. t. 155. f. 7. ?—Moris. hist. 1. p. 153. sect. 2. f. 8. Perhaps distinct from *M. ciliaris*.

*Interwoven Medick.* Fl. June, Aug. Clt. 1629. Pl. proc.

79 *M. CILIARIS* (Willd. spec. 3. p. 1411.) stems prostrate; leaflets obovate, toothed; stipulas ciliate-toothed; peduncles usually 2-flowered; legume cochleate, ovate-globose, pilose, membranous, much reticulated, having a thick, concave, somewhat cartilaginous margin; spines conical, firm, divaricate; seeds reniform, large, black. ☉. H. Native of the south of Europe.—Moris. hist. 1. p. 153. sect. 2. t. 15. f. 7.

*Ciliated-podded Medick.* Fl. June, Aug. Clt. 1686. Pl. pr.

80 *M. ECHINUS* (D. C. fl. fr. 4. p. 546.) stems prostrate; leaflets obovate or obcordate, obsolete-toothed; stipulas lanceolate, rather ciliate-toothed; peduncles 5-6-flowered, longer than the petioles; legume twisted into an oval form, smooth, membranous, and much reticulated; spines compressed, channelled laterally, divaricate, adpressed, very long, and very acute, having 6-7 circles seeds reniform, black. ☉. H. Native of the south of France, about Nice. Moris. hist. sect. 2. t. 15. f. 9.

*Hedge-hog Medick.* Fl. June, Aug. Clt. 1818. Pl. prostr.

81 *M. ÆGAGRÓPHILA* (Desv. journ. bot. 1814. 1. p. 76.) stem procumbent, glabrous; leaflets obovate, toothed, mucronate, somewhat emarginate; stipulas pinnatifidly-toothed; peduncles usually 2-flowered; legume cochleate, smooth, somewhat compressed, having 6 approximate circles, bearing thick prickles on the back. ☉. H. Collected in gardens.

*Wild-goat-loved Medick.* Fl. June, Aug. Clt. 1820. Pl. pr.

*Cult.* The seeds of the annual species of this genus only

require to be sown in the open border in spring. The perennial herbaceous species may be increased by dividing the plants at the root in spring. The shrubby species, as *M. arborea*, are easily raised from cuttings.

**LXVI. HYMENOCARPOS** (from *ὑμην*, *hymen*, a membrane, and *καρπος*, *karpos*, a fruit; in reference to the membranous legumes). Savi, fl. pis. 2. p. 205. *Medicago*, sect. 1. *Hymenocarpos*, Ser. mss. in D. C. prod. 2. p. 171.

**LIN. SYST.** *Diadelphia*, *Decandria*. Calyx subcylindrical, 5-cleft. Keel remote from the vexillum. Stamens diadelphous. Legume many-seeded, rather membranous, compressed, and arched, never twisted. Herbs with 3-5-foliate leaves, and yellow flowers.

1 *H. CIRCINNATUS* (Savi, l. c.) stem prostrate; leaves pinnately 5-foliate; leaflets entire, ovate, the terminal one large and oblong; peduncles 2-4-flowered, subcorymbose; legume membranous, kidney-shaped, pilose, with the margins toothed but not winged; seeds kidney-shaped, compressed. ☉. H. Native of the Mediterranean, on the sea-shore, and of Corsica. *Medicago circinnata*, Lin. spec. 1096.

*Circinnate-legumed Hymenocarpus.* Fl. July, Aug. Clt. 1640. Pl. prostrate.

2 *H. NUMMULARIUS* (Savi, l. c.) stem prostrate, lower leaves entire, upper ones pinnately 5-7-foliate; leaflets ovate, entire, the terminal one largest and oblong; pedicels 3-flowered, rather shorter than the leaves; legume broad, compressed, somewhat membranous, of a reniform, orbicular figure, with the margins entire, and furnished with a narrow, nerved wing. ☉. H. Native of the south of France and Egypt. *Medicago nummularia*, D. C. cat. hort. monsp. p. 124. but not of Steven. *Medicago circinnata*, Gaertn. fruct. 2. p. 348. t. 155. f. 6. *Medicago circinnata* β, Willd. spec. 3. p. 1404.

*Money-wort-legumed Hymenocarpus.* Fl. June, Aug. Clt. 1640. Pl. prostrate.

3 *H. RADIATUS* (Willd. enum. p. 801.) stem erect; leaves trifoliate; leaflets obovate, sharply toothed; stipulas toothed; pedicels 1-flowered, longer than the leaves; legume membranous, broad, compressed, reniform, having broadly winged, toothed, reticulately veined margins. ☉. H. Native of Italy and the Levant. *Medicago radiata*, Lin. spec. 1096. Gaertn. fruct. 2. p. 348. t. 155. f. 7. *M. lunata*, J. Bauh. hist. 2. p. 386.—Moris. hist. sect. 2. t. 15. f. 3.

*Var. β, dasycarpus* (Ser. mss.) legume pilose. Native of the Levant.

*Ray-legumed Hymenocarpus.* Fl. June, Aug. Clt. 1629. Pl. ½ foot.

*Cult.* The seeds of these plants only require to be sown in the open border in spring.

**LXVII. TRIGONELLA** (from *τρεῖς*, *treis*, three, and *γωνία*, an angle; the vexillum of the flower is flat, and the keel is very small and narrow, which gives the flower a triangular appearance). Lin. gen. no. 1213. Gaertn. fruct. 2. p. 332. t. 152. f. 3. D. C. prod. 2. p. 181.

**LIN. SYST.** *Diadelphia*, *Decandria*. Calyx campanulate, 5-cleft. Carina small, the wings and vexillum rather spreading, forming apparently a 3-petalled corolla. Legume oblong, compressed or cylindrical, acuminate, erectish, many-seeded.—Sweet-scented herbs, with trifoliate leaves, the middle leaflet stalked.

**SECT. I.** *GRAMMOCARPOS* (from *γραμμα*, *gramma*, writing, and *καρπος*, *karpos*, a fruit; in reference to the nerved legumes). Ser. mss. in D. C. prod. 2. p. 181. Flowers capitate or umbellate. Legume ovate, longitudinally nerved, ending in a long beak.

1 *T. CÆRULÆA* (Ser. mss. in D. C. prod. 2. p. 181.) stem upright; leaflets ovate, lower ones ovate-roundish, denticulated; stipulas lanceolate, toothed at the base; heads pedunculate, dense-flowered; calycine teeth linear, longer than the tube; petals white, lined with blue; legume ovate, beaked, nerved lengthwise, 2-3-seeded; beak long, straight; seeds globose, olive-coloured, wrinkled from dots; radicle rather prominent. ☉. H. Native of Bohemia and Switzerland. Sturm, deutsch. fl. 1. fasc. 15. *Trifolium melilotus cærulæa*, Lin. spec. 1077. *Melilotus cærulæa*, Lam. dict. 4. p. 62. Sims, bot. mag. 2283. Flowers blue.

*Blue-flowered Trigonella.* Fl. July, Aug. Clt. 1562. Pl. 1 to 2 feet.

2 *T. BESSERIANÆA* (Ser. mss. in D. C. prod. 2. p. 181.) stem decumbent; stipulas membranous lanceolate; racemes oblong, pedunculate; legume 2-seeded, short, pilose, veined, tapering into a mucrone at the apex, 3-times longer than the calyx. ☉. H. Native of the south of Podolia, and Bessarabia. *Melilotus procumbens*, Besser. enum. volh. 30. no. 946. Very like *T. cærulæa*, but differs in the decumbent habit, the narrower leaflets, the smaller flowers, the larger legumes, and the brown seeds.

*Besser's Trigonella.* Fl. June, Aug. Clt. 1810. Pl. proc.

3 *T. MARITIMA* (Delil. in Poir. dict. suppl. 5. p. 361.) stem diffuse, glabrous; leaflets obversely cordate, glabrous, denticulated; peduncles axillary, shorter than the leaves; flowers disposed in capitate umbels, reflexed; legume short, acute, turgid at the base, striated, straight. ☉. H. Native near Alexandria, on the sea-shore. Flowers yellow.

*Sea-side Trigonella.* Pl. diffuse.

4 *T. UNCINATA* (Ser. mss. in D. C. prod. 2. p. 181.) stems ascending; leaflets oblong-ovate, denticulated; stipulas linear-setaceous; flowers disposed in dense spikes; calyx nerved, bilabiate, upper lip entire, short, lower lip 4-cleft; legume ovate, pilose, beaked, hardly nerved, 1-seeded; beak long, curved; seeds ovate, compressed, wrinkled from dots, black; radicle hardly prominent. ☉. H. Native of Iberia and of France, about Libourne. *Trifolium Melilotus hamosum*, Bieb. fl. taur. 2. p. 207. and suppl. 705. *Melilotus uncinata*, Besser. cat. hort. crem. 1816. no. 155. *M. hamosa*, Link. enum. 2. p. 266. but not of Lamarek. *M. uncinata*, Poir. suppl. 3. p. 648. Flowers yellow.

*Hooked-podded Trigonella.* Fl. Ju. Aug. Clt. 1798. Pl. 1 ft.

5 *T. LITTORALIS* (Guss. cat. 1821. p. 83.) stem branched, rather diffuse; leaflets cuneiform, denticulated at the apex; legumes pedicellate, umbellate, declinate, rather falcate, compressed, tapering to both ends, obliquely and reticulately veined; peduncles spinose. ☉. H. Native of Sicily, among stones by the sea-side. Corolla yellow. This species is allied to *T. maritima*, but it differs in the leaflets being cuneiform, not obcordate, and in the legumes being acute at both ends, not turgid at the base, somewhat falcate, not straight, as well as in being pilose, not glabrous.

*Shore Trigonella.* Fl. June, Aug. Clt. 1816. Pl. diffuse.

6 *T. CALLICERAS* (Fisch. in Bieb. fl. taur. suppl. p. 515.) stems ascending; leaflets obovate-cuneate, sharply toothed at the apex; stipulas linear-subulate; teeth of calyx acute, length of tube; legume falcate, somewhat spirally striated, having a long beak; seeds 5-6, ovate, wrinkled from dots. ☉. H. Native of Iberia. D. C. mem. soc. gen. 2. p. 135. hort. gen. fasc. 2. with a figure. *Lotus medicaginoides*, Retz. obs. 2. p. 38. no. 74. *T. oxyrhyncha*, Fisch. in litt. Flowers yellow.

*Pretty-horned Trigonella.* Fl. Ju. Jul. Clt. 1816. Pl. ascend.

SECT. II. *FÆNUM-GRÆCUM* (from *fænum*, hay, and *Græcus*, Greek; Greek hay; the *T. Fænum-Græcum* was formerly made into hay in Greece). Ser. mss. in D. C. prod. 2. p. 182. *Fæ-*

*num-Græcum*, Tourn. inst. 1. p. 408. t. 230. Flowers sessile, solitary, and twin. Legume elongated, compressed, ending in a long beak, and reticulated lengthwise.

7 *T. PROSTRATA* (D. C. fl. fr. 5. p. 571.) stems diffusely procumbent; leaflets obovate-oblong, cuneiform, sharply serrated; calyx pilose; teeth of calyx subulate, length of tube; legume falcate, longer than the beak, 6-seeded; seeds small, ovate, and somewhat kidney-shaped, wrinkled from dots; radicle hardly prominent. ☉. H. Native of Provence and about Montpellier. *T. Fænum-Græcum* β, D. C. fl. fr. 4. p. 551.—J. Baulh. hist. 2. p. 365. f. 2. Flowers white.

*Prostrate Fenugreek.* Fl. June, Aug. Clt. 1818. Pl. prost.

8 *T. GLADIATA* (Stev. cat. hort. gor. 1808. p. 112. Bieb. fl. taur. 2. p. 222. and suppl. p. 516.) plant covered with rufous pili; stems spreading; leaflets triangularly-obovate, toothed at the apex; teeth of calyx linear, length of tube; legume falcate, about equal in length to the beak, tomentose, striated with veins. ☉. H. Native of Tauria, in fields. Perhaps only a variety of *F. prostrata*. Flowers white.

*Sword-podded Fenugreek.* Fl. April, May. Clt. 1825. Pl. spreading.

9 *T. FÆNUM-GRÆCUM* (Lin. spec. 1402.) stem erect, simple; leaflets obovate, obsolete toothed; stipulas lanceolate, falcate, entire; calyx pilose; the teeth subulate, length of tube; legume falcate, twice the length of the beak, reticulated lengthwise, many-seeded; seeds large, ovate, wrinkled from dots; radicle rather prominent. ☉. H. Native of the south of France. Gärtn. fruct. t. 152. f. 3. Schkuhr. handb. 2. t. 211. Woodv. med. bot. t. 158. *T. gladiata*, Hortul. This plant was formerly cultivated by the Romans, and is still occasionally employed in the agriculture of the south of Europe. The seeds have a strong disagreeable smell, and an unctuous, farinaceous taste, accompanied with a slight bitterness. An ounce renders a pint of water thick and slimy. To rectified spirit they give out the whole of their distinguishing smell and taste, and afterwards to water a strong flavourless mucilage. These seeds are never given internally, their principal use being in cataplasms and fomentations, for softening, maturating, and dispersing tumours, and in emollient glysters. They were also an ingredient in the oleum e mucilagibus; but this has no longer a place in the pharmacopæia. They are used by grooms and farriers for horses. *Fenugreek* has not been cultivated in any quantity for use in England, because it is an uncertain crop, occasioned by the inconstancy of our weather.

*Common Fenugreek.* Fl. June, Aug. Clt. 1597. Pl. 1 to 2 ft.

SECT. III. *BUCERAS* (from βουρ, *bous*, an ox, and κερα, *keras*, a horn; in reference to the form of the pods). Ser. mss. in D. C. prod. 2. p. 182.—*Bucératis*, spec. Mœnch. meth. p. 143. Flowers disposed in pedunculate or sessile racemose umbels. Legume cylindrically-compressed, a little arched, reticulated and mucronate.

#### § 1. *Racemes pedunculate.*

10 *T. SPINOSA* (Lin. spec. 1094.) stems spreading; leaflets obovate-cuneate, denticulated at the apex; stipulas dissected; flowers in fascicles, sessile; middle peduncle spinose, sterile; legume arched, compressed, declinate, very long, transversely veined, glabrous, many-seeded; seeds irregularly oblong, wrinkled from dots; radicle rather prominent. ☉. H. Native of Crete. *Buceras spinosa*, Mœnch. meth. p. 143.—Breyn. cent. 79. t. 33. f. 1. Flowers pale-yellow.

*Spinose Trigonella.* Fl. July, Aug. Clt. 1739. Pl. pr.

11 *T. STRIATA* (Lin. fil. suppl. p. 340.) stems spreading; leaflets obovate, denticulated at the apex, striped; stipulas linear, dilated at the base, and toothed; umbels pedunculate; legume arched, compressed, very long, glabrous, having trans-

verse, arched veins, many-seeded, assurgent; seeds oblong, somewhat truncate, having wrinkled lines. ☉. II. Native of Abyssinia. Willd. spec. 3. p. 1399. Flowers yellow.

*Striped-leaved Trigonella*. Fl. June, Aug. Clt. 1800. Pl.  $\frac{1}{2}$  to 1 foot long.

12 *T. HAMOSA* (Lin. spec. 1094.) stems decumbent; leaflets ovate-cuneiform, denticulated at the apex; legumes disposed in racemes, declinate, hooked, terete; common peduncle spinose, longer than the leaves. ☉. II. Native of Egypt.—J. Bauh. hist. 2. p. 357.—Alp. Egypt. t. 124. Flowers yellow. The seeds of this plant are said to be used by the Egyptians in fomentations for all kinds of pains.

*Hooked-podded Trigonella*. Fl. Jul. Aug. Clt. 1640. Pl. dec.

13 *T. TÓRTA* (Smith, in Rees' cycl. vol. 36.) stem firm; leaflets obcordate, toothed, obscurely nerved; flowers umbellate; peduncles short; legume cylindrical, twisted, reticulated lengthwise, stiff, glabrous. ☉. II. Native of Egypt. Flowers yellow. Plant quite smooth.

*Twisted-podded Trigonella*. Pl.  $\frac{1}{2}$  foot.

14 *T. FLEXUOSA* (Delil. ex Poir. suppl. 5. p. 362. but not of Fischer) stem firm; leaflets obcordate, toothed, obscurely nerved; legumes disposed in umbels, which are nearly sessile, compressed, reticulated, twisted. ☉. H. Native of Egypt. This plant comes near to *T. tórta*, but differs in the umbels being nearly sessile, and in the teeth of the calyx being longer, the legume also is very different, ex Smith, in Rees' cycl. vol. 36. Perhaps a variety of *T. anguina*, of Delil.

*Flexuous-podded Trigonella*. Fl. June, July. Clt. 1820. Pl.  $\frac{1}{2}$  to  $\frac{3}{4}$  foot.

15 *T. FISCHERIA'NA* (Scr. mss. in D. C. prod. 2. p. 183.) stems spreading; leaflets obovate-cuneated, striated, serrulated; stipulas straight, lanceolate-subulate; flowers disposed in racemes, each containing about 6; common peduncle awnless; floriferous peduncle exceeding the leaf; calycine segments subulate, length of tube; legume a little arched, erectish, flexuously-torulose, many-seeded; seeds oblong, somewhat truncate, wrinkled. ☉. II. Native of Tauria, about Tiflis. *T. flexuosa*, Fisch. in hort. gor. ex Bieb. fl. taur. suppl. p. 515. but not of Delil. Flowers yellow.

*Fischer's Trigonella*. Fl. July, Aug. Clt. 1818. Pl.  $\frac{1}{2}$  to  $\frac{3}{4}$  ft.

16 *T. ANGUINA* (Delil. fl. ægypt. p. 110. t. 110. f. 2.) stems branched, prostrate; leaflets ovate-cuneated, crenated; stipulas toothed; heads of flowers nearly sessile; legume linear, compressed, pilose, plicately flexuous. ☉. II. Native near Cairo. Flowers yellow.

*Snake-podded Trigonella*. Pl. prostrate.

17 *T. TENUIS* (Fisch. in hort. gor. and Bieb. fl. taur. suppl. p. 514.) stems spreading; leaflets obovate-obcordate, striated, serrulated; stipulas lanceolate, toothed at the base, straight; flowers usually in fours; floriferous peduncle awnless, about equal in length to the leaf; calycine segments subulate, length of tube; legumes usually twin, a little arched, erect, compressed, transversely and flexuously reticulated; seeds ovate, compressed, somewhat truncate, wrinkled from dots; radicle hardly prominent. ☉. H. Native of Tauria, on mountains about Tiflis. This species is allied to *T. cancellata*. Flowers yellow.

*Slender Trigonella*. Fl. June, July. Clt. 1824. Pl. proc.

18 *T. HAMIGERA* (Spreng. neue entd. 3. p. 158.) legumes pedicellate, linear, hooked, declinate, pubescent; fructiferous peduncles unarmed; leaflets cuneated, toothed, silky. ☉. II. Native of? Perhaps *T. tenuis*, ex Spreng. l. c.

*Hook-bearing Trigonella*. Pl.  $\frac{1}{2}$  foot.

19 *T. CANCELLATA* (Desf. cat. hort. par. 218. Poir. dict. suppl. 5. p. 361.) stems spreading, much branched; leaflets cuneated, serrated; stipulas subulate, small; fructiferous peduncle awnless, about equal in length to the leaf; legume arched,

glabrous, compressed, reticulated with veins; seeds oblong, somewhat truncate, wrinkled from dots. ☉. H. Native of? Flowers yellow.

*Latticed Trigonella*. Fl. June, July. Clt. 1823. Pl. dec.

## § 2. *Racemes sessile.*

20 *T. MONSPELI'ACA* (Lin. spec. 1095.) pilose; stems prostrate; leaflets obovate-cuneated, serrulated; teeth numerous; stipulas linear-subulate; umbels sessile; segments of calyx subulate, length of tube; legumes usually 7, sessile, crowded, arched, divaricate, short, obliquely veined; seeds oblong, somewhat truncate, olive-coloured, wrinkled with dots. ☉. II. Native of the south of Europe. Waldst. et Kit. hung. 2. t. 142.—Breyne cent. 80. t. 33. f. 2. *Bucceras elliptica*, Mœnch. meth. p. 143. Flowers yellow. • •

*Montpelier Trigonella*. Fl. June, July. Clt. 1710. Pl. pr.

21 *T. ELATIOR* (Sibth. et Smith, fl. græc. t. 762. ex prod. 2. p. 108.) stem erect; stipulas lanceolate, toothed; legumes disposed in racemes, pendulous, rather falcate; peduncle elongated. ☉. H. Native of Asia Minor and the Island of Cyprus. Flowers yellow.

*Taller Trigonella*. Pl. 1 to 2 feet.

22 *T. PARVIFLORA* (Smith, in Rees' cycl. vol. 36.) stems ascending; peduncle length of the leaflets, which are acuminate; stipulas ovate, acute, toothed; legumes disposed in racemose heads, ascending, linear-lanceolate, compressed, curved, usually containing 2 seeds. ☉. II. Native of Switzerland.

*Small-flowered Trigonella*. Fl. June, Aug. Clt. 1817. Pl. ascending.

23 *T. PINNATIFIDA* (Cav. icon. 1. p. 26. t. 38.) stem prostrate, tetragonal; leaflets cuneated, truncate at the apex, pinnatifidly-toothed; stipulas pinnatifid; umbels sessile; legumes usually 4 together, sessile, linear, arched, reticulately veined; seeds oblong, truncate, wrinkled from dots; radicle rather prominent. ☉. II. Native of Spain. *T. media*, Delil. ill. 722. Flowers yellow.

*Pinnatifid-stipuled Trigonella*. Fl. June, Aug. Clt. 1801. Pl. prostrate.

24 *T. POLYCERATA* (Lin. spec. 1093.) stems diffuse; leaflets cuneiform, dentate at the apex; stipulas lanceolate, rather toothed at the base; umbels sessile; legumes almost sessile, usually 4 together, erect or erectish, long, linear, reticulately-veined; seeds oblong, somewhat truncate, yellow, wrinkled from dots; radicle rather prominent. ☉. II. Native of the south of France. Flowers yellow.

*Many-horned Trigonella*. Fl. July, Sept. Clt. 1759. Pl. diffuse, 1  $\frac{1}{2}$  foot long.

25 *T. ÆGYPTIACA* (Poir. dict. 8. p. 95.) stem prostrate; branches short, erect; leaflets ovate-cuneiform, denticulated; stipulas entire; umbels sessile; legumes somewhat compressed, erectish, reticulated with veins. ☉. II. Native of Egypt. Flowers yellow.

*Egyptian Trigonella*. Fl. June, July. Clt. 1818. Pl. prost.

26 *T. POLYANTHA* (Desv. journ. bot. 1814. 1. p. 77.) stem diffuse; leaflets obovate-cordate, quite smooth, rather fleshy, obscurely toothed; legumes sessile, crowded, rather falcate, glabrous; common peduncle sessile, mucronate. ☉. II. Native of the Levant. Flowers yellow.

*Many-flowered Trigonella*. Pl.  $\frac{1}{2}$  to 1 foot.

27 *T. ORNITHORHYNCHOS* (Fisch. ex Horn. hort. hafn. suppl. p. 85.) leaflets roundish, rather serrated, fleshy; peduncles spiny; legumes on very short peduncles, umbellate, reflexed, and recurved, beaked. ☉. II. Native of the Russian empire. Flowers yellow.

*Bird's-beak-podded Trigonella*. Fl. June, Aug. Clt. 1818. Pl.  $\frac{1}{2}$  to  $\frac{3}{4}$  foot.

SECT. IV. *FALCATA* (from *falcatus*, falcate; in reference to the shape of the pods). Ser. mss. in D. C. prod. 2. p. 183. Brot. phyt. 160.—*Bucératis*, spec. Mœnch. Flowers disposed in pedunculate umbels. Legume compressed, falcate, reticulated, mucronate.

28 *T. RUTHÉNICA* (Lin. spec. 1093.) stems prostrate; leaflets lanceolate, very blunt, sharply serrated; stipulas nearly entire; flowers disposed in racemose heads; legume oblong, straight, or a little arched; seeds unequally cordate; radicle very long.  $\odot$ . H. Native of Siberia.—Gmel. fl. sib. 4. p. 24. no. 33. t. 8. Legume obtuse, and terminated by a recurved mucrone, and the leaflets are oblong-obovate, according to the specimens received from Siberia. Flowers yellow. This plant would be an excellent substitute for *lucern*, see *Medicàgo sativa*.

*Russian Trigonella*. Fl. June, July. Clt. 1759. Pl. ascending, 1½ foot long.

29 *T. LACINIATA* (Lin. spec. 1095.) stems spreading; leaflets obovate-cuneate, half pinnate-cut; stipulas dissected; flowers disposed in racemose umbels; peduncles length of leaves; teeth of calyx shorter than the tube; legume short, elliptical.  $\odot$ . H. Native of Egypt. Flowers yellow.

*Jagged-stipuled Trigonella*. Pl. spreading.

30 *T. PLATYCARPOS* (Lin. spec. 1093.) stems erect or diffuse; leaflets obovate-roundish; stipulas a little toothletted; flowers racemose; legume flat, pendulous; seeds unequally cordate, obtuse; radicle very long.  $\odot$ . H. Native of Siberia.—Gmel. sib. 4. p. 25. t. 9. Flowers yellow. Legumes white.

*Broad-podded Trigonella*. Fl. June, Sept. Clt. 1741. Pl. ½ foot.

31 *T. HYBRIDA* (Pourr. act. toul. 3. p. 33.) stems ascending; leaflets obovate-cuneate, entire, glabrous; stipulas unequally lanceolate, denticulated; flowers few, racemose; legumes pedicellate, glabrous; falcate, reticulated with veins; seeds irregularly cordate.  $\odot$ . H. Native of France.—D. C. icon. pl. rar. 1. p. 29. t. 29. Flowers yellow.

*Hybrid Trigonella*. Fl. June, Sept. Clt. 1806. Pl. ascending, 1 to 2 feet.

32 *T. ORNITHOPODIOIDES* (D. C. fl. fr. 4. p. 550.) stems prostrate; leaflets obovate, denticulated; stipulas lanceolate, entire, rather membranous, very acute; flowers usually 2-4, disposed in a kind of umbel; legume somewhat falcate, compressed, twice the length of the calyx.  $\odot$ . H. Native of France and other parts of Europe; in Britain on several heaths about London, and elsewhere. *Trifolium ornithopodioides*, Lin. spec. 1078. Smith, engl. bot. 1047. *Falcátula falsotrifolium*, Brot. phyt. 160. t. 68. Flowers red.

*Ornithopus-like Trigonella*. Fl. June, July. Brit. Pl. prost.

33 *T. CORNICULATA* (Lin. spec. 1094.) stem erect; leaflets obovate, dentate at the apex; stipulas lanceolate, entire; flowers racemose; legumes compressed, declinate, somewhat falcate, transversely veined; seeds unequally cordate, wrinkled from dots; radicle rather prominent.  $\odot$ . H. Native of the south of France. *Buceras grandiflora*, Mœnch. meth. p. 143.—J. Bauh. hist. 2. p. 372. f. 2. ? Flowers yellow, sweet-scented.

*Horned Trigonella*. Fl. June, July. Clt. 1597. Pl. 1 foot.

34 *T. ESCULENTA* (Willd. enum. 709.) racemes pedunculate; common peduncle longer than the leaf; legumes linear, somewhat falcate, crowded, pedicellate.  $\odot$ . H. Native of the East Indies. *Medicàgo esculenta*, Rottl. ex Willd. l. c. The legumes of this plant are esculent.

*Esculent Trigonella*. Fl. June, Aug. Clt. 1815. Pl. 1 ft.

35 *T. OCCULTA* (Delil. ill. fl. ægyp. 727.) stem herbaceous, diffuse, angular at the apex; leaflets on short petioles, cuneate, serrated, rather villous; stipulas semi-orbicular, acutely and coarsely serrated, girding the head of flowers; petals shorter than the calyx; legume ovate, rather compressed, hairy, reti-

culately nerved, hooked from the style.  $\odot$ . ? H. Native of sandy islands in the Nile. Flowers axillary, crowded, small, yellow.

*Hidden-flowered Trigonella*. Pl. diffuse.

† *Species not sufficiently known.*

36 *T. PETIOLARIS* (Viv. fl. lyb. p. 49. t. 18. f. 5.) flowers disposed in heads, pendulous; pedicels somewhat falcate; petiole double the length of the peduncle; leaflets obcordate-cuneate; stipulas oblique, ovate, acute, profoundly toothed; legume?  $\odot$ . ? H. Native of Cyreniaca, in pastures.

*Petioled Trigonella*. Pl. 1 foot.

37 *T. CRASSIFOLIA* (Horn. hort. hafn. 2. p. 723.) leaflets roundish, fleshy; peduncles rather spinose; legumes pedunculate, crowded, reflexed, rather falcate.  $\odot$ . H. Native of Egypt. Flowers yellow.

*Thick-leaved Trigonella*. Pl. ½ foot.

38 *T. VILLOSA* (Thunb. prod. p. 137.) leaflets obovate, glabrous; legumes racemose, villous. Native of the Cape of Good Hope.

*Villous Trigonella*. Pl. 1 foot.

39 *T. SPICATA* (Sibth. et Smith, fl. græc. t. 763. ex prod. 2. p. 108.) stipulas subulate, quite entire; legumes disposed in spikes, pendulous, short, pilose; peduncles elongated, rather spiny.  $\odot$ . H. Native of the island of Scirphos.

*Spicate Trigonella*. Pl. ½ to 1 foot.

40 *T. ARMATA* (Thunb. prod. 137.) branches spinose; leaflets ovate, glabrous; legumes lateral, spiny.  $\odot$ . ? G. Native of the Cape of Good Hope.

*Armed Trigonella*. Shrub.

41 *T. GLABRA* (Thunb. prod. p. 137.) leaflets ovate, toothed, glabrous; legumes umbellate, reflexed, glabrous.  $\odot$ . ? G. Native of the Cape of Good Hope.

*Glabrous Trigonella*. Shrub?

42 *T. HIRSU'TA* (Thunb. prod. p. 137.) leaflets oblong, obtuse, villous; legumes racemose, reflexed.  $\odot$ . ? G. Native of the Cape of Good Hope.

*Hairy Trigonella*. Shrub.

43 *T. TOMENTOSA* (Thunb. prod. 137.) leaflets and branches tomentose; legumes pedunculate, ternate.  $\odot$ . ? G. Native of the Cape of Good Hope.

*Tomentose Trigonella*. Shrub.

44 *T. CYLINDRACEA* (Desv. journ. bot. 1814. vol. I. p. 77.) leaflets oblong, obtuse, toothed, rather pubescent, terete, acute, striated, somewhat incurved; common peduncle elongated, mucronate.  $\odot$ . ? H. Native of the Levant.

*Cylindrical-leafletted Trigonella*. Pl.

*Cult.* None of the species of this genus are worth cultivating unless in botanical gardens. The seeds of the hardy annual kinds only require to be sown in the open border in spring. The hardy perennial kinds are easily increased by dividing the plants at the root or by seeds. Those natives of the Cape are perhaps shrubby; if this be the case, they may be propagated by young cuttings planted in sand under a hand-glass. All the species grow best in a light sandy soil.

LXVIII. POCOCKIA (in honour of Richard Pocock, a traveller in the Levant). Ser. mss. in D. C. prod. 2. p. 185.—*Trifolium*, spec. Lin.

LIN. SYST. *Diadélphia*, *Decándria*. Calyx campanulate, 5-toothed. Carina simple, and wings shorter than the vexillum. Legume longer than the calyx, membranous, compressed, winged, emulating a samara.—Flowers racemose. Leaves trifoliate, terminal or middle leaflet stalked.

1 *P. CRÉTICA* (Ser. mss. in D. C. prod. 2. p. 185.) stem ascending; leaflets obovate-cuneate, obsoletely-toothed; stipulas lanceolate, profoundly-toothed; teeth of calyx acute, shorter than the tube; legume wrinkled transversely, 2-seeded; seeds

ovate-oblong, compressed, wrinkled from dots; radicle rather prominent. ☉. H. Native of Candia and Barbary. *Trifolium Melilotus Crética*, Lin. spec. 1078. *Melilotus Crética*, Desf. fl. atl. 2. p. 192. —Moris. hist. sect. 2. t. 14. f. 3. Flowers yellow.

*Cretan Pocockia*. Fl. June, Aug. Clt. 1713. Pl. 1 foot.

*Cult.* The seeds of this plant only require to be sown in the open border about the beginning of April.

**LXIX. MELILOTUS** (from *mel*, honey, and *lotus*; honey Lotus. The plants are similar to the *Lotus*, and are the favourite resort of bees). Tourn. inst. 406. t. 229. Juss. gen. 256. Lam. ill. t. 613. D. C. prod. 2. p. 186. —*Trifolium spec.* Lin.

**LIN. SYST.** *Diadélphia, Decándria*. Calyx tubular, 5-toothed. Carina simple; wings shorter than the vexillum. Legume longer than the calyx, coriaceous, one or many-seeded, hardly dehiscent, of various forms. —Herbs. Stipulas adnate to the petiole. Leaves trifoliate; leaflets usually toothed. Flowers disposed in loose racemes, yellow, rarely white.

**SECT. I. CÉLORUTIS** (from *κοιλος*, *koilos*, channelled, depressed, and *ρυτις*, *rutis*, a wrinkle; in reference to the surface of the legumes). Ser. mss. in D. C. prod. 2. p. 186. Legume wrinkled from lacunæ.

1 *M. KOCHIANA* (Willd. enum. 790.) stem ascending; leaflets linear-oblong, denticulated; stipulas toothed; teeth of calyx equalling the tube in length; vexillum longer than the carina; legume 1-2-seeded, wrinkled somewhat transversely from lacunæ, ovate, acute, compressed, length of style; seeds egg-shaped, bay-coloured, and somewhat compressed. ♂. H. Native of Germany and France. D. C. fl. fr. 5. p. 561. • *Trifolium Kochianum*, Hayne in Schrad. neue Journ. 2. p. 336. *M. diffusa*, Koch. diss. ined. Flowers yellow.

*Koch's Melilot*. Fl. June, Sept. Clt. 1816. Pl. 2 to 3 feet.

2 *M. DENTATA* (Willd. enum. 790.) stems erect, firm; leaflets oblong, denticulated; stipulas lacinated; teeth of calyx equalling the tube in length; vexillum longer than the keel; legumes dense, black when mature, 1-2-seeded, obovate, obtuse, compressed, irregularly and finely wrinkled from lacunæ, with the seminiferous margin gibbous; style short; seeds irregularly cordate, of a bay colour; radicle very prominent. ♂. H. Native of Hungary. *Trifolium dentatum*, Waldst. et Kit. pl. hung. 1. p. 41. t. 42. Sturm, deutschl. fl. 1. fasc. 15. *M. procumbens*, Hort. prag. ex W. Gerhard in litt. 1824. but not of Besser. The plant has the fruit of *M. officinalis*, and the flowers of *M. parviflora*.

*Var. β, angustifolia* (Wallr. sched. crit. 1. p. 394.) leaflets linear.

*Toothed-leaffletted Melilot*. Fl. Ju. Aug. Clt. 1802. Pl. 3 to 4 ft.

3 *M. LINEARIS* (Cav. ex Pers. ench. 2. p. 318.) stem erect, angular; leaflets linear-oblong, nearly entire; stipulas linear, hardly toothed at the base; teeth of calyx unequal, about equal in length to the tube; vexillum length of carina; legume 2-seeded, wrinkled reticulately, ovate-orbicular; style short; seeds unequally cordate, bay-coloured. ☉. H. Native of Spain. Flowers yellow. This species comes near to *M. dentata*, but differs in the leaflets being obovate-linear, and in the flowers being larger.

*Linear-leaffletted Melilot*. Fl. July, Aug. Clt. 1820. Pl. 2 ft.

4 *M. RUTHÉNICA* (Bieb. fl. taur. suppl. p. 506. in a note.) stem erect, angular; leaflets cuneiform, remotely-serrated; stipulas setaceous; legumes ovate, compressed, wrinkled reticulately, 1-seeded; racemes elongated, loose; young legumes densely reticulated; seeds testaceous. ♂. H. Native of Russia, about the colony of *Sarepta*. • *M. Wólgica*, Poir. suppl. 3. p. 648. ex herb. Desf. Flowers white. Legume like that of *M. macrorrhiza*.

*Russian Melilot*. Fl. July, Aug. Clt. 1820. Pl. 2 to 4 feet. • 5 *M. MELANOSPERMA* (Besser in litt. 1824.) stem firm, unequally furrowed; racemes numerous; twiggy, very long, ascending; leaflets oblong, denticulated; legumes ovate, lacunose, black; seeds ovate, not cordate or compressed, black, rugged from dots. ♂. H. Native of Tauria. Flowers yellow like those of *M. officinalis*.

*Black-seeded Melilot*. Fl. July, Aug. Clt. 1819. Pl. 3 to 4 ft.

6 *M. OFFICINALIS* (Willd. enum. p. 790.) stem erect, branched; branches spreading much; leaflets obovate-oblong, obtuse, remotely-serrated; stipulas setaceous; teeth of calyx unequal, length of tube; vexillum striated with brown; wings equal in length to the keel; legume 2-seeded, obovate, acute, and transversely wrinkled, rather pilose, at length blackish, and rather gibbous; style filiform, length of legume; seeds unequally cordate. ♂. H. Native of Europe. In Britain in thickets and hedges, and the borders of fields. *Trifolium Melilotus officinalis*, a, Lin. spec. 1078. Oed. fl. dan. 934. Sturm, deutschl. fl. 1. fasc. 15. var. a. *Trifolium officinale*, Smith, fl. brit. 781. engl. bot. 1346. Flowers yellow. Fruit nearly like that of *M. dentata*, but the flowers are much larger. The flowers and seeds of this plant are the chief ingredients in flavouring the Gruyère cheese. This cheese no doubt owes its excellence to the mixture of herbs in the mountain pasturage, which surrounds the valley of Gruyère in Switzerland, but more particularly to the flowers and seeds of this plant, which are bruised and mixed with the curd before it is pressed. The whole plant has a peculiar scent, which becomes more fragrant in a dry state, then having some resemblance to that of *Anthoxanthum*. The flowers are sweet-scented; a water distilled from them possesses little odour in itself, but improves the flavour of other substances. In medicine it was esteemed emollient and digestive, and was used in fomentations and cataplasms, particularly in blister plaisters, but it is now laid aside as being rather acrid than emollient. Notwithstanding the strong smell of the plant, and its bitter acrid taste, it does not appear to be disagreeable to any kind of cattle; and horses are said to be extremely fond of it; hence the plant is called by some Italian writers *Trifolium caballinum*. Ray affirms that it was formerly sown in England for the food of kine and horses; but at present it is not cultivated with us.

*Var. β, unguiculata* (Ser. mss. in D. C. prod. 2. p. 187.) legumes elongated, sterile ones claw-formed, pedicellate. ♂. H. Native about Bern and Geneva.

*Official or Common Melilot*. Fl. July, Sept. Britain. Pl. 3 to 6 feet.

7 *M. PALUSTRIS* (Kit. in litt. 1815.) stems branched, erect; leaflets oblong-linear, obsolete-toothed; stipulas linear-setaceous; teeth of calyx unequal, length of tube; vexillum longer than the wings and keel; legume 1-seeded, ovate, a little winged, rugged from lacunæ, of a brownish-black colour; seeds irregularly cordate, bay-coloured. ♂. H. Native of Hungary, growing among *Ariundo phragmitis*. *Trifolium Melilotus palustre*, Waldst. et Kit. pl. rar. hung. 3. p. 295. t. 266. Very nearly allied to *M. officinalis*, and perhaps distinct. Flowers yellow.

*Marsh Melilot*. Fl. July, Aug. Clt. 1820. Pl. 2 to 4 feet.

8 *M. ARBOREA* (Castagne in litt. D. C. prod. 2. p. 187.) stems arborescent; leaflets ovate-oblong, sharply-toothed; stipulas setaceous, entire; flowers disposed in long racemes; teeth of calyx acute, length of tube; keel and wings shorter than the vexillum. ♀. G. Cultivated about Constantinople, where it grows 15 feet high, and with a trunk about 3 inches in diameter. Flowers white.

*Tree Melilot*. Fl. July, Sept. Clt. 1826. Shrub 15 feet.

9 *M. ALTÍSSIMA* (Thuill. fl. par. ed. 2. p. 378 and 83.) stem

erect; leaflets ovate-oblong; racemes very long; wings equal to the keel; legumes naked, ovate, acute at both ends, 1-seeded. ♂. II. Native of France. *Trifolium altissimum*, Lois. fl. gall. 2. p. 4. *M. alba*, Lam. dict. 4. p. 63. Perhaps *M. arvensis* or *M. alba*, Thuill. Flowers white.

*Tallest Melilot.* Fl. July, Aug. Clt. 1816. Pl. 6 to 8 feet.

10 *M. LEUCA'NTHA* (Koch. ex D. C. fl. fr. 5. p. 564.) stem erect, branched; leaflets ovate-oblong, truncate at the apex and mucronulate, remotely serrated; stipulas setaceous; teeth of calyx unequal, length of tube; vexillum longer than the keel and wings; legume 1-seeded, ovate, wrinkled from lacunae, green; seeds exactly ovate. ♂. II. Native of Europe, in fields. *Trifolium officinale* β, Lin. spec. 1078. *Sturn. deutsch.* fl. 1. fasc. 15. f. K. *M. vulgaris*, Willd. enum. p. 790. *M. alba*, Thuill. fl. par. ed. 2. p. 378. but not of Lam. Flowers white.

*Var. β, unguiculata* (Ser. mss. in D. C. prod. 2. p. 187.) legumes elongated, sterile ones claw-formed, pedicellate.

*White-flowered Melilot.* Fl. July, Sept. Clt. Pl. 3 to 5 feet.

11 *M. MACRORHIZA* (Pers. ench. 2. p. 348.) stems and branches erect; leaflets linear-oblong, sharply and remotely toothed; stipulas setaceous, toothless at the base; teeth of calyx equal, length of tube; wings equal in length with the vexillum, but exceeding the carina; legume ovate, compressed, acutish, wrinkled from lacunae, black, a little winged, 1-seeded; seeds unequally sub-cordate, bay-coloured. ♀. II. Native of Hungary. *Trifolium macrorhizum*, Waldst. et Kit. pl. rar. hung. 1. p. 24. t. 26. Flowers yellow.

*Long-rooted Melilot.* Fl. July, Sept. Clt. 1801. Pl. 2 to 3 ft.

12 *M. PARVIFLORA* (Desf. atl. 2. p. 192.) stem ascending; branches spreading; lower leaflets obovate-roundish, entire, upper ones oblong, obsoletely-toothed; stipulas linear-setaceous; flowers very minute, in dense spikes; teeth of calyx nearly equal, broad; wings about equal in length to the vexillum and carina; legume ovate, rugged from lacunae, yellowish-green, 1-seeded; seeds ovoid, adhering to the legume, bay-coloured, rugged from dots. ☉. II. Native of Barbary, Italy, and France. *Trifolium Melilotus Indicum* α, Lin. spec. 1077. Flowers yellow. This plant has the habit of *M. sulcata*, but the legumes are very different, and the spikes are rarely mucronate at the apex.

*Small-flowered Melilot.* Fl. Ju. Aug. Clt. 1798. Pl. 1 to 2 ft.

13 *M. SEGETALIS* (Ser. mss. D. C. prod. 2. p. 187.) stem sometimes erect, sometimes procumbent; leaflets obovate, serrulated even to the base; stipulas ciliate-toothed; legume nearly globose, naked, 1-seeded, wrinkled archwise. ☉. II. Native of Portugal, in Estramadura, among corn. *Trifolium Melilotus segetale*, Brot. fl. lus. 2. p. 484. Flowers yellow. Perhaps only a variety of *M. Indica*.

*Corn-field Melilot.* Fl. July, Aug. Clt. 1820. Pl. 1 to 2 ft.

14 *M. POLONICA* (Pers. ench. 2. p. 348.) stem erect, terete; leaflets cuneate-ovate, denticulated, rather truncate at the apex, and mucronulate; stipulas subulate; flowers very minute; spikes mucronate; teeth of calyx equal, broad; legume ovate, wrinkled from lacunae, bay-coloured, 2-seeded; seeds ovoid, black, wrinkled from dots. ☉. II. Native of Poland. *Trifolium Melilotus Polonicum*, Lin. spec. 1078. Flowers yellow. Allied to *M. parviflora*, but very distinct.

*Polish Melilot.* Fl. July, Aug. Clt. 1778. Pl. 1 to 2 feet.

15 *M. TAURICA* (Ser. mss. in D. C. prod. 2. p. 188.) stem erect; leaflets rhomboidal-cuneate, lined, dentately-serrated in front; stipulas subulate-setaceous; racemes elongated; legumes roundish, compressed, wrinkled transversely, 1-seeded. ♂. II. Native of Tauria. *Trifolium Melilotus Tauricum*, Bieb. fl. taur. suppl. p. 506. Plant quite smooth, of a glaucous green-colour. Flowers white.

*Taurian Melilot.* Fl. July, Sept. Clt. 1818. Pl. 3 to 4 feet.

16 *M. ITALICA* (Lam. dict. 4. p. 65.) stem erect; branches ascending, thick; leaflets obovate-roundish, obsoletely-denticulated; stipulas lanceolate, acute, somewhat jagged at the base; teeth of calyx unequal, hardly the length of the tube; wings equal to the carina, but shorter than the vexillum; legume globose, somewhat suberose, rugged from lacunae, yellowish-green, 1-2-seeded; seeds orbicular, compressed, rugged from dots, bay-coloured. ☉. II. Native of Italy. *Trifolium Melilotus Italicum*, Lin. spec. 1078. *Melilotus rotundifolia*, Ten. cat. 1819. p. 57. Flowers yellow. There is a variety of this plant with entire leaves.

*Italian Melilot.* Fl. July, Aug. Clt. 1596. Pl. 1 to 2 feet.

17 *M. GRACILIS* (D. C. fl. fr. 5. p. 565.) stem and branches ascending, slender; leaflets obovate, narrow, denticulated at the apex; stipulas somewhat setaceous; teeth of calyx nearly equal, hardly shorter than the tube; wings equal in length to the carina and vexillum; legume globose, hardly suberose, rugged from lacunae, yellowish-green, 2-seeded; seeds orbicular, compressed, rugged from dots, bay-coloured. ☉. II. Native of the south of France. *M. Neapolitana*, Tenore ex herb. Moricand. Flowers yellow.

*Slender Melilot.* Fl. July, Sept. Pl. 1 to 2 feet.

18 *M. PALEIDA* (Besser. in litt. 1824.) stem rather terete, lined, much branched; leaflets obovate-linear, serrulated; legume nearly globose, obsoletely reticulated, mucronate by the style, 1-seeded, of a yellowish bay-colour; seeds globose, bay-coloured, smooth. ♂. II. Native of Volhynia. Flowers pale-yellow, like those of *M. officinalis*.

*Pale-flowered Melilot.* Fl. July, Aug. Clt. 1816. Pl. 3 to 4 ft.

19 *M. SUAVEOLENS* (Ledeb. ind. hort. dorp. suppl. 1824. p. 5.) legume 2-seeded, reticulated, glabrous; wings equalling the keel in length, but shorter than the vexillum; leaflets lanceolate-oblong, remotely serrated; stipulas entire. ♀. II. Native of Dahuria, near Nertschinsk. Flowers yellow.

*Sweet-scented Melilot.* Fl. July, Aug. Clt. 1824. Pl. 3 to 4 ft.

SECT. II. *PLAGIORHYSIS* (from *πλαγιος*, *plagios*, transverse, and *ρυτίς*, *rutis*, a wrinkle; in reference to the transverse wrinkles on the surface of the legume). Ser. mss. in D. C. prod. 2. p. 188.) legumes wrinkled transversely and areuately.

20 *M. ARVENsis* (Wallr. sched. crit. p. 391.) stem much branched from the base, ascending; leaflets obovate, irregularly toothed; stipulas subulate; racemes very long; teeth of calyx nearly equal, length of tube; wings equal in length to the vexillum, but exceeding the carina; legume ovate, acute, wrinkled transversely from lacunae, usually 2-seeded, yellowish-green; seeds ovate-oblong, olive-coloured, smooth; radicle hardly prominent. ☉. II. Native of Germany, among corn. Flowers yellow.

*Var. β, albiflora* (Wallr. sched. 392.) *M. Petitpierreana*, Hayne in Schrad. neue journ. 2. part 2. p. 337. Willd. enum. 790. ex Wallr. Flowers white.

*Corn-field Melilot.* Fl. July, Aug. Clt. 1800. Pl. 1 to 2 ft.

21 *M. ELEGANS* (Salzmann, in litt. D. C. prod. 2. p. 188.) teeth of calyx about equal, lanceolate, length of tube; legume ovate, adhering to the seeds, wrinkled irregularly and transversely, and somewhat lacunose, and bay-coloured, 1-seeded; seeds subglobose, hardly retuse, rugged from dots, bay-coloured. ☉. II. Native of Corsica.

*Elegant Melilot.* Pl. 1 to 2 feet.

22 *M. BESSERIA'NA* (Ser. mss. in D. C. prod. 2. p. 188.) stem angular, firm, branched; branches assurgent; leaflets ovate, serrulated; legume ovate, hardly compressed, very rugged, greenish; wrinkles elevated, transverse, tumid, and lacunose; seeds irregularly heart-shaped, bay-coloured, rather veiny. ♂. II. Native of Tauria. *M. imbricata*, Besser in litt. (1824.) *M. plicata*, Stev. ? Flowers yellow, like those of *M. officinalis*.

*Besser's Melilot.* Fl. July, Aug. Clt. 1816. Pl. 4 to 6 ft.

SECT. III. *CAMPYLODONTIS* (from *καμπυλος*, *campylos*, a curve, and *οντις*, *ontis*, a wrinkle; in reference to the curved or arched wrinkles on the surface of the legumes). Ser. mss. in D.C. prod. 2. p. 189. Legumes ovate or obovate, densely and arcuately veined.

23 *M. MESSANIENSIS* (Desf. fl. atl. 2. p. 192.) stem erect; leaflets obovate-cuneated, denticulated; stipulas broad at the base, toothed, linear at the apex; racemes few-flowered; teeth of calyx nearly equal, hardly shorter than the tube; legume lanceolate, acute, very much nerved, 1-seeded; seeds ovate, compressed, large, black, rugged from dots. ☉. II. Native of Barbary, Sicily, and Piedmont, and the Straits of Messina. *Trifolium Messaniense*, Lin. mant. 175. Flowers yellow.

*Messina Melilot.* Fl. July, Aug. Clt. 1670. Pl. 1 to 2 feet.

24 *M. SULCATA* (Desf. fl. atl. 2. p. 193.) stem procumbent; leaflets obovate, obsolete-toothed; stipulas linear-subulate, dilated at the base, entire or toothed; teeth of calyx broadish, shorter than the tube; legume obovate, somewhat globose, densely nerved, 2-seeded; seeds somewhat orbicular, rugged from dots. ☉. II. Native of Algiers and Alexandria, in cultivated fields. *Trifolium Melilotus Indicum* γ, Lin. spec. 1077. *M. Mauritania*, Willd. enum. p. 789. *M. longifolia*, Tenore, prod. suppl. 1. p. 66. Flowers yellow.

*Var. β, Libanotica* (Ser. mss. in D. C. prod. 2. p. 189.) fruit larger, 1-seeded; seeds ovate, wrinkled from dots; teeth of calyx narrower. ☉. II. On mount Libanon. Perhaps a proper species.

*Furrowed-stemmed Melilot.* Fl. Ju. Aug. Clt. 1798. Pl. pr.

† *Species not sufficiently known.* •

25 *M. BAUMETTI* (Horn. hort. hafn. suppl. p. 84.) slender; stem erect; leaflets oblong-obovate, truncate, sharply-serrated at the apex; legume racemose, naked, wrinkled, 1-seeded. ☉. II. Native of? Flowers yellow.

*Baumetti's Melilot.* Fl. July, Aug. Clt. 1818. Pl. 1 to 2 ft.

26 *M. MINIMA* (Roth. nov. spec. p. 361.) stem decumbent; leaflets cuneated, deeply toothed; stipulas palmately awned, rather membranous; legumes axillary, sessile, crowded, roundish, muricated, rugged, 1-seeded. ☉. II. Native of the East Indies. Flowers small, white.

*Smallest Melilot.* Pl. decumbent.

27 *M. NEAPOLITANA* (Tenore, prod. suppl. 1. p. 66. cat. 1819. p. 57.) stem erect; leaflets deltoid-obovate, toothed at the apex; stipulas setaceous, entire; flowers spreading; legumes 1-seeded, obovate, obtuse, naked, arcuately wrinkled. ☉. II. Native on exposed hills near Naples.

*Neapolitan Melilot.* Fl. Ju. Aug. Clt. 1820. Pl. 2 feet.

*Cult.* None of the species are worth cultivating except in botanical gardens. They are all easily increased by seeds, which only require to be sown in the open border in spring. A dry light soil suits them best.

LXX. *TRIFOLIUM* (from *tres*, three, and *folium*, a leaf; all the species of the genus have trifoliate leaves, or each leaf is composed of 3 leaflets; the Greeks call it *τριφυλλον*; the French *trèfle*; and the English *trefoil* or *clover*). Tourn. inst. 404. t. 228. Juss. gen. 355. Lam. ill. 613. D. C. prod. 2. p. 189.—*Trifolium*, spec. Lin.

LIN. SYST. *Diadelphia, Decandria*. Calyx tubular (f. 32. a), permanent, glandless, 5-cleft (f. 32. a); segments subulate. Carina shorter than the wings and vexillum. Stamens diadelphous (f. 32. b.). Legume small, hardly dehiscent, usually ovate, 1-2-seeded, shorter than the calyx, and covered by it, rarely oblong, and containing 3-4 seeds, in which case it exceeds the calyx a little.—Herbs. Stipulas adnate to the petioles. Leaves usually trifoliate, rarely with 5 leaflets. Flowers disposed in

dense heads or spikes, bracteate, purple, white, or cream-coloured. Petals in the greater part of the species joined together at the base. This genus includes the most valuable herbage plants adopted in European agriculture, the white, red, and yellow *clover*. Notwithstanding all that has been said of the superiority of *lucerne* to *clover*, and of the excellence of *saintfoin* and various other leguminous plants, yet the red *clover* for mowing, and the white species for pasturage, are, and probably ever will be, found to excel all plants in these respects. The yellow *clover*, and the cow or meadow *clover* are also in cultivation but are inferior to the white and red *clover*.

SECT. I. *LAGOPUS* (from *λαγως*, *lagos*, a hare, and *πους*, *pous*, a foot; in reference to the soft villous heads of flowers, which have been compared to the softness of a hare's foot). Ser. mss. in D. C. prod. 2. p. 189. Flowers spicate; spikes oblong, bractless at the base. Calyx very villous, not inflated after flowering.

1 *T. ANGUSTIFOLIUM* (Lin. spec. 1083.) stem erect; leaflets linear-lanceolate, very acute, ciliated; stipulas very long, narrow, subulate at the apex; spike solitary, terminal, between conical and oblong in shape; calyx ribbed, glandular, and pilose; segments setaceous, spinescent at the apex, hardly exceeding the monopetalous corolla, lower segment longest; seeds egg-shaped, smooth, bay-coloured. ☉. II. Native of the south of Europe and the extra-tropical parts of the south of Africa, ex Burch. cat. geogr. no. 286. Sturm, deutsch. fl. 1. fasc. 16. Savi, obs. p. 58.—Barrel. icon. 698. Flowers pale rose-coloured.

*Narrow-leaved Trefoil.* Fl. June, Aug. Clt. 1640 or 1739. Pl. 1½ foot.

2 *T. INTERMEDIUM* (Gussone, cat. 1821. p. 82. in a note, p. 14. but not of Lapeyr.) plant pilose; stem diffuse; leaflets lanceolate, oblong; spikes villous, between conical and oblong in shape; segments of the calyx setaceous, and nearly equal, but not spinescent at the apex; corolla hardly exceeding the calyx. ☉. II. Native of Italy, on sandy hills. Corolla white. Calyx striated, the segments terminated by fascicles of hairs. The rest of the plant appears as if it were a hybrid between *T. angustifolium* and *T. arvense*.

*Intermediate Hare's-foot Trefoil.* Fl. June, July. Clt. 1820. Pl. ½ to 1 foot.

3 *T. PURPUREUM* (Lois. fl. gall. 484. t. 11.) stem erect; leaflets linear-lanceolate, acute, quite entire, ciliated; stipulas narrow, somewhat setaceous at the apex; spikes ovate-oblong, terminal, solitary; calyx ribbed, glandular, and pilose; the segments setaceous, much shorter than the corolla, which is perhaps monopetalous, the lower segment longest. ☉. II. Native about Montpellier, Florence, and of the Levant. Savi, obs. p. 60. Flowers purple.

*Purple-flowered Hare's-foot Trefoil.* Fl. June, July. Clt. 1816. Pl. 1 foot.

4 *T. RUBENS* (Lin. spec. 1081.) stem erect, straight; leaflets oblong, very blunt, and quite smooth, denticulated; stipulas very long and very broad, lanceolate at the apex; spikes terminal, usually twin; calyx very much striated, glandless, with the segments setaceous and very short, the lower segment longest, but hardly equal in length to the monopetalous corolla; seeds egg-shaped, smooth; radicle rather prominent. ♀. II. Native of Europe, on mountains, in meadows, and on the margins of woods. Sturm, deutsch. fl. 1. fasc. 15. Savi, obs. p. 55. Mart. fl. rust. t. 9. Jacq. aust. 4. p. 385. Flowers dark red. An elegant plant.

*Var. β, furcatum* (Ser. mss. in D. C. prod. 2. p. 190.) stems forked at the top, bearing 2 spikes of flowers.

*Var. γ, ramosissimum* (Ser. mss. in D. C. l. c.) stem much branched, bearing many spikes. On Mount Sileva.

*Red Trefoil.* Fl. June, Sept. Clt. 1633. Pl. 1 to 1½ foot.

5 *T. CŒRULESCENS* (Bieb. fl. taur. suppl. 509.) stem erect? leaflets roundish-rhomboidal, villous, as well as the half-ovate, subulate, dentate stipulas; teeth of calyx nearly equal in length to the wings. ☉. II. Native of the desert Anketer, between the rivers Terek and Kuma. The plant is known from *T. incarnatum* in the leaflets being lined, in the stipulas being membranous, and in the heads of flowers being shorter. Flowers bluish-purple.

*Bluish-flowered Trefoil.* Fl. July. Clt. 1827. Pl. 1 foot.

6 *T. INCARNATUM* (Lin. spec. 1083.) stem erect; leaflets roundish, obcordate, crenated, villous; stipulas broad, very short, obtuse, and spiculate at the apex; spikes terminal, solitary, on long peduncles; calyx ribbed, very pilose; the segments lanceolate-setaceous, equal, somewhat stellately disposed, equal in length with the monopetalous corolla; seeds egg-shaped, radicle rather prominent. ☉. II. Native of the south of Europe, in subhumid meadows. Sims, bot. mag. 328. Sturm, deutsch. fl. 1. heft. 16. Mill. fig. t. 267. f. 1. Flowers crimson, red, flesh-coloured, or even white. This is an elegant plant when in flower. Mr. Miller says it will make good food for cattle, but being an annual plant will not suit with the common practice of farmers.

*Var. β, Molinieri* (D. C. fl. fr. 5. p. 556.) flowers pale flesh-coloured; stipulas hardly spiculate; leaflets more or less denticulated. ☉. II. *T. Molinieri*, Balb. ex Horn. hort. hafn. p. 715.

*Flesh-coloured-flowered Trefoil.* Clt. 1610. Pl. 1 foot.

7 *T. LAGOPUS* (Poir. ex Willd. spec. 3. p. 1365.) plant very hairy; stem much branched; leaflets obovate-cuneated, denticulated; stipulas lanceolate, very broad, short, nerved; spike terminal, oblong, solitary, sessile; calyx ribbed, very pilose; the segments setaceous and equal, but shorter than the corolla. ☉. II. Native of Spain.—Poir. dict. 8. p. 10. Flowers red.

*Hare's-foot Trefoil.* Fl. July, Aug. Clt. 1827. Pl. pr.

8 *T. SPICATUM* (Sibth. and Smith, fl. græc. t. 743. ex prod. 2. p. 93.) stem erect; legume 1-seeded, disposed in spikes, erect, naked, wrinkled, acute; stipulas subulate, quite entire. ☉. II. Native of the Island of Cyprus. Flowers yellow.

*Spike-flowered Trefoil.* Pl. 1 foot.

9 *T. ARVENSE* (Lin. spec. 1083.) stem erect, branched, or simple; leaflets spatulate, linear, somewhat tridentate at the apex; stipulas narrow, membranous, nerved, bristle-pointed, pilose; spikes oblong, very villous, soft; calyx very pilose, the segments bristle-shaped, longer than the polypetalous corolla, and equal in length with each other; seeds egg-shaped, bay-coloured; radicle not prominent. ☉. II. Native of Europe; common in fields; plentiful in Britain, in sandy barren fields. Smith, engl. bot. 944. Sturm, deutsch. fl. 1. heft. 16. Curt. fl. lond. 6. t. 50. Fl. dan. 724. Flowers pale-reddish.

*Var. β, crassicaule* (Ser. mss. in D. C. prod. 2. p. 191.) heads ovate-globose, much smaller; stem very thick and very much branched; branches divaricate. ☉. II. Native of Caucasus, in fields.

*Var. γ, perpusillum* (Ser. l. c.) spikes somewhat globose; stems very short, procumbent. ☉. II. Ray, syn. p. 320. no. 15. t. 14. f. 2. Lobel first found this plant near South-sea Castle; Dillenius near Brackelsham, in Sussex, and Mr. Woodward, on Yarmouth Dunes, at Lowestoft, &c.

*Var. δ, gracile* (D. C. fl. fr. 4. p. 530.) stem and leaves smoothish; segments of the calyx villous at the apex, and coloured. ☉. II. Native of France. *T. gracile*, Thuil. fl. par. ed. 2. p. 283.—Barrel. icon. 901.

*Var. ε, capitatum* (Ser. l. c.) heads of flowers globose, sessile. *T. arvense* β, Savi, obs. trif. p. 19.—Barrel. icon. t. 902.

*Field Hare's-foot Trefoil.* Fl. July, Aug. Brit. Pl. ½ to 1 ft.

10 *T. LIGUSTICUM* (Balb. in act. acad. ital. 1. p. 192. f. 2. ex

Savi, obs. trif. p. 38.) stem branched, diffuse; leaflets obovate or obcordate, broad, somewhat denticulated at the apex; stipulas broadish, lanceolate, nerved, small, ending in an acumen, which is equal in length to the limb; spikes oblong, twin, divaricate, pedunculate, pilose; teeth of calyx subulate, equal, twice the length of the tube, but exceeding the corolla; seeds egg-shaped, yellow; radicle rather prominent. ☉. II. Native of Italy, about Pisa, also in Spain and Corsica. *T. arrectisetum*, Brot. phyt. p. 152. t. 63. f. 1. *T. aristatum*, Horn. hort. hafn. p. 712. Link. enum. 2. p. 262. Flowers pale-red.

*Var. β, parvulum* (Ser. mss. in D. C. prod. 2. p. 191.) stem much branched, slender; spikes small, somewhat globose. ☉. II. Native of the Starchades Islands, and about Pisa.

*Loage Trefoil.* Fl. June, July. Clt. 1816. Pl. ½ foot.

11 *T. DIVARICATUM* (Horn. hort. hafn. 2. p. 715.) stem erect, divaricate, much branched; leaflets obovate, emarginate, pilose; stipulas lanceolate; spikes elongated, ovate-cylindrical; teeth of calyx subulate; corolla monopetalous. ☉. II. Native of? Perhaps only a variety of *T. gemellum*, ex Horn. l. c. Flowers white and pale-red.

*Divaricate Trefoil.* Fl. June, July. Clt. 1816. Pl. spread.

12 *T. GEMELLUM* (Poir. in Willd. spec. 3. p. 1376.) stem straight, simple; leaflets obovate, narrow, retuse, hardly denticulated at the apex; stipulas narrow, with a long acumen, hardly nerved; spikes oblong, terminal, pedunculate and approximate, pilose; segments of the calyx dilated at the base, unequal, divaricate, length of tube, but longer than the corolla; seeds irregularly egg-shaped, small, yellowish-green; radicle rather prominent. ☉. II. Native of Spain. Flowers pale-red or white.

*Twin-spiked Trifolium.* Fl. June, July. Clt. 1816. Pl. ½ ft.

13 *T. PHLEOIDES* (Poir. in Willd. spec. 3. p. 1377.) stem branched a little, slender; leaflets oblong, obcordate, denticulated; stipulas rather membranous, nerved, very narrow, awl-shaped; spike pedunculate, solitary or twin, between conical and oblong, villous, bractless; flowers very dense; segments of calyx equal, diverging, subulate, dilated at the base, length of tube, but shorter than the corolla; seeds exactly egg-shaped, small, bay-coloured; radicle hardly prominent. ☉. II. Native of Spain and Italy. Flowers pale-purple or white. Heads like those of a species of *Phleum*.

*Phleum-headed Trefoil.* Fl. May, Jul. Clt. 1818. Pl. ½ ft.

14 *T. LAPPACEUM* (Lin. spec. 1082.) stem branched, diffuse; leaflets obovate, or obcordate, denticulated; stipulas rather membranous, nerved, narrow, long, and subulate; spike subglobose, hispid, terminal, usually solitary; segments of the calyx equal, subulate, twice or thrice longer than the tube, but equal in length to the corolla; seed egg-shaped, brown; radicle hardly prominent. ☉. II. Native of Europe. Flowers pale-red.

*Burdock-like Trefoil.* Fl. June, Aug. Clt. 1821. Pl. divaricate, ½ to ½ foot.

15? *T. ECHINATUM* (Bieb. fl. taur. 2. p. 216.) stem declinate, branched; leaflets obovate-oblong, quite entire; stipulas subulate, pilose; heads ovate, terminal, and axillary, pedunculate, leafless; segments of calyx subulate, unequal, pilose, shorter than the monopetalous corolla, when in fruit spreading much. ☉. II. Native of Caucasus. Flowers pale. Vexillum lanceolate, elongated.

*Echinated-headed Trefoil.* Fl. Ju. Jul. Clt. 1821. Pl. dec.

16 *T. ERINACEUM* (Bieb. fl. taur. suppl. 510.) stem erect, branched; leaflets cuneated, emarginate, almost entire, villous; stipulas lanceolate, cuspidate; segments of the calyx nearly equal, a little longer than the tube, but exceeding the corolla. ☉. II. Native of Iberia. Allied to *T. divaricatum*. Flowers pale-red.

*Tricky-headed Trefoil.* Fl. June, July. Clt. 1818. Pl. ½ ft.

17 *T. MALACANTHUM* (Link. enum. 2. p. 261.) stem flexuous,

hairy; leaflets obcordate, hairy: stipulas ovate, acuminate; heads terminal and lateral; calyx campanulate, lined; the segments subulate and spreading, hairy. ☉. H. Native of? Corolla small and pale-purple.

*Soft-flowered* Trefoil. Fl. July, Aug. Clt. 1824. Pl.  $\frac{1}{2}$  ft.

18 *T. SYLVATICUM* (Gerard, in Lois. not. p. 111.) stem a little branched, erect, pubescent; leaflets ovate, obtuse: stipulas dilated, upper ones inclosing the spike of flowers; spike oblong, villous; calycine segments setaceous, ciliated, shorter than the corolla, one of which is longer than the rest and spreading. ☉. ? H. Native of the south of France. Plant clothed with silky wool. Corolla purple. Spike about an inch long, constantly composed of about 40 flowers.

*Wood* Trefoil. Fl. June, July. Clt? Pl.  $\frac{1}{2}$  foot.

19 *T. NIGRO-PUNCTATUM* (Wahl. in isis. 1828. vol. 21. p. 971.) spikes of flowers oblong, pedunculate; lower tooth of calyx shorter than the wings of the corolla, which is gamopetalous; stipulas linear, lined with black; leaflets lanceolate-elliptic; stem branched. ☉. H. Native about Constantinople.

*Black-dotted-stipuled* Trefoil. Pl. 1 foot.

SECT. II. *PHLEASTRUM* (from *phleum*, the cat-tail grass, and *astrum*, an affixed signification, like; the heads of most of the species resemble those of the cat's-tail grass). Ser. mss. in D. C. prod. 2. p. 192. Flowers disposed in ovate-conical heads. Calyx not inflated after flowering.

20 *T. BOCCONI* (Savi, obs. trif. p. 37. no. 14.) stem erect, branched; leaflets oblong-obovate, denticulated at the apex; stipulas very long and very narrow, subulate; heads ovate, dense-flowered, twin, sessile, terminal, bracteate at the base; segments of the calyx nearly equal, narrow, coarsely nerved in the middle, length of tube, and about equal in length to the corolla; seeds small, yellow, egg-shaped; radicle prominent. ☉. H. Native of Italy, Corsica, Portugal, and Andegavany. *T. collinum*, Bast. fl. main. et loir. and Poir. suppl. p. 5. *T. semiglābrum*, Brot. phyt. p. 155. t. 63. f. 2. Flowers pale-red.

*Bocconi's* Trefoil. Fl. June, July. Clt. 1820. Pl.  $\frac{1}{2}$  foot.

21 *T. STRIATUM* (Lin. spec. 1085.) stem procumbent, branched; leaflets obovate-oblong, denticulated at the apex, downy; stipulas membranous, broad, nerved, apiculated; heads ovate-conical, dense, terminal and lateral, solitary, sessile, bracteate at the base; tube of calyx much nerved, ventricose, the teeth small and unequal, divaricated, bristle-shaped, shorter than the corolla; seeds turgid, bay-coloured, egg-shaped; radicle not prominent. ☉. H. Native of Europe, in dry sandy places; plentiful in some parts of Britain, in dry barren sandy fields and pastures. Smith, engl. bot. 1843. Flowers pale-red.

*Striated-calyxed* Trefoil. Fl. June, July. Brit. Pl. proc.

22 *T. TENUIFLORUM* (Tenore, prod. p. 44. et cat. 1819. p. 58.) stems erect, branched, villous; leaflets obovate-cuneated, serrulated, villous; lower stipulas lanceolate, acute, upper ones ovate, mucronate, nerved; heads cylindrical, villous; flowers length of calyx; calyx clothed with rufous, silky pubescence; the teeth spinose. ☉. H. Native about Naples. Flowers pale-red.

*Fine-flowered* Trefoil. Fl. June, July. Clt. 1823. Pl. 1 ft.

23 *T. TENUIFOLIUM* (Ten. fl. nap. pr. p. 44.) stem and branches erect; lower leaflets obcordately-cuneated, superior ones linear, denticulated towards the apex, mucronate; calycine teeth unequal, setaceous, shorter than the corolla; heads of flowers oblong, solitary, or twin, sessile. ☉. H. Native of Lucania, in sandy fields. Flowers straw-coloured. Stems numerous from the root. Corolla gamopetalous. The plant has the habit of *T. Bocconi*.

*Fine-leaved* Trefoil. Fl. May, July. Pl. 1 foot.

24 *T. SCABRUM* (Lin. amoen. 4. p. 287. spec. 1084.) stem

procumbent; leaflets obovate, denticulated; stipulas ovate, small, nerved, somewhat membranous, pointed; heads of flowers ovate, sessile, terminal, and lateral; calycine segments linear-lanceolate, stiff, 3-nerved, unequal, hardly equal in length to the polypetalous corolla; finally recurved; seeds ovate, yellow; radicle not prominent. ☉. H. Native of Europe, in sterile barren places; plentiful in some parts of Britain, in chalky and dry barren fields. Smith, engl. bot. 903. Flowers white.

*Scabrous* Trefoil. Fl. May, July. Britain. Pl. procumb.

25 *T. DALMATIUM* (Visiani ex bot. zeit. march. 1829. p. 21.) pubescent; stems prostrate, inflexed at the apex; stipulas ovate, membranous, nerved; leaflets stalked, nerved, obovate, finely denticulated, floral ones almost sessile, involucreted by dilated stipulas; heads of flowers ovate-conical, axillary, and terminal, sessile and leafy at the base; calyx pubescent, having linear, straight teeth, which are at length recurved, not half the length of the gamopetalous corolla. ☉. H. Native of Dalmatia. Flowers white or red. Allied to *T. scabrum*.

*Dalmatian* Trefoil. Pl. prostrate.

SECT. III. *EUTRIPHYLLUM* (from *eu*, *eu*, well or good, and *τρίφυλλον*, *triphylon*, trefoil; genuine species). Ser. mss. in D. C. prod. 2. p. 192. Flowers disposed in ovate, pedunculate, or sessile, usually bracteate heads. Calyx villous, not inflated.

26 *T. MARITIMUM* (Huds. angl. ed. 1. p. 284.) stem spreading, often recumbent; heads of flowers somewhat ovate-globose; leaflets oblong-obovate, obtuse, or emarginate, somewhat denticulated; stipulas narrow, pointed; spikes ovate-globose, nearly sessile; calycine segments shorter than the tube and polypetalous corolla, stiff, unequal, at length much dilated and spreading, 3-nerved; seeds ovoid, bay-coloured, hardly gibbous at the base. ☉. H. Native of Europe, by the sea-side in salt marshes and meadows; plentiful in some parts of Britain, on the east and south coasts of England, from Norfolk to Somersetshire in various places. Smith, engl. bot. 220. Hook. fl. lond. t. 57. *T. irregulāre*, Pour. act. toul. 3. p. 331. *T. rigidum*, Savi, fl. pis. 2. p. 159. t. 1. f. 1. obs. trif. p. 42. Flowers pale-red. Plant hairy.

*Var. β, Bastardiūnum* (Ser. mss. in D. C. prod. 2. p. 192.) spikes pedunculate; calycine segments larger and finely nerved.

*Sea-side* Trefoil. Fl. June, July. Brit. Pl. decumbent, or  $\frac{1}{2}$  foot high when growing in a tuft.

27 *T. SUPINUM* (Savi, obs. trif. p. 46. f. 2.) stems spreading, branched; leaflets obovate, broad, ciliated; stipulas narrow, nerved, small, subulate; heads somewhat obovate, pedunculate, egg-shaped after flowering; calycine segments unequal, linear, stiff, spreading, shorter than the corolla; seeds unequally subcordate, bay-coloured; radicle prominent. ☉. H. Native of the south of Europe. Flowers pale-red.

*Supine* Trefoil. Fl. June, July. Clt. 1816. Pl. trailing.

28 *T. CONSTANTINOPOLITANUM* (Ser. mss. in D. C. prod. 2. p. 193.) stems spreading, branched; leaflets lanceolate-linear, somewhat denticulated; stipulas narrow, nerved, subulate; heads of flowers somewhat globose, terminal, and lateral, pedunculate when mature, of a conical shape; flowers crowded, at length rather loose, and apparently somewhat verticillate; calycine segments unequal, subulate, stiff, much shorter than the corolla. ☉. H. Frequent about Constantinople. Flowers yellow.

*Constantinople* Trefoil. Fl. June, July. Clt. 1820. Pl. spread.

29 *T. XATARDI* (D. C. fl. fr. 5. p. 558.) stem erect, villous, branched; leaflets obovate-elongated, a little ciliated; stipulas narrow, nerved; heads of flowers ovate, pedunculate; calyx striated, glandular, and pilose; the segments hardly unequal and smaller than the corolla. ☉. H. Native of the eastern Pyrenees. Flowers pale-purple?

*Var. β, Bœ'ticum* (Ser. mss. in D. C. prod. 2. p. 193.) plant smoothish; stipulas very long; calycine segments ciliated. Native of Spain. *T. Bœ'ticum*, Lag. ex Balb. in litt.

*Natural's Trefoil.* Pl. 1 foot.

30 *T. cinctum* (D. C. cat. hort. monsp. p. 152.) stems erect, pilose, a little branched; leaflets oval-oblong, villous; stipulas broad, nerved, the two upper ones somewhat palmate; heads ovate, pedunculate; calyx striated; the segments unequal, the lower one large, but shorter than the corolla. ☉. H. Native about Montpellier. Flowers cream-coloured. Vexillum elongated, linear, rather acute. Allied to *T. maritimum* and *T. ochroleucum*.

*Girded Trefoil.* Fl. June, July. Clt. 1820. Pl.  $\frac{1}{2}$  to 1 foot.

31 *T. ALEXANDRINUM* (Lin. amœn. 4. p. 286.) plant smoothish; stems ascending, thick, flexuous; leaves numerous; leaflets ovate-elliptic, somewhat denticulated; stipulas narrow, nerved, about equal in length to the petiole; heads of flowers terminal, ovate; calyx hardly ribbed, pilose; the segments setaceous and nearly equal, the two superior ones joined at the base, much shorter than the monopetalous corolla; seeds ovate, compressed, yellow (ex Savi). ☉. H. Native of Egypt, about Alexandria. —Forsk. fl. ægypt. descr. p. 139. Savi, obs. trif. p. 47. Flowers pale-yellow. Forskal says that this *trefoil* is universally cultivated in Egypt, being the best and indeed the principal fodder for cattle in that country. It is sown only in the recess of the Nile, and where the fields are too high to be inundated by that river they are watered by means of hydraulic engines; the seeds being committed to the earth while it is wet. The produce is three separate crops, the plants growing each time about half an ell in height. After the last crop the plants die. When this *trefoil* is wanted for seed, it is sown along with the wheat. Both are gathered at once by the hand, not reaped or mown, and are threshed out together, the *trefoil-seed* being afterwards separated by a sieve. This species of clover, being so important in its own country, might be worth the notice of British agriculturists.

*Var. β, ramosum* (Ser. mss. in D. C. prod. 2. p. 193.) stem branched; lower segment of the calyx bi-trifurcate.

*Alexandrian Trefoil.* Fl. June, July. Clt. 1798. Pl. 1 ft.

32 *T. ochroleucum* (Lin. syst. nat. 3. p. 233.) pilose; stems ascending, slender; leaves distant; leaflets ovate-elliptic, obtuse, or retuse, finely hairy, upper ones narrowest; stipulas narrow, nerved, much shorter than the petioles, pointed; heads terminal, ovate-oblong, on long stalks; calyx ribbed, smoothish; the segments linear and setaceous, unequal, stiffish, half-spreading, much shorter than the corolla, lowest segment very long. ♀. H. Native of Europe, in dry fields. Curt. fl. lond. 6. t. 49. Mart. fl. rust. 35. Jacq. austr. t. 40. Sturm, deutsch. fl. 1. heft. 16. t. 40. Smith, engl. bot. 1224. *T. roseum*, Presl. ex Gussone, in litt. Flowers cream-coloured. Mr. Curtis recommends this species of *trefoil* to the notice of the experimental agriculturist, and thinks it may be a good substitute for the *T. repens* or *T. pratense* in certain soils and situations, but we think it in no respect worthy of attention, as an object of culture.

*Var. β, dichotomum* (Ser. mss.) stem forked at the top; spikes twin, approximate.

*Var. γ, humile* (Ser. mss.) plant less villous; leaflets broad, lower ones emarginate. *T. ochroleucum β*. D. C. fl. fr. 4. p. 528.

*Var. δ, ramosum* (Ser. mss.) stem much branched.

*Cream-coloured-flowered Trefoil.* Fl. May, July. Britain. Pl. 1 foot.

33 *T. TRICHOCEPHALUM* (Bieb. fl. taur. 3. p. 212. and suppl. p. 508.) stem ascending, simple, few-leaved; leaflets entire, ovate, or oblong; stipulas broadish, long, much shorter than the petiole; heads hairy, elliptic, leafy at the base, sessile; calyx ribbed, glandular, pilose; the segments setaceous and unequal,

much shorter than the corolla. ♀. H. Native of Caucasus, on the Alps. An intermediate plant between *T. ochroleucum* and *T. Pannonicum*. Flowers cream-coloured.

*Hair-headed Trefoil.* Pl.  $\frac{1}{2}$  foot.

34 *T. CANESCENS* (Willd. spec. 3. p. 1369.) stems ascending, covered with adpressed hairs; leaflets obovate, emarginate, villous; stipulas lanceolate-subulate; heads terminal, large, oblong, nearly sessile; calyx smooth; the segments lanceolate and pilose, dilated at the base, lowest one a little longer; corolla monopetalous, much longer than the segments. ♀. H. Native of Cappadocia. Sims, bot. mag. 1168. Perhaps a variety of *T. Pannonicum* only. Flowers cream-coloured.

*Canescent Trefoil.* Fl. May, June. Clt. 1803. Pl.  $\frac{1}{2}$  to 1 foot, ascending.

35 *T. PANNONICUM* (Lin. mant. p. 276.) plant very pilose; stem simple, straight; leaflets lanceolate, oblong, acutish, obtuse or retuse at the apex, nearly entire, ciliated; stipulas narrow, linear, and very long at the apex, length of petiole; heads terminal, pedunculate, ovate-oblong, thick; calyx ribbed, glandular, pilose, the segments setaceous and unequal, much shorter than the corolla. ♀. H. Native of the alps of Piedmont. Jacq. obs. 2. p. 21. t. 42. and of Lower Hungary. Flowers white, but when dry yellowish.

*Var. β, barbatum* (Ser. mss. in D. C. prod. 2. p. 194.) stem forked; leaflets lanceolate, acute. *T. barbatum*, D. C. cat. hort. monsp. 150. Native about Montpellier.

*Pannonian Trefoil.* Fl. June, July. Clt. 1752. Pl. 1 foot.

36 *T. OLYMPICUM* (Horn. mss. Hook. bot. mag. t. 2790.) stem erect, hairy; leaflets hairy, lanceolate-elliptic, entire; stipulas subulate, sheathing; spikes of flowers oblong, solitary; calyx hairy, with the lower tooth equal in length to the tube of the corolla; vexillum very long. ♀. H. Native of Mount Olympus. Flowers yellowish.

*Olympic Trefoil.* Fl. July. Clt. 1817. Pl. 1 foot.

37 *T. ARME'NIUM* (Willd. enum. p. 793.) stems simple, ascending; leaflets linear-lanceolate, emarginate; stipulas subulate; spike dense, oblong-elliptic, solitary; lower tooth of calyx about equal in length to the tube of the monopetalous corolla. ♀. H. Native of Armenia. Perhaps only a variety of *T. Pannonicum*. Flowers cream-coloured.

*Armenian Trefoil.* Fl. June, Jul. Clt. 1820. Pl. 1 ft. ascend.

38 *T. SQUARROSUM* (Lin. spec. 1082.) stem branched; upper leaves opposite or alternate, rather pilose; leaflets lanceolate or oval, rather retuse; stipulas narrow, smoothish, nerved, rather membranous, ending in a long acumen each; heads ovate; calyx ribbed; the segments unequal, 3-nerved, and ciliated, the lowest segment length of corolla and deflexed; seeds oval, yellow. ☉. H. Native of Spain, and of France about Paris. D. C. fl. fr. 4. p. 531. *T. dipsaceum*, Thuill. fl. par. ed. 2. p. 382.—Moris. hist. 2. sect. 2. t. 13. f. 1. Flowers white or cream-coloured.

*Var. β, flavicans* (Ser. mss. in D. C. prod. 2. p. 194.) flowers pale-yellow. *T. squarrosum*, Savi, obs. p. 65. t. 3.

*Squarrose-headed Trefoil.* Fl. June, Jul. Clt. 1640. Pl.  $\frac{1}{2}$  ft.

39 *T. ALBIDUM* (Rets. obs. fasc. 4. p. 30.) stem diffuse; leaflets ovate-lanceolate, ending each in a short awn, and with the margins and keel ciliated; heads nearly globose, but when in fruit ovate; calycine segments subulate, unequal, adpressed, lower one 3-nerved, and about equal in length to the corolla. ☉. H. Native of? Flowers cream-coloured. Perhaps only a variety of *T. ochroleucum*.

*Whitish-flowered Trefoil.* Fl. June, July. Clt. 1796. Pl. 1 foot.

40 *T. CONICUM* (Pers. in Savi, obs. trif. p. 41. 1810.) leaflets obovate, denticulated at the apex, mucronulate; stipulas somewhat ventricose, short, obtuse, and triangular at the apex; heads

ovate-conical, pedunculate; calyxes very much nerved; segments half spreading, about equal in length to the corolla. ☉. H. Native of Europe. Flowers cream-coloured.

*Conical-headed Trefoil.* Fl. Jul. Aug. Clt. 1816. Pl.  $\frac{1}{2}$  to 1 ft.

41 *T. KITAIBELIA'NUM* (Ser. mss. in D. C. prod. 2. p. 194.) stems ascending, hairy; leaflets obovate-elliptic, quite entire, pilose; heads conical, terminal, sessile. ☉. H. Native of Hungary. *T. cónicum*, Kit. in Horn. hort. hafn. 2. p. 717 (1813) but not of Pers. nor Lag. Flowers cream-coloured.

*Kitaibel's Trefoil.* Fl. June, Aug. Clt. 1818. Sh.  $\frac{1}{2}$  foot.

42 *T. ELONGATUM* (Willd. spec. 3. p. 1368.) stem ascending, branched; leaflets lanceolate, emarginate, mucronate, villous; stipulas lanceolate; heads loose, elliptic, solitary; lower segment of the calyx length of wings; corolla monopetalous; vexillum very long. ♀. H. Native of Galatia. The whole plant is villous. It differs from *T. alpestre* in the leaves being smaller, in the vexillum being longer, in the stem being branched and ascending, and in the villi. Flowers red.

*Elongated-headed Trefoil.* Pl. 1 foot.

43 *T. ALPE'STRE* (Lin. spec. 1082.) stem erect, simple; leaflets lanceolate, coriaceous, ciliate-serrulated; stipulas narrow, nerved, nearly sessile, long, and linear at the apex; heads globose; calyx striated; the segments unequal, beset with spinulose warts, the lower segment shorter than the monopetalous corolla, the rest very short and tooth-formed; seeds somewhat reniform, compressed, and yellowish. ♀. H. Native of Europe, on the Alps. Savi, obs. trif. p. 54. Jacq. obs. 3. p. 14. t. 64. fl. aust. 433. Sims, bot. mag. 2779. Root creeping. Flowers purple. The plant has the leaves of *T. rubens* and the flowers of *T. pratense*.

*Var. β, distachyum* (Ser. mss. in D. C. prod. 2. p. 194.) heads of flowers twin, approximate. Sturm, deutschl. fl. 1. heft. 15.

*Var. γ, lanigerum* (Ser. mss. D. C. prod. 2. p. 194.) stems and petioles covered with numerous, white, soft, spreading pili. Native on Mount Pennino.

*Var. δ, rubellum* (Besser, in litt.) flowers rose-coloured. Native of Lithuania.

*Alp Trefoil.* Fl. June, July. Clt. 1789. Pl.  $\frac{1}{2}$  to 1 foot.

44 *T. MEDIUM* (Lin. faun. succ. ed. 2. p. 558.) smoothish; stem erectish, flexuous, branched; leaflets oblong, coriaceous, ciliated, many-nerved, glaucous beneath; stipulas tapering, converging; heads subglobose, pedunculate, rather loose; calycine segments unequal, rather pilose, the uppermost ones rather the shortest, all shorter than the monopetalous corolla; seeds irregularly cordate; radicle very prominent. ♀. H. Native of Europe, in elevated pastures; plentiful in some parts of Britain. Sturm, deutschl. fl. 1. fasc. 15. Smith, engl. bot. 190. *T. flexuosum*, Jacq. fl. austr. t. 386. Mart. fl. rust. 13. *T. affine*, Lejeune, ex herb. D. C. *T. alpestre*, Crantz, aust. 407. Fl. dan. 662. Root creeping. Flowers purple. It differs from *T. pratense* in the looser heads of flowers, flexuous stems, and creeping woody roots. This species goes under the names of *Cor-grass*, *Meadow-clover*, and *Marl-grass*. It is sometimes cultivated as an agricultural plant in England and some other parts of Europe. The best properties of the present kind of clover seem to be its power of resisting drought, and its thriving on cold tenacious soils. Yet Mr. Sinclair reports it to be preferable to *T. pratense* or *red clover* for permanent pasture on light soils. Its produce of nutritious matter, however, is said to be but half as much as that of *T. pratense*.

*Meadow Trefoil.* Fl. June, July. Britain. Pl. 1 foot.

45 *T. EXPANSUM* (Kit. in litt. D. C. prod. 2. p. 195.) pilose; stem erect; leaflets lanceolate; stipulas narrow, nerved, elongated, and ascending at the apex; heads ovate, obtuse, sessile; calycine segments pilose, flexible, unequal, tetragonal, shorter than the corolla. ♀. H. Native of? Perhaps it is a variety

of *T. pratense*, but the stipulas are longer, and the leaflets are narrower. Flowers purple.

*Expanded Trefoil.* Fl. June, July. Clt. 1820. Pl. 1 foot.

46 *T. BRACTEATUM* (Schousb. in Willd. enum. p. 792.) stem branched; leaflets ovate, obtuse, obsolete denticulated; stipulas awned; heads of flowers ovate-conical, dense, solitary, sessile; corolla monopetalous, about equal in length to the calycine segments. ♂. ? ☉. ? H. Native of Morocco. Perhaps only a variety of *T. pratense*. Flowers purple.

*Bracteate-flowered Trefoil.* Fl. June, July. Clt. 1804. Pl. 1 to 1 $\frac{1}{2}$  foot.

47 *T. PRATENSE* (Lin. spec. 1082.) stems ascending; leaflets elliptic, more or less acute, entire; stipulas broad, nerved, glabrous, each ending in a short bristle point, inflexed; heads ovate, dense, obtuse, nearly sessile; calycine segments pilose, flexible, unequal, the lowest one longest, the rest equal; corolla gamopetalous; seeds reniform, compressed, yellowish. ♀. H. Native of Europe, frequent on the Alps and in meadows; plentiful in some parts of Britain. Sturm, deutschl. fl. 1. heft. 5. Savi, obs. trif. p. 48. Smith, engl. bot. 1770. Mart. fl. rust. t. 3.

Leaflets dark-green, usually with a white subsagittate mark in the centre. Flowers purple, rarely white.

The red or broad clover is the kind most generally cultivated on land that carries white and green crops alternately, as it yields the largest crop of all the other.

The soil best adapted for clover is a sandy loam, which is favourable to its long tap roots; it will grow in any soil, provided it be dry. Marl, lime, or chalk, is very congenial to clover.

The climate most congenial to clover is one neither very hot nor very dry and cold. Clover will be found to produce most seed in a dry soil and warm temperature, but as the production of seed is only in some situations an object of the farmer's attention, a season rather moist, provided it be warm, is always attended by the most bulky crop of clover herbage.

The culture which clover receives is ordinary farm culture, and that destined also for another crop.

The time of sowing clover-seed is generally in spring, during the corn seed time, or from February to May; but it may also be sown from August to October, and when it is sown by itself, unaccompanied by any other crop, this will be found the best season, as the young plants are less liable to be dried up, and impeded in their progress by the sun, than when sown alone in spring and remaining unshaded during the dry and hot weather of summer; but clover-seed is usually mixed with a certain portion of rye-grass seed, and sown along with or among other crops, especially with spring-sown wheat, barley, and the early varieties of oats. Unless, however, the soils on which these crops are sown are well pulverized, and have been some years under tillage, clover will not succeed in them; it being ascertained that newly broken-up pasture grounds cannot be sown down to clover and grasses till the soil is thoroughly pulverized, and the roots of the former grasses and herbage plants completely destroyed.

Some prepare clover-seed for sowing by steeping it in water or in oil, as in Switzerland, and then mixing it with powdered gypsum, as a preventive to the attacks of insects.

The manner of sowing clover is always broad-cast. When

FIG. 33.

sown with spring corn, clover and grass seeds are usually put in after the land has been pulverized by harrowing in the corn-seed, and are themselves covered by one course more of the harrows, or if the corn is drilled, the small seeds are sown immediately before or after hand-hoeing, and the land is then finished by a course of the harrow. When the land is under an autumn-sown crop of wheat or other grain, though the clovers and rye-grass are still sown in spring, the proper period must depend both upon the state of the land and the progress of the crops; and it may be often advisable to break the crust formed on the surface of tenacious soils, by using the harrow before the clover-seed is sown, as well as afterwards to cover it. Sometimes the roller only is employed at this time, and there are instances of clover and rye-grass succeeding when sown without either harrow or rolling, if the weather is moist at the time of sowing. Half an inch may be considered a proper depth to cover clover-seed in clay soils, and an inch in dry light soil, but it will grow when barely covered.

The quantity of seed sown on an acre is exceedingly various; not only as more or less white and yellow clover is sown along with grass-seeds and red clover, or when pasturage is intended, but even when they are the only kinds sown, the quantity is varied by the quality of the soils, and the different purposes of hay, soiling, or one year's pasture, to which the crop is to be applied. When pasturage is the object more seed is necessary than when the crop is to be cut green for soiling; and for hay less is necessary than to either of the former. Timely pulverized soils do not require so much seed as clays, on which clovers and rye-grass are very frequently sown among autumn or winter-sown wheat, when there is more danger of a part of it perishing from being imperfectly covered. In general 8 or 10 pounds may be taken as a minimum quantity, and from that to 14 pounds as the maximum. Rye-grass, commonly at the rate of a bushel per acre, but in many cases only half or two-thirds of a bushel, is mixed with this weight of clover, and both are sown at the same time.

When it is intended to retain the land in pasture for several years the quantity of red clover is diminished, and several kinds of more permanent herbage are added, the most common of which are white and yellow clover, and rib-wort and rye-grass. No general rule can be laid down as to the proper quantity of each to be sown; the red clover and rye-grass, however, should predominate.

In the selection of clover and rye-grass seeds particular attention should be paid to their quality and cleanness; the purple colour of cloverseed denotes that it has been ripe and well saved, and the seeds of weeds may be detected in it by narrow inspection, if there be any; but various noxious weeds are frequently mixed up with seeds of rye-grass, which it is difficult either to discover or to separate from them. Red clover from Holland or France has been found to die out in the season it has been cut or pastured, while the English seed produces plants which stand over the second, and many of them the third year (General Report of Scotland, vol. 1. p. 537.); thus remaining, in the latter case, four years in the ground from the time of sowing.

The after culture of clover and rye-grass is chiefly keeping the ground clear of weeds and stones. After this the surface should be rolled once to smooth it for the scythe. This operation is best performed in the first dry weather of March. Some give a top dressing of soot, gypsum, common lime, peat or wood ashes at this time or earlier; but where the soil is in good heart, and contains calcareous matter, top-dressing cannot be considered as necessary.

The taking of the clover or clover and rye-grass crop is either for cutting green for soiling, or cutting green for feeding, or fat-

tening live stock, by making it into hay, or by pasturing. It has been pretty uniformly found, after repeated trials upon soils of almost every description, that oats taken after clover that has been cut, either for soiling or hay, is superior to the crop taken after clover pasture by sheep. On all farms a part of this crop is cut green for the working horses, and for milch-cows, and in some instances both for growing and fattening cattle.

In feeding cattle with green clover attention must be paid to prevent swelling or hoving, which is very apt to take place when they are first put on this food, especially if it be wet with rain or dew, and the more luxuriant the clover the greater is the danger. After being accustomed to this rich food for a few days, during which it should be given rather sparingly, the danger is much diminished; but it is never safe to allow milch cows in particular to eat large quantities of wet clover.

The mode of making clover hay is to cut it close to the ground, and in as perfect and uniform a manner as it is possible to accomplish. The surface in the preceding spring having been freed from stones and well rolled, the stubble after the mower ought to be as short and smooth as possible, by which means the after growth will be more vigorous and weighty. It is turned with a fork or by hand every day until it is quite dry; it is then put up in field ricks, and afterwards stacked.

The after growth or second crop of clover is vigorous or weak according to the proportion of clover plants to rye-grass, to the time when the first crop was cut, and to the moisture and warmth of the season. The first of these after cuttings may be made into hay, and sometimes the second, but in general both are consumed by soiling or pasturing, unless in some dry warm districts, as Norfolk, and parts of Suffolk and Kent, when the second growth is left to ripen its seed. In the northern counties, should it be cut for hay, which it seldom is, the best method of saving it is to mix it up with straw, which will absorb a part of its juices. It is often cut green as a part of the soiling system, or where a sheep stock is kept, pastured by the old ewes or other sorts, that are to be fattened the ensuing winter on turnips.

When clover is used as a pasturage crop the live stock are either pent in by hurdles, and the hurdles shifted as the clover is eaten, or they may be tethered in the field, and the tethers removed in order to have the clover eaten regularly, as in some parts of Scotland, or the stock is introduced into the field, but in this case always earlier than in tethering and hurdling, in order to avoid the loss that would be sustained by cattle or sheep treading on tall herbage; but red clover is not generally pastured till the third year; but when white or yellow clovers are sown the herbage is sometimes not mown at all, but only pastured for three or more years, but if a little red clover is sown with them a crop of hay may be taken the second year.

The produce of clover hay without any admixture of rye-grass, on the best soils is from 2 to 3 tons per acre, and in this state in the London market it generally sells 20 per cent higher than meadow hay or clover and rye-grass mixed. The weight of hay from clover and rye-grass mixed varies according to the soil and the season from one to three tons per English acre, as it is taken from the damp ricks; but after being stacked and kept till spring the weight is found to be diminished 25 or 30 per cent. The value of clover and rye-grass hay in comparison with the straw of beans or peas, may be in the proportion of 3 to 2, and with the finest straw or corn crops in the proportion of 2 to 1. One acre of red clover will go as far in feeding horses or black cattle as 3 or 4 of natural grass. And when it is cut occasionally, and given to them fresh, it will probably go still farther, as no part of it is lost by being trodden down. With the exception of lucern, *Medicago sativa*, and the herbage of rich marshes, there is no crop by which so much stock can be supported as by clover. It may be profitably employed in fattening

sheep in spring, and with this food they will soon be ready for the butcher. Afterwards a crop of hay may be got, and in two or three weeks after the hay has been taken off, sheep intended to be fattened on turnips may be turned in, and kept there until the turnips are ready for them.

*The nutritive products of red clover*, according to Sir Humphrey Davy (the quantity analysed 1000 parts) are as follows: the whole quantity of soluble or nutritive matter 59; mucilage or starch 31; saccharine matter or sugar 3; gluten 2; extract, or matter rendered insoluble during evaporation, 3.

*The saving of clover-seed* is attended with considerable labour and difficulty. Clover will not ripen its seeds if saved for that purpose early in the year; therefore it is necessary to take off the first crop either by feeding or with the scythe, and to depend for the seed upon those heads that are produced in the autumn. Seed clover turns out to good account in those years when the crops are not injured by the blight, which is often fatal to them, or by the rains in the autumn, which sometimes prove their destruction; for the time of harvesting this seed falling out late, when rainy weather may be expected, renders it on that account very tedious. The produce in seed may generally be from 3 to 4 or 5 bushels per acre, when perfectly clean weighing from 2 to 3 cwt. But there is great uncertainty in the produce of clover-seed from the lateness of the season at which it becomes ripe; and the fertility of the soil is considerably impaired by such a crop. Yet the high value of the seed is a great inducement to the saving of it in favourable situations (Dickson's Practical Agriculture, vol. 2. p. 863). The growth of clover reserved for seed should be the second crop, and it should be suffered to remain until the husks become perfectly brown, when it should be cut and harvested in the usual manner, leaving it on the field till it is very dry and crisp, that the seeds may become more fully hardened; it may then be laid up dry, to be threshed out at the farmer's convenience. Much labour and expense are necessary in separating the seeds from the husk, especially when it is effected by thrashing, which seldom costs less than from 5 to 6 or 7 shillings per bushel. By the use of mills the work may be done much cheaper.

*The diseases of clover* are the blight or mildew, and suffocation or consumption from insects, slugs, and worms. It often happens that clover after being repeated at short intervals on the same soil either fails or does no good, whether this is owing to a disease, or a defect in some peculiar substance which enters into the food of the plant, does not appear to be clearly ascertained. A top dressing with ashes or lime is said to be unfavourable to slugs; but where vermin of this sort are very numerous the most certain remedy is a naked fallow well worked in the hottest months.

*Var. α, sativum* (Ser. mss. in D. C. prod. 2. p. 195.) tall; leaflets ovate or lanceolate; heads large, globose.

*Var. β, graciliscens* (Ser. l. c.) smoothish; stems filiform; heads small, few-flowered. *T. pratense* γ, Ser. trif. exsic. no. 19.

*Var. γ, pedunculatum* (Ser. l. c.) heads on long peduncles. *T. pratense sativum*, Sturm, deutschl. fl. 1. fasc. 15.

*Var. ε, multifidum* (Ser. l. c.) calycine segments 6-7, hispid from pili. Native of Corsica.

*Field Trefoil or Red Clover*. Fl. May, Sept. Britain. Pl. 1 to 2 feet.

48 *T. VAGINATUM* (Schleich. cat. p. 51.) plant villous; stems prostrate; leaflets ovate, obtuse or retuse; stipulas broad, nerved; heads ovate, obtuse, nearly sessile; segments of calyx nearly equal; corolla gamopetalous; seed reniform. 2. II. Native of Switzerland, on mount Grimsel, and of Vallais. Flowers yellowish.

*Sheathed Trefoil*. Fl. May, July. Clt. 1819. Pl. prostrate.

COL. II.

49 *T. MICROPHYLLUM* (Desv. journ. bot. 2. p. 316.) smoothish; stems ascending; leaflets ovate, obtuse or retuse, denticulated, superior ones mucronulate; stipulas broadish, nerved, furnished at the apex with a broad, short, inflexed point; heads ovate, obtuse, sessile; calycine segments pilose, flexible, unequal, shorter than the gamopetalous corolla. 2. II. Native of Scandinavia, and about Paris, in dry groves. D. C. fl. fr. 5. p. 356. Flowers purple. Perhaps only a variety of *T. pratense*.

*Small-leaved Trefoil*. Fl. May, July. Clt. 1819. Pl. 1 foot, ascending.

50 *T. NORICUM* (Wulf. in Röm. arch. 3. p. 387.) villous; stem declinate, simple; leaflets oval-oblong; stipulas smoothish, rather narrow, somewhat lanceolate; heads of flowers subglobose, pedunculate and sessile; calycine segments filiform, flexible, about equal in length, the lower one much shorter than the carina. 2. II. Native of Carinthia. Savi, obs. trif. p. 61. Sturm, deutschl. fl. 1. fasc. 16. Allied to *T. pratense*, but the calyxes are twice the length, and thicker; and the flowers are cream-coloured.

*Noric Trefoil or Clover*. Fl. July, Aug. Clt. 1821. Pl. pr.

51 *T. SYCCINETUM* (Visiani. ex bot. zeit. March, 1829. p. 21.) plant hairy; stems ascending; leaflets oval, obtuse, obsolete-denticulated at the apex, upper leaves opposite; stipulas ovate, membranous, nerved; heads of flowers ovate, terminal, girded by a 10-toothed 1-leaved involucre; calyx compressed, nerved at the base, having lanceolate acuminate pilose teeth, the lower tooth twice the length of the others. 2. II. Native of Dalmatia. Flowers white. This plant is distinguished from all others of the genus in the form of the involucre.

*Girt Trefoil*. Fl. May, June. Pl. ascending.

52 *T. PENNSYLVANICUM* (Willd. enum. p. 793.) stem much branched, flexuous; leaflets ovate-elliptic, obtuse, quite entire; stipulas awned; heads ovate, cylindrical, solitary, dense; lower segment of calyx shorter than the monopetalous corolla. 2. II. Native of North America. Very like *T. medium* or *T. pratense*. Flowers red.

*Pennsylvanian Trefoil or Clover*. Fl. May, Sept. Clt. 1811. Pl. 1 foot.

53 *T. FIMBRIATUM* (Lindl. bot. reg. 1070.) stems prostrate, glabrous; leaflets oval, smooth, toothed, the teeth setaceous; heads of flowers on long peduncles; involucre shorter than the flowers, and are, as well as the stipulas, multifid; the segments awned; calyx turbinate, with the segments pungent, about the length of the tube of the corolla; seeds round, black. 2. II. Native of North America, in the neighbourhood of the Columbia river. Flowers purple.

*Fringed-stipuled Trefoil*. Fl. Sept. Oct. Clt. 1825. Pl. prostrate.

54 *T. WORMSKIÖLDI* (Lehm. cat. sem. hort. hamb. 1825.) heads of flowers hemispherical, solitary, terminal, girded by an orbicular, jagged, awned involucre; wings divaricate, a little shorter than the vexillum; leaflets obovate-oblong, pectinately-denticulated, mucronate; stipulas broad, fringed. 2. II. Native of Greenland.

*Wormskiöld's Trefoil*. Pl. reclining.

55 *T. TRIDENTATUM* (Lindl. bot. reg. no. 1070.) stems ascending, nearly simple, glabrous; leaflets linear, acute, toothed, the teeth setaceous; heads of flowers on long peduncles; involucre fringed, awned, shorter than the flowers; upper stipulas pectinated; calyx tubular, the limb dilated and coloured, with the segments tridentate and awned, shorter than the corolla. 2. II. Native of North America, in the neighbourhood of the Colombia river. Flowers purple.

*Tridentate-sepalled Trefoil*. Pl. ascending.

56 *T. CYATHIFERUM* (Lindl. l. c.) stems prostrate, glabrous; leaflets obovate, denticulated, obtuse; heads of flowers on long

B b

peduncles; involucre cup-shaped, truncate, veiny, and toothed, length of flowers; stipulas ovate, short; calyxes membranous, the segments setaceous, 3-5-parted, length of corolla.  $\mathcal{U}$ . H. Native with the two preceding species. Flowers purplish.

*Cup-bearing Trefoil.* Pl. prostrate.

57 *T. INVOLUCRATUM* (Willd. spec. 3. p. 1372.) plant quite smooth; stems straight, erect; petioles long; upper leaflets oblong-linear, sharply-toothed; stipulas membranous, narrow, linear, very acute; heads pedunculate, hemispherical, girded by an orbicular, toothed involucre; bracteas bifurcate, but multifid according to Kunth; segments of the calyx setaceous, longer than the tube, and much shorter than the corolla; ovary stipitate, 5-6-ovulate.  $\odot$ . H. Native of Mexico, near Valladolid, at the height of 6000 feet. H. B. et Kunth, nov. gen. amer. 6. p. 302. Kunth, pl. legum. 186. t. 52. Flowers purplish. Stigma small, oblique, rather linear, obtusely papillose.

*Involucrated Trefoil.* Pl. 1 foot.

58 *T. MUCRONATUM* (Willd. herb. ex Spreng. syst. 3. p. 208.) stem ascending, 1-leaved; leaflets linear, mucronate, serrulated; stipulas broad, lanceolate, cuspidate; calyxes bracteate, the teeth awned and equal, shorter than the corolla; heads of flowers roundish.  $\mathcal{U}$ . H. Native of New Spain.

*Mucronate-leafletted Trefoil.* Pl. ascending.

59 *T. MICROCEPHALUM* (Pursh, fl. amer. sept. 2. p. 478.) stem ascending, pubescent; leaflets obovate, emarginate, denticulated; stipulas ovate, acuminate; heads of flowers small, few-flowered, on long peduncles; flowers sessile in the heads; leaflets of involucre ovate, awned; calycine segments awned, length of corolla.  $\mathcal{U}$ . H. Native of North America, on the banks of Clark's river, and of California. Flowers pale-purple.

*Small-headed Trefoil.* Pl. 1 foot.

60 *T. PALLIDUM* (Waldst. et Kit. pl. rar. 1. p. 35. t. 36.) stems diffuse; leaflets ovate-roundish, denticulated; stipulas pilose, broad, setaceous at the apex; heads of flowers globose, rather hispid, hardly pedunculate; calycine segments setaceous, pilose, unequal, shorter than the monopetalous corolla; seeds ovate, compressed, yellow, globose.  $\odot$ . H. Native of Hungary, in meadows and corn-fields. This plant is nearly allied to *T. pratense*, but the heads are smaller, the flowers are white, and the vexillum is emarginate.

*Pale-flowered Trefoil.* Fl. Ju. Jul. Clt. 1803. Pl. diffuse.

61 *T. DIFFUSUM* (Ehrh. Beitr. 7. p. 165.) plant soft, villous, and glaucous; stems diffuse; leaflets ovate-lanceolate, obtuse or retuse; stipulas narrow, ending in a linear-lanceolate acumen; heads of flowers ovate, rather hispid; calycine segments setaceous, very villous, straight, equal, shorter than the monopetalous corolla; legume circumscised, 2-seeded; seeds bay-coloured, irregularly obcordate.  $\odot$ . H. Native of Hungary, in sandy places, and about Paris. Waldst. et Kit. hung. 1. p. 40. t. 50. *T. ciliatum*, Thuill. fl. par. ed. 2. p. 380. Flowers purple. Perhaps a variety of *T. hirtum*.

*Diffuse Trefoil.* Fl. July, Aug. Clt. 1801. Pl.  $\frac{1}{2}$  foot.

62 *T. HETEROPHYLLUM* (Tratt. arch. 1. p. 26. with a figure.) stems procumbent, diffuse, very straight, lower leaflets obcordate, upper ones ovate or lanceolate; stipulas ovate, awned; heads of flowers globose, solitary, dense; calycine segments nearly equal, about equal in length to the tube of the monopetalous corolla.  $\mathcal{U}$ . H. Native of the top of mount Aetscher. Flowers red.

*Variable-leaved Trefoil.* Pl. procumbent.

63 *T. HIRTUM* (All. auct. p. 20.) stem erect; leaflets obovate, cuneate, nearly entire; lower stipulas narrow, each ending in a long acumen, upper ones short, and very broad; heads of flowers nearly globose, hispid; calycine segments very long, about equal in length to the corolla, hardly unequal; seeds large, regularly ovate, very blunt.  $\odot$ . H. Native of the south

of Europe. *T. hispidum*, Desf. atl. 2. p. 200. t. 209. f. 1. Flowers rose-coloured. Plant hairy.

*Var.  $\beta$ , pictum* (Ser. mss. in D. C. prod. 2. p. 196.) leaflets denticulated, spotted with red. *T. pictum*, Roth, cat. 2. p. 201. Savi, obs. trif. p. 27.

*Var.  $\gamma$ , pygmaeum* (Ser. l. c.) stems almost simple; head solitary, terminal. Native of the Pyrenees, about Prades.

*Hairy Trefoil.* Fl. July, Aug. Clt. 1817. Pl.  $\frac{1}{2}$  to 1 foot.

64 *T. POLYCEPHALUM* (Ser. mss. in D. C. prod. 2. p. 196.) plant hairy, prostrate; leaflets cuneate-obovate, entire; stipulas lanceolate, the cauline ones free; heads of flowers very numerous, ovate; calyx very hairy, the segments nearly equal and flexile, shorter than the corolla; vexillum length of corolla; legume villous, 2-seeded; seeds cordate-reniform.  $\mathcal{U}$ . G. Native of the Cape of Good Hope. Perhaps *T. lanatum* of Thunb. prod. 136.

*Many-headed Trefoil.* Pl. prostrate.

65 *T. PAUCIFLORUM* (d'Urv. enum. pl. arch. p. 94.) stems trailing, villous, much branched at the base; petioles very long; leaflets cuneate, very much dilated at the apex, usually emarginate, entire; stipulas scarious, ciliated, subulate at the apex; spikes solitary or twin, few-flowered, on short peduncles; calyxes villous, the segments setaceous, and shorter than the corolla.  $\delta$ . H. Native of Turkey, near Constantinople. Flowers purple.

*Few-flowered Trefoil.* Pl. trailing.

66 *T. HUMBOLDTI* (Spreng. syst. 3. p. 213.) heads somewhat umbellate, 8-flowered; calyxes hairy, at length deflexed, the teeth lanceolate, shorter than the corolla; stipulas oblong-lanceolate, nerved; leaflets obovate-roundish, denticulated, nerved.  $\odot$ . H. Native of Quito. *T. pauciflorum*, Willd. herb.

*Humboldt's Trefoil.* Pl. prostrate.

67 *T. CHERLERI* (Lin. amoen. 4. p. 286.) stem procumbent; leaflets obcordate, nearly entire; stipulas broad, ending each in a linear incurved point; heads globose, hispid, sessile: stipulas roundish; calycine segments hispid, longer than the corolla; seeds ovoid, compressed.  $\odot$ . H. Native of the south of Europe. Savi, obs. trif. p. 23.—Barrel. icon. 859. Desf. atl. 2. p. 197. Flowers white.

*Cherler's Trefoil.* Fl. May, June. Clt. 1750. Pl. procumbent.

68 *T. SPILEROCEPHALON* (Desf. fl. atl. 2. p. 201. t. 209. exclusive of the synonyme of Barrelier.) stems diffuse; leaflets obcordate or obovate; stipulas lanceolate, acute; heads of flowers globose, hispid, sessile, involucre; calycine segments setaceous, longer than the corolla.  $\odot$ . H. Native of the north of Africa, near Mascar. Flowers white. Plant villous.

*Round-headed Trefoil.* Fl. June, July. Clt. 1820. Pl.  $\frac{1}{2}$  foot.

69 *T. ROTUNDIFOLIUM* (Smith, fl. græc. t. 747.) stems simple, diffuse; leaflets nearly orbicular, toothed, hairy; calyx very hairy, longer than its teeth, which are short, lanceolate, and upright; heads of flowers globose, terminal, with lanceolate bracteas.  $\odot$ . H. Native of the Morea. Corolla twice the length of the calyx, elegantly variegated with pale purple and white; its petals distinct; germ hairy. The whole plant clothed with white hairs.

*Round-leaved Trefoil.* Fl. May, July. Pl.  $\frac{1}{2}$  foot.

70 *T. GLOBOSUM* (Lin. spec. 1081.) plant very villous; stems diffuse, slender, branched; leaflets obovate-cuneiform, somewhat denticulated; stipulas lanceolate, nerved; heads of flowers globose, villous, stalked; the superior calyxes destitute of a corolla, the lower ones about equal in length to the corolla; seeds egg-shaped, compressed, large, black.  $\odot$ . H. Native of Syria, Arabia, and Italy. Savi, obs. trif. p. 16. Flowers white.

*Globose-headed Trefoil.* Fl. June, Aug. Clt. 1713. Pl. diffuse,  $\frac{1}{2}$  foot.

71 *T. RADIOSUM* (Wahl. in isis. 1828. vol. 21. p. 971.) stems ascending, and are, as well as the leaves, villous; leaflets obovate; the interior of the head of flower abortive; teeth of calyx curved, setaceous, plumose, shorter than the corolla. ☉. H. Native of the Levant. Like *T. globosum*, but double the size.

*Ray-headed Trefoil.* Pl. ascending.

72 *T. OLIVERIANUM* (Ser. mss. in D. C. prod. 2. p. 197.) villous; stems diffuse; leaflets obovate-cuneate, short, broad, entire; stipulas lanceolate, each ending in a long narrow acumen; heads subglobose, few-flowered; calycine segments bent, filiform, pilose, ascending, equal, much shorter than the corolla. ☉. H. Native about Constantinople. Flowers red.

*Oliver's Trefoil.* Pl. diffuse.

73 *T. CLYPEATUM* (Lin. spec. 1084.) pubescent; stems diffuse; leaflets obovate, denticulated; stipulas broad, nerved, ciliated; heads of flowers subglobose; calycine segments leafy, lanceolate, nerved, unequal, spreading, much shorter than the corolla; legume 1-seeded; seeds sub-cordate? ☉. H. Native of the Levant.—Savi, obs. trif. p. 61. Gært. fruct. t. 153.—Alp. exot. t. 306. Flowers pale-red. The plant is named *T. clypeatum* in reference to the calyx when in fruit being spread like a buckler.

*Clypeate-calyxed Trefoil.* Fl. June, Aug. Clt. 1711. Pl.  $\frac{1}{2}$  ft.

74 *T. STELLATUM* (Lin. spec. 1083.) plant villous, diffuse; leaflets obcordate, somewhat triangular, with the upper margin denticulated; stipulas obovate, very broad, serrulated; heads of flowers ovate-globose; calycine segments foliaceous, linear-lanceolate, spreading, equal, length of the corolla; legume 1-seeded; seeds ovate, orbicular, bay-coloured. ☉. H. Native of the south of Europe. Sturm, deutsch. fl. 1. fasc. 10. Savi, obs. trif. p. 30. Desf. atl. 2. p. 199. Smith, engl. bot. 1546.—Barrel. icon. p. 860. Flowers pale rose-coloured.

*Stellate-calyxed Trefoil.* Fl. Ju. July. Britain. Pl.  $\frac{1}{2}$  to 1 ft.

75 *T. LEUCANTHIUM* (Bieb. fl. taur. 2. p. 214.) stems ascending, villous; leaflets obovate-oblong, somewhat serrated at the apex; stipulas lanceolate, subulate; heads of flowers subglobose, pedunculate, villous; calycine segments spreading, nearly equal, shorter than the corolla; legume 1-seeded; seeds ovoid; radicle hardly prominent. ☉. H. Native of Tauria, on dry hills, and of Corsica. *T. stellatum*, Pall. ined. taur. *T. variabile*, Gussone in litt. 1824. *T. obscurum*, Guss. cat. ex litt. 1824. This plant differs from *T. stellatum* in the stipulas being lanceolate-subulate and entire, not ovate and denticulated, as well as in the leaflets being more oblong, and the flowers being smaller and almost white, not pale-red.

*White-flowered Trefoil.* Fl. June, July. Clt. 1820. Pl.  $\frac{1}{2}$  foot, declinate.

76 *T. LONGIPEDUNCULATUM* (Lois. fl. gall. ex bull. sc. Aug. 1828. p. 425.) stem ascending, smooth; leaflets oblong-elliptic, quite entire, rather pilose; stipulas narrow, linear-awl-shaped beyond the middle; heads of flowers ovate, terminal, on long peduncles; teeth of calyx unequal, rather pilose, the lower tooth largest, about equal in length to the monopetalous corolla. ☉. H. Native of Corsica, near Bonifacio. Flowers white.

*Long-peduncled Trefoil.* Fl. May, June. Pl. ascending.

77 *T. REFLEXUM* (Walsb. et Kit. pl. hung. 3. p. 299. t. 269.) stems decumbent, diffuse, numerous, pilose; leaflets oblong, somewhat denticulated; stipulas subulate; heads of flowers subglobose, pedunculate; calycine segments spreading, unequal, shorter than the corolla; vexillum elongated; legume obovate, fleshy, glabrous, brown, 1-seeded; seed brown, roundish; radicle hardly prominent. ☉. H. Native of Hungary, in grassy places. Perhaps distinct from *T. leucanthum*.

*Reflexed Trefoil.* Pl. decumbent.

78 *T. OBLONGIFOLIUM* (Ser. mss. in D. C. prod. 2. p. 197.) villous; stems erect; leaflets oblong, ciliated; stipulas lanceo-

late, nerved, ending each in a long acumen; heads of flowers globose; calycine segments somewhat setaceous, equal, longer than the corolla. ☉. H. Native of Spain and Barbary. *T. squarrosum*, Lam. in herb. Vahl. Flowers purple.

*Oblong-leaved Trefoil.* Pl. 1 foot.

79 *T. OBSCURUM* (Savi, obs. trif. p. 31. f. 1.) stems spreading; leaflets obovate or obcordate, entire; stipulas membranous, nerved, acute at the apex, ciliated; heads of flowers subglobose; calycine segments lanceolate, acuminate, nerved, pungent, length of tube, and longer than the corolla; legume 1-seeded. ☉. H. Native of Italy. Perhaps only a variety of *T. leucanthum*. Flowers white.

*Obscure Trefoil.* Fl. June, July. Clt. 1820. Pl. spreading.

80 *T. SAXATILE* (All. fl. ped. no. 1108. t. 59. f. 3.) stems rather erect; leaves villous; leaflets cuneate, small, and entire, but emarginate at the apex; stipulas ovate, mucronulate, nerved; heads of flowers globose, depressed, sessile, bracteate; calyxes tomentose; the segments small and ascending, equal, length of corolla; seeds small, black, irregularly subcordate. ☉. ♂. H. Native of Switzerland, Piedmont, and Dauphiny, on the higher alps. Savi, obs. trif. p. 28. *T. thymiflorum*, Vill. dauph. 3. p. 437. *T. glaciale*, Reyn. mem. 1. p. 166. Flowers white.

*Rock Trefoil.* Fl. May, July. Clt. 1816. Pl.  $\frac{1}{2}$  foot.

SECT. IV. *TRIFOLIASTRUM* (from *trifolium*, and *astrum*, an affixed signification, like). Ser. mss. in D. C. prod. 2. p. 198. Flowers capitate; heads globose, sessile, or pedunculate; flowers usually deflexed at length. Calyx not inflated.

81 *T. SUFFOCATUM* (Lin. mant. 276.) glabrous; stems very short, procumbent; petioles long; leaflets obcordate-cuneiform, denticulated; stipulas scarious, a little nerved, each ending in a short acumen; heads of flowers axillary, sessile, nearly globose, glabrous, approximate; flowers dense, sessile; calyx membranous, smooth; the segments lanceolate, acute, flat, and nearly equal, recurved, much longer than the corolla; legume concealed, 2-seeded; seeds nearly globose, yellowish; radicle prominent. ☉. H. Native of the south of Europe. In England on the sandy sea-coast at Yarmouth and Lowestoft, and at Landguard Fort. Jacq. hort. vind. t. 60. Savi, obs. trif. p. 96. Brot. phyt. p. 158. t. 64. Smith, engl. bot. 1040. Flowers pale pink.

*Suffocated Trefoil.* Fl. June, July. Brit. Pl. procumbent.

82 *T. CONGESTUM* (Guss. cat. 1821. p. 80. pl. rar. p. 311.) stems branched, smooth, trailing; leaves on long petioles; leaflets obcordate, entire, pubescent; heads of flowers lateral and terminal, roundish, sessile, approximate; calyx pilose; the teeth erect, equal in length to the corolla; legume 1-seeded. ☉. H. Native of Calabria in arid fields by the sea-side.

*Crowded-flowered Trefoil.* Fl. May. Clt. 1820. Pl. trailing.

83 *T. GLOMERATUM* (Lin. spec. 1084.) glabrous; stems spreading; leaflets obovate, sharply toothed; stipulas scarious, nerved, each ending in a long acumen; heads of flowers axillary, sessile, distant, globose; flowers dense, sessile; calycine segments heart-shaped, short, nerved, acuminate, reflexed, shorter than the polypetalous corolla; legume 1-seeded; seed irregularly cordate, bay-coloured. ☉. H. Native of the south of Europe. In England, in gravelly fields and pastures about London, Isle of Shepey, on Kew-green and Hanwell-heath, Middlesex, on the Bath hills, near Bungay, Suffolk, at Yarmouth, &c. Smith, engl. bot. 1063. Curt. lond. 4. t. 51. Flowers rose-coloured.

*Glomerated Trefoil.* Fl. June, July. Britain. Pl. decumb.

84 *T. PARVIFLORUM* (Ehrh. Beitr. 7. p. 165.) stems diffuse; leaflets obovate, nerved, sharply serrated; stipulas scarious, ending each in a sharp acumen; heads of flowers axillary, pedunculate, and sessile, globose; flowers dense, sessile; calycine

segments nerved, lanceolate, acute, unequal, the two superior ones longer than the corolla; legume 2-seeded; seeds somewhat cordate, bay-coloured. ☉. H. Native of Hungary and Siberia. *T. strictum*, Sturm, deutsch. fl. 1. fasc. 15. but not of Lin.

*Small-flowered Trefoil.* Fl. June, July. Clt. 1820. Pl. pt.

85 *T. strictum* (Lin. spec. 1079.) glabrous; stems branched at the base; lower leaflets obovate, superior ones oblong-elliptic, serrulated; stipulas somewhat scarious, very broad, and bluntish; heads of flowers axillary, on long peduncles, globose; bractæ membranous, almost lanceolate; flowers dense, sessile; calycine segments subulate, unequal, spreading a little, shorter than the corolla; legume a little exserted, 2-seeded; seeds ovate; radicle hardly prominent. ☉. H. Native of the south of Europe, in Hungary, &c. Waldst. et Kit. pl. hung. 1. p. 37. f. 37. Mich. gen. 27. t. 25. f. 7. Flowers white.

*Var. β, clatum* (Ser. mss. in D. C. prod. 2. p. 198.) stems and leaflets elongated. *T. lævigatum*, Poir. itin. 2. p. 219. Desf. fl. atl. 2. p. 195. t. 208. Native of Barbary.

*Straight Trefoil.* Fl. June, July. Clt. 1805. Pl.  $\frac{1}{2}$  to 1 ft.

86 *T. obcordatum* (Desv. journ. bot. 1814. 3. p. 76.) stems creeping; leaflets obcordate, quite entire; peduncles ascending, at length reflexed; calyxes and peduncles villous.  $\mathcal{A}$ . F. Native about Buenos Ayres. This plant has the habit of *T. repens*. Flowers of a fine purple colour. Perhaps two species are confused under this name, one of which has the leaflets, peduncles, and calyxes glabrous, and the other having the leaflets, peduncles, and calyxes villous.

*Obcordate-leafletted Trefoil.* Pl. creeping.

87 *T. grandiflorum* (Hook. in Beech, bot. p. 16.) stems creeping; leaflets obcordate, striated, denticulated, and are as well as the petioles pilose; stipulas oval, ending in a long awn; peduncles hardly pilose, ascending, 3-times longer than the petioles; calyx campanulate, pilose; the segments unequal, lanceolate, exceeding the tube; corolla 5-6-times longer than the calyx, scarious, permanent.  $\mathcal{A}$ . F. Native about Concepcion, Chili. Like *T. obcordatum*, but probably belonging to section *Lupinaster*.

*Great-flowered Trefoil.* Pl. creeping.

88 *T. repens* (Lin. spec. 1080.) stems creeping, rooting, diffuse, branched at the base; leaflets obovate-roundish, rather retuse, denticulated; stipulas scarious, narrow, lanceolate, each ending in a long mucrone; heads of flowers globose, axillary, on very long peduncles; flowers pedicellate, deflexed after flowering; calycine segments unequal, tooth-formed, shorter than the corolla; legume 2-4-seeded; seeds irregularly ovoid, bay-coloured.  $\mathcal{A}$ . H. Native of Europe, in meadows and pastures; plentiful in Britain, and now cultivated in Jamaica. Sturm, deutsch. fl. 1. fasc. 15. Savi, obs. trif. p. 16. Smith, engl. bot. 1769. Curt. lond. 3. t. 46. Oed. fl. dan. 990. Mart. fl. rust. 31. Corolla white, tinged with purple. *White clover* is common in pastures through the greater part of Europe, flowering from May to September. There are many varieties of it, depending upon the richness or poverty of the soil. In a fertile moist soil it has a more upright branching stem. On all our good lands it seems to rise spontaneously; but however this may be, the growth of it is much encouraged by spreading of ashes or other manure. It does not come early, neither is it of a tall growth, but it forms an excellent bottom in pastures, and affords a great abundance of succulent stalks and leaves, affording late feed in dry summers, when grasses are mostly burnt up. Mr. Curtis affirms that a single seedling covered more than a yard square of ground in one summer. It does not seem to be ascertained when this *white clover* or *trefoil* came first into cultivation in this country, but it seems to be of late date, for it is not mentioned by Gerarde, Parkinson, or Ray, as an agricultural plant in this country, nor by any of the agricul-

tural writers of the 17th century. Gerarde, however, says that there is a *trefoil* of this kind which is sown in fields in the low countries of Italy, &c. that cometh up ranker and higher than that which groweth in meadows, and is an excellent food for cattle, both to fatten them and cause them to give great store of milk. Gerarde, herball. p. 1018. edit. 1579. *White clover* is generally sown in pastures to be fed on the land. The time and mode of sowing is the same as that for *red clover*, see *Trifolium pratense*. The nutritive products of *white clover*, according to Sir Humphrey Davy (the quantity analyzed 1000 parts) whole quantity of soluble or nutritive matter 32 $\frac{1}{2}$ ; mucilage or starch 29; saccharine matter or sugar 1; extract of matter rendered insoluble during evaporation 5; gluten or albumen 3. *White trefoil* is generally called shamrock, but *Oxalis acetosella* is supposed to be the true Irish shamrock.

*Var. β, rubescens* (Ser. mss. in D. C. prod. 2. p. 199.) flowers purplish; stems numerous. About Geneva.

*Var. γ, luxurians* (D. C. herb.) leaflets 4-6, very large.—J. Bauh. hist. 4. p. 380. f. 1.

*Var. δ, phyllanthum* (Ser. l. c.) segments of the calyx changed into leaflets; peduncles longish. About Bern and Geneva.

*Var. ε, unguiculatum* (Ser. l. c.) peduncles elongated; legumes rather foliaceous, pedicellate, much longer than the calyx.

*Var. ζ, pentaphyllum*; leaflets 5.

*Var. η, nigricans*; leaflets 4-5, blackish.

*Var. θ, foliaceum*; head of flowers having a bunch of leaves rising from its apex.

White or Sheep's Clover, *Creeping Trefoil*. Fl. May, Oct. Britain. Pl. creeping,  $\frac{1}{2}$  foot.

89 *VAILLEANTH* (Poir. dict. suppl. vol. 8. p. 4.) stems branched, decumbent, solid; leaflets elliptic-obovate, finely serrated; heads of flowers globose; flowers pedicellate.  $\mathcal{A}$ . H. Native in pastures about Florence and Paris, in the meadows of Switzerland, and in the Morea.—Mich. gen. 27. t. 25. f. 6.—Vaill. par. t. 22. f. 1. Flowers white.

*Vaillant's Trefoil.* Fl. May, Aug. Clt. ? Pl. decumbent.

90 *T. AMABILE* (H. B. et Kunth, nov. gen. amer. 6. p. 503. t. 593.) plant tufted, diffuse; leaflets roundish-ovate, denticulated, glabrous; petioles and peduncles pilose; umbels axillary, 8-10-flowered; peduncles hardly longer than the leaves; calycine segments ending each in a subulate acumen, shorter than the corolla; legume rather wrinkled, 1-2-seeded.  $\mathcal{A}$ . G. Native of Mexico, near Toluca, at the height of 4140 feet. Very like *T. repens*. Flowers reddish.

*Lovely Trefoil.* Pl.  $\frac{1}{2}$  foot, spreading.

91 *T. ANOMALUM* (Schränk, pl. rar. t. 47.) stems creeping; leaves on long petioles; leaflets obovate or obcordate, black, sharply serrulated; lower stipulas lanceolate, entire, upper ones broad, crenated; heads of flowers axillary, on long peduncles; flowers pedicellate; calycine segments short, unequal, much smaller than the corolla; legume terete, 4-seeded.  $\mathcal{A}$ . H. Native of? Perhaps only a dark-leaved variety of *T. repens*. Flowers white.

*Anomalous Trefoil.* Fl. May, Oct. Pl. creeping.

92 *T. UMBELLATUM* (Ser. mss. in D. C. prod. 2. p. 199.) stems prostrate, pubescent; leaves petiolate; leaflets obcordate, cuneated; stipulas lanceolate, cuspidate, foliaceous, nerved; peduncles filiform, very long; heads umbellate, few-flowered; pedicels pilose, arched; flowers ascending; calyxes pilose, striated; the segments lanceolate and 3-nerved, hardly the length of the corolla; vexillum denticulated. ☉. H. Native of Carolina. Flowers white?

*Umbellate-flowered Trefoil.* Pl. prostrate.

93 *T. CERNEUM* (Brot. phyt. p. 150. f. 62.) stem procumbent; peduncles 3-times shorter than the leaves; leaflets obovate or oval-cuneated, mucronate at the apex; stipulas membranous,

ovate, acuminate, entire; heads of flowers umbellate, almost globose; flowers numerous, drooping a little, and reflexed after flowering; calyxes glabrous, having nearly equal segments, length of corolla; legumes 2-3-seeded; seeds almost reniform, bay-coloured. ☉. H. Native of Portugal. Flowers pale-purple.

*Drooping-flowered Trefoil.* Fl. Ju. Jul. Clt. 1820. Pl. pr.

94 *T. PALLESCENS* (Schreber in Sturm, deutschl. fl. 1. fasc. 15.) stems creeping; leaflets obovate-roundish, denticulated; stipulas scarious, lanceolate, nerved, ending each in a long acumen; heads axillary, on long peduncles; flowers pedicellate, the pedicels deflexed when in fruit; calycine segments unequal, longer than the tube but shorter than the corolla. ☉. H. Native of Salzburg, on the alps. Flowers cream-coloured. Perhaps a yellowish-flowered variety of *T. repens*.

*Pale-flowered Trefoil.* Fl. Sept. Clt. 1804. Pl. creep.  $\frac{1}{2}$  ft.

95 *T. NIGRESCENS* (Viv. frag. fl. ital. p. 12. t. 13.) stems tufted, decumbent; leaflets roundish, cuneate, denticulated; stipulas membranous, broad, marked with black, ending in a narrow acumen; heads of flowers naked; peduncles longer than the leaves; calycine segments unequal, much shorter than the corolla; legume 3-4-seeded. ☉. H. Native about Rome, on the banks of the Tiber. Flowers yellowish.

*Blackish-leaved Trefoil.* Fl. June, Aug. Pl. decumbent.

96 *T. CÆSPITOSUM* (Reyne, mem. 1. p. 162.) plant quite smooth; stems tufted, very short; leaflets obovate, rather retuse, denticulated; stipulas scarious, narrow, lanceolate, very acute, 1-nerved; heads axillary, on long peduncles; flowers almost sessile, the pedicels spreading when in fruit; calycine segments nearly equal, lanceolate, spinose at the apex, shorter than the corolla; legume 3-4-seeded; seeds cordate, bay-coloured. ♀. H. Native of Dauphiny, Switzerland, and Piedmont, in alpine meadows. *T. Thalii*, Vill. dauph. 3. p. 478. t. 41. The calyxes are longer than in *T. repens*. Flowers white?

*Var. β, glareosum* (Ser. mss. in D. C. prod. 2. p. 200.) heads small, few-flowered; calyxes much shorter. *T. glareosum*, Schleich. ex herb. Reyn.

*Tufted Trefoil.* Fl. June, Aug. Clt. 1815. Pl. tufted.

97 *T. BURCHELLIANUM* (Ser. mss. in D. C. prod. 2. p. 200.) plant smoothish; stems short; leaflets obcordate, sharply toothed; stipulas long, narrow, lanceolate, foliaceous, bluntish, having numerous flexuous nerves; heads of flowers axillary, on long peduncles; flowers almost sessile; calycine segments linear, 1-nerved, foliaceous, hardly awned at the apex, longer than the tube, but shorter than the corolla; vexillum longer than the wings. ♀. G. Native of the Cape of Good Hope.—Burchell, cat. no. 316.

*Burchell's Trefoil.* Pl.  $\frac{1}{2}$  foot.

98 *T. AFRICANUM* (Ser. mss. in D. C. prod. 2. p. 200.) plant pilose; stems short; leaflets obovate or obcordate, somewhat serrulated; stipulas long and narrow, lanceolate, foliaceous, acute, having numerous, straight, parallel nerves; heads of flowers axillary, on long peduncles; flowers sessile; calycine segments tetragonal, about equal in length to the tube, but shorter than the corolla; vexillum length of wings. ♀. ? G. Native of the Cape of Good Hope. Burch. cat. pl. afr. extratrop. no. 2817.

*African Trefoil.* Pl.  $\frac{1}{2}$  foot.

99 *T. ROTUNDATUM* (Ser. in D. C. prod. 2. p. 200.) plant pilose; stems short, tufted; leaflets roundish, somewhat obcordate, almost entire, much nerved; stipulas broad, each ending in a long mucrone, having numerous flexuous nerves; heads of flowers terminal, somewhat globose, villous, fulvous, pedunculate; flowers sessile; calycine segments tetragonal, nearly equal, length of tube, but much shorter than the corolla; vexillum longer than the wings. ♀. H. Native of?

*Roundish-leafletted Trefoil.* Pl.  $\frac{1}{2}$  to  $\frac{1}{4}$  foot.

100 *T. POLYMORPHUM* (Poir. suppl. 8. p. 20.) plant very villos; stems creeping; leaflets cuneiform, obcordate, denticulated, thickly beset with nerves; stipulas broad, membranous at the base, foliaceous, nerved, ending each in a deflexed mucrone; heads of flowers roundish, on very long peduncles, axillary, straight, but at length reflexed; calycine segments somewhat tetragonal, length of tube, but shorter than the corolla; vexillum longer than the wings. ♀. ? Native of the Straits of Magellan and about Buenos Ayres.

*Polymorphous Trefoil.* Pl. creeping.

101 *T. ANGULATUM* (Waldst. et Kit. pl. hung. 1. p. 26. t. 27.) plant almost smooth; stems decumbent, angular; leaflets obovate or obcordate, sharply serrated; stipulas scarious, narrow, ending in a long acute acumen; heads of flowers axillary, pedunculate; flowers pedicellate, at length deflexed; calycine segments narrow, acute, ascending, shorter than the corolla; legume exserted, 4-seeded, somewhat articulated; seeds triangular, dense, somewhat ovate, black. ☉. H. Native of Hungary, in places impregnated with salt, and about Montpellier. Savi, obs. trif. p. 91. Flowers red.

*Angular-stemmed Trefoil.* Fl. Ju. Aug. Clt. 1803. Pl. dec.

102 *T. SERRULATUM* (Lagasc. nov. gen. p. 23.) leaflets oblong-obovate, serrulated; heads of flowers umbellate, globose; the pedicels reflexed when in fruit; calycine segments unequal, about equal in length to the corolla; legume 2-seeded. ♀. H. Native of sandy places about Madrid.

*Serrulated-leaved Trefoil.* Pl. prostrate.

103 *T. SUAVEOLENS* (Willd. enum. suppl. p. 52. hort. berl. t. 108.) stems weak, striated; leaflets obovate, somewhat acuminate, sharply serrated; stipulas very narrow, ending each in a long acumen; heads of flowers somewhat hemispherical, axillary, on long peduncles; flowers sessile; calycine segments unequal, 1-nerved; seeds oblong-reniform. ☉. H. Native of Persia and of Italy. *T. formosum*, Curt. ex herb. Coult. 1822. Flowers purplish. Very like *T. resupinatum*, but the calyxes are not bladdery.

*Sweet-scented Trefoil.* Fl. June, Sept. Clt. 1820. Pl.  $\frac{1}{2}$  ft.

104 *T. HYBRIDUM* (Savi, fl. pis. 2. p. 90. obs. trif. 90.) glabrous; stems ascending, solid; leaflets obcordate, cuneiform, denticulated; stipulas broad, rather membranous, very narrow, acute; heads somewhat umbellate, axillary, few-flowered; flowers pedicellate, the pedicels deflexed when in fruit; calycine segments unequal, broadish, shorter than the tube, and much shorter than the corolla; legume exserted, 4-seeded; seeds irregularly cordate, bay-coloured. ♀. H. Native of the south of Europe.—Mich. gen. t. 25. f. 6. *T. hybridum*, Lin. spec. 1076. in Desf. atl. 2. p. 195. Sturm, deutschl. fl. 1. fasc. 15. *T. polyanthemum*, Tenore, ex herb. Balb. Flowers white, tinged with red. Desfontaine's plant has pale-red flowers. Linnaeus thinks his plant is a hybrid between *T. pratense* and *T. repens*.

*Hybrid Trefoil.* Fl. June, Aug. Clt. 1777. Pl.  $\frac{1}{2}$  to 1 ft.

105 *T. MICHELLIANUM* (Savi, fl. pis. 2. p. 139. obs. trif. 93.) stem ascending, fistular; leaflets obovate and obcordate, serrulated; stipulas foliaceous, lanceolate, acute; heads of flowers somewhat umbellate, axillary; flowers on long pedicels, the pedicels deflexed when in fruit; calycine segments setaceous, rather spreading, nearly equal, twice or thrice longer than the tube but shorter than the corolla; legume exserted, 2-seeded; seeds ovate, compressed, black. ☉. H. Native of the south of Europe. *T. Vaillantii*, Lois. journ. bot. 2. p. 365.—Mich. gen. t. 25. f. 25. Flowers of a greenish-white colour.

*Michell's Trefoil.* Fl. June, Aug. Clt. 1815. Pl. pr.

106 *T. ELEGANS* (Savi, fl. pis. 2. p. 161. t. 1. f. 2. obs. trif. 92.) stem ascending, solid; leaflets obovate, denticulated; sti-

pulas leafy, ending each in a long, narrow acumen; heads of flowers subglobose, axillary; flowers on long pedicels, the pedicels deflexed when in fruit; calyx short, the segments about equal, corolla; legume 2-seeded: seeds ascending, shorter than the black. *2. H.* Native of Calabria, on Mount Corno. Flowers white. Allied to *T. montanum*.

*Rock Trefoil.* Fl. June, July. Clt. 1820. Pl. 1 foot.

113 *T. PRÆTUTIANUM* (Guss. pl. rar. 308.) clothed with soft and dense pili; stems tufted and ascending; leaflets oval, entire, or denticulated, finely veined towards the margins; stipulas narrow, ending in a long, bristle-like acumen; heads of flowers globose, solitary, bracteated by a stipule; tube of calyx lined with pili; the segments awl-shaped and parallel, unequal, having the throat filled with white pili. *2. H.* Native of the higher mountains of Aprutia, on Mounts Corno and Cortone. Stems 3 inches high. Flowers reddish.

*Prutian Trefoil.* Pl.  $\frac{1}{2}$  foot.

114 *T. LATINUM* (Seb. pl. rom. fasc. 1. pt. 7. t. 1. f. 2.) stem erectish, dichotomous; leaflets lanceolate, acuminate, nearly entire; stipulas narrow, nerved, pilose, linear, acute; heads of flowers on long peduncles, oval; calyxine segments between triangular and subulate, ciliated, lowest one very long, but shorter than the tube of the corolla; legume membranous; seeds somewhat turbinate. *2. H.* Native near Rome. The whole plant is very soft and beset with small short pili. Flowers red or white.

*Latin Trefoil.* Fl. June, July. Clt. 1825. Pl.  $\frac{1}{2}$  foot.

SECT. V. *VESICA'STRUM* (from *vesica*, a bladder, and *astrum*, an affixed signification, like; in reference to the calyxes in all the species of this section being inflated after flowering). Ser. mss. in D. C. prod. 2. p. 202. Flowers disposed in dense heads; under lip of calyx remaining unchanged, but the upper one, after flowering, becomes increased and inflated, and covers the legume in a kind of arched manner. Nerves in the leaves numerous.

115 *T. SUBTERRANEUM* (Lin. spec. 1080.) villous; stems procumbent; leaflets obcordate, entire; stipulas lanceolate, broad, acute; heads few-flowered, usually 3-4, piercing the ground when in a seeding state; the lower flowers fertile having the calyx inflated; upper flowers sterile, empty, elongated, deflexed; legume 1-seeded; seed ovate, black.  $\odot$ . II. Native of Europe; plentiful in Britain, in dry gravelly pastures, and on barren heaths and exposed places, as on Black-heath, Greenwich-park, Hyde-park, &c. Savi, obs. trif. 12. Smith, engl. bot. 1048. Curt. lond. 1. t. 54. Flowers white or very pale red. Involucrum central, reflexed, stiff, starry, embracing the fruit.

*Subterraneous Trefoil.* Fl. May, Aug. Brit. Pl. pr.

116 *T. VESICULOSUM* (Savi, fl. pis. 2. p. 165. obs. trif. 84.) stems erect, firm, striated; leaflets lanceolate, acute, sharply serrulated; stipulas narrow, rather membranous, ending each in a long acumen; heads of flowers ovate, thick, on long peduncles; calyxes scarious, inflated; the segments subulate and very acute, equal, much shorter than the corolla; legumes 2-seeded; seeds ovate, compressed, yellow.  $\odot$ . II. Native of the south of Europe. *T. recurvum*, Walds. et Kit. pl. rar. hung. 2. p. 179. t. 165. and *T. turgidum*, Bieb. l. c. and suppl. Flowers reddish.

*Bladdery-calyxed Trefoil.* Fl. Ju. Jul. Clt. 1805. Pl.  $\frac{3}{4}$  ft.

117 *T. AMBIGUUM* (Bieb. fl. taur. 2. p. 208.) stems creeping; leaflets ovate, bluntish, serrulated; heads dense, double the size of those of *T. repens*; calyx striated; the teeth nearly equal, subulate, and divaricate; vexillum lanceolate; legume 1-2-seeded. *2. H.* Native of Tauria and Caucasus in meadows, and on the lower Volga. The barren stems creeping and tufted, the floriferous ones erect. Flowers pale-red.

*Var.  $\beta$ , cærulescens* (Bieb. fl. taur. suppl. 507.) corollas bluish. Native of the south of Tauria.

*Ambiguous Trefoil.* Fl. June, July. Clt. 1815. Pl.  $\frac{3}{4}$  foot.

*Elegant Trefoil.* Fl. red or white. Plant creeping.

107 *T. ISTHMOCA'NUM* (Brot. phyt. p. 148. t. 61.) stems prostrate and ascending; petioles much shorter than the peduncles; leaflets obovate, obtuse, serrulated, villous; stipulas broad, nerved, subulate, heads of flowers ovate; flowers sessile; calyxine segments equal, erect, small, shorter than the corolla, which is somewhat falcate; legume 2-3-seeded; seeds somewhat reniform, of a yellowish-grey colour.  $\odot$ .  $\delta$ ? II. Native of Port. Legume membranous, coarctate in the middle from dry substance. Flowers pale-purple.

*Rock-fruited Trefoil.* Pl. ascending,  $\frac{1}{2}$  foot.

108 *T. REFLEXUM* (Lin. spec. 1079.) plant pilose; stems ascending; leaflets obovate, serrulated; stipulas foliaceous, obliquely-cordate, acuminate; heads of flowers globose, axillary; flowers on long pedicels, at length deflexed; calyxine segments nearly equal, very narrow, 1-nerved, nearly twice the length of the tube, but shorter than the corolla. *2. H.* Native of Virginia. Flowers purple. Heads of flowers nearly twice the size of those of *T. elegans*. Legumes usually 3-seeded.

*Reflexed-flowered Trefoil.* Fl. Ju. Aug. Clt. 1794. Pl. pr.

109 *T. CAROLINIANUM* (Mich. fl. bor. amer. 2. p. 58.) plant small; leaflets roundish, obcordate, ciliated; heads pedunculate, reflexed, few-flowered; calyxine segments straight, linear, shorter than the tube; corolla white, hardly exerted beyond the calyx; legume usually 3-seeded. *2. H.* Native of Carolina.

*Carolinian Trefoil.* Pl.  $\frac{1}{2}$  foot.

110 *T. MONTANUM* (Lin. spec. 1087.) plant pubescent; stem erect, nearly simple; leaflets lanceolate-oblong, obtuse, denticulated, thickly beset with nerves; stipulas lanceolate, very acute; heads of flowers nearly globose, axillary, pedunculate, but at length oblong; flowers almost sessile, crowded, spreading, at length reflexed; calyxine segments unequal, narrow, length of tube, but shorter than the carina; legume 1-seeded; seed ovate-roundish. *2. H.* Native of Europe, in mountain meadows. Savi, obs. trif. 100. Sturm, deutschl. fl. 1. fasc. 15. Fl. dan. 1172. Flowers white.

*Var.  $\beta$ , pedunculosum* (Ser. mss. in D. C. prod. 2. p. 201.) heads of flowers globose, solitary, on long peduncles, thicker; calyxes larger.

*Var.  $\gamma$ , incanum* (Ser. l. c.) stem, peduncles, and lower surface of leaves clothed with hoary pili. Native of Bessarabia.

*Mountain Trefoil.* Fl. June, Aug. Clt. 1786. Pl.  $\frac{1}{2}$  to 1 ft.

111 *T. BALBISIANUM* (Ser. mss. in D. C. prod. 2. p. 201.) plant villous; stems tufted, simple; leaflets elliptic, obtuse, denticulated, much nerved; stipulas lanceolate, acute; heads of flowers hemispherical, terminal, solitary; peduncles much longer than the stamens; flowers ascending, purple; calyxine segments equal, spreading, narrow, much longer than the cylindrical tube, and shorter than the carina. *2. H.* Native of Provence, on Mount Lachen.

*Balbis's Trefoil.* Pl.  $\frac{1}{2}$  to 1 foot.

112 *T. RUPE'STRE* (Tenore, ex Gussone, in herb. Dunant. D. C. prod. 2. p. 201.) stems erect, simple; leaves nearly all radical; leaflets oval, denticulated, much nerved; stipulas membranous, acuminate; peduncle striated, pilose, terminal, length of stem; flowers capitate, depressed, at length deflexed; calyx rather coriaceous, having smooth, blackish-green angles; the teeth or segments narrow, parallel, equal, longer than the tube.

118 *T. spumòsum* (Lin. spec. 1085.) stem spreading, branched; leaflets obovate or obcordate, nearly entire; stipulas broad, very acute; heads of flowers ovate, thick, nearly sessile; calyxes scarious, inflated, striated, transversely veined; the segments setaceous and diverging, about equal in length to the corolla; bracteas lanceolate, shorter than the calyx; legume 4-seeded; seeds ovate-globose. ☉. H. Native of the south of Europe. Gärtn. fruct. t. 153. Savi, obs. trif. 82.—Cup. panph. t. 69. f. 1. Flowers pale-red.

*Frothy* Trefoil. Fl. June, July. Clt. 1771. Pl. prostrate.

119 *T. RESUPINATUM* (Lin. spec. 1086.) stems prostrate; leaflets obovate, sharply serrulated, spotted at the base; stipulas short, linear-lanceolate, acute; heads hemispherical, at length globose; peduncles longer than the petioles; flowers nearly sessile; calyxes scarious, inflated after flowering, longitudinally and transversely veined; the segments lanceolate, reticulated, and very acute, shorter than the corolla; legumes usually 2-seeded; seeds irregularly subcordate, bay-coloured. ☉. H. Native of the south of Europe. Sturm, deutschl. fl. 1. fasc. 16. with a figure. Savi, obs. trif. 79. *T. bicorne*, Forsk. fl. ægypt. 139.—Clus. hist. 2. p. 247.—Barrel. icon. 872. Nearly allied to *T. suavèolens*, but differs in the peduncles being shorter and in the calyxes being inflated. The corolla of this species is turned upside down, hence the specific name. Flowers pale-red.

*Resupinate-flowered* Trefoil. Fl. Ju. Jul. Clt. 1713. Pl. pr.

120 *T. FRAGIFERUM* (Lin. spec. 1086.) stem prostrate, creeping; leaflets obcordate, denticulated; stipulas ovate, elongated at the apex; heads of flowers ovate-globose, on long peduncles; flowers sessile; calyxes inflated after flowering, membranous, reticulated, pilose; the segments unequal, shorter than the corolla and reticulated; bracteas small, lanceolate; legume 2-seeded. ♀. H. Native of Europe, in meadows. In England in moist meadows and pastures in black boggy soil. Savi, obs. trif. 76. Sturm, deutschl. fl. 1. fasc. 16. icon. Smith, engl. bot. 1050. Fl. dan. 1042. Curt. fl. lond. 2. t. 55. Stems prostrate, rooting, extending a considerable length. Flowers rose-coloured. The heads when in seed resemble strawberries; hence the specific name.

*Var. β, proliferum* (Bernard in litt.) flowers 6-8 in a whorl, beneath the head of flowers.

*Strawberry-bearing* Trefoil. Fl. June, Aug. England. Pl. prostrate.

121 *T. TOMENTOSUM* (Lin. spec. 1086.) stems prostrate; leaflets obcordate, cuneiform, sharply serrulated; stipulas lanceolate, acute, scarious; heads of flowers globose, on very short peduncles; bracteas small, lanceolate; flowers sessile; calyxes inflated after flowering, membranous, reticulated, tomentose, the segments shorter than the corolla; legume 1-seeded; seeds irregularly cordate, green, shining. ♀. ? ☉. ? Native of the south of Europe. Savi, obs. 73. —Barrel. icon. 864.—Magn. monsp. 265. t. 264. Flowers purplish.

*Tomentose* Trefoil. Fl. June, July. Clt. 1640. Pl. prostrate.

122 *T. PHYSDÈS* (Stev. in Bieb. fl. taur. 2. p. 217.) stems procumbent, slender; leaflets ovate, obtuse, serrulated, mucronate; stipulas narrow, acuminate; heads of flowers roundish, on long peduncles, about equal in length to the leaves; calyx inflated when in fruit, membranous, pubescent; the segments setaceous, and about equal the length of the tube. ♀. H. Native of Iberia. Flowers reddish.

*Bladdery-calyxed* Trefoil. Fl. June, Aug. Clt. 1818. Pl. procumbent.

123 *T. TURGIDUM* (Bieb. fl. taur. 2. p. 210.) stems erectish; leaflets obovate, obcordate, almost entire; stipulas acute; heads of flowers ovate, chaffy; calyx globose, smooth, the teeth setaceous and recurved; petals mucronate. ☉. H. Native of Caucasus between the rivers Kuba and Jegorlik. Flowers white.

This plant comes very near *T. spumòsum* in the want of the universal involucre to the head of the flowers.

*Turgid-calyxed* Trefoil. Fl. Ju. July. Clt. 1818. Pl.  $\frac{1}{2}$  ff.

124 *T. TUMENS* (Stev. in Bieb. fl. taur. 2. p. 217.) stems procumbent, quite smooth; leaflets obovate, somewhat emarginate; heads of flowers roundish; peduncles longer than the leaves; calyx when in fruit inflated, membranous, pubescent; the segments setaceous, and nearly equal, shorter than the tube. ☉. ? H. Native of Iberia. This species differs from *T. physodes* in being more slender, in the leaflets being more acute at the base, in the flowers being fewer, heads smaller, peduncles longer, and especially in the teeth of the calyx being smaller. Flowers reddish.

*Swelling-calyxed* Trefoil. Pl. procumbent.

125 *T. ALATUM* (Biv. stirp. rar. 4. p. 14.) stems decumbent, glabrous, striated; leaflets obovate, obtuse or emarginate and serrulated; heads of flowers globose, terminal; peduncles twice the length of the superior leaves; stipulas very long, subulate at the apex; calyx much inflated after flowering, reticulated, rather pilose, the segments setaceous, and nearly equal, shorter than the corolla. ♀. H. Native of Sicily, about Palermo. *T. Cupani*, Timeo, pl. rar. sic. pag. 1. p. 16.—Cup. panph. t. 97. f. 1. Schrank, in fl. 1819. p. 387. Flowers reddish.

*Winged* Trefoil. Fl. June, Aug. Clt. 1820. Pl. decumbent.

126 *T. BONANNI* (Presl. ex Spreng. syst. 3. p. 218.) stems creeping; leaflets obovate, retuse; calyx tomentose, the lower teeth setaceous, straight, and conniving; heads of flowers roundish. ♀. H. Native of Sicily.

*Bonanni's* Trefoil. Pl. creeping.

127 *T. DEPAUPERATUM* (Desv. journ. bot. 1814. vol. 4. p. 69.) plant many-stemmed, decumbent; stems simple; leaflets linear, somewhat cuneiform, glabrous, toothed at the apex; heads pedunculate, terminal, few-flowered; involucre 1-leaved, entire, truncate; calyx glabrous; vexillum when in fruit inflated. ☉. ? F. Native of Peru (Dombey). This species has the habit almost of *T. filiforme* of Poir. dict. suppl. 5. p. 385.

*Depauperated* Trefoil. Pl. decumbent.

SECT. VI. LUPINASTER (from *lupinus*, a lupine, and *aster*, an affixed signification, like. Some of the species contained in this section have the habit of *Lupines*). Ser. mss. in D. C. prod. 2. p. 203. *Lupinaster*, Mørch. meth. suppl. p. 30. Flowers large; the petals coriaceous and permanent, red, white or yellow. Calycine segments subulate, erect. Leaves having 3 coriaceous leaflets, rarely 5-7, reticulated with numerous nerves.

128 *T. CHILENSE* (Hook. in Beech. voy. p. 18.) stem diffuse, glabrous; leaflets narrow, oblong-obovate, sharply-denticulated, quite smooth, equal in length to the petiole; stipulas oval, membranous, nerved, pectinately-fringed; heads of flowers on long peduncles; involucre shorter than the flowers, multifid, awned; calyx campanulate, the segments tridentate and awned, the middle tooth longer than the rest, about equal in length to the corolla. ♀. H. Native of Chili, about Concepcion. Nearly allied to *T. fimbriatum* of Lindl. in bot. reg. 1070.

*Chili* Trefoil. Pl. diffuse.

129 *T. UNIFLORUM* (Lin. amœn. 4. p. 285. spec. 1085.) plant tufted, creeping; stems very short; leaflets 3, ovate, acuminate, toothed, nerved; stipulas sheathing, ending each in a long acumen; flowers axillary, solitary, on short peduncles; calyx cylindrical, striated; the segments short, subulate, and nearly equal; corolla very long, much longer than the calyx; legume 2-seeded; seeds ovoid, apiculated. ♀. H. Native of Syria, Provence, and Italy.—Buxb. cent. 3. p. 17. t. 31. f. 1. *T. Buxbaumii*, Sternb. in flora. 1820. p. 600. Flowers having the vexillum blue, and the keel and wings purple.

*Var. β, Sternbergianum* (Ser. mss. in D. C. prod. 2. p. 203.)

leaflets obovate-roundish; flowers white. *T. uniflorum*, Sternb. in flora. 1820. p. 599.—Buxb. cent. 3. p. 18. t. 31. f. 2.

*One-flowered* Trefoil. Fl. May, Sept. Clt. 1800. Pl. creeping.

130 *T. EXIMIUM* (Steph. ex Fisch. and Stev. in litt. D. C. prod. 2. p. 203.) plant glabrous; stems ascending, firm; leaflets obovate, nerved, somewhat denticulated; petioles very short; stipulas leafy, veiny, obtuse; heads few-flowered; peduncles and pedicels short, tomentose; calyxes campanulate; the segments lanceolate and very acute, equal, longer than the tube, but shorter than the corolla; legume 4-5-seeded. *U. H.* Native of Dahuria. *T. grandiflorum*, Fisch. Led. Vexillum large. Style elongated. Corolla purple.

*Var. β, albiflorum* (Fisch. in litt.) flowers white. *U. H.* Native of the Altaian mountains.

*Choice* Trefoil. Fl. June, July. Clt. 1820. Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

131 *T. ALPINUM* (Lin. spec. 1080.) plant quite smooth; stems short, thick, under ground; petioles very long; leaflets 3, lanceolate-linear, bluntish, denticulated; stipulas very long, and very narrow, linear, and acute; heads of flowers umbellate, on long peduncles; pedicels small, disposed in something like a whorl; calyx campanulate, the segments equal, very long, and setaceous, but much shorter than the corolla; legume 2-seeded. *U. H.* Native of Europe, on the higher Alps and mountains. Sturm, deutschl. fl. 1. fasc. 15. with a good figure. Savi, obs. trif. 99.—Park. theatr. 1104. f. 4. Flowers large, purple, the vexillum flesh-coloured and streaked with purple. The roots have the taste of liquorice.

*Alpine* Trefoil. Fl. June, Aug. Clt. 1775. Pl.  $\frac{1}{4}$  to  $\frac{1}{2}$  foot.

132 *T. LUPINASTER* (Lin. spec. 1079.) plant quite smooth; stems straight, branched; petioles wanting; leaflets 5, linear-lanceolate, sharply-toothed, mucronate; stipulas broad, membranous, acuminate; heads of flowers pedunculate, bractless; flowers umbellate; calyx campanulate, hardly nerved; the segments acute, longer than the tube, but shorter than the corolla; legume 6-seeded. *U. H.* Native of Siberia. *Lupinaster pentaphyllus*, Mönch. meth. suppl. p. 50. *Pentaphyllum lupinaster*, Pers. ench. 2. p. 352. *Pentaphyllum Ammanni*, Ledeb. hort. dorp. suppl. 1823. p. 5. Mart. fl. rust. t. 16. Curt. bot. mag. 876.—Gmel. sib. 4. p. 19. t. 6. f. 1. Flowers large, purple; the wings and keel paler than the vexillum.

*Var. β, albiflorum* (Ser. mss. in D. C. prod. 2. p. 204.) flowers white; leaflets very narrow. *T. albens*, Fisch.

*Lupine-like* Trefoil or Bastard Lupine. Fl. June, Aug. Clt. 1741. Pl. 1 to  $1\frac{1}{2}$  foot.

133 *T. PURPURASCENS* (Fisch. in litt.) the character of this species agrees with the last in almost every particular, except in the leaflets being very broad and bluntish. *U. H.* Native of Siberia, about Barnaul. *T. lupinaster* var.  $\gamma$ , oblongifolium, Ser. mss. in D. C. prod. 2. p. 204. Flowers purplish, large.

*Purplish-flowered* Trefoil or Bastard Lupine. Fl. June, Aug. Clt. 1816. Pl. 1 to  $1\frac{1}{2}$  foot.

134 *T. MEGACEPHALUM* (Nutt. gen. amer. 2. p. 105.) stems simple, angular; leaflets 7, cuneate-lanceolate; petioles very long; stipulas cuneate, deeply 3-toothed; segments of the calyx setaceous and feathery; legume 2-4-seeded. *U. H.* Native of North America, at the head waters of the river Missouri. *Lupinaster macrocephalus*, Pursh. fl. amer. sept. 2. p. 479. t. 23. Flowers yellowish-white with a pale-purple carina.

*Large-headed* Trefoil or Bastard Lupine. Fl. July, Aug. Clt. 1826? Pl. 1 foot.

135 *T. GISSONI* (Tinco, pl. rar. sic. pug. 1. p. 17.) plant smoothish; stem branched; leaflets 3, oblong, obovate, sharply-denticulated, terminal one on a long petiole, lateral ones sessile; stipulas lanceolate, bluntish, toothed, ciliated; heads of flowers rather egg-shaped; peduncles pilose; flowers on short pedicels; calycine segments unequal, narrow, the two lower ones

longest, the uppermost ones very short; vexillum obovate, dilated, serrulated. *U. H.* Native of Sicily, on the Nebròdes. Schrank, in flora. 1819. p. 387. Flowers bluish-red, but they fade to a reddish-yellow colour. Bonan. t. 248.

*Gussone's* Trefoil. Fl. June, Aug. Clt. 1826. Pl. 1 foot.

136 *T. PLUMOSUM* (Douglas, mss.) stem simple, erect, villous, forked at the apex; petioles about the length of the leaflets; leaflets 3, lanceolate, acuminate, ciliated, clothed with silky villi on the under surface as well as the stipulas, but pubescent above; heads of flowers ovate-oblong, villous; calycine segments subulate, unequal, lowest one longer than the corolla. *U. H.* Native of North America. Flowers apparently purple.

*Plumose-headed* Trefoil. Pl.  $1\frac{1}{2}$  foot.

137 *T. ALTISSIMUM* (Doug. mss.) stem erect, forked at the apex, glabrous; leaflets 3, lanceolate, glabrous, ciliated; petioles length of the combined part of the stipulas; heads of flowers globose, glabrous; calycine segments subulate, much shorter than the monopetalous corolla. *U. H.* Native of North America. Flowers purple.

*Tallest* Trefoil. Pl. 2 feet.

SECT. VII. *CHRONOSEMIUM* (from *χρονος*, *chronos*, time, and *σημα*, *sema*, a standard; in reference to the permanent nature of the standard or vexillum.) Ser. mss. in D. C. prod. 2. p. 204. Flowers disposed in an ovate pedunculate head. Petals scarious, yellow, fading to a bay-colour; vexillum deflexed, and permanent.

138 *T. BADIUM* (Schreb. in Sturm, deutschl. fl. 1. fasc. 16. with a good figure,) stems ascending; leaves petiolate; leaflets sessile, obcordate, denticulated; stipulas lanceolate, acute, rather membranous; heads of flowers globose, pedunculate, rather loose; vexillum obovate; calyx very short, campanulate, the segments unequal, the uppermost one very small; legume subglobose, 1-seeded; seeds ovoid; radicle hardly prominent. *U. H.* Native of Europe, in mountain meadows. Savi, obs. trif. 113. *T. spadiceum*, Vill. dauph. 3. p. 491. but not of Lin. Flowers yellow.

*Bay-coloured-flowered* Trefoil. Fl. June, Aug. Pl. ascending.

139 *T. BRUTIUM* (Ten. prod. fl. nep. 1826. ex Schlecht. Linnæa. 3. p. 103.) stems ascending, branched; leaves stalked; leaflets obovate, cuneate, denticulated, the terminal one hardly petiolate; heads of flowers axillary, spherical; peduncles longer than the leaves; segments of calyx unequal, the 2 upper ones short, the rest piliferous at the apex; vexillum large, golden, furrowed; keel copper-coloured; seeds elliptical, yellow. *U. H.* Native of Naples. Allied to *T. procumbens* and *T. agrarium*.

*Brutium* Trefoil. Fl. May, Aug. Pl. ascending.

140 *T. AGRIUM* (Lin. spec. 1087.) stem ascending, branched, firm; leaves almost sessile; leaflets oblong-ovate, sessile, denticulated; stipulas leafy, lanceolate, acute, longer than the petiole; heads of flowers on long peduncles, egg-shaped; vexillum obcordate; calyx campanulate, short, the segments unequal, glabrous, and elongated, the superior one smallest; legume 1-seeded, ovoid, compressed; seeds bay-coloured, irregularly cordate; radicle prominent. *U. H.* Native of Europe, in dry pastures and woods. Sturm, deutschl. fl. 1. fasc. 16. with a good figure. Fl. dan. 554. *T. stræpens*, Crantz. austr. 411. no. 8. Flowers yellow.

*Field* Trefoil. Fl. June, Aug. Clt. 1815. Pl. prostrate.

141 *T. SPADICEUM* (Lin. spec. 1087.) stem erect, almost simple, slender; leaves stalked; leaflets oblong, ovate, sessile, denticulated; stipulas leafy, narrow, acuminate; heads of flowers ovoid, on peduncles; vexillum obcordate; calycine segments unequal; the lower ones long and pilose, the two upper ones small and glabrous; legume ovoid, compressed, 1-seeded; seeds irregularly egg-shaped, bay-coloured; radicle prominent. *U. H.* Native of Europe, in mountain meadows. Sturm, deutschl. fl.

1. fasc. 16. with a good figure. Savi, obs. trif. p. 112. Sims, bot. mag. 557. Flowers yellow; the vexillum tending to a ferruginous colour.

*Var. β, ramosissimum* (Ser. mss. in D. C. prod. 2. p. 205.) stem much branched; heads of flowers numerous.

*Chestnut-brown-coloured-flowered Trefoil.* Fl. June, Aug. Clt. 1778. • Pl.  $\frac{1}{2}$  foot.

142 *T. CILIA'TUM* (Clark. itin. 3. ex Spreng. neue entd. 3. p. 159.) leaflets obcordate, denticulated; stipulas ciliated, rather large; heads ovate-hemispherical, few-flowered; teeth of calyx subulate, ciliated, unequal; corolla scarious, rather large; petals denticulated. ☉. II. Native of Abercromby Island, formerly called Lagusa. Flowers yellow.

*Ciliated-calyxed Trefoil.* Pl. procumbent.

143 *T. DECIPIENS* (Horn. hort. hafn. 2. p. 719.) stem erect; leaflets oval, sessile, mucronate; heads of flowers oval; vexillum somewhat deflexed, permanent; calyx 3-toothed; teeth awl-shaped, pilose. ☉. H. Native of? Very like *T. spadiceum*, Horn. Flowers bay-coloured.

*Deceiving Trefoil.* Fl. Ju. Aug. Clt. 1820. Pl.  $\frac{1}{2}$  foot.

144 *T. SPECIOSUM* (Willd. spec. 3. p. 1382.) plant rather vil-  
lous; stems prostrate; leaves hardly stalked; leaflets obovate, denticulated, on very short stalks; stipulas lanceolate, ciliated, large; heads of flowers oblong-cylindrical, bay-coloured, on long peduncles; vexillum obovate, very broad, somewhat denticulated; calyxes glabrous, the segments unequal, the 2 superior ones smallest; legume somewhat globose, on a long stipe, 1-seeded; seed oblong, shining; radicle hardly prominent. ☉. II. Native of the islands of Candia, Cyprus, and Zant. Flowers bay-coloured. In Zant this is the only plant made into hay. It might perhaps be tried in the south of England in dry open parts.

*Sherry Trefoil.* Fl. June, July. Clt. 1752. Pl. procumbent.

145 *T. BILLARDIERI* (Spreng. syst. 3. p. 211.) stem erect, pilose; heads of flowers oblong; leaflets obovate-oblong, ciliated; stipulas denticulated; upper calyxes sterile; the teeth subulate, ciliated, and unequal; vexillum orbicular, nerved, permanent, deflexed. ☉. II. Native of Syria. *T. comosum*, Labill. syr. dec. 5. p. 15. t. 10. Flowers yellow.

*La Billardier's Trefoil.* Pl. 1 foot.

146 *T. PROCUMBENS* (Lin. spec. 1088.) stems procumbent; leaves on short stalks; leaflets obovate or obcordate, denticulated, terminal one on a short stalk; stipulas half ovate, ciliated, shorter than the petiole; heads of flowers axillary, oval, dense; peduncles longer than the leaves, or equal with them; calycine segments unequal, two superior ones very short; vexillum finally deflexed; legume 1-seeded; seed kidney-shaped, yellow; radicle hardly prominent. ☉. II. Native of Europe, in gravelly fields and pastures; plentiful in Britain. Smith, eng. bot. 945. *T. campestre*, Schreb. in Sturm, deutschl. 1. fasc. 15. *T. pseudo-procumbens*, Gmel. fl. bad. 3. p. 240. *T. agrarium*, Huds. ang. 528. Curt. lond. 3. t. 45. Mart. fl. rust. 121. Mill. dict. no. 3. Flowers yellow. This plant is called *Yellow* or *Hop Trefoil*; the latter name is bestowed on it with much propriety, the heads being larger, and more resembling the hop than any of the rest of the species. It is common on borders of fields in dry gravelly soils. In some meadows it forms a considerable part of the crop, and makes excellent fodder; and it is now very generally used for pasture with or without the *white clover*. The manner of sowing the seeds and after culture of *yellow clover* are the same as that for *red clover*. See *Trifolium pratense*.

*Procumbent Trefoil, Yellow Clover, or Hop Trefoil.* Fl. June, Aug. Britain. Pl. procumbent. •

147 *T. PARISIENSE* (D. C. fl. fr. 5. p. 562.) stems procumbent; leaflets obovate or obcordate, denticulated, the terminal one usually petiolulate; peduncles filiform, very long; heads of flowers somewhat umbellate, few-flowered; calycine segments

unequal, the two superior ones very short, longer than the tube; legume pedicellate, 1-seeded; seeds elliptic; radicle prominent.

☉. II. Native of Europe, in fields, particularly in France. *T. patens*, Schreb. in Sturm, deutschl. fl. 1. fasc. 16. Flowers yellow.

*Var. β, pygmaeum* (Ser. mss.) stems branched, short

*Paris Trefoil.* Fl. June, Aug. Pl. procumbent.

148 *T. SEBASTIANI* (Savi, in diar. med. Flajani, 1815.) stems diffuse; leaflets obovate, sessile, denticulated; stipulas narrow, longer than the petiole; peduncles short, firm; flowers somewhat umbellate, pedicellate; tube of calyx very short; the segments long, setaceous, and equal; legume stipitate, 1-seeded; seed ovoid-elliptic. ☉. H. Native of Italy, about Rome. Sebast. pl. rom. fasc. 2. p. 14. t. 4. Flowers pale-yellow.

• *Sebastian's Trefoil.* Fl. June, Aug. Clt. 1800. Pl. diffuse.

149 *T. FLAVESCENS* (Tineb, pug. 1. p. 15.) stems rather erect, branched, dichotomous, glabrous; the two superior leaves opposite, approximating the head of the flowers; leaflets obovate, denticulated; stipulas membranous, nerved, pilose, subulate; heads of flowers roundish; calyx nerved, pilose; the segments ciliated and unequal, longer than the tube. ☉. ? H. Native of Sicily, on the Nebrodes. Schrank, in flora. 1819. p. 386. Flowers yellow.

*Yellowish-flowered Trefoil.* Pl.  $\frac{1}{2}$  foot.

150 *T. FILIFORME* (Lin. spec. 1088.) stems prostrate; leaflets obovate or obcordate, somewhat denticulated, nearly sessile; stipulas small, ovate, length of petiole, a little fringed; peduncles filiform, long; flowers somewhat racemose, leaning all one way, on short pedicels; calycine segments unequal, 2 superior ones shorter than the tube; vexillum even; legume 1-2-seeded, on a short stipe; seeds oblong-ovate, bay-coloured. ☉. II. Native of Europe, in dry or moist grassy meadows, pastures, borders of fields, and on dry gravelly soils common; plentiful in Britain. Flowers yellow. Sturm, deutschl. fl. 1. fasc. 16. Smith, eng. bot. 1257. Cattle and sheep are so fond of this trefoil that a specimen of it can scarcely be had in any pasture to which they have access.

*Filiform Hop Trefoil.* Fl. Ju. Aug. Britain. Pl. procumbent.

151 *T. MINUS* (Relh. 290. Smith, eng. bot. 1256.) stems procumbent; leaflets obcordate, toothed, lateral ones almost sessile, middle one stalked; stipulas half ovate, acute; peduncles straight, rigid; heads of flowers hemispherical; vexillum nearly even; calycine teeth unequal, hairy towards the points; legume 1, rarely 2-seeded. ☉. II. Native of Europe, in gravelly fields and pastures; plentiful in Britain. *T. filiforme*, Ehrh. beit. 49. *T. procumbens*, Huds. ang. 328. Curt. lond. fasc. 5. t. 53. *T. dubium*, Sibth. 231. Flowers yellow.

*Var. β, microphyllum* (Ser. mss. in D. C. prod. 2. p. 206.) plant small; leaves very minute; heads few-flowered. *T. contraversum*, Jan. pl. exsic. ital. sup. cent. 10. Heads generally 3-flowered.

*Lesser Yellow Trefoil.* Fl. June, Aug. Britain. Pl. proc.

152 *T. MICRANTHUM* (Viv. fl. libyc. p. 15. t. 19. f. 3.) stems diffuse; racemes few-flowered, disposed in loose pedunculate heads; legume 1-seeded, shining, spherical; leaflets cuneate-obovate; stipulas ovate, ciliated. ☉. II. Native of Cyrenaica, on mountains. Plant very like *T. minus* β, *microphyllum*. Flowers yellow.

*Small-flowered Trefoil.* Fl. June, Aug. Clt. 1816. Pl. proc.

153 *T. VOLUBILE* (Lour. coch. p. 445.) stem elongated, slender, twining; leaflets roundish, quite entire, tomentose; heads many-flowered, axillary; legume 2-seeded, glabrous. ☉. ? H. Native on the eastern coast of Africa. Flowers yellow.

*Twining Trefoil.* Pl. procumbent.

† *Species not so sufficiently known as to be placed in either of the above sections.*

154 *T. MINIMUM* (Bart. fl. phil. 2. p. 74.) stems somewhat

C c

procumbent, smooth; leaflets cuneated, emarginate, denticulated, glabrous; stipulas ovate, acuminate; peduncles filiform; capsule roundish; vexillum deflexed. ☉. H. Native of New Jersey. Flowers yellow?

*Least Trefoil.* Pl. procumbent.

155 *T. comosum* (Lin. spec. 1080.) heads of flowers umbellate, globose, imbricated; vexillum deflexed, permanent. 4. H. Native of North America. Flowers white.

*Tufted Trefoil.* Fl. Ju. July. Clt. 1798. Pl.  $\frac{1}{2}$  foot.

156 *T. stipulaceum* (Thunb. prod. p. 136.) stems herbaceous, decumbent at the base; leaflets cut, villous.—Native of the Cape of Good Hope.

*Stipulaceous Trefoil.* Pl. decumbent.

157 *T. hirsutum* (Thunb. prod. p. 136.) stems herbaceous, diffuse; leaflets oblong, hairy.—Native of the Cape of Good Hope.

*Hairy Trefoil.* Pl. diffuse.

158 *T. lanatum* (Thunb. prod. p. 136.) stems herbaceous, decumbent; leaflets obovate, obtuse, pilose; heads of flowers globose, woolly, bractless.—Native of the Cape of Good Hope.

*Woolly Trefoil.* Pl. decumbent.

159 *T. capense* (Willd. spec. 3. p. 1364.) stem herbaceous, decumbent; leaflets obovate, obtuse, pilose; heads of flowers globose, woolly, involucre.—Native of the Cape of Good Hope. *T. diffusum*, Thunb. prod. 136. but not of Ehrh.

*Cape Trefoil.* Pl. decumbent.

160 *T. rupestre* (Tenore, prod. p. 43. cat. 1819. p. 58.) stems almost simple, suffruticose at the base; leaflets rhomboidal-ovate, scabrous; spiny-serrated, veiny; spike terminal, globose, villous, pedunculate; calycine segments setaceous, spreading, equal in length to the corolla.—Native of Naples, on the rocks of Magella.

*Rock Trefoil.* Pl.  $\frac{1}{2}$  foot.

161 *T. clandestinum* (Lag. nov. gen. p. 23.) stems prostrate; leaflets obovate-cuneated, pubescent, almost entire; heads of flowers ovate, terminal, and axillary, pedunculate; calycine segments stiff, unequal; corolla hidden. ☉. H. Native of Spain, among rubbish about Madrid.

*Clandestine-flowered Trefoil.* Fl. June, Aug. Clt. 1816. Pl. prostrate.

162 *T. cuspidatum* (Lour. coch. p. 445.) stem suffruticose, 4 feet high; leaflets linear, quite entire, cuspidate; flowers capitate, numerous; calyx pilose; vexillum of corolla ovate, distinct, with a purple spot; legume naked, 1-seeded. h. G. Native of Cochinchina. Flowers white.

*Cuspidate-leafletted Trefoil.* Shrub 4 feet.

163 *T. ascendens* (Horn. hort. hafn. 2. p. 716.) stems ascending; leaflets oval, pubescent; heads roundish, terminal, pedicellate, exstipulate; calyx compressed; the segments nearly equal, 3 times shorter than the monopetalous corolla. 4. H. Native of Georgia.

*Ascending-stemmed Trefoil.* Pl. ascending.

164 *T. formosum* (D'Urv. enum. pl. archip. p. 94. no. 691.) stem erect, villous, branched above; leaflets ovate-oblong, mucronate; stipulas large, straight, ending each in a long subulate point; heads ovate, dense, many-flowered; calyx clothed with hoary villi; the segments nearly equal, and very long, at length spreading, a little longer than the corolla. ☉. H. Native of the island of Melos. Leaves an inch and more long, and 4 lines broad. Flowers pale flesh-coloured.

*Beautiful Trefoil.* Pl.  $\frac{1}{2}$  to 1 foot.

165 *T. lasiocarpalum* (Link. enum. 2. p. 262.) stem erect, hairy; leaflets linear; stipulas ventricose; heads of flowers ovate; calyxes hairy; the segments lanceolate-subulate, spreading much. ☉. H. Native of the Cape of Good Hope.

*Woolly-headed Trefoil.* Pl.  $\frac{1}{2}$  foot.

166 *T. ornatum* (Clark, itin. 3. ex Spreng. neue entd. 2. p.

165.) leaflets obovate, sharply-serrulated, mucronate, glabrous; heads of flowers terminal, roundish, truncate at the base, sterile at the apex; teeth of calyx subulate, equal. ☉. H. Native of? *Ornamented Trefoil.* Pl.

N. B. *Trifolium Magellanicum* is *Oxalis eriocarpa*, D. C. in annal. sc. nat. 4. p. 23.

*Cult.* Many of the species of *Trefoil* are very showy, and very fit for ornamenting flower borders. All the species will grow in any common garden soil. The perennial kinds are easily increased by dividing the plants at the root in spring, or by seeds, which always ripen in abundance. The seeds of the annual kinds only require to be sown in the open border. Those species marked frame and greenhouse only require to be protected in winter.

LXXI. ACROPODIUM (*ακρος*, *akros*, the summit, and *πους* *podos*, a foot; in allusion to the legumes being stalked within the calyx). Desv. obs. legum. ex Schlecht. Linnæa. 2. p. 510.

LIN. SYST. *Diadelphia*, *Decandria*. Calyx deeply 5-cleft. Vexillum short, hispid. Wings opposite, bidentate. Stamens diadelphous. Ovary stalked. Legume oval-oblong, smooth, usually 2-seeded, standing on a capillary footstalk.—A subshrub, with fasciated leaves and 3-flowered axillary racemes, which are rather longer than the leaves.

1 *A. suffruticosum* (Desv. l. c.). h. G. Native of the Cape of Good Hope. *Lôtus suffruticosus*, Burm. cat.

*Suffruticose Acropodium.* Shrub.

*Cult.* This plant will grow in any light soil, and young cuttings will root in sand, under a hand-glass.

LXXII. DORYCNium (from *δору*, *dory*, a spear; the ancient plant was used to poison spears. The present genus has, however, nothing to do with the plant of the ancients). Tourn. inst. 391. t. 211. f. 3. D. C. prod. 2. p. 208.—*Lôtus*, species of Lin. and others.

LIN. SYST. *Diadelphia*, *Decandria*. Calyx somewhat campanulate, bilabiate, somewhat gibbous at the base. Wings shorter than the vexillum. Keel nearly awnless. Style straight, crowned by a capitate stigma.—Herbs or subshrubs, with trifoliate leaves, and with the stipulas the form of the leaflets. Flowers usually numerous, capitate, white or pale-red.

1 *D. rectum* (Ser. mss. in D. C. prod. 2. p. 208.) villous; stems erect, suffruticose; leaves petiolate; leaflets obovate, mucronate; stipulas ovate, cordate; peduncles bractless, many-flowered, hardly twice the length of the leaves; pedicels woolly, as well as the calyxes; segments of the calyx about the same length, very narrow, longer than the tube, but shorter than the corolla; legume terete, smooth, twice the length of the calyx, black; seeds reniform. h. H. Native of the south of Europe. *Lôtus rectus*, Lin. spec. 1092.—Barrel. icon. t. 544. Flowers small, rose-coloured. Pedicels length of the calyx.

*Straight Dorycnium.* Fl. Ju. Aug. Clt. 1640. Pl. 2 feet.

2 *D. latifolium* (Willd. spec. 3. p. 1397.) plant pilose; stems erect, suffruticose; leaves sessile; leaflets and stipulas obovate and mucronulate; peduncles many-flowered, bracteate towards the apex, 3 times longer than the leaves; bractes solitary or tern; pedicels woolly, shorter than the calyx; the segments lanceolate, and longer than the tube, but shorter than the corolla; legume oblong, terete, black, twice the length of the calyx; seeds somewhat reniform. h. H. Native of Iberia, on dry hills. *D. Ibéricum*, Willd. enum. suppl. 52. *Ononis quinata*, Forsk. descr. 130. but not of Vahl. Flowers white.

*Broad-leaved Dorycnium.* Fl. Juné-Aug. Clt. 1818. Pl. 1 to 2 feet.

3 *D. graecum* (Ser. mss. in D. C. prod. 2. p. 208.) stems

erect, spreading; leaves sessile; leaflets and stipulas oblong, glaucous, and silky; heads of flowers roundish; pedicels short; legume oblong, 2-seeded, rusty; seeds globose, black, with a white hilum, separated from each other by spongy substance.  $\gamma$ . H. Native of the Levant. *Lôtus Græcus*, Lin. mant. 104. *L. Belgrádica*, Forsk. descr. fl. ægypt. p. 215. Flowers white, larger than those of *D. hirsutum*, but smaller than those of *D. réctum*.

*Grecian Dorycnium*. Pl. 1 to 2 feet.

4 *D. HIRSU'TUM* (Ser. mss. in D. C. prod. 2. p. 208.) plant clothed with hoary tomentum; stem erect, suffruticose; leaves sessile; leaflets ovate, lanceolate or obovate; stipulas lanceolate; peduncles when bearing the fruit twice the length of the leaves; bracteas lanceolate, equal in length to the calyx; heads many-flowered: pedicels much shorter than the calyx; the segments subulate, and much longer than the tube, but shorter than the corolla; legume turgid, oblong, hardly longer than the calyx; seeds somewhat reniform.  $\gamma$ . H. Native of the south of Europe. *Lôtus hirsutus*, Lin. spec. 1091.—J. Bauh. hist. 2. p. 360. Flowers large, pale-red.

*Hairy Dorycnium*. Fl. Ju. Aug. Clt. 1683. Pl. 1 to 2 feet.

5 *D. TOMENTOSUM* (G. Don, in Loud. hort. brit. p. 300.) plant shrubby, clothed with silky hoary down; heads of flowers more dense, and on shorter peduncles than in the *D. hirsutum*.  $\gamma$ . H. Native of Italy, in exposed places. *Lôtus tomentosus*, Rhode in Schrad. neue Journ. 1809. p. 42. in a note. *L. hirsutus incanus*, Lois. not. p. 116. *L. sericeus*, D. C. cat. hort. monsp. p. 122. and fl. fr. 5. p. 573. *L. affinis*, Bess. cat. hort. crem. p. 81. *D. hirsutum* var.  $\beta$ , *incanum*, Ser. mss. in D. C. prod. 2. p. 208. Flowers large, pale rose-coloured.

*Tomentose Dorycnium*. Fl. Ju. Aug. Clt. 1817. Sh. 2 to 3 ft.

6 *D. ARGENTEUM* (Delil. fl. ægypt. 113. t. 40.) plant silky; stems suffruticose, prostrate; leaflets, stipulas, and bracteas linear-lanceolate; heads 4-6-flowered; peduncles longer than the leaves; calycine segments lanceolate, hardly equalling the corolla in length; legumes thick, ovate, hardly longer than the calyx; seeds globose, few.  $\gamma$ . H. Native of Egypt. *D. argenteum* Alexandrinum, Lippi, mss. in herb. Juss. Flowers yellow, painted with bay-coloured lines.

*Silvery Dorycnium*. Pl. prostrate.

7 *D. PARVIFLORUM* (Ser. mss. in D. C. prod. 2. p. 208.) plant clothed with soft hairs; stems rather prostrate; leaflets obovate; stipulas ovate; heads 4-5-flowered; bracteas simple, lanceolate; peduncles longer than the leaves; calycine segments very long, about equal in length to the corolla, which is small; legume oblong, green, rather pellucid, veined transversely, hardly longer than the calyx; seeds roundish, yellowish-green.  $\odot$ . H. Native of Corsica and the Stæchades Islands. *Lôtus parviflorus*, Desf. atl. 2. p. 206. t. 211. D. C. icon. rar. 1. p. 9. t. 30. *Lôtus hispidus*, D. C. fl. fr. no. 3937. exclusive of the synonymes. Flowers yellowish-green. Carina narrow, and very long.

*Small-flowered Dorycnium*. Fl. July, Aug. Clt. 1810. Pl. ascending  $\frac{1}{2}$  foot.

8 *D. MICROCARPUS* (Ser. mss. in D. C. prod. 2. p. 209.) plant clothed with pili; stems ascending; leaflets obovate; stipulas ovate or somewhat cordate; flowers capitate, on short peduncles; calyx deeply 5-parted, hardly equal in length to the corolla; legumes 3-4 in a head, rather turgid, glabrous, hardly longer than the calyx, drooping; seeds 9-11? roundish, reniform.  $\odot$ . H. Native of Spain. *Lôtus microcarpus*, Brot. fl. lus. 2. p. 119. Flowers yellow.

*Small-fruited Dorycnium*. Pl. ascending.

9 *D. SUBIFLORUM* (Ser. mss. in D. C. prod. 2. p. 209.) plant hairy; stem branched, diffuse; peduncles 2-3-flowered; legumes erect, terete, and are, as well as the corollas, longer than the calyx.  $\odot$ . H. Native of Spain. *Lôtus subiflorus*, Lag.

in Pers. ench. 2. p. 354. gen. et spec. p. 23. Perhaps distinct from *D. microcarpus*. Flowers yellow.

*Two-flowered Dorycnium*. Pl. diffuse.

10 *D. DISPERMUM* (Ser. mss. in D. C. prod. 2. p. 209.) leaflets and stipulas oblong, acute, tomentose, very white; flowers capitate; legumes 2-seeded, inclosed in the calyx.  $\odot$ ? H. Native of the south of Europe. *Lôtus dispermus*, Desv. Journ. bot. 1814. vol. 1. p. 77.

*Two-seeded Dorycnium*. Pl.

11 *D. HERBACEUM* (Vill. dauph. 3. p. 417. t. 41.) stems herbaceous, erect; leaflets and stipulas obovate, obtuse; calyx pilose; teeth of calyx much shorter than the tube; heads of flowers on long peduncles; bracteas simple, distinct from the head of flowers; legume ovate, 3 or 4 times longer than the calyx, many-seeded.  $\gamma$ . H. Native of the south of Europe. *Lôtus Dorycnium*, Crantz, fl. austr. 402. Flowers white.

*Herbaceous Dorycnium*. Fl. Ju. Sept. Clt. 1802. Pl.  $1\frac{1}{2}$  ft.

12 *D. SUFFRUTICOSUM* (Vill. dauph. 3. p. 416.) stems suffruticose; leaflets and stipulas oblong-lanceolate, acute; calyx pilose, the teeth much shorter than the tube; heads of flowers on long peduncles; bracteas simple or 3-leaved; legume globose, 1-seeded, twice the length of the calyx; seeds globose, shining, variegated.  $\gamma$ . H. Native of the south of Europe. *Lôtus Dorycnium*, Lin. spec. 1093. *D. monspeliense*, Willd.—Lob. icon. 2. p. 51. f. 1 and 2. Flowers white, but with the keel reddish. Plant hoary.

*Suffruticose Dorycnium*. Fl. June, May. Clt. 1640. Shrub 2 to 3 feet.

*Cult.* Elegant plants of easy culture, growing best in dry soil. They are all easily increased by seeds.

LXXIII. LOTUS (from *λωτος* of Theophrastus, and Dioscorides, but the true *λωτος* is *Zizyphus Lôtos*. *Lotos* was a nymph turned into a tree to avoid the pursuit of Priapus. Ovid. metam. 97, &c. But the name is perhaps of Egyptian origin). Ser. mss. in D. C. prod. 2. p. 209.—*Lôtus*, species of Lin.

LIN. SYST. *Diadélphia*, *Decándria*. Calyx tubular, 5-cleft. Wings equal in length to the vexillum. Carina beaked. Legume cylindrical or compressed, wingless. Style straight, crowned by a subulate stigma.—Herbs, with trifoliate leaves, and leafy stipulas. Peduncles axillary, 1-6-flowered, furnished with a floral simple or trifoliate leaf at the apex. Flowers yellow, rarely white or rose-coloured.

SECT. I. KROKÈRIA (in honour of A. J. Kroker, author of Flora Silesiaca). Ser. mss. in D. C. prod. 2. p. 209.—*Krokèria*, Mœnch. meth. 143. Legume turgid, curved. Flowers 1-2.

1 *L. EDULIS* (Lin. spec. 1090.) plant pilose; stems erect; leaflets ovate, ciliated; flowers 1-3; bracteas ovate, about equal in length to the calyx; legume turgid, arched, glabrous; seeds globose, compressed, wrinkled from dots.  $\odot$ . H. Native of the south of Europe. Cav. icon. t. 157. *Krokèria oligocérates*, Mœnch. meth. 143.—Moris. hist. 2. p. 176. sect. 2. t. 18. f. 3. Flowers yellow. The pods of this plant are eaten in Caudia when young by the poorer inhabitants, as we do French beans.

*Edible-podded Lotus*. Fl. July, Aug. Clt. 1759. Pl. trailing.

SECT. II. LÔTEA (see genus for derivation). D. C. fl. fr. 4. p. 554. prod. 2. p. 209.—*Lôtea*, Medic. phil. bot. fasc. 1. p. 204. Mœnch. meth. 151. Legume compressed, long. Flowers umbellate.

2 *L. ORNITHOPODIODES* (Lin. spec. 1091.) plant rather villous; stems diffuse; leaflets obovate-rhomboid, entire; stipulas ovate; flowers 3-5 in an umbel; bracteas much longer than the calyx; legume compressed, somewhat lomentaceous, glabrous, a little curved and deflexed, of a bay-colour; seeds globose, compressed, olive-coloured, smooth.  $\odot$ . H. Native of the south of

Europe. Cav. icon. 2. p. 48. t. 163. *Lotea ornithopodioides*, Mœnch. meth. p. 151. Flowers yellow. Seeds about the size of those of *L. siliquosus*.

*Bird's-foot-like-podded Lotus*. Fl. July, Aug. Clt. 1683. Pl. 2 feet long, diffuse.

3 *L. PEREGRINUS* (Lin. spec. 1090.) plant pubescent; stems diffuse; leaflets obovate, entire; stipulas ovate; flowers 2-3 in an umbel; bracteas longer than the calyx; lateral leaflets smallest and sessile, terminal one larger and stalked; legume compressed, somewhat lomentaceous, glabrous, straight, horizontal; seeds globose, compressed, dark, smooth. ☉. H. Native of the south of Europe. L. oligoceras, Lam. dict. 3. p. 605.

*Foreign Bird's-foot Lotus*. Fl. July, Aug. Clt. 1713. Pl. diffuse, 2 feet long.

4 *L. INDICUS* (Lam. dict. 3. p. 606.) plant pubescent; stems diffuse; leaflets obovate-linear, entire; stipulas lanceolate; flowers usually twin, opposite the leaves, on very short peduncles, bractless; legume compressed, pilose, erect, hardly arched. ☉. H. Native of the East Indies. *Trigonella indica*, Lin. spec. 1095. Burm. fl. ind. 173.—Pluk. phyt. t. 200. f. 7. Flowers yellow. Perhaps a species of *Hosackia*.

*Indian Bird's-foot Lotus*. Fl. July, Aug. Clt. 1793. Pl. diffuse.

5 *L. TETRAPHYLLUS* (Lin. fil. suppl. p. 340.) plant rather hispid; stems prostrate; leaves with one stipula only; leaflets obcordate, cuneate, entire; flowers axillary, on long peduncles; bracteas obovate, much shorter than the calyx. ☉. H. Native of the Balearic Islands and of Cyrenaica, on the mountains. Lam. dict. 3. p. 605. Flowers yellow, but with the vexillum dark-purple on the outside. Leaves having two leaflets on one side, and one on the other, as well as a terminal one.

*Four-leaved Bird's-foot Lotus*. Pl. prostrate.

6 *L. SUBPINNATUS* (Hook. in Beech. voy. p. 17. t. 8.) plant pilose; stems erect; leaves pinnate, exstipulate; leaflets 5-6, 2 or 3 of these terminal, and other 2 on one side of the petiole, all elliptic; peduncles very short, axillary, solitary, 1-flowered; legume straight, compressed, margins hairy. ☉. H. Native of Chili, at Concepcion. Flowers yellow. Stigma obtuse, not subulate, as in the rest of the genus. It comes nearest to *L. tetraphyllus*, that species being furnished with one additional leaflet at the side of the petiole, and this is furnished with 2 unilateral leaflets. Stamens diadelphous. *Lotus utriculatus*, Dombey. et Lag. herb. *Anthyllis Chilensis*, D. C. prod. 2. p. 171.

*Somewhat-pinnate-leaved Bird's-foot Lotus*. Pl.  $\frac{1}{2}$  foot.

7 *L. FLEXUOSUS* (Lam. dict. 3. p. 606.) plant pilose; stems prostrate, branched, flexuous; leaflets and stipulas lanceolate, ciliated, small; flowers solitary; peduncle longer than the leaf; bracteas shorter than the calyx; calycine segments acute, length of tube, but shorter than the corolla. ☉. ? H. Native of Europe. Flowers yellow.

*Flexuous-stemmed Bird's-foot Lotus*. Fl. June, Aug. Clt. 1816. Pl. prostrate.

SECT. III. *EULOTUS* (from *eu*, *eu*, well or good, and *λωτος*, *lotos*, the lotus; in reference to its containing the genuine species). Ser. mss. in D. C. prod. 2. p. 210. Legume cylindrical, long. Flowers disposed in corymbose umbels.

#### § 1. *Style furnished with one tooth.*

8 *L. GLAUCUS* (Ait. hort. kew. ed. 1. vol. 3. p. 92. ed. 2. vol. 4. p. 392.) plant glaucous, and pilose; stems prostrate; leaflets and stipulas thickish, obovate, small; flowers 3-4 in a corymb; bracteas form of the leaflets, shorter than the calyx; pedicels very short; legume somewhat lomentaceous, smoothish, shining; seeds rather globose, black, smooth. ♀. F. Native of Madeira. Flowers yellow.

*Glaucous Bird's-foot Lotus*. Fl. June, Aug. Clt. 1777. Pl. prostrate.

9 *L. SESSILIFOLIUS* (D. C. cat. hort. monsp. p. 122.) plant glaucescent; stem suffruticose; leaflets rather fleshy, linear, sessile, canescent; stipulas linear; peduncles very long, axillary; flowers corymbose, on short pedicels; legumes cylindrical, glabrous, divaricate; seeds almost globose, small, dark, smooth. ♀. G. Native of Teneriffe. *L. dorycnoides*, Poir. suppl. 3. p. 507. Flowers yellow.

*Sessile-leaved Bird's-foot Lotus*. Fl. June, Aug. Clt. 1820. Pl.  $\frac{1}{2}$  to 1 foot.

10 *L. ANTHYLLOIDES* (Vent. malm. p. 92. t. 92.) shrubby; leaflets and stipulas spatulate and pilose; bracteas shorter than the calyx; peduncles long; flowers on very short pedicels, disposed in a corymb. ♀. G. Native of the Cape of Good Hope. Perhaps only a variety of *L. Jacobæus*, with yellow flowers.

*Anthyllis-like Bird's-foot Lotus*. Fl. June, Aug. Clt. 1812. Shrub 1 to 2 feet.

11 *L. ATROPURPUREUS* (D. C. cat. hort. monsp. p. 121.) plant glaucescent; stem shrubby; leaflets and stipulas obovate, smoothish; bracteas either of 1 or 3 leaflets, obovate; peduncles longer than the leaves; flowers corymbose, on very short pedicels; legumes terete, glabrous; seeds nearly globose, of a greenish-black colour. ♀. G. Native of? Perhaps a variety of *L. Jacobæus*. Perhaps a hybrid between *L. anthylloides* and *L. Jacobæus*. Flowers very dark purple.

*Dark-purple-flowered Bird's-foot Trefoil*. Fl. April, Dec. Shrub 1 to 3 feet.

12 *L. JACOBÆUS* (Lin. spec. 1091.) plant rather glaucous; stems shrubby; leaflets and stipulas linear or linear-spatulate, rather pilose and canescent, mucronate; bracteas of 1 or 3 linear leaflets; peduncles longer than the leaves; flowers corymbose, on very short pedicels; legume terete, glabrous. ♀. G. Native of the Island of St. James. We have also seen this plant in the Island of Teneriffe, and in several of the Cape de Verd islands, particularly in St. Jago. Curt. bot. mag. 79. Mill. fig. 168. Comm. hort. 2. p. 165. t. 83. Mœnch. meth. suppl. p. 52. Corolla dark-purple, almost black, with the vexillum yellowish.

*Var. β, luteus*; flowers yellow. Reared in the gardens.

*St. Jago Island Bird's-foot Trefoil*. Fl. all the year. Clt. 1714. Shrub 1 to 3 feet.

13 *L. ARENARIUS* (Brot. fl. lus. 2. p. 120.) stems procumbent, branched, pubescent; branches and peduncles erectish; leaflets rather acute, cuneate; stipulas ovate; heads 5-10-flowered; bracteas nearly lanceolate, smaller than the calyx; calyx somewhat bilabiate, the two superior teeth longest; legume terete, glabrous. ☉. H. Native of Portugal, in the sea-sand at Costa da Trafaria, beyond the Tagus. Flowers yellow.

*Sand Bird's-foot Trefoil*. Fl. June, July. Pl. procumbent.

#### § 2. *Styles without a tooth.*

14 *L. BROUSSENETII* (Choisy, fl. teneriff. mss. D. C. prod. 2. p. 211.) stems shrubby; leaflets broad, obovate, smoothish; petioles and branches tomentose; stipulas ovate, obtuse, solitary, or twin, about the size of the leaflets; corymbs of flowers terminal, bractless, on short peduncles; pedicels and calyxes tomentose; the segments length of the tube. ♀. G. Native of Teneriffe or Mogodor. Flowers yellow?

*Broussonet's Bird's-foot Trefoil*. Shrub 1 to 2 feet.

15 *L. SPECTABILIS* (Choisy, fl. teneriff. mss. D. C. prod. 2. p. 211.) plant quite glabrous; stem suffruticose; leaflets obovate, rather retuse; stipulas ovate-roundish, much smaller than the leaflets; corymbs many-flowered, axillary, bractless; peduncles longer than the leaves; pedicels about the length of the calyxes; calycine segments shorter than the tube; legume

long, many-seeded. *h. G.* Native of Teneriffe or Mogodor. Flowers yellow. The habit of this plant is very like that of *Coronilla F'omerus*.

*Shewy Bird's-foot Trefoil.* Shrub 1 to 3 feet.

16 *L. PUSILLUS* (Viv. fl. libyc. p. 47. t. 17. f. 3.) plant diffuse and hairy; stems diverging, filiform, rather stiffish; leaflets, stipulas, and bracteas ovate-elliptic; peduncles 1-flowered, 3-times longer than the leaves; legume unknown. *⊙. H.* Native of Cyrenaica, on the mountains. Like *L. cytisoides* and *L. secundiflorus*. Flowers yellow.

*Least Bird's-foot Trefoil.* Fl. June, Aug. Clt. 1816. Pl. diff.

17 *L. MICHAUXIA'NUS* (Ser. mss. in D. C. prod. 2. p. 211.) plant clothed with hoary tomentum; stems prostrate; leaflets obovate, somewhat truncate; stipulas ovate-roundish; leaflets smaller than the stipulas; peduncles axillary, twice the length of the leaves; heads few-flowered; bracteas obovate, hardly longer than the calyx; calycine segments length of tube, but much shorter than the corolla. *℥. H.* Native of Persia. Flowers yellow.

*Michaux's Bird's-foot Trefoil.* Pl. prostrate.

18 *L. CRE'TICUS* (Lin. spec. 1091.) plant silky; stems suffrutescent, ascending; leaflets obovate; stipulas ovate, 3-times shorter than the fructiferous peduncles; bracteas lanceolate, linear, smaller than the calyx; heads usually containing 4 flowers; calycine segments lanceolate, length of tube, but much shorter than corolla; style exserted; legume terete, smoothish, erect, somewhat torulose. *h. F.* Native of Syria, Candia, and Spain. Cav. icon. 2. p. 44. t. 156.—Pluk. phyt. t. 43. f. 1. Flowers yellow. A slender shrub, requiring support.

*Var. β, varians* (D. C. prod. 2. p. 211.) taller; stem suffrutescent. *L. varians*, Desv. journ. bot. 1814. p. 77.

*Cretan Bird's-foot Trefoil.* Fl. June, Sept. Clt. 1680. Sh.  $1\frac{1}{2}$  foot.

19 *L. CYTISOIDES* (Lin. spec. 1092.) stems prostrate at the base, a little branched; pedicels and calyxes hoary; leaflets obovate, rather fleshy, covered with adpressed pili; calycine segments shorter than the tube; legume somewhat torulose, glabrous; seeds ovoid, bay-coloured, shining. *⊙. H.* Native of Europe, in sterile places by the sea-side. All. pedem. no. 1136. t. 20. f. 1. D. C. fl. fr. 4. p. 555. *L. diffusus*, Schrank, pl. rar. t. 40. ? but not of Solander.—Barrel. icon. t. 1031. Flowers yellow.

*Cytisus-like Bird's-foot Trefoil.* Fl. Jul. Aug. Clt. 1752. Pl. pr.

20 *L. PROSTRATUS* (Desf. atl. 2. p. 206.) stems procumbent, much branched; leaves glabrous; peduncles many-flowered; legume compressed, torulose, spreading. *℥. H.* Native of the north of Africa. *L. Allioni*, Desv. journ. bot. and perhaps of Poir. *L. cytisoides β*, prostratus, Ser. mss. in D. C. prod. 2. p. 211. Flowers yellow. Like *L. corniculata*.

*Var. β, uniflorus* (Ser. mss. in D. C. l. c.) flowers solitary; leaflets smaller. *⊙. H.* Native of the Island of Melos, in the sand by the sea-side.

*Prostrate Bird's-foot Trefoil.* Fl. June, Aug. Pl. prostrate.

21 *L. SECUNDIFLORUS* (Viv. fl. libyc. 46. t. 21. f. 3.) plant suffrutescent, silky and silvery; stem furrowed; leaflets obovate-cuneate; stipulas ovate, oblique; peduncles bearing a head of secund reflexed flowers; leaflets of the bracteas obovate; calyx somewhat bilabiate, shorter than the corolla; legume glabrous, but unknown in a mature state. *⊙. ? H.* Native of Cyrenaica, on dry hills. Allied to *L. cytisoides*. Flowers yellow.

*Secund-flowered Bird's-foot Trefoil.* Pl.  $\frac{1}{2}$  foot.

22 *L. POLYPHYLLUS*\* (Clark, itin. vol. 3. ex Spreng. neue entd. 3. p. 164.) stem suffrutescent; leaflets linear-parabolic, silky; flowers usually tern; legume turgid, glabrous. *h. F.* Native on Mount Gargaro.

*Many-leaved Bird's-foot Trefoil.* Shrub 1 foot.

23 *L. OBTUSATUS* (Ser. mss. in D. C. prod. 2. p. 212.) plant canescent; stems decumbent; leaflets and bracteas obovate, clothed with hoary tomentum, mucronulate, rather thickish; stipulas ovate, much shorter than the peduncles; heads few-flowered; calycine segments obtuse, much shorter than the tube and corolla; style inclosed in the calyx; legume rather terete, bay-coloured, but ending in a yellow mucrone. *℥. H.* Native of Egypt. Flowers yellow.

*Obtuse-calyxed Bird's-foot Trefoil.* Pl. decumbent.

24 *L. GARCINI* (D. C. prod. 2. p. 212.) stems pubescent, branched; leaflets nearly sessile, and are as well as the stipulas obovate-oblong and pubescent; flowers axillary, usually solitary, almost sessile; segments of the calyx oblong, villous; legume glabrous, straight, a little longer than the calyx. *⊙. ? H.* Native of Persia. *Aspalathus Persicus*, Burm. fl. ind. 155. exclusive of the synonymes. Legumes black when dry. Corolla hardly longer than the calyx. Stamens diadelphous.

*Garcin's Bird's-foot Trefoil.* Pl. prostrate.

25 *L. DIOSCORIDIS* (All. pedem. no. 1131. t. 59. f. 1.) stems erect, branched; leaflets obovate, thickish, emarginate, glaucous; stipulas ovate, shorter than the petiole; peduncles axillary, much longer than the leaves, usually 2-flowered; calycine segments lanceolate, longer than the tube, but shorter than the corolla; legumes usually twin, long, torulose. *⊙. H.* Native of Piedmont, and about Nice. Flowers small, yellow.

*Dioscorides's Bird's-foot Trefoil.* Fl. June, July. Clt. 1658. Pl. 1 foot.

26 *L. GEBELIA* (Vent. hort. cels. t. 57.) plant glabrous; stems decumbent, rather woody; leaflets and stipulas ovate, rather glaucous; bracteas about equal in length to the calyx; heads of long peduncles usually 3-flowered; calycine segments length of tube, but much shorter than the corolla; legume cylindrical, torulose, thick; seeds globose, bay-coloured. *℥. H.* Native about Aleppo, on Mount Gebel-cher. Flowers large, at first red, but at length becoming pale rose-coloured. The pods or legumes are eaten by the inhabitants of its native country, as French beans are with us.

*Gebel-cher Bird's-foot Trefoil.* Fl. June, July. Clt. 1816. Pl. decumbent.

27 *L. ARABICUS* (Lin. mant. 104.) stems prostrate; leaflets and stipulas obovate-cuneate, equal, hoary beneath; heads few-flowered; bracteas longer than the calyx; peduncles length of bracteas; calycine segments very narrow, longer than the tube; legume terete, very smooth, somewhat torulose; seeds somewhat kidney-shaped, variegated. *℥. F.* Native of Arabia. Jacq. hort. vind. t. 155. Flowers red.

*Arabian Bird's-foot Trefoil.* Fl. Jul. Sep. Clt. 1773. Pl.  $1\frac{1}{2}$  ft.

28 *L. DECUMBENS* (Poir. suppl. 3. p. 508.) plant pilose; stems slender, decumbent, branched; leaflets and stipulas lanceolate; heads on long peduncles, containing about 4 flowers each; bracteas lanceolate, about equal in length to the calyx; calycine segments acute, hardly longer than the tube; legume rather terete, glabrous, bay-coloured. *⊙. H.* Native of the south of France. Flowers yellow, greenish at the apex.

*Decumbent Bird's-foot Trefoil.* Fl. June, Aug. Clt. 1816. Pl. decumbent.

29 *L. PHILOSSIMUS* (Poir. suppl. 3. p. 504.) plant very pilose; stems branched, rather prostrate; leaflets ovate-lanceolate; stipulas ovate, acutish; heads on long peduncles, few-flowered; bracteas narrow-lanceolate; calycine segments narrow, acute, longer than the tube; legume nearly terete, glabrous, brown. *⊙. H.* Native of the south of France.\* *L. hispidus*, Pers. ench. 2. p. 354. but not of D. C. Corolla yellow, but becoming green when dried. Perhaps only a variety of *L. hispidus*.

*Var. β, filiformis* (Poir. l. c.) stem and branches filiform and very long; leaflets smaller.

. *Very pilose Bird's-foot Trefoil.* Fl. June, July. Clt. 1818. Pl. decumbent.

30 *L. nístrus* (Desf. cat. hort. par. 190.) stems numerous, prostrate; leaflets hispid, oblong-lanceolate; stipulas ovate; heads few-flowered, much longer than the leaves; bracteas lanceolate, length of calyx; calycine segments longer than the tube, but shorter than the corolla; legume compressed, dotted; seeds orbicularly reniform, black. ☉. H. Native of France, about Bayonne, and of Corsica. Lois. fl. gall. 490. t. 16. D. C. fl. fr. 5. p. 572. Flowers yellow.

*Hispid Bird's-foot Trefoil.* Fl. June, Jul. Clt. 1817. Pl. pr.

31 *L. UNIBRACTEATUS* (Viv. fl. libyc. p. 48. t. 18. f. 4.) plant diffuse, clothed with rufescent hairs; leaflets and stipulas obovate; flowers axillary, solitary; calycine segments lanceolate-linear, setaceous at the apex, much shorter than the corolla; wings length of carina, which terminates in a long beak; bracteas solitary; legume unknown. ☉. H. Native of Cyrenaica, on the mountains. Corolla with the vexillum and carina deep-purple, as well as the tops of the wings, the rest yellow.

*One-bracted Bird's-foot Trefoil.* Pl. diffuse.

32 *L. SUAVEOLENS* (Pers. ench. 2. p. 354.) stem diffuse, pilose, tomentose; leaflets ovate, rather oblique; bracteas usually solitary; flowers generally 3 on the top of each peduncle; calyx hairy; legumes terete. ♀. H. Native of the south of France. Flowers 3-5 in an umbel, at first pale-yellow, but at length becoming bay-coloured, smelling like those of *Lupinus luteus*. The plant is like *L. hispidus*, but larger.

*Sweet-scented-flowered Bird's-foot Trefoil.* Fl. June, Aug. Clt. 1816. Pl. ascending.

33 *L. ANGUSTISSIMUS* (Lin. spec. 1090.) stems branched, prostrate, tubular, and are as well as the leaves hispid; leaflets and stipulas ovate or oblong-linear, rather pilose, and glaucous; heads 1-3-flowered; peduncles hardly twice the length of the leaves; bracteas unequal or solitary; calyx loosely hairy; calycine segments fringed, longer than the tube but shorter than the corolla; legume compressed, 2-edged, very slender, and usually solitary; seeds globose, pale-green. ☉. H. Native of the south of Europe. In Britain in meadows towards the sea, on the south and western coasts of England; on the rocky beach at Hastings, Sussex; in Devonshire; in a meadow near St. Vincent's Rocks, Bristol. *L. angustifolius*, Gouan. hort. 394. —J. Bauh. hist. 2. p. 356. f. 2.—Moris. hist. vol. 2. p. 175. sect. 2. t. 18. f. 1. *Lotus diffusus*, Sol. in Smith, fl. brit. 2. p. 794. engl. bot. t. 925. Flowers yellow.

*Very-narrow-leaved Bird's-foot Trefoil.* Fl. May, June, Britain. Pl. procumbent.

34 *L. CILIATUS* (Ten. prod. p. 44. cat. 1819. p. 58.) stems prostrate; leaflets glabrous, with the margins and calyxes ciliated; legumes solitary, cylindrical, glabrous, sessile. ☉. H. Native of Sicily, in humid fields. Flowers yellow. Perhaps only a variety of *L. diffusus*.

*Ciliated Bird's-foot Trefoil.* Fl. June, July. Clt. 1812. Pl. pr.

35 *L. GRACILIS* (Waldst. et Kit. hung. p. 254. t. 229.) stems erect, and are as well as the leaves pilose; leaflets and stipulas lanceolate; peduncles twice the length of the leaves, usually bearing about 2 flowers; bracteas equal in length to the calyx; calycine segments narrow, pilose, longer than the tube, but shorter than the corolla; legumes linear; very slender, almost terete, glabrous, 6-times longer than the calyx; seeds nearly globose. ☉. H. Native of Hungary. Flowers yellow. Perhaps only a variety of *L. angustissimus*.

*Slender Bird's-foot Trefoil.* Fl. Ju. Aug. Clt. 1812. Pl.  $\frac{1}{2}$  ft.

36 *L. LANUGINOSUS* (Vent. malm. p. 22. in a note) stems prostrate, branched, and are as well as the leaves woolly; leaflets

obcordate; stipulas ovate-roundish; peduncles axillary, elongated, drooping, 1-flowered. ☉. H. Native of the Levant. Flowers rose-coloured. Bracteas ovate, hardly equal in length to the calyx; calycine segments lanceolate, hardly longer than the tube, but much shorter than the corolla.

*Woolly Bird's-foot Trefoil.* Pl. prostrate.

37 *L. COIMBRICENSIS* (Brot. fl. lus. 2. p. 118. phyt. p. 127. t. 53.) plant rather glabrous; leaves glaucescent; intermediate leaflet obovate, lateral ones lanceolate; stipulas ovate; peduncles very short, 1-flowered; calycine segments narrow, length of tube, but shorter than the corolla; the tops of the leaflets and stipulas ciliated and awned; legume cylindrical, very long, arched, glabrous; seeds very numerous, ovate, green. ☉. H. Native of the south of Europe, particularly in Portugal, about Coimbra. *L. aristatus*, D. C. hort. monsp. p. 122. Flowers small, white, with the keel purple.

*Coimbra Bird's-foot Trefoil.* Fl. May, June. Clt. 1800. Pl. 2 to 3 inches.

38 *L. GLABERRIMUS* (D. C. cat. hort. monsp. p. 122.) plant quite smooth, diffuse; leaflets obovate; stipulas ovate; flowers axillary, solitary, on very short pedicels; legumes linear, rather compressed, a little arched. ☉. H. Native of? Flowers small, white, but with the carina purple.

*Quite smooth Bird's-foot Trefoil.* Fl. May, June. Clt. 1816. Pl. 2 to 3 inches.

39 *L. TRICHOCAEPUS* (Lag. nov. gen. 23.) stems decumbent; leaflets cuneated, pilose; stipulas cordate, twice the length of the common petiole; bracteas length of calyx; legumes very long, nearly terete, falcate, tomentose. ☉. H. Native country unknown. Flowers white, but the keel is dark purple at the apex. Perhaps a hairy-fruited variety of *L. Coimbricensis*.

*Hairy-fruited Bird's-foot Trefoil.* Fl. May, July. Clt.? Pl. 2 to 3 inches.

40 *L. ODORATUS* (Sims, bot. mag. 1233.) plant hairy; stems diffuse; leaflets lanceolate; stipulas ovate; bracteas usually 1-leaved, lanceolate; peduncles long, usually bearing about 5 flowers at the apex; legumes straight, somewhat torulose. ☉. H. Native of Barbary. Flowers yellow. Perhaps only a variety of *L. corniculatus*.

*Sweet-scented Bird's-foot Trefoil.* Fl. June, Aug. Clt. 1804. Pl. diffuse.

41 *L. CORNICULATUS* (Lin. spec. 1092.) stems recumbent, pithy; leaflets obovate, acute, entire, glabrous, or a little hairy; stipulas ovate; leaflets of bractea lanceolate or linear; peduncles very long, each bearing 3-4-5 or 10 flowers at the apex, in a kind of flat umbel; calyx campanulate; the segments length of tube but much shorter than the corolla; legumes spreading, nearly cylindrical; seeds reniform, blackish-green; filaments all dilated; claw of the vexillum obovate. ♀. H. Native of Europe, in open grassy pastures, heaths, and commons; plentiful in Britain. Smith, engl. bot. 2090. Curt. fl. lond. 2. t. 56. Mart. rust. t. 53. Fl. dan. t. 991. Stems like the leaves glaucous; underside of the leaves clothed with close-pressed hairs; but sometimes they are quite smooth; when this is the case it is *L. arvensis* of Schkuhr. handb. 2. t. 211. Flowers bright yellow, fading to an orange-colour, but becoming dark-green in drying. The vexillum is striped with red at the base in front. This plant has been recommended for cultivation under the erroneous names of *Milk-vetch* and *Astragalus glycyphyllos* by the late Dr. Anderson, in his Agricultural Essays, as very excellent for fodder as well as for hay; it has been tried as a substitute for clover on moist lands, and seems to succeed very well, but to have no particular advantage over the clover.

*Var. β, alpinus* (Schleich. cant. exsic. no. 75.) stems and leaves small; flowers usually reddish on the outside. ♀. H. Native of the alps of Switzerland.

*Horned or Common Bird's-foot Trefoil.* Fl. June, Sept. Brit. Pl. recumbent.

42 *L. MAJOR* (Scop. carn. 2. p. 86.) stem erect, tubular, more or less pilose, rarely smooth; leaflets obovate, fringed, or hairy; peduncles long, bearing from 6-12 flowers in an umbel; calycine teeth stellate; claw of vexillum linear; shorter filaments not dilated; legumes drooping, terete.  $\gamma$ . H. Native of Europe, in wet bushy places, osierholts, and in hedges and ditches. Smith, engl. bot. 2091. *L. corniculatus*  $\gamma$ , Smith, fl. brit. 794. *L. corniculatus*  $\beta$ , Hook. scot. 220. *L. corniculatus*  $\beta$ , major, Ser. mss. in D. C. prod. 2. p. 514. *L. uliginosus*, Schkuhr. handb. 2. t. 211. Flowers larger and of a duller orange-colour than those of *L. corniculatus*. Whether there may be any difference in the agricultural qualities of these two plants, and whether the present might be capable of cultivation in wet meadows, no one has hitherto inquired.

*Var.  $\beta$ , villösus*; stems and leaves villous; erect. *L. villösus*, Thuill. fl. par. ed. 2. p. 387.

*Greater Bird's-foot Trefoil.* Fl. Jul. Aug. Brit. Pl. 1 to 3 ft.

43 *L. CRASSIFOLIUS* (Pers. ench. 2. p. 354.) plant glaucous and pilose; stems recumbent; leaflets ovate, fleshy; root thick, fibrous.  $\gamma$ . H. Native of the south of Europe, in sterile places by the sea-side. Flowers yellow. *L. corniculata*  $\delta$ , crassifolius, Pers. l. c.

*Thick-leaved Bird's-foot Trefoil.* Fl. July, Sept. Clt. 1812. Pl. recumbent.

44 *L. TENUIUS* (Kit. in Willd. enum. 797.) plant glabrous; stems decumbent, branched; leaflets and stipulas linear-lanceolate, glabrous; legumes usually 4 in an umbel, terete, awned.  $\gamma$ . H. Native of Europe, in waste places, particularly in Hungary and France. *L. depressus* and *L. humifusus*, Willd. enum. suppl. p. 52. ex Link. enum. 2. p. 265. *L. tenuifolius*, Poll. pal. 2. p. 711. *L. corniculatus*  $\zeta$ , tenuifolius, D. C. prod. 2. p. 214. Flowers yellow.

*Slender Bird's-foot Trefoil.* Fl. Jul. Aug. Clt. 1816. Pl. pr.

45 *L. FORSTERI* (Sweet, hort. brit. p. 206.) stems recumbent, nearly solid, angular, smooth, and glaucous; leaves glaucous, smooth above, but occasionally clothed beneath with short, close-pressed, bristly hairs; leaflets and stipulas similar, lanceolate, pointed, oblique, except the terminal one, which is obovate-lanceolate; peduncles 4 or 5-times the length of the leaves, each bearing an umbel of 3-6-flowers, accompanied by a terminal leaf; calyx having its teeth shorter than the tube; legumes spreading, cylindrical, 2-edged.  $\gamma$ . H. Native of Britain in fields and meadows; at Hastings, Sussex; near Bulverhithe; also in meadows near Tonbridge; in Scotland, in moors near Forfar, particularly in the Forest-moor, and at Balincho on the road to Kerrymuir. The plant is said also to be a native of Switzerland and the Levant, as well as on the sandy shores of Sicily. *L. decumbens*, Forst. tonb. 86. Smith, eng. fl. 3. p. 314. but not of Poir. Flowers bright-yellow. This plant approaches nearest to *L. pedunculatus* of Cav. icon. t. 164. but its stem is said to be erect; about 3 feet high, and every part of the plant is perfectly smooth.

*Forster's Bird's-foot Trefoil.* Fl. July. Brit. Pl. recumb.

46 *L. PEDUNCULATUS* (Cav. icon. 2. p. 52. t. 164.) plant smooth; stems erect; leaflets lanceolate, acute, terminal one stalked; stipulas ovate, somewhat cordate; peduncles very long, bearing each a capitate umbel of flowers; bracteas lanceolate, acute, longer than the calyx, which is rather campanulate; calycine segments nearly equal, acute, length of tube, but much shorter than the corolla.  $\gamma$ .? H. Native of Spain. Flowers yellow.

*Long-peduncled Bird's-foot Trefoil.* Fl. July, Aug. Clt. 1814. Pl. 1 to 3 feet.

47 *L. PALUSTRIS* (Willd. spec. 3. p. 1394.) stems branched,

erect, and are as well as the leaves hairy; leaflets obovate, acute; stipulas ovate, rather cordate, size of the leaflets; heads usually 4-flowered; legume terete, glabrous.  $\gamma$ . H. Native of Candia. Flowers yellow. Habit of *L. corniculatus*.

*Marsh Bird's-foot Trefoil.* Fl. July. Clt. 1821. Pl. 1 ft.

48 *L. AMBIGUUS* (Besser. ex Spreng. syst. 3. p. 282.) plant herbaceous, decumbent; leaflets obovate-oblong, acute, and are pilose as well as the ovate stipulas; umbels of flowers on long peduncles, somewhat bracteate; legumes torulose, obtuse, awned, spreading.  $\odot$ . H. Native of Volhynia. Flowers yellow.

*Ambiguous Bird's-foot Trefoil.* Pl. decumbent.

† *Species not sufficiently known.*

49 *L. INTERMEDIUS* (Pers. ench. 2. p. 354.) stems erect, villous, herbaceous; leaflets obovate-lanceolate, acuminate; heads roundish, containing 6-8-flowers, axillary, on long peduncles.  $\odot$ . H. Native of? Flowers purplish.

*Intermediate Bird's-foot Trefoil.* Fl. June, July. Pl.  $\frac{1}{2}$  foot.

50 *L. TRIFOLIATRUM* (Desrous. in Lam. dict. 3. p. 612.) plant hairy; stems prostrate; leaflets ovate, obtuse; stipulas ovate, acute, small; flowers capitate; calyx bilabiate; upper lip 2-lobed; lobes acute; lower lip tridentate; bracteas setaceous; corolla length of calyx; legume turgid, villous.  $\gamma$ . H. Native of the Levant. Perhaps a species of *Dorjenum*.

*Trefoil-like Bird's-foot Trefoil.* Pl. prostrate.

51 *L. CANDIDUS* (Mill. dict. no. 7.) stems erect, branched, hairy; leaflets tomentose; heads of flowers nearly globose, hairy.  $\gamma$ . H. Perhaps *Dorjenum tomentosum*. Flowers pale-red or white.

*White Bird's-foot Trefoil.* Fl. June, Aug. Pl. 2 to 3 feet.

*Cult.* The hardy species of *Lotus* are well adapted for ornamenting rock-work or dry banks. The seeds of the annual kinds only require to be sown in the open border or on rock-work in spring. The greenhouse and frame kinds grow well in any light soil, and young cuttings of them will root if planted in a pot of sand, with a hand-glass placed over them; however, all the species are most easily increased by seeds.

LXXIV. TETRAGONOLOBUS (from *τετρας*, *tetras*, four, *γωνια*, *gonia*, an angle, and *λοβος*, a pod; in reference to the legumes, which are furnished with 4 wings or angles). Scop. carn. 2 p. 87. Mœnch. meth. p. 164. D. C. prod. 2. p. 215. —Scandalida, Neck. elem. no. 1306.

LIN. SYST. *Diadelphia*, *Decandria*. Calyx tubular, 5-cleft. Wings shorter than the vexillum. Carina beaked. Style flexuous. Stigma funnel-shaped, at length obliquely beaked. Legume cylindrical, furnished with 4 foliaceous wings, so as to give it a tetragonal appearance.—Herbs, with broad leafy stipulas, trifoliate leaves, winged petioles, alternate leaflets, axillary, 1-2-flowered peduncles, each furnished with a bractea or floral leaf at the apex.

1 *T. PURPUREUS* (Mœnch. meth. p. 164.) plant pilose; stems rather decumbent; leaflets obovate, entire; stipulas ovate; flowers solitary or twin; bracteas longer than the calyx; legume glabrous, with broad wings; seeds globose.  $\odot$ . H. Native of the south of Europe. *Lotus tetragonolobus*, Lin. spec. 1089. D. C. fl. fr. 4. p. 553. Curt. bot. mag. 151.—J. Bauh. hist. 2. p. 258. f. 2. Flowers dark-purple.

*Var.  $\beta$ , minor* (Moricand, herb.) stem, leaves, and legumes much smaller.

*Purple Winged-pea.* Fl. June, Aug. Clt. 1769. Pl. 1 foot.

2 *T. BIFLORUS* (Ser. in D. C. prod. 2. p. 215.) plant pilose, rather decumbent; leaflets obovate, somewhat mucronulate, entire; stipulas orbicularly-oblong, acuminate; flowers twin or tern; bracteas ovate, shorter than the calyx; legumes pilose, with narrow wings; seeds almost globose.  $\odot$ . H. Native of Barbary, and in fields about Palermo. *Lotus biflorus*, Desrous.

in Lam. dict. p. 604. Desf. fl. atl. p. 202. t. 210. *L. conjugatus*, Poir. voy. barb. 220. but not of Lin. Flowers yellow. Seeds smaller than those of the preceding species.

*Two-flowered Winged-pea*. Fl. Ju. Aug. Clt. 1818. Pl. dec.

3 *T. siliquosus* (Roth. fl. germ. 1. p. 323.) plant pilose; stems rather decumbent; leaflets obovate, entire; stipulas ovate, bluntish; flowers solitary, on long peduncles; bracteas obovate-linear, shorter than the calyx; legume smooth, with very narrow wings. 2. II. Native of Europe, in humid meadows. *Lôtus siliquosus*, Lin. spec. 1089. Lam. ill. t. 611. f. 2. Jacq. fl. aust. 4. t. 361. Flowers yellow.

*Siliquose-podded Winged-pea*. Fl. May, Aug. Clt. 1683. Pl. decumbent.

4 *T. maritimus* (Roth. fl. germ. 1. p. 323.) plant glaucous, smoothish; stems decumbent; leaflets obovate, fleshy, sessile, the edge towards the top having a few scattered hairs, as well as the stem; stipulas ovate, acute, the same size as the leaflets; peduncles long, 1, seldom 2-flowered; bractea trifoliate, the middle leaflet longest, shorter than the calyx, which is hairy at the edge; legume smooth, with narrow wings. 2. II. Native of Europe, by the sea-side, as Sweden, Denmark, the south of France, &c. *Lôtus maritimus*, Lin. spec. 1089. Oed. fl. dan. t. 800. Flowers yellow.

*Sea-side Winged-pea*. Fl. May, Oct. Clt. 1683. Pl. dec.

5 *T. conjugatus* (Ser. mss. D. C. prod. 2. p. 215.) plant pilose; stems rather decumbent; leaflets obovate, entire; stipulas ovate, small, acuminate; flowers in pairs; bracteas obovate, longer than the calyx; legume glabrous, nearly terete, with very narrow wings, which are hardly curled; seeds ovate, compressed, black. 2. II. Native about Montpellier. *Lôtus conjugatus*, Lin. spec. 1089. Flowers purple.

*Trin-flowered Winged-pea*. Fl. Jul. Aug. Clt. 1759. Pl. dec.

*Cult.* The perennial species of *Tetragonolobus* are well adapted for ornamenting rock-work, and the annual kinds for flower-borders. The best way of propagating them is by seeds.

LXXV. HOSACKIA (in honour of David Hosack, M. D. F. R. S. Professor of Botany, in the university of New York, a gentleman to whom the scientific men of North America owe the same gratitude as those of England do to Sir Joseph Banks). Douglas, mss. Bentham, in bot. reg. 1257.

LIN. SYST. *Diadélphia*, *Decándria*. Calyx campanulate, 5-cleft. Wings about equal in length to the vexillum. Keel beaked. Style filiform, crowned by a capitate stigma. Legume cylindrical or a little compressed, straight, smooth. Herbs with impari-pinnate leaves, and with the leaflets usually alternate. Stipulas membranous, minute, or obsolete. Peduncles axillary, long. Flowers umbellate, usually yellow.

1 *H. bicolor* (Douglas, mss. ex. bot. reg. 1257.) plant glabrous; flowers umbellate, bractless; leaves with 7-9 leaflets. 2. II. Native of North America, in overflowed meadows, between Fort Vancouver and the grand rapids of the Columbia river. *Lôtus pinnatus*, Hook, bot. mag. 2913. Root creeping. Stems ascending. Flowers 6-10 in each umbel. Vexillum and carina yellow, but with the wings white.

*Two-coloured-flowered Hosackia*. Fl. July, Aug. Clt. 1823. Pl. ascending, 1½ long.

2 *H. decumbens* (Bentham, in bot. reg. no. 1257.) plant pubescent; flowers umbellate; bractea

FIG. 32.

of 1 or 3 leaflets; leaves having 4 or 5 alternate leaflets. 2. II. Native of North America. Stipulas very minute or wanting. Calycine segments linear, equal, villous. Form of petals like those of the preceding species. Filaments all antheriferous.

*Decumbent Hosackia*. Pl. decumbent.

3 *H. PURSHIANA* (Bentham, l. c.) plant pubescent; peduncles 1-flowered, bearing a 1-leaved bractea just under the flower; calyx villous; leaves having 3-4 or 5 leaflets. 2. II. Native of North America, on the banks of the Missouri. *Lôtus sericeus*, Pursh, fl. amer. sept. 2. p. 489. *Trigonella Americana*, Nutt. gen. 2. p. 120. Ser. in D. C. prod. 2. p. 185. Leaflets usually alternate. Stipulas very minute or wanting. Calycine segments about equal in length to the corolla. Flowers yellow.

*Pursh's Hosackia*. Fl. July, Aug. Clt. 1824. Pl. ½ foot.

4 *H. PARVIFLORA* (Bentham, l. c.) plant quite smooth and glaucous; peduncles 1-flowered, furnished with a bractea under each flower, which is usually trifoliate; calyx almost glabrous; leaves having 4-6 leaflets. 2. II. Native of North America. Root furnished with pea-formed tubercles. Leaflets alternate, obtuse. Stipulas very minute or wanting. Calyx almost glabrous, its segments short, and sparingly pilose. Corolla as in *H. Purshiana*, but smaller.

*Small-flowered Hosackia*. Pl. decumbent.

5 *H. ANGUSTIFOLIA*; plant procumbent, silky; leaflets 5-7, obovate or linear-lanceolate, mucronate; flowers solitary or in pairs; calyx hairy, with awl-shaped teeth. 2. F. Native of Mexico. *Lôtus angustifolius*, Moc. et Sesse, in herb. Lamb. Resembles *Lôtus corniculatus*. Flowers large, purple? Pod linear, compressed, nearly 2 inches long. Stigma large, capitate.

*Narrow-leafletted Hosackia*. Pl. procumbent.

6 *H. REPENS*; plant almost smooth; stems creeping, rooting; leaflets 5 pairs, obovate, slightly mucronulate; heads containing about 5 flowers; calyx strigately hairy, with lanceolate teeth. 2. F. Native of Mexico. *Lôtus repens*, Moc. et Sesse, in herb. Lamb. Resembles *H. bicolor*. Flowers yellow. Pods linear, compressed. Stigma capitate.

*Creeping Hosackia*. Pl. creeping.

*Cult.* The species of *Hosackia* are rather shewy, and well adapted for ornamenting flower-borders and rock-work. They will grow in any common garden soil, and are easily increased by seeds, or by dividing the plants at the root.

LXXVI. CARMICHAELIA (in honour of the late Captain Dugald Carmichael, F.L.S. an acute Scotch botanist, author of a Flora of the island of Tristan da Acunha, inserted in the 12th volume of the Linnaean Society's Transactions). R. Br. in bot. reg. t. 950.

LIN. SYST. *Diadélphia*, *Decándria*. Calyx cup-shaped, 5-toothed. Vexillum broad. Ovary many-seeded. Style simple. Legume few-seeded, with the valves separating from both margins, which are left on the plant even when the seeds have fallen.—A shrub, with flat branches and bluish flowers; the leaves when present ternate or pinnate.

1 *C. AUSTRALIS* (R. Br. in bot. reg. 912.) ½ G. Native of New Holland and New Zealand. Legumes quinate; leaves with 3-7 obovate leaflets. Stem arborescent; branches compressed. Racemes simple, rising from the denticulations of the branches. Flowers lilac. Frame of legume permanent. *Lôtus arboreus*, Forst. prod. 278. *Lôtus australis*, Hort. but not of Andrews.

*Southern Carmichaelia*. Fl. May, Sep. Clt. 1823. Sh. 2 to 4 ft.

*Cult.* This shrub is a great ornament to greenhouses in spring and almost all the year, being profusely clothed with beautiful blue flowers. A mixture of loam, peat, and sand suits it best, and young cuttings will root if planted in a pot of sand, with a bell-glass placed over them.

LXXVII. CYAMOPSIS (from *κνᾶμος*, *kyamos*, a beam,

and *opsis*, *opsis*, resemblance; the plant resembles the bean). D. C. leg. mem. vi. prod. 2. p. 215.

LIN. SYST. *Monadelphica*, *Decándria*. Calyx turbinate-tubular, 5-cleft; the lobes lanceolate-subulate and acute, the two superior ones rather remote. Petals about equal, at length separating elastically. Vexillum roundish. Wings oblong. Keel composed of 2 petals, straight and acute. Stamens 10, monadelphous. Ovary linear, terete. Style ascending. Stigma capitate. Legume compressed, 2-valved, oblong-linear, beaked, by the acuminate style, having 2 nerves near the superior suture, and furnished with cellular substance between the seeds. Seeds 7-8, obovate or truncate, compressed. Endopleura tumid, appearing like albumen. Cotyledons elliptic, flat, thickish, and foliaceous. Primordial leaves simple and ovate.—An erect herb, with subulate stipulas, pinnately trifoliate leaves, ovate, exstipellate, glaucous, denticulated leaflets, and axillary, short, racemes of small, erect, blue flowers. The hairs on the plant are fixed by their centre, as in *Indigófera*. The genus appears to be allied to *Dólichos* or *Canavalia* on the one hand and to *Lupinus*, *Psoralea* or *Indigófera* on the other.

1 C. PSORALEOIDES (D. C. prod. 2. p. 216.). ☉. S. Native of the East Indies, from whence it has probably been sent into Arabia and the West India Islands. *Psoralea tetragonolobus*, Lin. mant. 104. *Dólichos fabæfórmis*, Lher. stirp. t. 78. *Dólichos psoraleoides*, Lam. dict. 2. p. 300. *Lupinus trifoliatus*, Cav. icon, 1. t. 59.

*Psoralea-like* Cyamopsis. Fl. Jul. Aug. Clt. 1813. Pl. 1 ft.

Cult. This plant is not worth cultivating, except in botanical gardens. The seeds of it should be sown in a pot filled with loam and sand, and placed in a hot-bed, and when the plants have grown 2 or 3 inches high, they should be planted singly into separate pots, and replaced again in the hot-bed, where they will ripen their seed. Some of the plants may be planted out in the open border, in a sheltered situation.

SUBTRIBE III. CLITÓRIÆ (plants agreeing with *Clitória* in some characters). D. C. leg. mem. vi. prod. 2. p. 216. Legume 1-celled (f. 34. c.). Stamens usually diadelphous (f. 34. d.). Stems herbaceous or suffrutescent, usually twining. Perhaps some of the genera should have been placed in Tribe *Phascóleæ*.

LXXVIII. PSORALEA (from *ψωραλεος*, *psoraleos*, scurfy; in reference to the scurfy appearance of the calyx, and most parts of the plants, from tubercles). Lin. gen. no. 894. Lam. ill. t. 614. D. C. prod. 2. p. 216.—*Dorycnium* and *Rutéria*, Mönch.

LIN. SYST. *Diadelphica*, *Decándria*. Sepals 5, joined together to the middle into a 5-cleft, permanent calyx, with the tube usually beset with glands; the lobes acuminate, having the lower one a little more lengthened out than the others. Stamens 10, usually diadelphous, the tenth one is sometimes connected with the others at the base. Legume length of calyx, valveless, 1-seeded, sometimes ending in a beak.—Shrubs or herbs, usually warted from glandular tubercles. Leaves variable. Stipulas adnate to the base of the petiole. Disposition of flowers variable, blue, white, or purple.

\* Flowers axillary, especially sessile, or on simple pedicels in the axils of the leaves, but never disposed in a spike or head.

1 P. ODORATÍSSIMA (Jacq. hort. schœnbr. 2. p. 229.) leaves impari-pinnate; leaflets usually 7-pairs, linear-lanceolate; pedicels axillary, 1-flowered, shorter than the leaves. ♀. G. Native of the Cape of Good Hope. Flowers blue and white. Lobes of calyx 3 acute and 2 obtuse, upper one reflexed at the apex, lower one straight. Bracteoles 2, rather distant from the calyx.

*Sweet-scented* Psoralea. Fl. May, Jul. Clt. 1725. Sh. 4 to 6 ft.

VOL. II.

2 P. ARBÓREA (Sims, bot. mag. t. 2090.) leaves impari-pinnate; leaflets 5-pairs, linear-lanceolate; pedicels axillary, 1-flowered, longer than the leaves. ♀. G. Native of the Cape of Good Hope. Flowers bluish. Bracteoles 2, concrete, approximating the calyx, which is hairy. Stipulas callous, recurved.

*Tree* Psoralea. Fl. May. Clt. 1814. Shrub 6 to 8 feet.

3 P. PINNATA (Lin. spec. 1074.) leaves impari-pinnate; leaflets 2-3-pairs, linear, and are as well as the branchlets rather puberulous; pedicels axillary, 1-flowered, much shorter than the leaves. ♀. G. Native of the Cape of Good Hope. Andr. bot. rep. 474. *Rutéria pinnata*, Mönch.—Herm. lugd. 273. —Burm. cap. 22. Flowers blue, striped.

*Pinnate-leaved* Psoralea. Fl. May, July. Clt. 1690. Sh. 3 to 6 feet.

4 P. LEVIGATA (Lin. fil. suppl. 339.) leaves impari-pinnate, with about 3 pairs of lanceolate leaflets, which are smooth as well as the branchlets; stipulas reduced to acute tubercles. ♀. G. Native of the Cape of Good Hope. Flowers purple, but not striped.

*Smooth* Psoralea. Shrub 2 to 3 feet.

5 P. VERRUCOSA (Willd. spec. 3. p. 1343.) leaves impari-pinnate, with 1 or 2 pairs of lanceolate, glabrous, glaucous leaflets; branches warted; pedicels 1-flowered, usually 3 together, axillary. ♀. G. Native of the Cape of Good Hope. P. angustifolia, Jacq. hort. schœnbr. 2. p. 226. P. triflora, Thunb.? Flowers blue and white. Peduncles sometimes 3-flowered.

Var. β, *intermedia* (D. C. prod. 2. p. 216) leaflets linear-lanceolate. ♀. G. P. *intermedia*, Bess. cat. hort. crem. no. 111. Jacq. l. c. the right hand figure. P. axillaris, Poir. dict. 5. p. 687. ex herb. Desf. and perhaps of Linnæus.

*Warted-stemmed* Psoralea. Fl. May, Aug. Clt. 1774. Sh. 4 to 8 feet.

6 P. TRIFLORA (Poir. dict. 5. p. 683.) leaves almost sessile, trifoliate; leaflets linear-spatulate, ending in a somewhat recurved mucrone; branches and calyxes pubescent; pedicels in threes, axillary, 1-flowered, and forming something like a spike at the tops of the branches. ♀. G. Native of the Cape of Good Hope. P. triflora, Thunb. p. 135. Flowers blue.

*Three-flowered* Psoralea. Shrub 2 to 3 feet.

7 P. FILIFORMIS (Poir. dict. 5. p. 682.) leaves trifoliate; leaflets filiform, upper ones simple, and are as well as the branches pubescent; pedicels axillary, 1-flowered, solitary. ♀. G. Native of the Cape of Good Hope. P. decidua, Berg. pl. cap. 220. Sieb. pl. exsic. cap. 37. Branches glandular, but pubescent at the apex. Very like *P. tenuifolia*.

*Filiform-leaved* Psoralea. Shrub 2 to 4 feet.

8 P. AXILLARIS (Lin. fil. suppl. 338.) leaves trifoliate; leaflets lanceolate; pedicels filiform, axillary, 1-flowered. ♀. G. Native of the Cape of Good Hope. P. linearis, Thunb. prod. 135. This species is hardly known. The plant preserved in the Banksian herbarium under this name has the leaflets obovate, emarginate, and the flowers almost sessile. Lher. mss.

*Axillary-flowered* Psoralea. Fl. June, July. Clt. 1820. Shrub 2 to 3 feet.

9 P. TENUIFOLIA (Lin. spec. 1074.) upper leaves simple, the rest trifoliate; leaflets linear-lanceolate, mucronate; pedicels axillary, 1-flowered, solitary. ♀. G. Native of the Cape of Good Hope. Jacq. hort. schœnbr. 2. p. 225. *Rutéria tenuifolia*, Mönch. Very like *P. verrucosa*, but the branches are smooth. Flowers blue and white, mixed.

*Fine-leaved* Psoralea. Fl. Mar. Jul. Clt. 1793. Sh. 3 to 4 ft.

10 P. FASCICULARIS (D. C. prod. 2. p. 217.) leaves trifoliate, but some of them are simple; leaflets linear, very much acuminate; pedicels axillary, 1-flowered, 6 or 8 in a fascicle, a little longer than the flowers. ♀. G. Native of the

D D

Cape of Good Hope. *Lôtus tenuifolius*, Burm. cap. prod. 22. Flowers blue.

\* *Fascicled-flowered Psoralea*. Shrub 3 to 4 feet.

11 *P. MULTICAULIS* (Jacq. hort. schœnbr. 2. p. 55. t. 230.) leaves trifoliate, but the upper ones are simple; leaflets linear-lanceolate, mucronate; pedicels axillary, very short, aggregate, and somewhat capitate.  $\frac{1}{2}$ . G. Native of the Cape of Good Hope. Flowers with the vexillum white and the wings and keel violet.

*Many-stemmed Psoralea*. Fl. Aug. Oct. Clt. 1793. Pl. 1 to 2 ft.

12 *P. APHYLLA* (Lin. mant. 450.) lower leaves trifoliate or simple; leaflets linear-lanceolate, upper ones abortive, scale-formed; pedicels axillary, short, solitary, 1-flowered.  $\frac{1}{2}$ . G. Native of the Cape of Good Hope. Jacq. hort. schœnbr. 223. Sims, bot. mag. 1727. Flowers blue, but with the keel and wings white. Breyn. cent. 25.

*Leafless Psoralea*. Fl. May, Aug. Clt. 1790. Sh. 4 to 7 ft.

13 *P. LATHYRIFOLIA* (Balb. st. hort. taur. descr. p. 25. with a figure) leaves simple, ovate, or oval-oblong, ciliated; stipulas joined in one, clasping the stem, bifid at the apex; stems decumbent, diffuse; flowers axillary, 1-2, almost sessile.  $\frac{1}{2}$ . G. Native of the Cape of Good Hope. Flowers blue.

*Lathyrus-leaved Psoralea*. Fl. Ju. Aug. Clt. 1816. Pl. dec.

14 *P. DECUMBENS* (Ait. hort. kew. 3. p. 80.) leaves trifoliate; leaflets obovate-cuneate, somewhat obcordate, mucronate, longer than the petiole; branches as well as the calyxes rather villous; flowers axillary, 1-2, sessile.  $\frac{1}{2}$ . G. Native of the Cape of Good Hope. Burch. cat. no. 485. Lodd. bot. cab. 282. *P. mucronata*, Thunb. prod. 135. *P. ononoides*, Poir. dict. 5. p. 688. *Ononis virgata*, Burm. cap. 21. *Ononis decumbens*, Sieb. pl. exsicc. cap. no. 58. Branches weak and slender. Leaves covered with pellucid as well as black dots. Flowers blue.

*Decumbent Psoralea*. Fl. April, May. Clt. 1774. Pl. dec.

15 *P. REPENS* (Lin. mant. 263.) leaves trifoliate; leaflets obovate, obtuse, shorter than the petiole; pedicels 1-flowered, disposed in something like umbels in the axils of the leaves, each furnished with 2 bracteas in the middle.  $\frac{1}{2}$ . G. Native of the Cape of Good Hope. Calyx pubescent. Flowers blue. Stems trailing and rooting.

*Creeeping Psoralea*. Fl. May, Aug. Clt. 1774. Pl. prost.

16 *P. HIRTA* (Lin. amœn. 6. afr. 35.) leaves trifoliate; leaflets obovate, ending in a recurved point, dotted, and pubescent beneath; branches clothed with adpressed hoary villi; flowers axillary, sessile, numerous, upper ones disposed in a spicate manner.  $\frac{1}{2}$ . G. Native of the Cape of Good Hope. Poir. dict. 5. p. 688. *Ononis strigosa*, Burm. cap. 21. but not of Thunb. Flowers blue.

*Hairy Psoralea*. Fl. May, Aug. Clt. 1713. Sh. 2 to 3 ft.

17 *P. JACQUINIANA*; leaves trifoliate, on short petioles; leaflets obovate, emarginate, hairy, as well as the rest of the plant; stipulas subulate; peduncles axillary and terminal, each bearing a bracteate head of flowers, those at the tops of the branches disposed in interrupted spikes.  $\frac{1}{2}$ . G. Native of the Cape of Good Hope. *P. hirta*, Jacq. hort. schœnbr. 2. t. 228. *P. hirta*, var.  $\beta$ , Jacquiniana, D. C. prod. 2. p. 217. Flowers white, but with the vexillum pale violet.

*Jacquin's Psoralea*. Fl. May, Jul. Clt. 1713. Sh. 3 to 4 ft.

18 *P. ACULEATA* (Lin. spec. 1074.) leaves trifoliate; leaflets cuneiform, ending in a recurved mucrone, glabrous; stipulas prickly-formed; flowers axillary, solitary, sessile, approximate.  $\frac{1}{2}$ . G. Native of the Cape of Good Hope. Andr. bot. rep. 146. Sims, bot. mag. 2158. Flowers blue and white mixed.

Var.  $\beta$ , *capitata*; flowers capitate. Thunb. prod. 136. Lam. ill. t. 614. f. 2.?

*Prickly-stipuled Psoralea*. Fl. Ju. Jul. Clt. 1774. Sh. 2 to 3 ft.

\* \* *Flowers nearly sessile, and approximate in the axils of the leaves, but capitate or spicate at the tops of the branches.*

19 *P. BRACTEATA* (Lin. mant. 264.) leaves trifoliate; leaflets cuneiform, ending in a recurved mucrone, full of pellucid dots, longer than the petiole; heads of flowers terminal, bracteate.  $\frac{1}{2}$ . G. Native of the Cape of Good Hope. Jacq. hort. schœnbr. 2. t. 224. Curt. bot. mag. 446. *P. cuneifolia*, Brot. *Ononis trifoliata*, Lin. syst. nat. *Trifolium fruticans*, Lin. spec. 1085. Stipulas membranous, rather fleshy. Flowers violaceous, but with the keel white. Comm. hort. 2. p. 211. t. 106.

*Bracteate-headed Psoralea*. Fl. June, July. Clt. 1731. Sh. 3 to 4 feet.

20 *P. INVOLUCRATA* (Thunb. fl. cap. 607.) leaves trifoliate; leaflets obovate, acute, stiff, glabrous; flowers umbellate, terminal, involucreted.  $\frac{1}{2}$ . G. Native of the Cape of Good Hope. Peduncles hairy. Umbels usually 5-flowered. Calyxes striated. Corolla bluish.

*Involucreted Psoralea*. Fl. Ju. Jul. Clt. 1818. Sh. 2 to 3 ft.

21 *P. SPICATA* (Lin. mant. 264.) leaves trifoliate; leaflets obovate-oblong, terminating in a recurved mucrone, beset with black dots beneath; spikes of flowers terminal, oblong.  $\frac{1}{2}$ . G. Native of the Cape of Good Hope. Willd. spec. 3. p. 1345. Andr. bot. rep. 411. Flowers blue, mixed with white? This species comes very near *P. bracteata*, but the leaves are without the pellucid dots which are so conspicuous in that plant.

*Spicate-flowered Psoralea*. Fl. June, July. Clt. 1774. Sh. 2 to 4 feet.

22 *P. STACHYDIS* (Lin. fil. suppl.) leaves trifoliate; leaflets oblong, mucronate, villous on both surfaces as well as the stems and calyxes; spike of flowers terminal, interrupted.  $\frac{1}{2}$ . G. Native of the Cape of Good Hope. *P. stachyos*, Thunb. fl. cap. 608. Leaves dotted above. Petioles 4-times shorter than the leaflets. Deflorated spike not unlike a head of lavender. Corolla ferruginous.

*Lavender-spiked Psoralea*. Fl. April, May. Clt. 1793. Shrub 2 to 4 feet.

23 *P. STRIATA* (Thunb. l. c.) leaves trifoliate; leaflets oblong, mucronate, pubescent beneath; racemes terminal, interrupted.  $\frac{1}{2}$ . G. Native of the Cape of Good Hope. Flowers blue.

*Striated Psoralea*. Fl. May, Ju. Clt. 1816. Sh. 2 to 3 ft.

24 *P. RACEMOSA* (Thunb. l. c.) leaves trifoliate; leaflets oblong, mucronate; racemes terminal, elongated.  $\frac{1}{2}$ . G. Native of the Cape of Good Hope. Flowers blue.

*Racemose-flowered Psoralea*. Shrub 2 to 4 feet.

25 *P. ARGENTEA* (Thunb. l. c.) leaves trifoliate; leaflets ovate, cut, mucronate, silvery; racemes of flowers interrupted.  $\frac{1}{2}$ . G. Native of the Cape of Good Hope. Flowers blue.

*Silvery Psoralea*. Fl. May, July. Clt. 1816. Sh. 2 to 4 ft.

26 *P. TOMENTOSA* (Thunb. fl. cap. 606. but not of Cav.) leaves trifoliate; leaflets oblong, tomentose beneath; heads of flowers terminal.  $\frac{1}{2}$ . G. Native of the Cape of Good Hope. Flowers blue.

*Tomentose Psoralea*. Fl. May, July. Clt. 1820. Sh. 2 to 4 ft.

27 *P. ASTRAGALIFOLIA* (Poir. dict. suppl. 4. p. 587.) leaves trifoliate, glabrous; lower leaflets elliptic-ovate, smaller, superior ones narrow, lanceolate, and longer; spike of flowers terminal, somewhat capitate.  $\frac{1}{2}$ . ? G. Native of the Cape of Good Hope. Perhaps the same as *P. capitata*.

*Milk-vetch-leaved Psoralea*. Shrub 1 to 2 feet.

28 *P. CAPITATA* (Lin. fil. suppl. 339. Thunb. l. c.) leaves trifoliate and simple, linear or elliptic-linear; heads of flowers spicate, terminal.  $\frac{1}{2}$ . G. Native of the Cape of Good Hope. Vexillum scattered over with dots, similar to those on the leaves. Flowers purple.

*Capitate-flowered Psoralea.* Fl. June, Aug. Clt. 1815. Shrub 2 to 3 feet.

29 *P. ROTUNDIFOLIA* (Lin. fil. suppl. 338. Thunb. l. c.) leaves simple, ovate, entire, glabrous; heads of flowers terminal, and arc, as well as the bractæas, villous. *h. G.* Native of the Cape of Good Hope. This species belongs probably to the following division.

*Round-leaved Psoralea.* Shrub.

\*\*\* *Peduncles axillary, bearing capitate spikes of flowers at their tops.*

30 *P. CORYLIFOLIA* (Lin. spec. 1075.) leaves simple, ovate, cordate, a little toothed; heads of flowers axillary, ovate, on long peduncles. *h. G.* Native of the East Indies and Arabia. Curt. bot. mag. 665. *Trifolium unifolium*, Forsk. descr. 140. Flowers violaceous or pale flesh-coloured.

*Hazel-leaved Psoralea.* Fl. Jan. July. Clt. 1739. Pl. 2 feet.

31 *P. VIRGATA* (Nutt. gen. amer. 2. p. 101.) leaves simple, very remote, almost glabrous, linear-lanceolate, radical ones oblong-ovate; spikes of flowers ovate-oblong, on peduncles, which are shorter than the leaves; bractæas long, subulate, deciduous. *h. G.* Native of the west of Florida, between St. Mary's and Satilla river. Stem striated, twiggy, a little pubescent, as well as the leaves. Flowers blue; the vexillum finely striated.

*Twiggy Psoralea.* Pl. 2 feet.

32 *P. ACAULIS* (Stev. in Bieb. fl. taur. 2. p. 206.) radical leaves trifoliate, on long petioles; leaflets ovate, obtuse, sharply toothed, the middle leaflet sessile; peduncles radical, very long. *h. G.* Native of Western Iberia. Spike of flowers oval-oblong. Flowers purplish. Petioles pubescent. Leaves hairy, as well as the peduncles. Calyx beset with black hairs.

*Stemless Psoralea.* Pl. 1 foot.

33 *P. ARENARIA* (Nutt. gen. amer. 2. p. 103.) leaves trifoliate, rather pubescent; leaflets linear-lanceolate, obtuse, mucronulate; peduncles axillary, longer than the leaves; spikes of flowers capitate; bractæas deciduous; teeth of calyx obtuse, nearly equal in length, glandular. *h. F.* Native of North America, on the banks of the river Missouri. *Psoralea lanceolata* and *P. elliptica*, Pursh, fl. sept. amer. 2. p. 475 and 741. Root creeping. Stems dichotomous, erect. Flowers purplish-blue. The leaves are aromatic when bruised.

*Sand Psoralea.* Fl. July, Aug. Clt. 1823. Pl. 1 foot.

34 *P. SIBERICA* (Poir. suppl. 4. p. 587.) leaves pinnately-trifoliate; leaflets elliptic, obtuse, glabrous, whitish beneath, somewhat emarginate and mucronulate at the apex; racemes very short, axillary, glandless; segments of the calyx linear, elongated, acuminate, and rather villous. *h. F.* Native of Siberia. Flowers pale-blue.

*Siberian Psoralea.* Pl. 1 to 2 feet.

35 *P. PALÆSTINA* (Gouan. ill. 51.) leaves pinnately-trifoliate; lower leaflets ovate, superior ones lanceolate; petioles pubescent, sulcated; peduncles axillary, 2-3-times longer than the leaves; spikes of flowers capitate; calyxes pubescent, at length a little inflated. *h. F.* Native of Palestine, south of Tauria, and about Constantinople, and now in the south of France. Jacq. hort. vind. 2. t. 184. D. C. fl. fr. suppl. p. 554. *P. bituminosa*, Pall. ined. Flowers blue. Very like the following species, but the plant is nearly scentless.

*Palestine Psoralea.* Fl. July, Aug. Clt. 1771. Pl. 2 feet.

36 *P. BITUMINOSA* (Lin. spec. 1075.) leaves pinnately-trifoliate; leaflets ovate-lanceolate; petioles pubescent; peduncles axillary, 3-4-times longer than the leaves; spikes of flowers capitate; calyxes pubescent. *h. F.* Native of the south of Europe, in exposed places. Lam. ill. 614. f. 1. There is a variety with narrower leaflets. Bés. cyst. aest. t. 11. f. 2. *Dorycnium angustifolium*, Moench. Perhaps this last variety is

sufficiently distinct from *P. frutescens* of Poir. dict. 5. p. 684. There is a plant described in Berg. cap. 221. which differs from this in the spikes of flowers being terminal. Flowers with the vexillum and keel purple, and the wings almost white, smelling like black currants. The leaves when handled emit a strong scent of bitumen.

*Bitumen-scented Psoralea.* Fl. April, Sept. Clt. 1570. Shrub 2 to 3 feet.

37 *P. SERICEA* (Poir. dict. 5. p. 687.) leaves pinnately-trifoliate; leaflets ovate-lanceolate, silky beneath; peduncles axillary, 2 or 3 times longer than the leaves; heads of flowers depressed, involucreted; leaflets of the involucre about equal in length to the calyx. *h. G.* Native of the Cape of Good Hope. *P. pedunculata*, Ker, bot. reg. t. 223. Stipulas narrow, acuminate. Corolla bluish-violet.

*Silky Psoralea.* Fl. Aug. Oct. Clt. 1815. Sh. 2 to 3 feet.

38 *P. MUTISII* (H. B. et Kunth, nov. gen. amer. 6. p. 487. pl. legum. 191. t. 54.) leaves trifoliate; leaflets lanceolate-oblong, quite entire, glabrous, having the middle nerve, petioles, and branches pilose; spikes axillary, pedunculate, oblong-cylindrical, dense-flowered; calyx clothed with adpressed pile. *h. ? S.* Native of South America, near Santa Fe de Bogota, and about Quito. *Indigofera Mexicana*, Lin. fil. suppl. 335. Flowers white.

*Mutis's Psoralea.* Shrub 2 to 3 feet.

\*\*\*\* *Peduncles axillary, bearing the flowers in loose spikes or racemes at their tops. Poikadenia, Ell.*

39 *P. PENTAPHYLLA* (Lin. spec. 1076.) leaves with 5 leaflets, palmately disposed; leaflets unequal, oval, acute at both ends, pubescent, and glandular, and with the margins ciliated; stem and petioles villous. *h. ? h. ? G.* Native of Mexico. B. Juss. act. par. 1741. p. 381. t. 17. The roots are thick, and are supposed to be the *contrayerva* of the shops.

*Five-leaved Psoralea.* Shrub.

40 *P. ESCULENTA* (Pursh. fl. sept. amer. 2. p. 475. t. 22.) plant hairy; leaves with 5 leaflets, which are disposed palmately; leaflets ovate-elliptic, glabrous above; spikes of flowers somewhat capitate, pedunculate, axillary; bractæas ovate, acuminate, each enclosing 3 flowers; corolla hardly longer than the calyx. *h. F.* Native of North America, on the elevated plains of the river Missouri. Flowers blue. Root simple, somewhat fusiform, bulbous above the middle; it is rather insipid in taste, but not disagreeable either raw or boiled, the latter is the common mode of preparation among the savages; its texture is lamellated, always tenacious, solid, and never farinaceous; it is also somewhat medicinal, and operates as a diuretic. It is known to the Canadian boatmen by the name of *Pomme de prairie*.

*Esculent-rooted Psoralea.* Fl. Ju. Jul. Clt. 1811. Pl. 1 ft.

41 *P. CUSPIDATA* (Pursh. fl. sept. amer. 2. p. 741.) plant villous; leaves with 5 leaflets, which are disposed in a palmate manner; leaflets obovate, mucronate; spikes axillary, dense-flowered; calyxine segments as well as the bractæas ovate, cuspidate, conspicuously dotted. *h. F.* Native of Upper Louisiana, on the high plains of the river Missouri. *P. macrorhiza*, Fras. cat. 1813. Root large, tuberous, branched. Flowers blue.

*Cuspidate-bracted Psoralea.* Fl. Jul. Aug. Clt. 1811. Pl. 1 ft.

42 *P. INCAÏNA* (Nutt. in Fras. cat. 1813. gen. amer. 2. p. 102.) plant silky and canerent; leaves having 3 or 5 leaflets, disposed in a palmate manner; leaflets elliptic-lanceolate; spikes few-flowered, interrupted; bractæas acuminate, 3-flowered. *h. F.* Native of North America, on the plains of the Missouri. *P. argophylla*, Pursh. fl. sept. amer. 2. p. 475. Root flagellately-fusiform. Flowers small, azure-blue. Like *P. esculenta*, but differs in being clothed with soft, white, and silky villi, but not tomentum.

*Haery Psoralea*. Fl. July, Aug. Clt. 1824. Pl. 1 foot.

43. *P. LUPINELLA* (Michx. fl. bor. amer. 2. p. 66.) plant smooth; leaves on long petioles, having 5 or 7 leaflets, which are disposed palmately; leaflets narrow, linear; racemes axillary, longer than the leaves; bracteas 1-flowered; lower segment of the calyx longer than the rest.  $\mathcal{U}$ . F. Native of North America, from South-Carolina to Florida. Nutt. gen. amer. 2. p. 103. Calyx and leaves glandular. All the lower leaves have 7 leaflets, and all the upper ones 5. Flowers purplish, not remarkably small. A very singular plant, the leaflets are so narrow as scarcely to be distinguished from the petiole, 2 or 3 inches long.

*Small-lupine Psoralea*. Fl. July, Aug. Clt. 1812. Pl. 1 ft.

44. *P. MULTI-JUGA* (Ell. sketch. 2. p. 198.) stem branched, smoothish; leaves pinnate, with 9 or 10 pairs of leaflets; leaflets oblong-lanceolate, obtuse, pubescent; spikes oblong; bracteas small, membranous, glandless.  $\mathcal{U}$ . F. Native of Carolina, about Abbeville. Corolla violaceous. Ovary perhaps 1 ovulate.

*Many-paired-leafletted Psoralea*. Pl. 1 to 2 feet.

45. *P. TENUIFLORA* (Pursh, fl. sept. amer. 2. p. 475.) plant nearly smooth, much branched; leaves trifoliate; leaflets elliptic, obtuse, rugged from dots on both surfaces, pubescent beneath; peduncles axillary, few-flowered, longer than the leaves; calycine segments nearly equal.  $\mathcal{U}$ . F. Native of North America, on the plains of the Missouri, near the Arikaree village. Habit and mode of vegetation similar to *Baptisia tinctoria*. Bracteas 3-flowered, shorter than the pedicels. Root flagellately fusiform. Racemes slender, 2 or 3 inches long, interrupted, 9-12-flowered. Flowers very small, pale-purple.

*Fine-flowered Psoralea*. Fl. July, Aug. Pl. 2 feet.

46. *P. LONGIFOLIA* (Pursh, fl. sept. amer. 2. p. 741.) plant clothed with silky villi; leaves trifoliate; leaflets linear, elongated; spikes pedunculated, loose-flowered, shorter than the leaves; teeth of calyx as well as bracteas subulate.  $\mathcal{U}$ . F. Native of Upper Louisiana. Leaves glandless. Flowers apparently white.

*Long-leaved Psoralea*. Pl. 1 to 2 feet.

47. *P. JAMESII* (Torrey, in. ann. lyc. new york. vol. 2. p. 165.) leaves trifoliate; leaflets obovate, very obtuse, cuneated at the base, quite entire, silky on both surfaces; petioles pubescent; spikes of flowers capitate; bracteas oblong, acuminate; calyx very hairy; the teeth subulate, and nearly equal.  $\mathcal{U}$ . F. Native of Canada, in the plains. Flowers blue. Stamens constantly monadelphous.

*James's Psoralea*. Pl.  $\frac{1}{2}$  foot.

48. *P. LATIFOLIA* (Torrey, l. c.) leaves trifoliate; leaflets broad-ovate, acuminate, smooth, but ciliated on the margins, terminal leaflet on a long petiole; spikes loose-flowered, elongated, axillary; bracteas deciduous; calyx glabrous, with acutish teeth.  $\mathcal{U}$ . F. Native of the plains of Missouri, near St. Louis.

*Broad-leaved Psoralea*. Pl. 2 to 3 feet.

49. *P. EGLANDULOSA* (Ell. sketch. 2. p. 198.) plant pubescent and glandless; leaves pinnately trifoliate; leaflets oblong-lanceolate, entire; racemes of flowers oblong; bracteas broad-lanceolate, ending each in a long acumen, and are pubescent as well as the calyx.  $\mathcal{U}$ . ? F. Native of Carolina and Florida, and common in the open forests of Ohio, Kentucky, and Tennessee. *Melilotus psoraleoides*, Nutt. gen. amer. 2. p. 104. ex Ell. Stem minutely strigose, grooved; spike or raceme of flowers 3-4 inches long, on a peduncle, which is from 4 to 6 inches long. Flowers pale-violet, pedicellate. Legume gibbous and transversely wrinkled. The plant appears to be a connecting link between *Psoralea* and *Melilotus*.

*Glandless Psoralea*. Fl. July. Pl. 1 to  $1\frac{1}{2}$  foot.

50. *P. MELIOTOIDES* (Michx. fl. bor. amer. 2. p. 58.) plant pubescent; leaves pinnately trifoliate; leaflets lanceolate, gland-

ular beneath; peduncles racemose, length of leaves; racemes or spikes linear; bracteas acuminate, longer than the calyx.  $\mathcal{U}$ . F. Native of Carolina, Florida, Ohio, Kentucky, and Tennessee in open forests. Sims, bot. mag. 2068. Ker. bot. reg. 454. Bart. fl. t. 51. f. 1. *P. melilotus*, Pers. Flowers pale-purple. Legume length of calyx, gibbous, wrinkled, terminated by the style.

*Melilot-like Psoralea*. Fl. Aug. Clt. 1814. Pl. 1 to 2 ft.

51. *P. ONOBRYSCHIS* (Nutt. gen. amer. 2. p. 104.) plant nearly glabrous; leaves pinnately trifoliate; leaflets ovate-lanceolate, rather pubescent; racemes axillary, on long peduncles; flowers secund; legume obovate, muricated, glabrous.  $\mathcal{U}$ . F. Native of North America, on the banks of the river Merimek, a few miles from St. Louis. Ker. bot. reg. 433. Root flagellate. Stems brownish. Flowers small, purplish. Perhaps *P. hedy-saroides*, Muhl. Perhaps a trifoliate species of *Onobrychis*.

*Saintfoin-like Psoralea*. Fl. Aug. Clt. 1818. Pl. 3 to 5 ft.

52. *P. GLANDULOSA* (Lin. spec. 1075.) plant glabrous; leaves pinnately trifoliate; leaflets ovate-lanceolate, acuminate; petioles scabrous from glands; racemes axillary, pedunculate, longer than the leaves.  $\mathcal{U}$ . G. Native of Chili, where it is called *Culen*. Sims, bot. mag. 990. Feuill. per. 7. t. 3. Ard. spec. 1. p. 24. t. 11. *P. lutea*, Mol. chil. 135. *P. Cûlen*, Poir. dict. 5. p. 685. Flowers bluish-purple, the wings and keel white. The plant has the smell of *rue*, and is considered vulnerary and purgative; the leaves are applied in the forming of a cataplasm to heal wounds, and an infusion of the roots is purgative.

*Glandular Psoralea*. Fl. May, Aug. Clt. 1770. Sh. 2 to 4 ft.

53. *P. PUBESCENS* (Balb. in Pers. ench. 2. p. 347.) leaves pinnately trifoliate; leaflets ovate-oblong, pubescent, dotted on both surfaces; branches, petioles, and peduncles hairy; bracteas and calyxes villous and glandular; spike interrupted, rather shorter than the leaves.  $\mathcal{U}$ . G. Native of Peru. *P. pubescens*, Willd. enum. 788. Lindl. bot. reg. 968. Poir. dict. 5. p. 686. *P. frutescens*, Poir. dict. Flowers bright blue.

*Pubescent Psoralea*. Fl. Aug. Clt. 1825. Sh. 2 to 3 feet.

54. *P. MACROSTACHYA* (D. C. prod. 2. p. 220.) leaves pinnately trifoliate, pubescent; leaflets ovate, mucronate; petioles scabrous from glands; peduncles axillary, 4-times longer than the leaves; spikes cylindrical, and are as well as the rachis, bracteas, and calyxes very hairy.  $\mathcal{U}$ . F. Native of Nootka Sound, on the north-west coast of America. Bracteas acuminate, length of calyx. Spike a little branched.

*Long-spiked Psoralea*. Pl. 2 feet.

55. *P. CANESCENS* (Michx. bor. amer. 2. p. 57.) leaves trifoliate, on very short petioles, pubescent; leaflets ovate, on longish petioles; peduncles axillary, 2 or 3-times the length of the leaves; spikes or racemes interrupted; calyx rather gibbous, villous; bracteas ovate, mucronate.  $\mathcal{U}$ . F. Native of Carolina and Georgia. Root rather fusiform, bulbous at the neck. Leaves and calyxes full of pellucid dots. Flowers blue.

*Canescent Psoralea*. Fl. Jul. Aug. Clt. 1821. Pl. 1 to 2 ft.

56. *P. DIVARICATA* (H. B. in Willd. enum. 788.) leaves trifoliate, glabrous; leaflets lanceolate; spikes interrupted, pedunculate, axillary, longer than the leaves; stem branched, divaricate.  $\mathcal{U}$ . S. Native of Peru, near Guancabamba. Allied to *P. pubescens*. Calyx tomentose, according to Link. in enum. 2. p. 258. Stipulas ovate, adnate to the base of the petiole. Stamens monadelphous, ex Bonpland, mss. in Kunth, nov. gen. amer. 6. p. 486. Flowers yellow.

*Divaricate Psoralea*. Fl. Jul. Aug. Clt. 1820. Sh. 2 to 3 ft.

57. *P. DENTATA* (D. C. prod. 2. p. 221.) leaves pinnately trifoliate, glandular, and almost glabrous; leaflets ovate, repandly-toothed, cuneated at the base and entire; racemes spicate, interrupted, pedunculate, longer than the leaves; bracteas subulate, hardly exceeding the pedicels.  $\mathcal{U}$ . G. Native

of Madeira, not of America. *P. Americana*, Lin. spec. 1075. Jacq. hort. schœnb. 227.—Lob. icon. 2. t. 81. f. 1. Flowers white, but the keel is dark purple at the apex. Calyx glandular and smoothish.

*Var. β, villosa*; calyx glandular and villous. *P. polystachya*, Poir. suppl. 4. p. 587. if the synonyme be rightly attached. Native of Mauritania, near Alcaassar.

*Toothed-leaved Psoralea*. Fl. Jul. Aug. Clt. 1640. Sh. 1 ft. 58 *P. FLICATA* (Delil. fl. ægypt. p. 109. t. 37. f. 3.) branches warted from glands; leaves pinnately trifoliate; leaflets oblong-lanceolate, plicate, repand-toothed; spikes axillary, longer than the leaves; rachis permanent after the flowers have fallen, and becoming hard and spinose. *h. G.* Native of Upper Egypt, at the foot of the mountains between Qournah and Medynet-abou.

*Plated-leaffletted Psoralea*. Shrub 1 to 2 feet.

59 *P. OBTUSIFOLIA* (D. C. prod. 2. p. 221.) branches and leaves clothed with adpressed caescent pubescence; leaves trifoliate; leaflets obovate, plicate, denticulated, the middle one petiolulate. *h. G.* Native of the Cape of Good Hope. Burch. cat. 1214. This plant is very much like the preceding species.

*Obtuse-leaved Psoralea*. Shrub.

† *Species not sufficiently known.*

60 *P. ? RUBESCENS* (Lour. coch. p. 444.) arboreous; leaves pinnate; leaflets oblong-ovate; peduncles lateral, many-flowered; calyx rather truncate, biglandular at the base. *h. G.* Native of Cochin-china, in woods. Flowers reddish-white.

*Reddish-flowered Psoralea*. Tree 10 feet.

61 *P. ? SCUTELLATA* (Lour. coch. p. 443.) arboreous; leaves impari-pinnate; leaflets ovate, acuminate, glabrous; spikes crowded, nearly terminal; calyx scutate, glandular. *h. G.* Native of Cochin-china in woods. Flowers violaceous. Legume 1-2-seeded.

*Saucer-calyxed Psoralea*. Tree 20 feet.

62 *P. ? HUMILIS* (Mill. dict. no. 7.) leaves impari-pinnate, with 3 or 4 pairs of roundish, villous leaflets; heads of flowers axillary and terminal. *h. S.* Native of Vera Cruz. Flowers yellow, mixed with red.

*Humble Psoralea*. Shrub 5 to 6 feet.

63 *P. ? SCANDENS* (Mill. dict. no. 4.) leaves pinnate, with 3 pairs of oval obtuse leaflets; racemes sessile, axillary; stem branched, climbing. *h. S.* Native of Campeachy. Flowers blue. Perhaps a species of *Galega*.

*Climbing Psoralea*. Shrub cl.

64 *P. ? PROSTRATA* (Lin. amœn. 6. p. 93.) leaves glabrous, supra-decompound, digitate; lobes and lobules linear, middle one trifid; racemes axillary, pedunculate, roundish; stem decumbent. *h. G.* Native of the Cape of Good Hope. Flowers yellow. The plant has the habit of a species of *Hermannia*. The stipulas are ovate and the stamens diadelphous. The legume is unknown, therefore the genus is doubtful.

*Prostrate Psoralea*. Shrub prostrate.

*Cult.* All the species of this genus are rather elegant when in bloom. The stove and greenhouse kinds grow best in a mixture of loam and peat, and young cuttings root freely, if planted in a pot of sand, with a bell-glass placed over them; those of the stove species in heat. The frame kinds, or those natives of North America, grow best in peat and sand, and are increased by seeds, or cuttings will strike root.

**LXXIX. INDIGOFERA** (*indigo*, a blue dye, stuff, which is a corruption of *Indicum*, Indian, and *fero*, to bear; the greater part of this species of the genus produce indigo). Lin. gen. 889. Lam. ill. 626. D. C. leg. mem. vi. prod. 2. p. 221.

**LIN. SYST.** *Diadelpia, Decandria*. Calyx 5-cleft; lobes acute. Vexillum roundish, emarginate (f. 33. a.). Keel furnished with a subulate spur on both sides, at length usually bending back

elastically. Stamens diadelphous. Style filiform, glabrous. Legume nearly terete (f. 38. c.), or flator-tetragonal, 2-valved, many-seeded, rarely few-seeded at base, 1-seeded at the base or sub-glabrous. Seeds ovate, truncate at both ends, and usually separated from each other by cellular substance. Herbs or sub-shrubs. Stipulas small, distinct from the petiole. Peduncles axillary. Flowers disposed in racemes, purple, blue, or white. Leaves impari-pinnate, digitate, or simple. Leaflets usually stipellate at the base. The hairs on the plants usually adpressed and fixed by their centre.

§ 1. *Simplicifolia* (from *simplex*, simple, and *folium*, a leaf; in reference to the leaves of all the species contained in this division being simple). Leaves simple, sessile, or standing on a very short petiole.

1 *I. LINIFOLIA* (Retz, obs. 4. p. 29. and 6. p. 33. t. 2.) leaves obovate, obtuse, mucronate, hoary; racemes axillary; flowers hardly pedicellate; legume ovate, globose, 1-seeded. *⊙. S.* Native of the East Indies. Roxb. cor. 2. t. 195. *Hedysarum linifolium*, Lin. fil. suppl. 331. *I. polygonoides*, Wendl. *Spharidiophorum*, Desv. journ. 3. p. 125. t. 6. f. 35. Flowers red.

*Flax-leaved Indigo*. Fl. July, Aug. Clt. 1792. Pl. proc.

2 *I. TETRASPERRMA* (Vahl. ined. in herb. Juss. ex Pers. ench. no. 6.) leaves simple, linear, acuminate, hoary; flowers axillary, usually solitary; legume nearly terete, 4-seeded. *⊙. S.* Native of Guinea. *J. scoparia*, Vahl. ined. ex herb. Puer. Stem erect, branched, herbaceous. Flowers red.

*Four-seeded Indigo*. Pl. 1 foot.

3 *I. PANICULATA* (Pers. ench. 2. p. 7.) leaves oblong-linear, nearly naked; peduncles shorter than the leaves, the alternate ones terminal and panicled, elongated; legume terete, deflexed, 4-seeded, glabrous. *h. S.* Native of Guinea. Stem much branched; branches twiggy. Flowers red.

*Panicled Indigo*. Shrub 1 to 2 feet.

4 *I. SIMPLICIFOLIA* (Lam. dict. 3. p. 251.) leaves oblong-linear, almost naked; peduncles shorter than the leaves, each bearing 3 or 4 remote flowers; legume terete, tetragonal, mucronate, erect, 12-16-seeded, glabrous. *h. S.* Native of Sierra Leone. Stem erect, much branched; branches twiggy. Leaves an inch long.

*Simple-leaved Indigo*. Shrub 1 to 2 feet.

5 *I. FILIFOLIA* (Thunb. prod. 132. fl. cap. 595, but not of Ker.) leaves and branches filiform; the strigæ on the leaves, branches, and calyxes are few and adpressed; racemes pedunculate, few-flowered; legume deflexed, filiform. *h. G.* Native of the Cape of Good Hope. Flowers red or purple.

*Thread-leaved Indigo*. Fl. July, Oct. Clt. 1812. Sh. 1 ft.

6 *I. OBLONGIFOLIA* (Forsk. descr. 137. Vahl. symb. 1. p. 55.) leaves simple, oblong, silky; racemes axillary, 3-times longer than the leaves; calyx and vexillum villous. *h. G.* Native of Arabia Felix at Lohajam. A decoction of the herb is used in Egypt against the colic.

*Oblong-leaved Indigo*. Shrub.

7 *I. ? DEPRESSA* (Thunb. prod. 132. fl. cap. 596.) leaves ovate, silky; branches stiff, pubescent; spikes terminal, leafy, silky. *h. G.* Native of the Cape of Good Hope. Willd. spec. 3. p. 1222. Flowers red.

*Depressed Indigo*. Shrub prostrate.

8 *I. OVATA* (Thunb. prod. 132. fl. cap. 596.) leaves simple, ovate, villous; stem erect, glabrous; racemes terminal, ovate. *h. G.* Native of the Cape of Good Hope. Flowers red.

*Ovate-leaved Indigo*. Shrub.

9 *I. MYSORENSIS* (Rottl. in herb. Balb.) leaves elliptic, mucronate, beset with adpressed strigæ on both surfaces; stems, branches, and legumes clothed with simple villi; flowers axillary, solitary, almost sessile, disposed in a leafy raceme; legume

nearly terete, hardly 3-times longer than the calyx.  $\frac{1}{2}$ ? S. Native of the East Indies.

*Mysore Indigo.* Shrub.

10 I. ECHINATA (Willd. spec. 3. p. 1222.) leaves obovate, glabrous; stem prostrate, compressed at the apex; racemes axillary, about equal in length to the leaves; legumes falcate, echinated.  $\odot$ . S. Native of Tranquebar. 1. prostrata, Roxb. but not of Willd. Flowers purple.

*Echinated-legged Indigo.* Pl. prostrate.

11 I. CORDIFOLIA (Roth, nov. spec. 357.) hoary and pilose; leaves simple, cordate, roundish, mucronate, almost sessile; flowers axillary, sessile.  $\odot$ . S. Native of the East Indies. Flowers small, purple.

*Cordate-leaved Indigo.* Pl. prostrate.

§ 2. *Oligophylla* (from  $\text{oλιγός}$ , *oligos*, few, and  $\text{φυλλον}$ , *phyllon*, a leaf; in reference to the species contained in this section having the leaves composed of very few leaflets). D. C. prod. 2. p. 222. *Petiole elongated. Leaflets 1 or 3, terminal one stalked, the rest lateral, usually only one pair.*

12 I. MONOPHYLLA (D. C. prod. 2. p. 222.) leaves and branches hoary from adpressed down; petiole furnished with 2 little stipulas at the base; leaflet one, obovate, mucronate, feather-nerved; racemes much longer than the leaves; corolla clothed with rufous villi; legume spreading, straight, somewhat compressed, clothed with rufescent down.  $\frac{1}{2}$ . G. Native of New Holland, on the eastern coast. A very distinct species: the leaves appear impari-pinnate, but are reduced to the terminal leaflet.

*One-leaved Indigo.* Shrub 2 feet.

13 I. DIPHYLLA (Vent. choix. t. 30.) plant decumbent and pubescent; leaves petiolate, bifoliate; leaflets ovate, one of which is terminal the other lateral and smaller; racemes length of leaves; legumes arched, compressed, 2-4-seeded.  $\odot$ . S. Native of Africa. Flowers small, rose-coloured.

*Var.  $\beta$ , lanuginosa* (D. C. prod. 2. p. 223.) plant clothed with lanuginous strige; stem and legumes very hispid.  $\odot$ . S. Native of Senegal. 1. glauca, Perr. in litt. but not of Lam.

*Two-leaved Indigofera.* Fl. July, Aug. Clt. 1815. Pl. dec.

14 I. SUBULATA (Vahl. in Poir. suppl. 3. p. 150.) erect, glabrous; leaves petiolate, trifoliate; leaflets ovate-elliptic, the lateral leaflets seldom absent; racemes slender, shorter than the leaves; legume reflexed, slender, terete, acuminate, many-seeded.  $\odot$ . S. Native of Guinea (Thonning), Jamaica (Bertero). 1. mucronata, Spreng. in herb. Balb. Stipulas subulate. Flowers pale-red.

*Subulate-stipuled Indigo.* Pl. 1 foot.

15 I. CLITORIOIDES; plant hairy, herbaceous, branched; leaves ternate; leaflets lanceolate, obtuse; racemes elongated, axillary; legume hairy, straight.  $\odot$ . S. Native of Sierra Leone, in arid places. Flowers flesh-coloured.

*Clitoria-like Indigo.* Pl. 1 foot.

16 I. ELONGATA; herbaceous, erect; stem simple; leaves ternate; leaflets elliptic, acute, hairy; racemes elongated, axillary; legume short, compressed, hairy.  $\odot$ . S. Native of Sierra Leone, in arid places.

*Elongated-racemed Indigo.* Pl. 1 foot.

17 I. PILOSA (Poir. suppl. 3. p. 151.) branches slender, pilose; leaves of 1 or 3 elliptic leaflets, on short petioles; pedicels axillary, 1-flowered; calyxes hairy.  $\odot$ . S. Native of Guinea. Flowers red.

*Pilose Indigo.* Pl. 1 foot.

18 I. LESCHENAU'LI (D. C. prod. 2. p. 223.) branches angular, finely pubescent; leaves on long petioles, trifoliate; leaflets oval, obtuse, terminal one largest; racemes shorter than the leaves, many-flowered, sessile, only bearing fruit at the base;

legumes straight, spreadingly deflexed, tetragonal, acute, 8-10-seeded.  $\odot$ . S. Native of Bengal. Flowers purple.

*Leschenault's Indigo.* Fl. July, Aug. Clt. 1820. Pl. 1 ft.

19 I. TRIFOLIATA (Lin. amœn. 4. p. 327.) plant ascending, rather pubescent, exstipulate; leaflets 3, oval-oblong, pilose, mucronulate; flowers axillary, almost sessile, glomerate; legume obsoletely tetragonal, pendulous, scabrous, 3-6-seeded.  $\odot$ ? S. Native of the East Indies. Lateral leaflets opposite. Flowers red.

*Trifoliate Indigo.* Fl. July, Aug. Clt. 1816. Pl. ascending.

20 I. ARISTATA (Spreng. syst. 3. p. 273.) leaflets 3, spatulate, mucronately-awned, hoary from hairs on both surfaces; pedicels axillary, 1-flowered; calycine segments capillary and plumose.  $\odot$ . G. Native of the Cape of Good Hope.

*Awned-leaved Indigo.* Pl. decumbent.

21 I. MULTICAULIS (D. C. prod. 2. p. 223.) stems numerous, slender, diffuse; stipulas subulate, small; leaflets 3, oblong-cuneate, obtuse, mucronulate; flowers axillary, sessile, glomerate; legumes pendulous, compressed, acute, 5-6-seeded, scabrous from adpressed pili, which are fixed by their centre, as well as the stems and leaves.  $\odot$ . G. Native of Nipaul. 1. trifoliata, D. Don, prod. fl. nep. 245. The terminal leaflet on a short petiole. Legume obsoletely tetragonal. D. Don. Flowers small, red.

*Many-stemmed Indigo.* Fl. July. Pl. diffuse.

22 I. GRACILIS (Spreng. syst. append. p. 285.) stem diffuse, branched, smoothish; leaflets 3, elliptic, mucronate, glabrous above, but rather strigose beneath; stipulas subulate; racemes few-flowered; legumes hairy, reflexed, few-seeded.  $\frac{1}{2}$ . S. Native of the Cape of Good Hope. Flowers red or purple.

*Slender Indigo.* Shrub diffuse.

23 I. TIMORIE'NSIS (D. C. prod. 2. p. 223.) erectish, hoary in every part from adpressed pubescence, which is fixed by the centre; leaflets 3, obovate-oblong, glandless; racemes axillary, length of petioles; legumes spreading, tetragonal, straight, 6-8-seeded.  $\odot$ . S. Native of the East Indies.

*Timor Indigo.* Pl. 1 foot.

24 I. GLANDULOSA (Willd. spec. 3. p. 1227.) erect; branches angular, rather pilose; leaflets 3, oblong-obovate, pilose beneath, and covered with glandular dots; racemes shorter than the petioles; legume mucronate.  $\odot$ . S. Native of the East Indies. Flowers purple.

*Glandular Indigo.* Fl. July, Aug. Clt. 1820. Pl. 1 foot.

25 I. DIVERSIFOLIA (D. C. prod. 2. p. 223.) plant diffuse, rather hoary from adpressed pubescence, which is fixed by the centre; leaflets 1 or 3, oblong, the terminal one longest, the rest solitary, alternate or opposite; peduncles 1-3-flowered, rather longer than the petioles; legumes straight, spreadingly deflexed, rather downy.  $\odot$ ? S. Native of Bourbon. Stem slender, a finger high, suffruticose at the base.

*Diverse-leaved Indigo.* Pl. diffuse.

26 I. BRACTEOLATA (D. C. prod. 2. p. 223.) stem herbaceous, erect, much branched; branches terete, rather hairy, at length glabrous; cauline leaves few, impari-pinnate, having 3 or 5 leaflets, those on the branches bractea-formed, oval, sessile, simple, all covered with adpressed bristles; legume oval-oblong, acute, compressed, 1-2-seeded.  $\odot$ . S. Native of Senegal. *Crotalaria bracteolata*, Perr. in litt. Perhaps the axillary branches are elongated peduncles, furnished with leaf-like bracteas, and bearing solitary flowers in the axils of these bracteas.

*Bracteolate Indigo.* Pl. 1 foot.

27 I. BIFLORA (Roth. nov. spec. 358.) shrubby, erect, clothed with rufescent down; leaflets 1-3, elliptic, acuminate, 3-nerved, scabrous; peduncles axillary, 2-flowered, equal in length to the petioles; legume ovate, 2-seeded, mucronate, glabrous.  $\frac{1}{2}$ . S. Native of the East Indies. Flowers dark-purple.

*Two-flowered Indigo.* Shrub 1 to 2 feet.

28 *I. PEREGRINA* (D. C. prod. 2. p. 224.) stem terete, filiform, glabrous, suffruticose; leaflets 3, about equal in size and shape, oblong-linear, acute, pubescent above, dotted and strigose beneath; flowers 2, axillary, nearly sessile; legume reflexed, tetragonal, straight, 6-8-seeded.  $\odot$ ? S. Native of the East Indies. *Lôtus peregrinus*, Burm. fl. ind. 173. but not of Lin. *Trifolium Indicum*, flore rubro, Kleinh. in herb. Burm. Flowers red.

*Foreign Indigo.* Pl. procumbent.

29 *I. DENUDATA* (Jacq. hort. schœnbr. 2. t. 233.) suffruticose, erect, glabrous; leaflets 3, obcordate or obovate; racemes pedunculate, few-flowered, hardly twice the length of the leaves; legume terete, acute, pendulous.  $\dagger$ . G. Native of the Cape of Good Hope. Lodd. bot. cab. 500. Flowers red, streaked with more intense lines. Thumb. fl. cap. 597.

*Striped Indigo.* Fl. May, July. Clt. 1790. Shrub 2 feet.

30 *I. AMŒNA* (Ait. hort. kew. 3. p. 68.) plant suffruticose, erect; leaflets 3, oval, rather pilose, mucronate, pale beneath; spike pedunculate, many-flowered, 4-times the length of the leaves; calyx loose; legume terete, acute, pendulous.  $\dagger$ . G. Native of the Cape of Good Hope. Jacq. hort. schœnbr. 2. t. 231. Ker. bot. reg. 300. *I. heterophylla*, Thumb. fl. cap. 597. Flowers deep red.

*Pleasing Indigo.* Fl. Mar. June. Clt. 1774. Sh. 2 to 3 ft.

31 *I. RIGIDA* (Willd. enum. 780.) plant shrubby, erect; branches angular, pendulous; leaflets 3, obovately orbicular, retuse, covered beneath with strigose pili.  $\dagger$ . S. Native of the East Indies. Flowers and fruit unknown.

*Stiff Indigo.* Fl. July, Aug. Clt. 1816. Shrub 1 to 2 feet.

32 *I. MUTISH* (Spreng. syst. 3. p. 274.) branches clothed with rufous pubescence; leaflets 3, and are as well as the stipulas ovate and glabrous; spikes of flowers panicled.  $\dagger$ . G. Native of New Granada. *I. Mexicana*, Lin. fil.

*Mutis's Indigo.* Shrub.

33 *I. VIRGATA* (D. C. prod. 2. p. 224.) plant suffruticose, erect, slender; branches terete; leaflets 3, obcordate, mucronate by an awn, somewhat coriaceous, glabrous above and pubescent beneath; racemes somewhat spicate, shorter than the leaves; calyxes villous.  $\dagger$ . S. Native of the East Indies. Flowers purplish.

*Var.  $\beta$ , parvifolia* (D. C. prod. 2. p. 224.) leaflets obovate, smaller.  $\dagger$ . G. Native of China.

*Twiggy Indigo.* Fl. July, Aug. Clt. 1820. Sh. 1 to 2 ft.

34 *I. COMPLANATA* (Reichb. ex Spreng. syst. append. p. 284.) branches flat, 2-edged; leaflets 3, lanceolate-linear, acute, silvery beneath, from very short, adpressed strigæ; racemes many-flowered, terminal; calyx white.  $\dagger$ . G. Native of the Cape of Good Hope. Flowers red.

*Flat-stemmed Indigo.* Shrub 1 foot.

35 *I. CANESCENS* (Lam. dict. 3. p. 251.) the whole plant clothed with adpressed canescent down; branches angular; leaflets 3, ovate, obtuse, terminal one largest; racemes axillary, sessile, shorter than the leaves; legume straight, linear, tetragonal, white, spreadingly reflexed.  $\dagger$ ? S. Native of the East Indies. Flowers red.

*Canescent Indigo.* Shrub 1 foot.

36 *I. NIVEA* (Willd. herb. ex Spreng. syst. 3. p. 273.) erect, and clothed with silky white down; leaflets 3, obovate, obtuse; racemes shorter than the leaves.  $\dagger$ . G. Native of the Cape of Good Hope. Flowers red.

*White-leaved Indigo.* Shrub 1 to 2 feet.

37 *I. PAUCIFOLIA* (Delil. fl. ægypt. 107. t. 37. f. 22.) plant shrubby, erect, clothed with white adpressed down; branches terete; leaflets 1 to 4, oblong, mucronulate, lower ones smallest, usually alternate; racemes somewhat spicate, longer than the leaves; legumes somewhatiform, torulose.  $\dagger$ . G. Native

of Egypt, in Elephant Island, and of the East Indies. Flowers probably red. Very like the following species.

*Pem-leaved Indigo.* Shrub 1 to 2 feet.

§ 3. *Multijugæ* (from *multus*, many, and *jugum*, a yoke or pair; in reference to the leaves being composed of many yokes or pairs of leaflets). *Leaves impari-pinnate, having usually many pairs of leaflets, rarely 2 pairs only.*

\* *Petioles elongated. Stems shrubby.*

38 *I. ARGENTEA* (Lin. mant. 27. but not of Burm.) shrubby; branches terete, white from silky adpressed down; leaves with 1-2 pairs of obovate leaflets, which are clothed with silky pubescence; racemes shorter than the leaves; legumes pendulous, somewhat compressed, torulose, canescent, 2-4-seeded.  $\dagger$ . G. Native of Egypt, Arabia, and the East Indies. *Iher. stirp.* t. 29. *I. articulata*, Gouan. ill. 49. *I. glauca*, Lam. dict. 3. p. 246. *I. tinctoria*, Forsk. descr. 138. This plant is gathered in Barbary and Egypt for indigo. According to Desfontaines it is cultivated extensively in the kingdom of Tunis for dyeing; but he says it is not indigenous there. The Arabs call it *Habail*. Flowers with the vexillum and keel yellow and wings red.

*Silvery or Arabian Indigo.* Fl. July, Aug. Clt. 1776. Sh. 2 to 3 feet.

39 *I. TINCTORIA* (Lin. spec. 1061.) stem suffruticose, erect; leaves pinnate, with 4-7 pairs of obovate leaflets, which are pubescent beneath; racemes axillary, shorter than the leaves; legumes terete, torulose, arched, 8-10-seeded.  $\dagger$ . S. Native of both Indies and tropical Africa, where it is cultivated to a great extent.—Sloan. jam. 2. t. 179. f. 2.—Rheed. mal. 1. t. 54. Rumph. amb. 5. t. 8. *I. Sumatrana*, Gærtn. fruct. 2. p. 317. t. 148. Lam. ill. t. 626. f. 1. Perhaps *I. cœrulea* of Roxb. hort. beng. p. 55. is sufficiently distinct from this plant. *I. Indica*, Lam. dict. 3. p. 245. Flowers with a pale vexillum and red keel and wings. *Indigo* is one of the most profitable articles of culture in Hindostan, because an immense extent of land is required to produce but a moderate bulk of the dye; because labour and land there is cheaper than any where else, and because the raising of the plant and its manufacture may be carried on even without the aid of a house. The first step in the culture of the plant is to render the ground, which should be friable and rich, perfectly free from weeds, and dry if naturally moist. The seeds are then sown in shallow drills about a foot apart. The rainy season must be chosen for sowing, otherwise if the seed is deposited in a dry soil or in the dry season, it heats, corrupts, and is lost. The crop, being kept clear of weeds, is fit for cutting in 2 of 3 months, and it may be repeated in the rainy season every six weeks. The plants must not be allowed to come into flower, as the leaves at that time become dry and hard, and the *indigo* produced is of less value, nor must they be cut in dry weather, as they would not spring again. A crop generally lasts two years. Being cut, the herb is first steeped in a vat till it has become macerated, and parted with its colouring matter, then the liquor is let off into another vat, in which it undergoes the peculiar process of beating, to cause the fecula to separate from the water. This fecula is then let off into a third vat, where it remains some time, and is then strained through cloth bags, and evaporated in shallow wooden boxes placed in the shade. Before it is perfectly dry it is cut into small pieces of an inch square; it is then packed in barrels or stowed in sacks for sale. *Indigo* was not extensively cultivated in India before the British settlements were formed there; its profits were at first so considerable, that, as in similar cases, its culture was carried too far, and the market glutted with the commodity. The *indigo* is one of the most precarious of oriental crops, being liable to be destroyed by hail-storms.

which do comparatively little injury to the sugar-cane and other plants.

*Indigo* has long been cultivated in Spain, but has been long on the decline in that country, owing to the more favorable circumstances of the East and West Indies. It was tried in the south of France and Italy during the time of Bonaparte, but found not worth following for the same reason.

The *indigo* commonly cultivated in the West Indies is the *I. Anil*, and sometimes *I. tinctoria* and *I. Guatimala*, though there are various species and varieties which afford a similar dye. *Indigo* thrives best in free rich soil and a warm situation, frequently refreshed with moisture. Having first chosen a piece of ground and cleared it, hoe it into little trenches, not above two inches or two inches and a half in depth, and not more than 14 or 15 inches asunder. In the bottom of these at any season of the year, strew the seeds pretty thick, and immediately cover them. As the plants shoot they should be frequently weeded, and kept constantly clean, until they spread sufficiently to cover the ground. Those who cultivate *indigo* in great quantities, only strew the seed pretty thick in little shallow pits, hoed up irregularly, but generally within 4-5 or 6 inches of each other, and covered as before. Plants raised in this manner are observed to answer as well or rather better than the others, but they require more care in the weeding. The plants grow to full perfection in 2 or 3 months, and are observed to answer when cut in full blossom. They are cut with reaping hooks, a few inches above the root, tied in loads, carried to the works, and laid by strata in the steeper. Seventeen negros are sufficient to manage twenty acres of *indigo*; and one acre of rich land, well planted, will, with good seasons and proper management, yield 500 pounds of *indigo* in twelve months, for the plant after being cut sends out stolons or new growths, and gives 4 or 5 crops a-year, but must be replanted or resown afterwards. (P. Browne.)

According to Loureiro *indigo* is spontaneous in China and Cochinchina, and is cultivated all over those vast empires. The ancients were acquainted with the dye which we call *indigo* under the name of *indicum*. Pliny knew that it was a preparation of vegetable substance, though he was not acquainted with the plant nor the process of making the dye. Even at the close of the sixteenth century it was not known in England what plant produced *indigo*. For in the Remembrance for Master T. by Richard Hakluyt in 1582, he was instructed "to know if *Anil*, that coloureth blew, be a natural commodity of those parts (Turkey) and if it be compounded of an herbe, to send the seed or root, with the order of sowing, &c. that it may become a natural commodity in the realme as woad is, that the high price of foreign woad might be brought down."

*Dyer's Indigo.* Fl. July, Aug. Clt. 1731. Shrub 2 to 3 ft.

40 *I. GUATIMALA* (Lam. hort. jam. 1. p. 420.) plant shrubby, erect; leaves pinnate, with 4 or 5 pairs of lanceolate leaflets, which are hoary beneath; racemes axillary, shorter than the leaves; legumes recurved, declining, gibbous at the sutures, many-seeded. *h. S.* Native of South America, at Guatimala. *I. tinctoria*  $\beta$ , *brachycarpa*, D. C. prod. 2. p. 224. Flowers red. Dr. Patrick Browne says this plant seldom exceeds 3 or 4 feet high, throwing out many suberect branches as it rises. It is said to be much hardier than *I. tinctoria* or *I. Anil*, and affords a finer pulp, but it does not yield so great a quantity, and is only cultivated where the seasons are not so certain, or in mixed fields. The former yielding more of the dye than either of the others is generally preferred, though liable to many more mischances.

*Guatimala Indigo.* Fl. July, Aug. Clt. 1731. Sh. 3 to 4 ft.

41 *I. ANIL* (Lin. mant. 272.) stems shrubby, erect; leaves pinnate, having 3-7 pairs of oval or oblong leaflets, hardly pubescent beneath; racemes axillary, shorter than the leaves;

legumes compressed, not torulose, deflexed, arched, with the sutures on both sides rather prominent. *h. S.* Native of South America, spontaneous, but cultivated for indigo in both Indies. See *I. tinctoria* for culture and uses. Mr. Miller says this plant grows to the height of 5 or 6 feet (if this be his *I. suffruticosa*), and that being a much larger plant than *I. tinctoria*, it will afford a greater quantity of *indigo* from the same compass of ground, than any of the other species, especially if cut before the stems grow woody; it will also grow on poorer land. It is very common in Jamaica, growing wild in all the savannahs, where doubtless it had been cultivated in former times. It is hardier than any of the other sorts, and grows very luxuriantly, even in the driest lands; but it does not yield so much pulp, according to P. Browne; the dye, however, that is extracted from it is generally the best, of a fine copperish cast, and of a fine grain. The plant is called *Hab-nil* or *Nilè* by the Arabs, and *Nil* by the Bengalese.

*Var. a, oligophylla* (D. C. prod. 2. p. 225.) leaves having 3-4 pairs of leaflets; legumes arched. *h. S.* Sloan. jam. t. 176. f. 3. Lam. ill. t. 629. f. 2. Native of South America, and the West Indies.

*Var. b, polyphylla* (D. C. 1. c.) leaves having 5-7 pairs of leaflets; legumes arched. *h. S.* I. Corneziello, Moc. et Sesse, fl. mex. icon. ined. Native of South America, and the West Indies.

*Var. c, orthocarpa* (D. C. 1. c.) leaves having 5-7 pairs of leaflets; legume deflexed, straight. *h. S.*—Rumph. amb. 5. t. 80. ? East Indies and Madagascar. Perhaps a proper species. *Anil* or West Indian Indigo. Fl. July, Aug. Clt. 1751. Shrub 2 to 4 feet.

42 *I. THIBAUDIANA* (D. C. prod. 2. p. 225.) stem suffruticose, erect; leaves pinnate, having 10 or 11 pairs of elliptic, retuse, mucronate leaflets, which are pubescent on both surfaces; racemes length of leaves; legume pendulous, straight, linear, compressed, tapering into an acumen at the apex, 8-10-seeded. *h. S.* Native of Mexico. Legumes disposed in a raceme, which is 30 or 40 inches long. Flowers dark purple.

*Thibaud's Indigo.* Shrub 5 to 6 feet.

43 *I. LEPTOSTACHYA* (D. C. prod. 2. p. 225.) stem suffruticose, erect; leaves pinnate, with 5-10 pairs of leaflets; leaflets elliptic-obovate, retuse, mucronulate, rather pubescent on both surfaces; racemes axillary, slender, length of leaves; flowers distant, erect; legumes reflexed, straight. *h. S.* Native of the East Indies. Flowers red, about 20 in a spike.

*Slender-spiked Indigo.* Fl. Ju. Jul. Clt. 1818. Sh. 2 to 3 ft.

44 *I. UNCINATA*; shrubby, erectish, branched, stiff; leaves pinnate, with 5 pairs of lanceolate, mucronate pubescent leaflets; racemes short, spicate, axillary, sessile; legumes arched, crowded. *h. S.* Native of Sierra Leone, in waste places.

*Hooked-podded Indigo.* Shrub 2 feet.

45 *I. ATROPURPUREA* (Hamilt. in Horn. hort. hafn. add. 152.) shrubby, erect; leaves pinnate, with 5-7 or 10 pairs of oval, retuse, mucronulate leaflets, having their margins rather undulated, younger ones covered with adpressed pubescence, adult ones nearly glabrous; racemes axillary, slender, lower ones length of leaves; calyx silky; legume straight, compressed, mucronate, pendulous, 8-10-seeded. *h. G.* Native of Nipaul, at Narain-hetty. D. Don, prod. fl. nep. 244. Flowers showy, dark-purple. Stipulas obsolete.

*Dark-purple-flowered Indigo.* Fl. June, Aug. Clt. 1816. Shrub 5 to 6 feet.

46 *I. DÛSUA* (D. Don, prod. fl. nep. 244.) shrubby; leaves pinnate, having 10-16 pairs of oval, retuse, mucronulate leaflets, which are clothed with rufescent pili on both surfaces, as well as the branches; spikes axillary, shorter than the leaves; bractæas and stipulas linear and deciduous; teeth of calyx ovate,

acute. *h. G.* Native of Upper Nipaul, at Suembu, where it is called *Dosi-swa* by the Nawaris. Flowers purple.

*Dosi-swa* Indigo. Shrub 2 to 4 feet.

47 *I. GALEGOIDES* (D. C. prod. 2. p. 225.) stem erect; leaves pinnate, having 8 or 9 pairs of elliptic, mucronate leaflets, which are beset with minute pubescence on both surfaces; racemes axillary, one half shorter than the leaves; legumes erect, straight, linear, acuminate, compressed, rather callous at the sutures on both sides. 10-12-seeded. *h. S.* Native of Ceylon. Legume 2 inches long and hardly a line broad.

*Galga-like* Indigo. Shrub 3 to 4 feet.

48 *I. CASSIOIDES* (Rottl. ex herb. Balb. D. C. prod. 2. p. 225.) stem suffruticose, erect; leaves pinnate, having 4 or 5 pairs of elliptic-obovate, retuse, mucronulate leaflets, which are rather pubescent on both surfaces; racemes length of leaves; legumes spreading, rather compressed, glabrous, 10-seeded, with the suture thick and prominent on both sides. *h. S.* Native of India, on the Nelligery mountains, where it is called *Maniligueta*. The leaves are nearly like those of a species of *Colutea*. Legume stiff, an inch long.

*Cassia-like* Indigo. Shrub 3 to 4 feet.

49 *I. CYLINDRICA* (D. C. prod. 2. p. 225.) stem suffruticose; leaves pinnate, having 4 or 5 pairs of obovate, obtuse, or emarginate, glabrous leaflets; racemes longer than the leaves; legumes spreading, straight, cylindrical, 8-10-seeded, glabrous, with the sutures not prominent. *h. G.* Native of the Cape of Good Hope. Leaves very like those of *Colutea*. The legume almost like that of *Calophyllum*, about an inch long, and about 2 or 3 lines in diameter.

*Cylindrical-podded* Indigo. Shrub 1 to 2 feet.

50 *I. JUNCEA* (Delaun. herb. amat. t. 227.) stem shrubby, erect, and is as well as the leaves smooth; petioles elongated, filiform, in the young plants the leaves are furnished with 3 or 4 pairs of obovate-oblong leaflets, but at length almost all nearly leafless; racemes erect, shorter than the petioles; legumes reflexed. *h. G.* Native of the Cape of Good Hope. *I. aphylla*, Link. enum. 2. p. 251. *I. filifolia*, Ker. bot. reg. 104. *Lebeckia contaminata*, Ait. hort. kew. ed. 2. vol. 4. p. 261. but not of Thunb. *Spartium contaminatum*, Ait. hort. kew. ed. 1. vol. 3. p. 10. but not of Lin. Flowers purple.

*Rushy* Indigo. Fl. June, July. Clt. ? Shrub 1 to 2 feet.

51 *I. AUSTRALIS* (Willd. spec. 3. p. 1235.) shrubby; branches terete, rather pubescent; leaves pinnate, having 5-7 pairs of elliptic-obtuse, glabrous leaflets; racemes rather shorter than the leaves; legumes spreading, terete, straight, glabrous, 8-10-seeded. *h. G.* Native of New Holland. Lodd. bot. cab. 149. Ker. bot. reg. 365. Flowers rose-coloured.

*Southern* Indigo. Fl. Mar. June. Clt. 1790. Sh. 3 to 4 ft.

52 *I. SYLVATICA* (Sieb. pl. exsic. nov. holl. no. 379.) erect, shrubby; stem and branches acutely angled; leaves with 4-7 pairs of leaflets; leaflets nearly equal, elliptic, quite smooth, for the most part emarginate; racemes shorter than the leaves, or about the same length. *h. G.* Native of New Holland. Hook. in bot. mag. 3000. *I. angulata*, Lindl. bot. reg. 2578. *I. speciosa*, Fraser, mss. Flowers rose-coloured, inclining to purple. A very showy plant.

*Wood* Indigo. Fl. Mar. June. Clt. 1824. Sh. 3 to 8 feet.

53 *I. NU'DA* (G. Don, in Loud. hort. brit. p. 301.) plant almost leafless; branches terete, mucronate; racemes axillary; corolla, calyx, and pedicels purple. *h. G.* Native of the Cape of Good Hope. Racemes long, in the axils of the branches. *Lebeckia nuda*, Sims, bot. mag. t. 2214. Flowers purple.

*Naked* Indigo. Fl. June, July. Clt. 1816. Shrub 2 to 3 ft.

54 *I. MACROSTACHYA* (Vent. malm. t. 44.) shrubby; branches terete, clothed with adpressed pubescence; leaves pinnate, having 8 or 10 pairs of oval-oblong, obtuse, mucronate, pubescent

leaflets; racemes many-flowered, longer than the leaves. *h. G.* Native of China. Flowers rose-coloured, those on the lower part of the raceme soon falling off in the gardens.

*Long-spiked* Indigo. Fl. June, July. Clt. ? Sh. 2 to 3 ft.

55 *I. POLYCARPA* (Willd. herb. ex Spreng. syst. 3. p. 276.) shrubby, erect; leaves with 5 pairs of obovate-oblong leaflets, which are rather strigose on both surfaces; racemes many-flowered, about equal in length to the leaves; legumes reflexed, tetragonal. *h. S.* Native of South America.

*Many-fruited* Indigo. Shrub 1 to 3 feet.

56 *I. FRUTESCENS* (Lin. fil. suppl. 334.) stem shrubby, terete, beset with short hairs at the apex, which are fixed by their centre, as well as the under side of the leaves; leaves pinnate, with 2 or 4 pairs of obovate-oblong leaflets; racemes a little longer than the leaves. *h. G.* Native of the Cape of Good Hope. Thunb. fl. cap. 598. Flowers red.

*Shrubby* Indigo. Fl. May, Aug. Clt. 1822. Sh. 2 to 3 ft.

57 *I. EMARGINATA*; shrubby, branched, spreading; leaves with 3 pairs of obovate-oblong, emarginate leaflets; flowers in axillary and terminal panicles. *h. S.* Native of Sierra Leone, at the edges of woods. Flowers dark purple.

*Emarginate-leafletted* Indigo. Shrub 2 to 3 feet.

58 *I. DIVARICATA* (Jacq. hort. schœnbr. t. 365.) shrubby; branches spreading much, puberulous, sulcated; leaves pinnate, with 4 or 5 pairs of elliptic-oblong, mucronate leaflets, which are clothed with adpressed pubescence beneath; racemes shorter than the leaves; legume spreading, arched upwards, rather tetragonal, and somewhat nodulose, 6-8-seeded. *h. G.* Native of? Flowers red. Lower leaves having 2 or 3 pairs of leaflets, the upper with 6 or 7 pairs.

*Divaricate-branched* Indigo. Fl. July, Aug. Clt. ? Shrub 2 to 3 feet.

59 *I. COMPRESSA* (Lam. dict. 3. p. 218.) shrubby; branches glabrous, compressed, flat; leaves pinnate, having 1 or 2 pairs of leaflets; leaflets ovate-lanceolate, rather silky, minute; racemes slender, longer than the leaves, 5-6-flowered; legume nearly terete, straight, smoothish. *h. S.* Native of Madagascar. Flowers red.

*Compressed-stemmed* Indigo. Shrub 1 to 2 feet.

60 *I. CINERASCENS* (D. C. prod. 2. p. 226.) shrubby; branches terete, slender, velvety at the apex from cinereous, rufescent, very short down; leaves pinnate, with 2 or 4 pairs of obovate, obtuse leaflets, which are clothed with cinereous pubescence beneath; racemes much shorter than the leaves, floriferous at the base. *h. S.* Native of the Mauritius.

*Greyish* Indigo. Shrub 1 to 2 feet.

61 *I. HUMILIS* (H. B. et Kunth, nov. gen. amer. 6. p. 451.) shrubby, procumbent, silvery from silky strigæ; leaves pinnate, having 2 or 4 pairs of oblong, acutish, stiff leaflets; racemes few-flowered, much exceeding the leaves; legumes reflexed, rather terete, straight, usually 2-seeded. *h. S.* Native of Peru, on the mountains near Caxamarca. Flowers red.

*Humble* Indigo. Shrub procumbent.

62 *I. TEPHROSIOIDES* (H. B. et Kunth, l. c. p. 455. t. 580.) shrubby, rather climbing, when young clothed with adpressed, strigose villi; leaves pinnate, with 6 to 9 pairs of leaflets; leaflets oblong, mucronately awned, clothed beneath with silky and silvery strigæ; racemes on very long peduncles; legumes reflexed, pendulous, tetragonal, straight. *h. S.* Native of Quito, near Cuenca. Flowers red. Ova 10 or 12, but the seeds are only 5 or 6, from abortion.

*Tephrosia-like* Indigo. Shrub 2 to 3 feet.

63 *I. TRUXILLÆNSIS* (H. B. et Kunth, l. c.) shrubby, much branched; branches clothed with ferruginous strigæ; leaves pinnate; leaflets 5 or 6 pairs, oblong, obtuse, mucronate, cuneated at the base, strigose on both surfaces, but especially on

the under; racemes many-flowered, nearly sessile, shorter than the leaves; legumes reflexed, nearly terete, rather falcate, 4-6-seeded.  $\text{h. S.}$  Native on the shores of Peru, near Truxillo. Flowers rose-coloured.

*Truxillo Indigo.* Shrub 6 feet.

64 *I. LESPEDEZIOIDES* (H. B. et Kunth, l. c.) shrubby; leaves pinnate; leaflets 3 pairs, cuneate-lanceolate, rounded at the apex and mucronate, acute at the base, beset with strigæ on both surfaces as well as the branches, glaucescent beneath; racemes many-flowered, on short peduncles, exceeding the leaves; legumes reflexed, rather compressed, straight, usually 8-seeded.  $\text{h. G.}$  Native of Mexico, on Mount Jorullo. Flowers red.

*Lespedeza-like Indigo.* Shrub 1 to 3 feet.

65 *I. ARBORESCENS* (Zucc. obs. 1. no. 84.) stems shrubby; rough from papulæ; branches terete; scabrous from adpressed bristles; leaves pinnate, with 4 to 8 pairs of oblong, mucronate leaflets, which are also beset with adpressed bristles beneath; racemes almost terminal, twice the length of the leaves; legumes spreading, terete, linear, glabrous.  $\text{h. S.}$  Native of?

*Arborescent Indigo.* Shrub.

66 *I. SECUNDIFLORA* (Poir. suppl. 3. p. 148.) shrubby; branches terete, and are as well as the leaves beset with clammy pili; leaves pinnate, with 2 or 3 pairs of almost lanceolate leaflets; racemes shorter than the leaves; flowers secund; calyx very pilose; legume almost cylindrical, mucronate, hairy.  $\text{h. S.}$  Native of Guinea. *I. glutinosa*, Vahl. in herb. Desf. Flowers red.

*Secund-flowered Indigo.* Shrub 1 to 3 feet.

67 *I. BERTERIANA* (Spreng. syst. 3. p. 277.) shrubby, decumbent; leaves with usually 4 pairs of oblong-spatulate leaflets, which are clothed with white silky pubescence beneath; peduncles axillary, usually 1-flowered; legumes linear, straight.  $\text{h. S.}$  Native of Guadaloupe. Flowers red.

*Bertero's Indigo.* Shrub decumbent.

68 *I. MUCRONATA* (Spreng. in herb. Balb. D. C. prod. 2. p. 227.) stem terete, suffrutescent at the base; petioles and leaves clothed with adpressed strigæ on both surfaces; leaves pinnate, with 2 pairs of mucronate, ovate leaflets, which are pale beneath; racemes pedunculate, longer than the leaves; legumes reflexed, straight, a little tetragonal, mucronate, clothed with strigose pubescence, many-seeded.  $\text{h. S.}$  Native of Jamaica.

*Mucronate-leafletted Indigo.* Shrub 2 to 3 feet.

*\*\* Petioles elongated. Stem herbaceous.*

69 *I. INQUINANS* (Willd. spec. 3. p. 1236.) stem herbaceous, erect, and is as well as the terete branches hispid from clammy pili; leaflets 4-5 pairs, elliptic-oblong, clothed with adpressed white pili beneath; racemes shorter than the leaves; legumes spreading, straight, terete, rather pilose, 8-10-seeded.  $\text{h. S.}$  Native of St. Domingo. Flowers red. This plant is cultivated for Indigo in St. Domingo.

*Dyeing Indigo.* Pl. 1 foot.

70 *I. LATERITIA* (Willd. spec. 3. p. 1233.) stem herbaceous, erect, pilose, clammy; leaves with 1 or 2 pairs of elliptic leaflets; racemes usually about equal in length to the leaves; legumes tetragonal, hairy, straight, 8-10-seeded.  $\text{h. S.}$  Native of Guinea, particularly in the island of St. Thomas. *I. hirsuta*, Jacq. icon. rar. t. 359. coll. 2. p. 359. but not of Lin. Flowers red.

*Brick-coloured-haired Indigo.* Fl. Ju. Jul. Clt. 1806. Pl. 1 ft.

71 *I. VISCOSA* (Lam. dict. 3. p. 247.) stem herbaceous, erect, and is as well as the terete branches, rather hispid from clammy pili; leaves with 6 pairs of oblong-elliptic leaflets, which are clothed with adpressed bristles beneath; racemes shorter than the leaves; legumes spreading, straight, somewhat compressed,

rather pilose, 8-10-seeded.  $\text{h. S.}$  Native of Guinea. Stems herbaceous, *I. graveolens*, Wendl. sert. han. t. 12. Flowers pendulous 2-species is very like *I. lateritia*.

*Var.  $\beta$ .* stem rather diffuse.  $\text{h. S.}$  Native of the island of Timor.

*Clammy Indigo.* Fl. July, Aug. Clt. 1806. Pl. 1 foot.

72 *I. GLUTINOSA* (Perr. in litt. but not of Vahl. D. C. prod. 2. p. 227.) stem almost herbaceous, much branched; branches terete, beset with glutinous hairs; leaves with 3 pairs of elliptic-obovate leaflets, which are clothed with adpressed bristles beneath; racemes a little longer than the leaves; flowers distant; legumes straight, nearly terete, erect, clothed with clammy hairs, 8-10-seeded.  $\text{h. S.}$  Native of Guinea, particularly in Senegal. Flowers red.

*Glutinous-haired Indigo.* Pl. 1 foot.

73 *I. DENDROIDES* (Jacq. icon. rar. 3. t. 571. coll. 2. p. 357.) stem herbaceous, erect, and is as well as the terete branches smoothish; leaves with 6-15 pairs of oblong leaflets, which are clothed on both surfaces with very minute adpressed pubescence; racemes slender, a little longer than the leaves; legume erect, terete, straight, mucronate, smoothish, 8-12-seeded.  $\text{h. S.}$  Native of Guinea. Flowers rose-coloured.

*Tree-like Indigo.* Pl. 1 foot.

74 *I. POLYPHYLLA* (D. C. prod. 2. p. 227.) stem herbaceous, erect, scabrous from strigæ; leaves with 12-16 pairs of elliptic leaflets, which are scabrous on the upper surface, and clothed with white tomentum on the under; racemes length of leaves; legumes pendulous, straight.  $\text{h. G.}$  Native of Nipaul. Habit almost of a species of *Dalea*. Racemes and branches clothed with rufous villi. Stamens diadelphous. Ovary linear, compressed, almost tetragonal, acuminate by the style.

*Many-leafletted Indigo.* Pl. 1 foot.

75 *I. HETEROTRICHA* (D. C. prod. 2. p. 227.) stem almost herbaceous, terete; branches and peduncles hispid from long, stiff, bristly hairs, which are hooked at their apexes; leaves with 4-6 pairs of elliptic or obovate, mucronate leaflets, which are beset with adpressed strigæ beneath; racemes much longer than the leaves, pedunculate; legumes reflexed, terete, mucronate, bearing adpressed strigæ and bristly hairs.  $\text{h. ? G.}$  Native of the Cape of Good Hope. Burch, cat. geogr. no. 2635. Flowers red? A very distinct species.

*Variable-haired Indigo.* Pl. 1 to 2 feet.

76 *I. DOMINGENSIS* (Spreng. in herb. Balb. D. C. prod. 1. c.) stems somewhat herbaceous; branches rather villous, and rather compressed at the apex; leaves with 4 pairs of obovate leaflets, which are dotted beneath and covered with adpressed pubescence on both surfaces; racemes longer than the leaves, crowded with flowers; legumes pendulous, terete, rather torulose, and rather villous, 3-4-seeded.  $\text{h. ? S.}$  Native of St. Domingo. Allied to the following and *I. enneaphylla*. Flowers rose-coloured.

*St. Domingo Indigo.* Pl. 1 foot.

77 *I. OLIGOSPERMA* (D. C. prod. 2. p. 228.) stem herbaceous, erect; branches angular at the apex and pubescent; leaves with 4-5 pairs of elliptic-oblong, mucronate leaflets, which are covered with adpressed bristly hairs on both surfaces; racemes length of leaves; legumes terete, villous, and bristly, 2-3-seeded, spreadingly-reflexed.  $\text{h. S.}$  Native of Senegal. It differs from *I. disperma* in the leaves not being glabrous, in the legumes being more slender and not torulose, and in being much more villous. Flowers red.

*Few-seeded Indigo.* Pl. 1 foot.

78 *I. DISPERMA* (Lin. syst. nat. 3. p. 232.) stem herbaceous? branches terete; leaves with 4-6 pairs of elliptic-oblong, glabrous leaflets; racemes slender, longer than the leaves; legumes terete, rather torulose, mucronate, 2-seeded, scabrous
